Of course, as in every case where officers meet together in war-time, many rumours got about, and they were all excited by one that the Crown Prince, attended, as usual, by General von Blumenthal, was coming from Versailles to make a tour of inspection and give decorations, &c. *Unser Fritz* was a great favourite. He was strict, but he was as humane as he was brave, and the men loved him. Buttons were brightened, and uniforms furbished up with more exactitude than ever; though, as it turned out, it was all a *canard*, and he never came at all. However, I duly sent word of this to Count de Valancourt, at the same time reiterating that I was going to return to service in a few days. But my departure, or rather flight, took place sooner than I expected.

(*Continued on page 391.*)

JOHN BROWN.

CHAPTER XVIII.—GENERAL POM-POM.

THE worst of being in a cadet school is the number of inspections you have. Inspectors for trench warfare, gas, bayonet-fighting, administration, general training, &c., &c., keep popping in. Each man believes that his branch is *It*, and should you fail to come up to his requirements, then there 's a bad report, a thousand curses, and lots of trouble. All the same, the system is absolutely necessary, and keeps specialists and instructors up to the scratch. The greatest defect is this: these inspectors frequently ask for suggestions, but often fail to back them up. This, I imagine, is due to the apathy of a higher authority, or the obtrusion of the inspector's own point of view. We often talked about this, and our view was that all cadet-school instructors ought to form a corporate body and demand 'the goods.' By the way, it was whispered that one real good W.O. man was named Browne. He, it is said, always endeavoured to get the schools whatever they wanted.

Good old Browne!

We always liked the visits from the younger men of the Staff. They were so bright, so business-like, and they *did* take an interest in all we were doing. Many gave us valuable tips, which were much appreciated. Indeed, were it not for these smarter men, military training would be in a muddle. They are being allowed fair scope, but if the powers that be would only sack all the old foozlers who are tottering round the various districts and home commands, life would certainly be brighter, and training would

be pushed along by the younger men, who at present cannot get full play for all their splendid ideas. We of the New Army belong to the New School. We are willing to learn from a duke or a pauper, but the teacher must have BRAINS. We are not concerned about seniority or foolish traditions.

I also think it is a great pity that we never saw *real* generals. We longed for lectures from Robertson, French, Haig, Allenby, Birdwood, and all the other good fellows who have done so well. We never had one. Of course, many such men are doing bigger things abroad; but some are at home, and others frequently cross the Channel. We would have pawned our shirts to go and hear them, for we do admire them. Certainly we got their ideas in the form of pamphlets. But what's a pamphlet compared to the living man? A mere shadow, and not at all impressive. I am writing this, of course, for a definite purpose. The W.O. will see these lines long before John Brown's diary is published, and something, I know, will be done. They always do things in the army when they see them in PRINT.

After all, what is the use of sending old dug-out generals to talk to cadet schools. Some are nice old gentlemen who have done well in Ashanti or on the Frontier—*in the past*. Others, again, are petty-minded old fools, who simply upset the instructors and give the cadets a thin time. They may be jolly good disciplinarians, and all that sort of thing; but we got our discipline from the best source (a Guards sergeant-major), and when we saw a general, we did expect him to talk sensibly about the war, and not about clean buttons, pipeclay, haircuts, and the proper way to stand to attention.

Brass-polish and pipeclay never win a war.

Still, some of those ancient mandarins gave us fun. For example, old General Pom-Pom, who was in a bath-chair in August 1914, suddenly found himself elevated to an active job. His great stunt was the carrying of a drill-book in his hand. This was his authority, and Heaven help the man who deviated from the official path! Unless an officer was prepared to slay the Boche according to the text-book, he declared we should lose the ruddy war. He was kept on, not that the Higher Command had any great belief in him, but no doubt because they imagined he would frighten the life out of the 'undisciplined' stuff carrying swords and sporting pips—especially one pip, for one pip is the sign of all that is reckless, careless, inefficient, &c., according to General Pom-Pom.

But we got to know him. Every unit had a secret-service agent in his office, and when he decided to make a raid on some poor 'unsuspecting' C.O., a little bird whispered that General Pom-Pom was *en route*.

Out came the whitewash, pipeclay, blanco, brasso, greasy paste, and 'soldier's friend.' Pioneers whitewashed every post—not forgetting the Last Post—and slapped the stuff all round the walls and the doors of the billets.

Pom-Pom was a devil for whitewash.

The band was hauled out by the hair of the head to practise the general salute, while all the men were hustled to get everything shining and—in line. Even the dixies in the cook-houses had to be drawn up according to the plans laid down by army architects. Before General Pom-Pom was half-way to the unit, the men were being moved about the square like perfect machines (he loved that), the band was playing 'The British Grenadiers,' and every officer, including the C.O. and the adjutant, was tropically busy on the square.

Pom-Pom galloped on parade. 'Morning, colonel; morning. What's the scheme to-day?'

'Ceremonial drill, sir. The companies are just being exercised. Then I'm going to work the battalion.'

'Excellent! Excellent! Nothing like ceremonial stuff for these fellows. Makes 'em smart! Makes 'em smart! By Jove! your band plays well. Reminds me of old days. Good to hear 'em! Good to hear 'em! Let's see your battalion show now, colonel.'

'Very good, sir.'

The battalion was mustered, during which the C.O. tactfully asked old General Pom-Pom if he would kindly take post at the saluting base.

'Certainly! Certainly!' and off he trotted to the flag-pole. There he sat on his old bus horse, pouting like a pigeon, and studying his wonderful shadow on the ground. The men, of course, were quite interested. Pom-Pom was very popular, on the whole, with the troops, and they *did* love to swank to the tune of 'The British Grenadiers.'

The band played.

Down came the battalion like a perfect machine. The general straightened himself again.

'Battalion—eyes right!' roared the colonel. The heads came round with a click, and the general saw one thousand cheery, sun-tanned faces.

'Splendid, men! Splendid! You can beat the Guards any day.'

They stalked past as proud as dukes.

Next the C.O. formed them into line. And one thousand well-scrubbed Tommies, with buttons and bayonets glistening, advanced in review order.

'Battalion—halt! General salute—present arms!'

'Ta—tum—tum—talee, tiddle—um—tum—talee,' went the bugles.

'Battalion—slope arms! Order—arms!'

'MAGNIFICENT!' roared Pom-Pom. This shout of praise could be heard miles away. Then he toddled round the billets. His eye caught the

whitewash, saw the neat kits, and the cooks' dixies—*all in line.*

'That's all! That's all, colonel! I'm very pleased! I congratulate you on your excellent unit. Morning! Morning!' And off he galloped on his bus horse.

The colonel smiled and faded away.

. . . . . .

General Pom-Pom came to our school one day. He went through the same performance. Even Ginger borrowed my Vinolia to have a wash. Pom-Pom stumped on to the parade in a way that shook the earth, looked at us very keenly, and muttered, 'Good stuff! Good stuff!'

One of his ideas was that a company officer must know the name of every man in his company. While he was inspecting our company he arrived at me.

'What's this man's name?' he asked Captain Bloggs.

'Eh? Smith, sir.'

'Is that right?' he inquired of me.

'Yes, sir,' I replied with emphasis. I wouldn't have let our company officer down for worlds. After all, it is a good deed to keep an old general happy.

'Where's your pull-through?' he asked Tosher.

'I guess it's broken, general.'

'No d—— guessing for me, my lad. Get it mended and shove it in your butt-trap.'

We enjoyed this immensely, and felt that General Pom-Pom could beat Tosher any day.

'Are you married?' he asked Billy Greens, who was always rather pale and carried a worried look.

'No, sir.'

'What are you in civil life?'

'A curate, sir.'

'Thought so! Thought so!' he said, passing on.

We all grinned.

'Ah! You're a musician, aren't you?' he inquired of a youth with lustrous locks.

'No, sir—a Socialist!'

'And you're fighting?'

'Yes, sir.'

'What for?'

'To destroy militarism.'

'Oh!' . . . The general hurried away.

After the inspection he gave us a few words. Not much intellectual food, but a lot about the bayonet.

'At 'em, when you see 'em come. Give it 'em hot. The short jab in the chin, or the smart thrust in the paunch. They loathe it! They're afraid of it! The bayonet will win the war,' he concluded.

On the whole we enjoyed his visit, and agreed that General Pom-Pom was good fun, kind-hearted, loyal, intensely patriotic—but not the man to win the war.

(*Continued on page 396.*)

THE WAY HOME.

PART II.

VII.

AN hour and a half had passed since they set the shed on fire. The storm had increased in fury; the wind was terrible, and seemed to shake the very earth to its foundations. The two of them staggered fitfully through the welter and whirl, speaking scarcely a word, each deep in the splendid isolation of his own thoughts. They were almost worn out with sheer weariness, sick of the struggle against the tireless storm.

With every passing moment the storm increased in volume. A gust of wind, more terrific than any that had come before, surged violently across the field, whirling the snow under the feet and round the eyes of the two soldiers. Bending almost double, clutching their coats and drawing them tightly round their bodies, they plodded on. Now and again one fell into a hole, but the other was ever ready with a hand to help his luckless comrade out.

'Aisy 'll do it, Bill,' the Irishman cried, coming to the assistance of his friend when the latter fell into the snow. 'Aisy does it, old mate. Whoa!'

He spoke as if to a restless colt, then broke into a lilt, doubtless with the intention of keeping up his own courage and the courage of his companion, and helped him out of his predicament.

Then, when Micky got into similar trouble, Bill was equally quick to succour and cheer. 'Stick to it, ole mate!' he would say. 'Put some ginger into it, and out you come.'

With these words, he would catch Micky's arm and haul him from a hole into which he had fallen.

After these mishaps, both men would take a few experimental steps forward, leaning well out of the perpendicular against the gale to keep themselves from falling. Now and again, when the frenzy of the squall spent itself, the two soldiers would halt, take advantage of the temporary lull in the storm to speak to one another, and button their coats, which were continually flying open.

'Heavy! Be the glory iv God, heavy!' Micky roared on one occasion. 'Never had as tough a nut as this to crack in all my natural. Isn't it a buck of a night, me boyo?'

'Not 'arf!' answered the other man, spitting the snow from his lips. 'We aren't togged up nohow for a night like this. And I've an orful pain in my inside. S'pose it'll be the snow that went down my back thawin'.'

'Poor matey! I'm sorry,' said Micky. 'But we'd better be gettin' along.'

'Where?'

'Anywhere away from here.'

'But we're as well here as somewhere else. What's the difference?' asked Bill, catching his breath as a gust of wind caught him.

'Well, let's get along, anyway,' cried the older man, seizing the youngster's arm and pulling him forward. 'If we step out quick, we'll get warm. G'on—Shanks' mare!'

VIII.

The two struggled forward, stumbling, reeling from side to side, and buffeted by the cruel wind that lashed against and tore around them. Micky trudged on, a little distance in front, holding Bill's hand, his eyes staring tensely into the wilderness of white before him, and seemingly lost to everything else in the world.

All at once, as the Cockney withdrew his hand and brushed his forehead, Micky spoke. 'Ye damned little Sassenach, ye've been a good pal to me, ye have,' he said, without turning round. 'I'd do anything for ye to get ye clear o' this. If once we get to our own lines, it'll be a dixie iv hot tay, and I'll not drink one drop iv it till ye've yer fill, Bill.'

There was no answer to this remark. He looked round, to find that the Cockney had disappeared.

'Bill!' he shouted. 'Where are ye, Bill?'

No answer greeted him, nothing but the sough of the wind, the sharp hiss of the snow driving through the air, and the lonely cry of the bleating goats in the distance. To the man everything seemed strange and unearthly—the whole world, himself, his clothes, and even his clay-caked, dirty hands, which became suddenly white when he held them out for a moment. The dry, whirling snow settled on his nose, moustache, eyelashes, and got blown into his ears, well-nigh deafening him. He peered round eagerly, surveying the circle of world that remained to him now that Bill was gone. The thickly falling flakes blinded him; he could hardly see ten paces in any direction.

'Bill!' he called again, using his hands as a speaking-trumpet. 'Where are ye, Bill?'

Still no response. Micky became frightened, so that he could scarcely believe in the reality of all that was happening.

'It's like things that be after I be out on the booze for a fortnight,' he said. 'Maybe it's dreamin' that I am.'

He clutched eagerly at the thought, only to thrust it roughly away from his mind as a fresh sweep of wind lifted the snow from beneath his feet and lashed it against his face. He was alone in the darkness, waiting fearfully for the coming of death—a death cruel and terrible. As if in protest against the terror that now overwhelmed him, he called out in a loud, shrill, despairing voice, 'Come back, Bill; I want ye.'

There was no answer.

'I'm done for!' he exclaimed. 'This is to be the end.'

IX.

Blindly, as a man in a dream, Micky walked back for a few steps, then paused irresolutely. He felt that he was going in the wrong direction, not back on his tracks, but forward. There was nothing to guide him; nothing was fixed in the world in which he moved. Snow and wind were in the throes of unrest everywhere, and he himself, a poor, helpless, shivering, human atom, as restless as the wind and the snow.

He stood in a drift, his legs deep in it almost to the thighs. He made no effort to drag himself clear until something heaved under him and threw him on his back. Struggling to his feet, he riveted his eyes on the spot where he had just been standing. The snow was moving, rising upwards as if caught by some gigantic and invisible hand! Next, the centre of the moving mass broke in twain, and Bill's head, then his shoulders, and lastly his legs emerged from the trampled drift.

Beating his breast and stomach with his arms, Bill endeavoured to shake the snow from his clothes. Then his eyes rested on Micky, who was staring at him, an expression almost of terror on his face.

'Was it you, ye big hulkin' Irishman, that was standin' on me?' he asked, laughing pitifully.

Micky shuffled his feet, grinned awkwardly, then grew serious. 'Not hurt, Bill, are ye?' he asked. 'My! I thought that I had lost ye. How did it happen?'

'I went down whop through the snow,' said Bill. 'Then some fell atop of me, and almost choked the life from me. But it's warm down there, and I must 'ave dropped off for a kip.'

'That was the wrong thing to do,' said Micky, clapping his hands vigorously, one against the other. 'Why didn't ye shout when ye fell?'

'And the bloomin' snow on top o' me?'

'I might have lost ye, ye know! But give me yer hand, and we'll get on our journey,' he added. 'And, Mother iv God, what's that at all?'

A lurid flash lit the obscurity of the night, then another and another—five in all. And these were accompanied by the long-drawn echoing thunder of guns throwing their shells out into the darkness. The two men sank to the snow, and lay there, quivering with fear.

'Gawd!' said Bill in a whisper. 'Almost walked right inter 'em, we did.'

'Field-guns,' said Micky. 'Short range. We're right for Blighty.'

'Think we're nearly there?' asked Bill, his teeth chattering.

'Not as yet, me bucko,' Micky replied. 'But we're on the right road, anyway. We've been paddin' it for close on three hours, and not goin' straight all the time. But we're near the Jerrys' trinches now. Wish I'd a bomb to throw on their heads.'

He laughed down in his throat, and rose to his feet with a bound. The proximity of the battle-line had heartened the man, and he was ready to run forward now, indifferent to any peril.

'If I'd only a bomb to throw into the middle iv them!' he repeated.

'Gawd! you're a big Irish fool,' said Bill, struggling to his feet. 'You're allus ready to run into danger. As if this damned journey's not as much as any one wants. Gawd! I'm sick of it. I've no feelin' in my feet or hands. I'm played out—done up—finee.'

'Then up on my shoulders, and I'll carry ye the rest iv the way,' said Micky, bending down and seizing the youngster by the waist.

But Bill drew back. 'Naw,' he said. 'I'll manage, old man. I was only jokin'.'

X.

Staggering fitfully, the two men set out again, fighting their way through the whirling snow, moving like automatons, their coat-tails flying to one side, the wind making a whistling sound as it flew past their open mouths. Their caps had long since been blown away, and the wind, snatching at their hair, ruffled it all over their heads. For ten minutes, during which they plodded onwards, not a coherent thought dwelt in their minds; eye and ear took in nothing but the streaks of white falling from the heavens, and the wind whistling through the night.

Suddenly both pitched forward into a drift piled deep in a ditch of some sort, and fell flat in the snow, Bill on top of Micky.

'It's no good, Micky,' the man underneath heard the man on top say in a weak voice, and with these words in his ears the Irishman sank into a merciful slumber.

He dreamt. He was running along a sunlit road, and a large, angry dog, with red tongue and flaming eyes, was following him. Why was that animal chasing him, he wondered, following him, and coming nearer every step he took? And the dog was a mad one, he knew. It would overtake him, tear at his leg, and he would go mad too.

He tripped and fell, his face striking heavily against a stone as he came to earth. In an instant the animal was upon him, chewing at his great toe. Only then did he discover that he was barefooted, having probably lost his boots in the race. But he could not call to mind when and where he had lost them.

He turned round and round in an effort to shake the dog off, but was unable to free himself from the terrible grip. Then some one came to his assistance—a thin-faced man dressed in corduroy trousers and flannel shirt—and endeavoured to pull the dog away. But the animal would not let go its hold; the harder the man pulled the tighter it clung.

'I'm going to pull the brute off,' the man exclaimed, clutching the animal by the hind-legs and stepping on Micky's chest. 'I'm going to pull him off, for the killing of you is my job. You tried to strangle me, but 'twas not an easy task. You didn't succeed, you English pig!'

Micky could now see that the thin-faced man in corduroy trousers had changed in some manner. He was no longer the same; in fact, he was now the German sentry whom Micky had throttled a few hours ago.

'I'll get this dog off you,' he repeated. 'And then I'll kill you.'

He dug his heels into the Irishman's chest, but this was more than the prostrate Micky could bear. He turned round, and opened his eyes, to see the white streaks of snow blowing to the earth, and to feel the wind striking against his face. The air was filled with fire and sparks and streamers of flame. Something black and big was resting on his body, pressing him down. He gazed at it curiously, wondering if he was still asleep or awake, and if that on which he was looking was real, or if it was merely the phantom of a disordered imagination.

'So here's where I am,' Micky exclaimed. 'And the whole world's on fire. But maybe it's star-shells. . . . And the dog?'

He paused for a moment, trying to recollect the gist of his dream.

'Chawin' my big toe, it was, the brute!' he muttered. 'Was there a dog and a Jerry? . . . Ah! it's my poor toe that's frozen. That's what it is. . . . Where am I at all? Where is Bill? We must be somewhere, anyway. . . . We've been paddin' it for three hours or more. —Bill!'

'Micky!' a very feeble voice above him answered. Yes, it was Bill sure enough, lying on top of him.

'We're goin' to freeze,' said Micky, groping for his mate's hand and getting hold of it. 'That'll serve them damned well right!'

'Who?' asked Bill in a low voice, changing his position and slipping into the snow by the side of the Irishman.

'Everybody,' was Micky's answer, given in a surly tone, as if he had just been offended by some one. 'Why should we be out here, the two iv us, like lost cooties, and every one

else snug in their dug-outs, and some maybe in nice warm beds? It's hell to think of it, Bill. Mother iv God, hell!'

'D'ye know where we are?' Bill inquired, his breath coming short, as if the effort to speak pained him.

'Be the colour iv the sky, with the star-shells goin' up, we'll be in a trinch,' said the man, pressing the hand which he held. 'We're off the level now, and the snow's piled deep in a sap or a fire-bay and the two iv us are in it to the neck.'

XI

The wind came in gusts, blowing directly against their faces and heaping the snow over their bodies. Occasionally it seemed to sober down somewhat, but not for long. As if to make up for such lulls, the blizzard would afterwards increase with tenfold vigour, and sweep and swirl round the devoted couple more cruelly than before. And all round star-shells were rising into the blackness and bursting into flame.

Micky drew closer to Bill, and pulling off his muffler, handed it to the Cockney. 'Tie that round yer neck if ye can,' he said. 'It'll keep ye warmer. As for me, I'm almost done. But if the day would come we might pull through yet. I wonder what time's it?'

'Dunno, but I think it'll be well on. Wot about tryin' to cross No Man's Land and gettin' 'ome?' said Bill, raising his hand and wiping away the snow from his face. Then he placed the muffler over his throat, but made no effort to tie it. 'Ye're a good pal, Micky,' he said, apparently forgetting the remark of a few moments before. 'A good ole pal; one that's allus obligin'. And, Gawd! it wasn't 'arf a tough night.'

'Tough it was, Bill,' said Micky, staggering to his feet. 'But the worst iv it's over, and we'll get up on the lip iv this trinch and strike home.'

'That's awright,' said Bill in a sleepy voice—'awright for you; but I'll lie 'ere and 'ave a real kip. I'm too damned comfy to start ploughin' through the muck again. You slide off, and leave me 'ere, Micky.'

'As if I would,' said the Irishman. 'And I've three childer at home in Ireland as well as the wife. I don't like thinkin' iv never seein' them again, but if yerself don't come with me, I'm not lavin' here, Bill.'

'Wot's the best road 'ome?' said the Cockney, rising to his feet and floundering through the snow towards a point where the drift rose to a ridge. This was the parapet.

The two soldiers clambered out and into the waste of white which might be No Man's Land. Arm-in-arm they ploughed forward, their horizon bounded by the falling snow, their feet and hands chilled, their boots tripping against strands of wire which strewed the ground. They came to a barbed entanglement, walked along its fringe until they reached an opening. Here they went through into the open field.

A bullet swept through the whiteness and whizzed past their heads; a second went plunk into the snow in front of them. Another step forward, and it would have hit one of them.

'Thanks be to God!' said Micky. 'It's a sign that we're near home.'

A second belt of spiked entanglement obstructed their way, the strong props standing upright, each wearing a little cap of white, and long, crooked strands of wire stretching taut between the posts. In front, the ridged snow, rising to a height, told of a parapet. Up from it a Very light whizzed into the air, and burst into a million petals of flame.

'Through here with the pair iv us,' said Micky, who was first to see an opening in the wire belt. 'We'll crawl up to the parapet, for who knows but it may be a new draft in, and windy?'

They trudged through, lay down on their bellies, and began worming their way forward in the snow, Micky leading, his whole mind concentrated on the job, Bill following behind, crawling like a slug and almost covered by the snow. Presently Micky became conscious of cessation of movement behind him. He stopped to listen when almost on the brink of the parapet, but could no longer hear the sound of movement or the soft crunch of the snow as Bill worked his way through it. He looked round, to see his friend in the snow, a dark and motionless figure. Probably Bill was asleep, Micky thought, and in a subconscious way it was borne to him that sleep would be fatal. He turned back, and crawled to the side of the youngster.

'Bill!' he whispered. 'Are ye sleepin', Bill?'

There was no answer.

'Bill!' he whispered again, and felt that his voice was a very little thing in the midst of the night, the wind, and the loneliness. He listened intently, but no answer reached his ears.

He wriggled round the boy, and as he did so a sharp pain shot up his left leg, and rested in his groin. Movement, he felt, was a monstrous futility, out of keeping with the wavering life that hovered within his body. He lay back shivering, and in a moment he was conscious of a feeling of repose stealing over him.

XII.

Pictures out of keeping with his present plight came and went before his eyes. Scenes of boyhood and manhood resolved themselves into dream-pictures before him. He was again looking on the little cabin amongst the Donegal

hills in which he was born, son of Hudagh Liam, a hard man, near-going, and full of money. Now he could see his home—the neatly brushed floor, the good turf fire, and the shiny delf in rows on the dresser. His mother was there, a kind woman, generous to the poor, dressed in a frilled cap, a woollen cloud, and a quilted petticoat. She was busy with the besom, sweeping the stray ashes from the hearth into the fire. And again he was there, Micky Hudagh Liam, a barefooted boy sitting by the fireside, his toes near the flames, and his heels in the ashes.

A mass of snow, lifted by the wind, settled on his face, destroying his dream and almost choking him. Struggling to his feet, he coughed and spluttered for a full five minutes, and endeavoured to brush the snow away from his clothes and hair. The snow which had fallen in under his coat-collar was thawing; he could feel the water slipping down his legs into his boots. By rubbing the ice-rime away from his half-frozen lashes, he was able to open his eyes and look round.

The storm was as fierce as ever. A heap of snow beside Micky rose higher than the surrounding sheet of white, and under this heap he knew that Bill was lying.

'Maybe it 's dead he 'll be,' the man muttered, then set to work, scraping deep down into the drift with both hands, pulling out from the snow the body of his comrade.

Presently he touched the boy's face, knowing it only by the resistance it offered to his hand, for all warmth had gone from it. Catching Bill round the shoulders, he tried to lift him upwards, but was unable to accomplish his design. Instead of lifting the youth, he staggered across the prostrate body and sank into the snow, the fall bringing his face on a level with the youngster's. How pale he looked! All the redness had gone from his cheeks and lips; his eyes were closed tightly, as if he were just sleeping; his mouth was open, the lower jaw hanging well down, and the teeth of the upper gum showing.

Micky wondered if the boy was dead, but the thought did not seem to trouble him much. It did not matter. All that had happened during the night, and all that was happening now, seemed, somehow, perfectly natural. Micky felt pleased with himself, with everybody and everything, even with the Germans who had so ill-used him.

Again he became drowsy, as with half-opened eyes he watched points of light appearing in the air and fading away into the darkness. The wind roared louder and louder, and the snow piled higher and higher over the two men.

XIII.

Even when a party of men in khaki came out from the trench and lifted the cold figures out of the snow, Micky and Bill were not aware of their delivery. It was only next day that the Irishman, snug in a hospital ward well to the back of the British lines, recovered consciousness. He sat up in his cot and looked round him; then his eyes rested on the M.O. at the foot of the bed.

'Where 's my mate, sir?' he inquired.

'Lyin' 'ere, ole pal,' said a voice from the next bed. 'You 're a bloomin' swank, not knowin' your pore pal.'

'The two of you have escaped from the Germans, haven't you?' asked the doctor.

'That 's right,' said the Irishman.

'Not 'arf,' said the Cockney.

'Lucky boys,' said the doctor, with a smile.

Bill looked at Micky; Micky looked at Bill.

THE END.

TO ORKNEY.

WHEN o'er the surging foam the vikings came,
They made thy misty isles a resting-place;
And dwelling there for years, they left their name
Deep graven on a hardy, virile race.
By creek and cove their towers and castles rose:
They launched their galleys on the restless deep,
To rush with eager valour on their foes,
A mighty harvest from the seas to reap.
They passed away; but legends still are told
Of Sweyn, of Kolbein, and of Hakon brave,
And other heroes, fearless, fierce, and bold.
The friendly sea they loved became their grave.
Those beetling crags have witnessed many a fight.
O Northern Isles, seen through the misty light.

Thy land-locked bays, O Orkney, once again
Have seen a great Armada, armed for war,
No feeble galleys creeping o'er the main,
But taller, fiercer, mightier, lordlier far.
A 'silent navy' hid 'in northern mists'
Has guarded well 'the freedom of the seas;'
Than that great fleet no stronger power exists,
Whose flag still waves victorious in the breeze.
Around thy cliff-lined shores new heroes lie,
Slain, not in battle, but by deadly mine,
Whose deeds with those of old in glory vie.
Thy rock-bound shore is now a nation's shrine,
O Northern Islands, swept by wind and wave,
Whose voices chant a requiem for the brave.

And now within thy misty 'hopes' and 'flows'
A vanquished foe in sorrow hides his head;
These untried warriors, all unused to blows,
As guilty prisoners to thy gates are led.
Thy boom-defended headlands close them in,
And friendless they are left beside their foe,
Shamed that they tried no victory to win,
And thus dishonoured in their overthrow.
Hold well thy trust; Britain relies on thee,
Grim, guardian outpost of the northern sea.

While in thy fane, 'the glory of the north,'*
Thou treasurest memories of heroes old,
Shall no memorial of their noble worth
Be raised for those whose tale is yet untold,
Stern sea-kings still, with courage all aflame,
Dauntless in danger, bold as vikings' breed,
Determined, whether death or glory came,
To save their country in her hour of need?

SEVENTH SERIES

A SCIENTIFIC METHOD OF TEACHING.

By J. STRACHAN, M.D.

PART I.

I.

IN this transitional period of the world's history, and of the conditions of life and industry in this country, there is in the minds of many a very significant questioning as to whether our school methods, upon which so much depends, could not be turned to more practical account. Some are strongly advocating the teaching of science to enable us to compete on more equal terms with Germany in chemical and other science products; others want more attention given to modern languages in order that we may extend our trade with foreign countries; while some still pin their faith to the ancient classics as the foundation of all learning and culture. There is, no doubt, much to be said for these and other claims which are being put forward; but, underlying the whole, there is the fundamental question of the method and principles of teaching upon which the practical bearing of all so greatly depends. What is awanting in our present school system is, I hold, not the teaching of science or any other special subject, but *scientific teaching*—in other words, a method of teaching founded upon, and conducted in strict accordance with, natural law.

It will, I believe, be generally admitted that the results at present being obtained from school-work are, as a rule, and as compared with the time and labour bestowed upon them, far from satisfactory. Teachers as a class are, as I have occasion to know, thoroughly conscientious and painstaking in their work, but are themselves dissatisfied with, and are apt to be disheartened by, the poor results they are able to obtain; while the coercive methods they find it necessary to apply must be very distasteful to themselves as well as to the pupils. All this, however, is put down to the demerit of the defaulting pupils, who are said to be lazy or stupid—faults, be it noted, not as a rule observable in their after-careers.

I know that much improvement has within recent years been effected in school teaching—all, I think, in the direction I advocate—but, from long observation in an important educational centre, I am convinced that the lines upon which it is run are, in the main, much in need of being relaid upon strictly scientific principles, by which I mean in accordance with natural law as manifested by the action and conduct of the young.

It seems to be too frequently assumed that learning by the young is something beyond, and contrary to, natural inclination, thus requiring to be superimposed by coercive means. This is as far from being the truth as it would be if the same were said of the taking of food. The young are as ready to learn as they are to eat, but under the same conditions of suitable pabulum and properly regulated dietary.

Take the case of children before school age. Do they learn nothing unless under compulsion? The question would seem absurd except in its bearing upon the future of the child, the fact being that this is, perhaps, the most fruitful educational period of man's existence. At the age of five the child has acquired a fair working knowledge of at least one language (sometimes of more than one), has learned the names and properties of hundreds of objects, and has advanced a certain distance in general knowledge and intelligence. It does not require an extensive acquaintance with young people to convince us that this voluntary or automatic learning according to opportunity goes on with ever-increasing width of scope during the whole preparative stage of life.

II.

We may be told that the above is all very well with regard to the general learning of everyday life, or when there is a special bent for some particular line of knowledge, but that it is not found to apply in the case of school subjects. I am afraid that this is only too true, and that, as a consequence, these subjects are very indifferently learned. But might we not find a complete parallel in the case of food? Suppose that certain foodstuffs, being considered specially nutritious or otherwise beneficial, were forced upon the young without regard to taste or appetite, should we not experience the same difficulty and want of success in feeding? Taste and appetite or their mental equivalents are no

 [*All Rights Reserved.*]

less important in teaching, or feeding the mind, than they are in feeding the body, and it is only by trusting to, and following, their guidance that school education can be either safe or successful.

The sensorium—a ganglionic structure at the base of the brain in direct connection with the eyes and the ears—may be regarded as the vestibule of the mind, through which all communication with the outer world is obtained. The action is very similar to that of the plate or film of the photographic camera, merely receiving impressions from the organs of sense, which may represent the lens. Such sense impressions, as with the photographic plate, are identical as pictures with the object or sound producing them. They may be very evanescent, fading away almost immediately, or they may be 'fixed' by the application of attention, as *memory*. The sensorium is possessed by the lowest of vertebrate animals, as the fish, in which memory acts as a retrospective guiding influence, leading to where food has previously been found, and causing the animal to avoid what has been hurtful. In man it may be regarded as an index to the mind in recalling associated mental concepts, but is as entirely apart from the mind as is the index of a book from the pages to which it refers. The intellectual powers lie, so to speak, behind the sensorium, and, by the faculty of observation, keep a watch upon what is passing there, eagerly, especially in the young, taking up and assimilating whatever may be found to *interest* the mind. Such interesting matter, when received, is worked up by the various faculties into conceptions, ideas, thoughts, knowledge, &c., in intimate relation to, and association with, those already existing. This mental feeding, along with the physical growth and development of the brain, goes on day by day, and almost every waking hour, gradually and steadily, according to opportunity and educational provision, piling up the structure, from the single idea (as the ticking of a watch and the falling of an object) in the infant, to the myriad swarm of the adult mind, each a vital and active organism, and all working together like bees in a hive, in the mysterious cosmos of the human intellect.

In considering the question of teaching or imparting such special knowledge as is deemed necessary, it must thus be kept in view that we have to deal with 'a going concern,' and that the duty of the teacher is simply to apply to special purpose a process in full activity and doing excellent work. In mental as in gastric feeding our office is not the imposition of a disagreeable task, but the ministering to a very natural and, in its operation, very enjoyable craving. The matter sought to be imparted must be of such a nature and be presented in such a form as will engage the interest, which is the mental equivalent of taste; and the amount or duration of the lesson must be regulated by voluntary attention, which is the gauge of capacity for the time being. The young mind has very little will-power. The teacher, therefore, cannot exercise despotic authority in the matter to any good purpose. Sight and hearing may be directed at will, and attention may be enforced by command, sense impressions being thus imprinted as memory upon the sensorium; but *mind* owes allegiance only to the promptings of Nature. Interest can be aroused only by presenting the matter in attractive form, and attention retained only in accordance with the vital condition of the brain-cells concerned, of which there is no other indication.

III.

Information is conveyed to the mind, first, directly by observation of sense impressions reflected on the sensorium, and, second, indirectly by language in transmitting thoughts from mind to mind.

(1) *Observation* is entirely automatic, and is first manifested in the infant by what is known as 'noticing,' a very important and anxiously-looked-for indication of normal brain action. From this initiative the mind develops, at first gradually, but, as weeks and months pass, more and more rapidly, the child thus learning to identify persons and objects, acquiring language and becoming familiar with its environment, long before there is any thought of actual teaching. In later years observation becomes very much a matter of habit, and may, by judicious encouragement and direction in youth, become a very valuable feeder of the mind, especially in the field of nature study. It should be an essential part of the training of every child.

(2) *Language.*—There are two forms of language by which knowledge may be conveyed—namely, (*a*) the spoken or oral, and (*b*) the printed or visual. The words used may be the same, and the information or sequence of ideas may be equally well expressed in either. The question for the teacher is which form of language has the more ready access to the young mind. In the case of adults years of constant use have practically made the two interchangeable, although some of us still much prefer listening to a lecture or a sermon to reading one. With the pupil reading is a more or less recent and imperfect acquisition; the worker has not yet mastered his tool. A series of printed words may, by an effort of attention, be imprinted as memory on the sensorium, where they may, for a time, be read off by the 'mind's eye,' and repeated vocally without any reference to the thoughts they may contain, which have never reached the mind. Such mere verbal memory records are of absolutely no intellectual value, and should have no place in education. With true *oral* teaching, on the other hand, there need be and should be no memory of words, the language used passing directly *through* the sensorium to the corresponding ideas in the

mind of the pupil—that is, of course, if the words employed are such as will form this connection in the brain organism; otherwise they are like 'dumb notes' on the piano or the organ. The test of true teaching is the spontaneous reflection of the matter taught in the talk or play of the pupil.

I have heard it argued that it is impossible for a teacher to give the individual attention required to teach a class of, say, thirty boys. Why 'individual'? If we provide a good savoury meal for thirty boys, it is not necessary to go round to each and stuff his allowance in with a spoon. By sight and sound the same item of instruction goes to each and all simultaneously, with no individual effort except that of attention. 'Ay! but there's the rub,' say the teachers. 'How are you to get the attention of thirty boys to a school lesson?' Well, I have frequently seen a popular lecturer rivet the attention of over a hundred boys for an hour and more. 'So have we,' they will say; 'but the lecturer has his lantern-slides, pictures, and diagrams, and does everything to make his lecture attractive.' Why, I would ask, should not the school have lantern-slides, pictures, &c., and do everything to make the lesson attractive? 'Because we have other means of securing attention,' they may say. 'We have pains and penalties to apply for inattention, and with these we can compel attention as required.' It is here they make a very great mistake. The eyes and the ears, as has been said, can be directed at will or in obedience to authority, and sense impressions may thus be forced only upon the memory. Such mere verbal memory is possessed, as is well known, by the parrot and some other birds, and, in some cases, to a very large extent by the idiot. It should have a secondary place in education, which has to do chiefly with *mind*. With true oral teaching, on the other hand, there need be no memory of words, which are only the vehicle for conveying the living thought of the teacher, through the sensorium, to the *mind* of the pupil, who should be encouraged or required, after a sufficient interval to allow of thorough assimilation, to put the matter *in his own words* for conveyance back again to the teacher. The pupil should also be encouraged, if far enough advanced, to read from a book an amplification of what he has been taught orally, which he will do with pleasure and benefit, as exercise for the new ideas. With true teaching he will almost certainly be found talking to parents and companions about what has been learned.

Then as to time. Excluding Saturdays, Sundays, and holidays, there are about two hundred school days in the year; thus a single daily item of knowledge, thoroughly *taught*, and so organised in the mind, will amount to two hundred such items in a year. If an associated group of, say, five such items were included in the lesson, as probably could be easily done, the year's result would rather astonish the present-day school inspector. A quarter of an hour's lesson should be sufficient for this purpose, and, with some revisal of that of the previous day, amounting in all to about half-an-hour, might be as long as the attention could be held continuously with advantage. To push it beyond this limit would tend to promote a habit of inattention.

I would here suggest that in teaching a foreign language the *noun* should be taken as the basis, the object, as far as possible, being presented to the eye, named, and handled—the lesson, of course, being conducted orally and conversationally. This would give, as a result of a year's teaching, a vocabulary of about a thousand names of selected objects, along with the verbs and other parts of speech which would come in time after time, and day by day. No English, but only the language being taught, should be used during the lesson; and no grammar, as such, but correct grammatical speaking, which even a young child can readily pick up by ear, should be aimed at. The arts of reading and writing can be easily acquired *after* the language has fully entered the mind. The philological teaching of grammar may or may not be found desirable afterwards, but is not necessary for correct speaking. We are not required to construct a language, but only to impart one ready made.

(*Continued on page 407.*)

THE SEARCHERS.

CHAPTER XXIV.—*continued.*

'I MAKE no claim to being a detective,' the Chief told me frankly as he rose to go. 'Ours is a law-abiding county, which affords few opportunities for Gaboriau mysteries. But although serious crime is rare, undiscovered criminals are rarer, and I admit that I am mortified by my non-success so far. However, I am hopeful. I have a cordon of the county police and plain-clothes men carefully posted, and if "The Searcher" gets through, I'll want to know the reason why.'

The two constables were left to watch the grounds, and the Chief departed.

He could hardly have been gone for more than ten minutes when another car buzzed up the avenue, and my spirits rose considerably, for the car's occupant was Tony, sunburned and looking uncommonly well. He had got my telc-

gram very late on his return to the Ross-shire hotel on the previous evening. In the morning he started early, and having heard at Castleton of the colonel's death, came on with all speed.

Without delay I gave him the police reports and the witnesses' statements; and after he had mastered the facts, I showed him the footprints and the gunroom window.

'Seems plain, Neil,' said he when we returned to the house. 'But before we go further I have something to show you.'

'The important news you mentioned in your last letter?'

'Yes. You'll open your eyes when I tell you. The family tradition about lost jewels sent by the Pope long ago—the *fons et origo* of the whole business—has been much in my mind. I worried away at it, and got Clement Hughes, who is attached to the Embassy at Rome, to become interested. He is keen on record-hunting, and is a great friend of Monsignor Rafia, one of the first men in Europe at that sort of thing. I gave Hughes the probable date of the gift, and among the "Narratives of Scottish Catholics" in the Valini MSS. at Rome, they unearthed an original letter written in English by a Father Sempill, one of the early Jesuits, to the then General of the Order.'

'What extraordinary luck!'

'Luck! I don't call it luck. A search through the archives at Rome ought to have been the first step thought of. Why it wasn't done long ago beats me! Your respected ancestors must either have been the slackest of the slack or were ignorant of the importance of the business. Lord knows! Perhaps they thought it a wild-goose chase, and as the years passed the story became a hazy legend. However, this letter clears up a good deal, but not, alas! one point. The other half of the paper is still missing. But here you are!' He triumphantly produced his letter-case and handed me the document.

I read the letter with extraordinary interest. Addressed '*To the Right Reverend Father in Christ*,' dated 1563, quaintly written, spelt, and worded, it ran as follows (Father Sempill's spelling, and here and there his diction, being modernised for the reader's comfort):

'† *Pax Christi* †

'I write racked in Mind and Body, yet resigned to the decree of Divine Providence and sustained by the knowledge of the Prayers of Your Paternity and the Brethren. We hoped ere this to have safely accomplished Our Mission, but it hath not come to pass. I am in great Sorrow, for Father Hamilton, who was of frail body, is Dead, and the Manner of it is this. Father Hamilton along with Father Fraser and myself did arrive in Edinburgh with *The Casket* in safety, and were received in Gracious Audience by Her Majesty. But there are many Currents to contend with when a Queen is young and beautiful; full certain were we that we were watched and spied upon, for—a strange thing—the New Religion hath grown, and although I know that the Deliverance of Israel will come, it is not yet, and many of the People bow the knee to Baal. Fearful of the Safety of *The Casket*, in our humble duty to your Paternity and Holy Church, we left Secretly and by Night for the North. Never travelling by day, we made slow progress, but at length came near C——. And here was Black News. The Castle of C—— was a smoking ruin and its Master a Prisoner in the Keep of Blackness on the Forth. *The Casket*, therefore, could not be delivered. Further, the Wolves of Heresy, who never cease their Questing, were near, but by Good Fortune we were hidden by a Son of the Church, until we did one night make our way through the Forest and entered the Great Dark Pass, our Purpose being to reach the East Country where we could find Kinsmen and Friends. The Written Word cannot picture the Savage Wilderness we entered. On the evening of the second day a Great Storm arose. Father Hamilton could go no further, and for Two days and Two nights we did hide with him in the Midst of blinding Snow. On the third day he died and Father Fraser and I did bury him with our own hands in a Secret Place among the Mountains. *Exultabunt Domino Ossa Humiliata.* The Castle of C—— being burned and Its Master a prisoner and in peril of his life, the safety of *The Casket*, blessed by His Holiness, weighed upon us. We therefore determined to hide it in The Grave until such time as we could return in Secret for it. This done, with many Prayers for its Safety, we left our Dear Brother in that Lonely Place and set out East and Besouth through the Pass. After enduring Monstrous Hardships, travelling only by night, we at length arrived at the House of a kinsman of Father Fraser in the Valley of Dee. There we devised a Writing showing where Father Hamilton's Grave lies. Lest it should fall into the hands of any Externs, we did divide it into two parts, Father Fraser secreting one half and I the other. Now Father Fraser's kinsman was suspect, and his house had already been searched once. He dared not harbour us long, wherefore we determined to return South. To avert Suspicion we set out by different Roads disguised as Countrymen, our Design being to meet in Edinburgh. There I arrived in safety, but in an extremity of exhaustion, and to my sorrow to this day I have neither seen nor heard of Father Fraser. I have made strict and secret Enquiry, and cannot think that he hath been taken. I pray that he hath sailed again to Rome, and here I await news of him and the commands of Your Paternity. By the Guiding of Providence I did contrive to get secret audience of the Lady of C——, who is at *a place* near Edinburgh. To her I told my story, and gave her a double of the half of the

Paper in my keeping, so I make no doubt that, these Evil Days over, *The Casket* will be found and come to its rightful Owner. Certain am I of its present Safety.

'Like Father Hamilton, I am of weak body, and I fear me that in this World my Work is near to its End. Yet have I Solace in the certainty of the Prayers of your Paternity and the Brotherhood and in the knowledge that He Who Ordaineth all things hath sweetly Ordained this my Tribulation.'

'This straightens matters out considerably,' said Tony when I had read it through. 'I often wondered how half of the paper got to The Bield, but the Lady of C—— is, of course, the Lady of Ciuin. She got it, and more we don't know, except that she or her husband—if he ever got out of Blackness alive—did not find the grave. Note the phrase, "*Exultabunt Domino Ossa Humiliata.*" It is clear that Father Hamilton's grave is somewhere in the Cairngorms, and that the secret paper holds the key of its whereabouts. If "The Searchers" have got our half, they may find the grave first; but if we manage to get their half, then we'll cut them out. Let me have another look at our half.'

The oft-read little paper was produced. Tony took it to the light.

'Here we have the Larig mentioned by name, and the words "Sron na Leirg." What is Sron na Leirg, Neil?'

'A great wind-searched waste of granite nearly four thousand feet high. To explore it would mean labour for weeks, but I don't think that the reference to it is intended for anything more than a guide. The words "Until you do come" point to its being a sign-post, a direction, and nothing more.'

'I agree. The hiding-place must be more accurately indicated than by a mere reference to a mountain. But we must make sure that "The Searcher" did not find a copy in the colonel's pocket or in his safe. The Pass near Sron na Leirg must be watched without an hour's delay. We can't do this, for I want you to help me with my *data* here. Who are the outside men—keepers and stalkers and so forth—on the estate? Are they trustworthy, and how long have they been here?'

I gave him the names of the outdoor servants, adding that I was convinced of their trustworthiness and loyalty. They were all old servants, and devoted to the colonel.

'I dislike taking any one on trust in my job, Neil. Anything is possible. However, I'll risk it! Whom do you suggest to keep an eye on the Pass?'

'The two stalkers. They know the ground.'

'How soon can you have them here?'

'By a bit of luck one of them, Finlay Mackenzie, is in the village now. The good fellow, when he heard of the trouble we were in, turned up this morning and offered me any assistance he could give. I'll send Angus for him.'

Finlay soon arrived—a short, slight man, but with plenty of breathing-space in his hillman's chest; tough as whipcord, and with an eye as alert as a bird's. I have known him, after a long day on the hill, trot lightly and easily home—a good three miles—without turning a hair. He knew every foot of the Cairngorms from boyhood.

'Finlay, we want you and Macbain to watch a bit of the Pass for us. We are not after poachers this time, but you had better take your rifles with you. There may be danger.'

Finlay's face visibly brightened at the mention of danger.

'You can pick up Macbain on the way, and the two of you will take posts near Sron na Leirg. The man we are looking for has something to do with the colonel's death.'

His mouth hardened. 'He'll get short shrift from either Rob Macbain or myself if he mak's ony trouble,' said Finlay with grim simplicity.

'No doubt; but we don't want him to suspect that he is being watched. Avoid any appearance of it, but observe the movements of any stranger who appears anywhere high up the Pass. He may be looking for something, and may be equipped with tools for digging. If he shows any signs of using them, stop him, and send Macbain with a message here at once.'

'And what will I be doing with him, sir?'

'Treat him as you would an ordinary trespasser, civilly but firmly, and don't let him out of your sight. Tell him that you are one of the watchers in the forest, and that wandering off the beaten track is not allowed. He must not suspect that we at The Bield know anything about his movements. The main thing is not to let him out of your sight. Macbain and you can relieve one another, and one of you will report to me in the morning.'

Finlay went over his instructions, and having thoroughly mastered them, set out to look for his fellow-watcher.

(*Continued on page 405.*)

CANNEL COAL

WE are all interested in coal in these days of shortage, and consequently have come to realise its paramount importance, not only as a fuel, but also as a source of many valuable substances derived from it by distillation out of contact with air. A few of these obtained from coal-tar are benzene, toluene (used in explosive-making), carbolic acid, creosote, and anthracene

(the starting-point for many of the aniline dyes). Is it to be wondered that the chemist feels sad to see so many precious raw materials being burned up in coal-fires? He tells us to use coke, and conserve such substances for the industries of the country.

Most of us are familiar with three varieties of coal—the ordinary bituminous coal of the household; anthracite, the smokeless variety for which South Wales is famed; and lignite, the brown coal which generally preserves the structure of the wood from which it is derived. A fourth kind, however, is known, and is of considerable interest, both on account of its properties and of its mode of formation. This is cannel coal. In appearance it is a dull black substance. Not possessing the characteristic layers of bituminous coal, it does not split on breaking, but has a conchoidal fracture. It does not soil the fingers on being touched. There is no difficulty in lighting it, and it burns with a bright-yellow, candle-like flame. (Hence the name cannel or can'le coal.) This brightness is due to the large amount of volatile substances it contains. These, however, are of quite a different nature from those obtained from other kinds of coal.

This luminosity of flame, when coal-gas was first used for lighting purposes, gave cannel coal a high commercial value. In the days of the fish-tail burner it was much sought after by manufacturers of coal-gas, because its use among other coal imparts considerable additional luminosity to the whole of the gas produced. In those times it sold for as much as five pounds per ton. After the introduction of the incandescent mantle it became practically worthless—so worthless, indeed, that in many cases it was not even brought to bank. The reason for this is that to produce a good light with a mantle a hot non-luminous flame is necessary, the light being due to the glowing of the mantle brought about by the intense heat of the flame.

However, since the oil-engine and the use of oil as a fuel have given a commercial importance to any strata from which petroleum oils can be extracted at a profit, cannel coal, being rich in such oils, has acquired a new importance. One ton of cannel coal is found to yield anything from ten to one hundred gallons of crude oil, part of which is water. This oil is obtained by dry distilling the coal in closed retorts. The crude oil so obtained is separated into the various oils which it contains by a process of fractional distillation. The more volatile oils boil off first; as the temperature gradually increases heavier oils pass over into the receivers successively fitted to contain them. In this way are obtained petrol, benzine (used in dry-cleaning processes), kerosene or burning oil, lubricating oil, vaseline, and paraffin-wax. Besides these, inflammable gas and ammonia pass off. The former is used for fuel and illumination; while the latter is converted by sulphuric acid into ammonium sulphate, a valuable fertiliser. The famous oil-shale of Torbanehill, torbanite or bog-head cannel, is often regarded as a variety of cannel coal, and it is well known that about half of the forty thousand tons of paraffin-wax produced annually is derived from Scottish shale.

Cannel coal is always found as a lenticular or basin-shaped mass, and the edges often pass into bituminous coal. On account of this, its nature, and the fact that it contains beautifully preserved fish and shell remains, it is concluded that it was formed under water. Imagine for a moment that you are living in the carboniferous epoch. Think of a tropical climate and a huge swamp, almost surrounding an extensive lagoon. The swamp supports an abundant flora of ferns and tall trees, whose roots find food in plenty in the rich black mud. On the still surface of the lagoon float masses of green weed, consisting of a low form of plant life known as algæ, whose remains, as they die, sink to the bottom of the lagoon, and there, with fragments of ferns and leaves, form a thick vegetable slime, the home of millions of bacteria, which set up a carbonising fermentation. This goes on as long as the conditions remain favourable, until the lagoon is almost filled with the accumulation of countless centuries. Meanwhile on the shores of the lagoon the lepidodendron and sigillaria live in luxury among the ferns, and, on dying, fall into the swamp whence they sprang.

By slow degrees the sea-floor sinks, submerging the swamp and the lagoon, so that the rivers now spread over them their sand and their mud, layer upon layer. As time goes on the pressure of the sediments above, combined with the action of the bacteria, converts the vegetable slime into cannel coal, and the remains of the vegetation of the swamp into bituminous coal. Later upheaval and folding again raise the sea-floor, and the one-time lagoon and swamp are now deep-seated in the land. Thus we have preserved for us the basin-shaped mass of cannel passing into bituminous coal.

It is instructive to note how an invention brought cannel coal into the first rank of commercial importance, how an improvement of that invention made it worthless, and how another invention again raised it to a position of first-rate importance.

CHRISTINE LONAVET.

PART IV.

IX.

IT happened that there was a distinguished general of brigade, Von Löwenthal by name, lying ill with pleurisy upstairs. He had made his nephew his aide-de-camp, and the conceited young puppy—a regular *Schlachtenbummler*, as the Germans say—now arrived. He was a captain in the Garde du Corps. It was the first time he had seen Christine, and he was struck at once with her beauty. A villainous look came into his protruding eyes.

'*Himmel!*' he exclaimed to his neighbour as she was leaving the room, 'that's a deuced pretty girl. I did not know you had birds like that in these parts. I'll bet you twenty marks,' he added with a wink, 'I make her acquaintance. I understand how to deal with those pretty'——

I was an idiot—an insensate idiot. I saw the mistake a second afterwards, but I allowed myself to be carried away by an uncontrollable fit of anger. 'Do you, you scoundrel?' I cried, but luckily in French. 'She is my fiancée, and we shall see about that when the Crown Prince arrives.'

For a moment the fellow and his brother-officers were speechless, and then all was confusion. Some produced their revolvers; others sprang up and seized me.

'You understand German, you *schweinhund!*' they cried.

'Only a few words,' I said. 'I went more by his looks.'

'Where do you come from, you spy?'

'Martinique.'

'And why did you learn German?'

'I picked up a few words for business.'

'This is a serious matter, my friend,' said the colonel, 'as you will find out. Call the guard, and tell the landlord to come.'

As it was the headquarters, a sentry was always posted before the hotel, and the first room on the left as you entered was set aside for the guard. Behind the guardroom was a smaller room looking on to the yard. This had iron bars to the window, as Loissier had a small safe there, which was hidden in a cupboard.

'Ah, this will do nicely for you till the firing-party comes to-morrow morning,' said the aide-de-camp with a sneer as I was pushed into this room and left to my own thoughts, which chiefly centred on my darling Christine. Ah, how I blamed myself for losing my temper! I sat down on a sofa and buried my head in my hands. Of course, Loissier was sent for. He, poor wretch! had not much courage at any time, and he lost his head and thought only of saving his own skin. At once he summoned Christine. He swore—and perfectly truly—that he had not known I understood any German, and declared his conviction that, at all events, I did not know enough to do any harm. Even the Germans had to admit his sincerity.

Then Christine came. Her imploring voice and her beauty were not without effect. 'If he does know a few words,' she said, 'you can't shoot a man for knowing a little of your language. Where would you be, messieurs, for you speak ours?'

This woman's logic brought a smile to their faces, especially that of the senior colonel, who *au fond* was a kind-hearted, home-loving man, who had always taken the Crown Prince as his model.

'But I may see him,' she cried. 'Oh, let me see him alone!'

'Yes, you shall see him for ten minutes,' he answered; 'but I am truly sorry for you.'

X.

So it came to pass that suddenly, as I sat in the darkened room, the key was turned. 'Ten minutes, mademoiselle,' said a voice; and holding a candle, Christine entered. She was deadly white; her fine eyes had a strange look in them.

'You shall not die,' she said, sinking into my arms, and rocking herself against me. 'If they kill you, they kill me.'

I thought she would swoon away, but she quickly recovered. I fancied even in the dim light she looked plumper than usual. Standing up, she took off a black woollen shawl and produced from somewhere a heavy, long cloak. Without a word, she put these articles under the sofa. I don't know how the time passed—it seemed but a minute she was with me. I gave her one long, long kiss, the man led her out, and the door was locked.

I remained half-dazed, and heard mechanically the clarion sound of the Last Post and 'Lights out;' and then all was quiet but for the tramp of a sentry in the spacious stable-yard, for the inn had been a famous posting-house in the old times. Away to the right of it were a number of ammunition-wagons which had arrived that day, and for safety had been placed in the yard. On the left side of the yard were a narrow lane, with a slight wooden fence, leading into the *grande rue*, and a little vacant ground between the stables; and immediately opposite the room I was in was an old, tarred, lean-to shed. This had one or two very old carriages in it, one actually without any wheels.

It was a very dark and rainy night. Suddenly in the shed I saw a bright light. I gazed bewildered at it, not realising at first what it

was. But soon lurid flames shot up. Quietly I opened the window, and the smell of smoke came in. I closed it again. At that moment the sentry gave the alarm. How can I describe what followed—the blare of the trumpets sounding '*Zum Feuer*,' the excitement of the men aroused from their sleep? In a moment the whole place became a pandemonium as an officer shouted, '*Wasser, Wasser—laufe schnell!*' and the men rushed madly about, knowing as they did the danger they were in from the ammunition-wagons. I saw the sparks blowing about and the lanterns glimmering as the men darted hither and thither, amid the shouts of the officers and the swearing of the troopers.

There was another door in my room by the sofa. I heard officers rushing down the stairway. 'Get the general down; we shall all be sent to heaven in a few minutes,' shouted one. '*Ja, oder H*——!' cried another.

Outside, too, in the street, to add to the confusion, I heard what seemed to be a woman's voice crying, 'Fire! fire!' I listened—yes, I felt certain it was Christine's.

'What the deuce are you all doing here?' suddenly cried an officer in the guardroom. Something was said about a prisoner. 'Curse him, you fools! he can't get out.'

Then I heard Christine again, apparently in the entrance, crying, 'Fire! fire!'

'Who are you? Stop that noise;' and it seemed as though she stumbled. Some were calling for buckets, others giving orders to harness the horses to drag the wagons out.

Then the door gently opened. It was Christine. 'Put this over your head—it's a petticoat,' she whispered.

Mechanically I did so, though I nearly split it. 'Now for the cloak and shawl!' I quickly found them, and beside her went through the empty guardroom, through the entrance, down the steps, and past the sentry. Without a word, we quickly walked into the street, where soldiers and civilians were running towards the inn as fast as they could. 'It's raining,' said Christine in a tremulous voice, putting up an umbrella, which completely hid us as, arm-in-arm, we went along the street. The poor girl was trembling so much that I feared she would fall, but she clung to me, and we pushed on through the thronged street. It had all happened in a few minutes. It seemed like a dream.

'Where are you going, *ma chérie?*' I asked.

'To Henri's,' she said.

XI.

Her brother had hurriedly dressed on hearing of the fire, for all the world knew by the trumpets what had happened. He was perfectly taken aback at seeing us, especially myself, as he had heard the news that I was to be shot the next morning. 'Hide him! Save him!' cried his sister. He knew the risk he was running, but, fine patriot that he was, he did not hesitate a moment. Taken by surprise, however, he could not make up his mind where to put me, for in his house and the tannery he had Germans quartered on him. While he paused Christine staggered. We placed her on a sofa, but it was only after she had had some cognac that she came round. This had taken a little time, and suddenly we heard voices and heavy steps.

'Here's the major and the captain coming. *Ô Ciel*, what shall I do?' cried Henri, aghast. 'You can't go in the attics. I don't know where you can go.' He paused a moment. 'There's only one chance. Follow me.'

He darted upstairs with a candle, and I followed him. 'I can't help it,' he said. 'It's their room, but they leave early to-morrow.'

It was the principal bedroom in the house, with two beds in it. These were surrounded with heavy red curtains that went down to the floor.

'Under you go,' whispered Henri, pointing to the bed opposite the door at the top of the stairs.

Neither of the two officers had gone to bed. They had been smoking and drinking down below when they heard the trumpets. Perhaps to give me time, I heard Henri talking to them and expressing surprise at the fire. I could hear all that was said, and for Loissier's sake I was not sorry to learn that it had been got under. Then I heard the two officers ascending the stairs, and, apart from my recent experience at the Lion d'Or, I don't know that I ever felt more uneasy in all my life.

'I can tell you, Steinmesel,' said the major, 'I feel very bad. It's not only the neuralgia, but I feel shivery all over, and going to see about that confounded fire has made me worse. I hope that there will be a strict inquiry about that. Some one ought to be shot. It's lucky old Löwenthal was not blown to bits in his bed.'

'Schwipesbrücke told me,' said the captain, 'they caught a spy there this evening, and now he's escaped.'

'I never heard anything about that,' returned the major. 'Why didn't they shoot him straight away?'

'Well, the Crown Prince is coming, and I suppose they thought they had better be careful, as there was nothing against the fellow apart from his knowing a little German. You can't shoot a fellow straight away for that, for they found nothing on him.'

'Can't you?' replied the major. 'Fancy what that fellow must have heard! *Mein Gott!* he would not get much mercy from me. Now,' he continued, after a while, 'I am going to drink half that carafe of cognac, and if I don't feel better to-morrow morning I shall stay behind.'

I heard him gulp the brandy down, and then

he bumped into bed just above me, leaving his junior to blow out the candle.

XII.

Of all the horrible nights I ever spent in my life, that was the worst. It was only the draught from the door and from the old wainscoting that prevented me from being suffocated. The major began a heavy stertorous snore, and the other soon joined in, and there was a regular duet. I feared to go to sleep lest I might snore also, for in that case, if one of them woke, I knew that there would be no second escape. And then, too, I thought of Christine, and what the noble girl had risked for me. Hour after hour I heard the church clock strike. Strive as I would, I felt I was gradually going off, and I fancy I must have slept a little, when I heard a heavy step on the stairs and a trumpet-call outside. The officers' orderly came in with a candle and informed them that it was half-past five.

'*Ach, Himmel!* I can't go,' said the major.

'I am sorry for that, sir,' said the captain. 'You had better send Hans for Schunk.'

'Yes, I will send Hans,' he answered, 'for I do feel ill. Give me the rest of the cognac, and tell Schunk, if you should see him first, to come as soon as he can.'

It did not take the captain long to dress, and immediately he had gone and all was quiet, my prospective brother-in-law came in with a candle.

'I am very sorry, major, to hear you are ill. Is there anything I can do? Will you have some coffee and eggs? I can write down the time you wish breakfast, and give the paper to your servant.'

The major thanked him, and told him he was going to sleep again till the surgeon came.

'*Bon!*' said Henri. 'I will leave you, then. Oh, *ma foi!*' he exclaimed suddenly, 'I have dropped my pencil;' and I heard it roll on the floor. 'I would not lose that for anything,' he continued. 'My wife gave it to me before we were married. Don't disturb yourself, major. I'll find it.'

This was the last thing the German was likely to do, as he had turned over and did not answer. Pretending to seek for it, Henri placed the candle on the floor quite near the bed, and put a paper in my hand. On it were the words: 'Wriggle backwards; the door is open.' Quickly, but very gently, I did this, while Henri, talking aloud all the time about his pencil, searched the floor. In a moment I was downstairs. Not a word was said. Opening a door, I followed him outside, where it was still fairly dark. 'This is the office,' said Henri. 'This place is always locked. Take this,' and he gave me a bottle of wine and some bread.

'Where's Christine?' I asked.

'Fast asleep.'

'*Bon!*' I said. 'Don't wake her.'

XIII.

I had finished my meal when Henri came in, followed by Christine. 'Oh, *ma chérie*, how can I thank you enough?' I cried as I embraced her.

'Never mind about that now,' said her practical brother. 'The surgeon has seen the major, and his servant has gone off to the *pharmacie*, so, while no one is about, you must get away.'

On board ship, on the voyage back from Martinique, it had been so rough that one could not shave, so I had grown a beard, and had left it.

'The first thing is to have your beard off.'

'Oh no,' said Christine. But her brother insisted, and produced the scissors. When this operation was over, a black blouse that he wore in the tannery was brought out. This, with an old hat and leggings, caused a smile to appear on Christine's face. 'He looks awful,' she said.

'Never mind that. Why, his own mother would not know him!—Now, come to Pinnard, the barber.'

As we crossed the street we passed several German soldiers, but not one turned to look at me. Henri whispered something to the barber. He was an intelligent fellow, and giving a significant nod, took us into his private room.

'Look here,' he said when he had shaved me; 'they were going to have some charades at a château near here, but they did not come off owing to illness, and I have a fine white beard and wig. What do you say to that?'

The room echoed with our laughter as I put these on. I left the shop so altered that I, too, was certain my mother would not have recognised me. As some lime was required at the tannery, it was arranged that Christine and I should have a lift to within a league of the farm. So sure was I of my disguise that I sat on the front-seat beside the old driver. It was necessary to pass the Lion d'Or, and I actually saw Loissier explaining with many gesticulations to some sympathetic friends all about the fire. When we got rather to the north of Coulmiers, where four roads met, I gave old Joseph my last five-franc gold piece (these were abolished after the war), and Christine and I descended. For the first time we were alone, and, what with my white locks and my long beard, I fear that if any one had seen me kissing the young girl he would have thought me a very wicked old man.

We made a short cut through a wood, where some trees had been felled, and sat down on a big log.

'It's an extraordinary thing,' I said, sniffing the air; 'there is a smell of *pétrole*. I think there must have been some in the cart.'

Now, Christine had been very gay hitherto, but at this remark she turned paler and became serious.

'Étienne,' she said softly, placing her hand on my shoulder—'Etienne, I must tell you; but you will never, never tell father, or Henri, or any one.'

'I swear it, *ma chérie*.'

Well,' she said, 'after they said you would be shot in the morning, I did not exactly know what I was about. I said nothing to Henri, but before I went to wish you adieu, I got you that cloak and shawl. After I left you, I ran down into the cellar and got a lot of straw envelopes, and bought a small bundle of wood at one shop, and a bottle of petroleum at another. Then, when all was quiet, I went down that passage by the inn, scrambled through the old fence, dodged behind that old broken carriage, and placed the straw and wood against the tarred shed. I poured the petroleum over the little pile, and got it well alight, then ran and threw the empty bottle into a neighbouring garden, and, trembling all over, waited in the rain for a time. Soon I heard cries of "Fire!" and immediately the trumpets and the bugles began all over the place. I began to cry "Fire!" myself as loud as ever I could, for I knew the greater the excitement was, the better it would be for you. I went right into the hotel and cried "Fire!" and a brute of a German officer told me to cease, and struck me in the chest and knocked me down.'

'He struck you!' I cried savagely. '*Ô Ciel!* I heard him tell you to stop.'

'Yes, he did,' she continued. 'But why tell you any more? You know the rest.'

'Yes; and I know you are the bravest and finest girl in Christendom,' I cried, 'and I can never repay you.'

'Well, everything is all right now,' she continued; 'but we must go.'

A bright light came into her eyes, and, supremely happy, we went on till we saw the old farm in front of us.

'I will go on,' she said. 'There may be Germans there. If I beckon, you come.' So I hid in some shrubs. Soon she beckoned, and I advanced.

XIV.

'It's all right. Julie is in, and father is somewhere near. We'll have some fun with Julie,' said Christine merrily. 'I will introduce you as a Monsieur Barlac, who wants to see father.'

As soon as we entered the kitchen Julie rushed forward and kissed Christine, but told her she looked pale. Then she was formally introduced to me. Making a pretty curtsy, Julie said she would go and find her father. Soon she came back, and her father arrived with Bobo, the sheep-dog, who knew me almost at once.

'Ah Bobo,' I said, stooping down to stroke him. A second after I received a violent push, and my hat and wig were sent flying.

'Ah Étienne, *mon brave*,' cried Julie, laughing boisterously. 'So you thought I did not know you. I saw through the whole thing at once.'

'Did you? Well, you made me a pretty curtsy, anyway.'

Her father had stood still, perfectly puzzled; but I soon explained all that had taken place.

'Well,' he exclaimed, 'I never wanted you to go. What an extraordinary and merciful coincidence it was that the fire should have taken place that very night!'

'Yes; was it not wonderful?' said Christine with a sly glance at me. 'The Holy Virgin must have done it.'

'It is a pity, though, they were not all blown up,' concluded her father bitterly.

The next day the old count came down, for his grandson had come back the evening before with the news of my escape.

'I knew I should find you here, *mon brave*. *Cherchez la femme* always holds good. Now, tell me all about it.'

It made me smile when he remarked, as Lonavet had done, on the extraordinary coincidence of the fire, and expressed the same bitter regrets as to the Germans not having been blown up. Then, after congratulating me on my escape, he said it was now time for me to rejoin my regiment.

'Oh no,' said Christine; 'he's not well enough yet.'

'But, mademoiselle, you would not like the disgrace of his being fetched. Ignorant people, who do not know what he has done, would brand him as a coward.—Is it not so?' he continued, turning to me.

'I know it,' I answered. 'I will go the day after to-morrow, the 1st of November.'

'*Bon!* I will give you a letter to the Staff, and if they don't give you a commission *sur-le-champ*, it will not be my fault.'

XV.

Thanks to the old count, I received a commission at once. Naturally I was depressed at parting from Christine, and it was lucky I did not know that within a fortnight she and her father and sister would be flying to Brittany, leaving their burning home behind them. Ignorant as I was of their misfortunes, soon all my patriotic ardour returned in the excitement of my surroundings, and I could only think of my duties. I can truly say that the three weeks that followed, till I was placed *hors de combat* by dislocating my shoulder and breaking my leg (through a shell smashing a ladder from which I was directing the fire of my men), were three of the happiest and most exciting of my life. My short career as an officer could not have commenced at a more lucky time, as there was just then a brief ray of sunshine in the fortunes of my country, for on the 7th of November we drove the Bavarians under Count Stolberg back on Artenay, and on the 9th we gained our one and only real victory over the Germans at Coulmiers, when we took two thousand prisoners.

Thus I had time, at any rate, to gain the *Médaille Militaire*, which has been one of my most treasured possessions ever since.

I found when the war was over that fortunately my father's farm had suffered no damage; but, alas! it was otherwise with my uncle Étienne's property on the borders of Lorraine. However, he had made a fair amount of money, and having but two daughters, with the legacy he had received he decided to retire, leaving the business to me. My family readily agreed to my marriage with Christine, for they knew how the brave and beautiful girl had saved my life. With her beside me, I did not fear to face the world, but my own common-sense told me that by the loss of Alsace-Lorraine, the business of my uncle Étienne would never be so profitable as it had been in his time, and I knew the future would not be an easy one. Then suddenly all the clouds were swept away, for I received a letter from M. Mardelet at Martinique, who urged that I should come over, and repeated his proposal that I should put the money my uncle had left me into the business and become his partner. I received this letter about a month before I was married in May.

It was at the wedding that my young brother Louis first saw Julie, and fell desperately in love with her. But he did not find it an easy matter to catch that lively young girl. She was like a filly in a field. She let him come pretty close, and then she tossed her head and went off again.

But Louis had nearly one hundred thousand francs, and that was the oats in the sieve. She came, she sniffed, but still he could not catch her. Getting despondent, he went to her father.

'Don't you worry,' said Lonavet. 'She will take you all right.'

At last, thinking she had amused herself long enough, and secretly fearing that she might lose him, she allowed Louis to slip the halter over her pretty head; and—apart, of course, from Christine—no fellow ever got a better wife.

Though I did not altogether like leaving my native land, both my parents and my father-in-law, remembering the money my uncle had made, for all his wild life, urged me to go. So Louis took over the business, and thus my dear Christine and I commenced our new life in a foreign land.

Three years afterwards Mardelet returned to France, leaving the whole business to me. My uncle, in the twenty years he was out there, made about half-a-million francs. We remained, with a few intervals when we went to France, nearly thirty years—in fact, long enough for our two eldest boys to be of age to carry on the business—and then returned with our eight children and a fortune of two million francs. I am no longer young, but I am hale and hearty. I can still eat, drink, and smoke as much as I like. The children have got the fine constitution of their parents, and the good looks and the abilities of their mother. The world has gone well with me, and I envy no man.

But all this good fortune must be put down entirely to Christine, for it was her brave heart and her clear head that really guided the ship. She is a true daughter of France. Yes, I have seen a good many women in my time, but none to be compared with her in any way. It may be selfish, perhaps, but I do hope and trust that I may die first; for if it is otherwise, I feel that life will no longer be worth much.

THE END.

JOHN BROWN.

CHAPTER XIX.—'THE BOYS.'

ONE thing the school, the war, and my regiment developed, and that was a love of my comrades—'The Boys.' What a delightful term! So human! So reminiscent of youth and fun and joy! Each day strengthened this love, till it became almost a passion. This was the true Democracy, for 'The Boys' have no social measures, only the simple standards of Faith, Hope, and Charity. When such comradeship is allied to regimental *esprit de corps*, there is created a *moral* that is invincible. Whatever pain and sorrow the war has brought me, I have always gloried in this meeting of the waters. Stripped of the masks created by politicians and Who's-Who snobs, we discovered common aims, common interests, common ties of affection. Ginger Thomson, the hide-bound prophet of Imperialism, was the sworn comrade of Nobby Clark, the ramping, raging lion of the Free Trade school; Tosher, the wild Canadian, walked arm-in-arm with Billy, the sweet and refined; and I, the dreamer, plugged along with Beefy, the full-chested Balzac of the camp. In our little hut we ragged with good feeling, and all seemed to look for an opportunity to do a good turn, like the proverbial Boy Scout. It was a manly, a noble, phase of life. Selfishness was absent. Love was triumphant.

But, oh, the sadness and the madness of the scheme! While our love was being developed, we were training to die. Now, death is nothing. But to one who loves mankind it seemed a scheme of the very Devil to breed such god-like men for the shambles. Here were the cream of the race, the flower of strength, the pick of intellect, supermen—with the hand of Death upon them. But that is war as the Kaiser willed it. By a stroke of his pen this proud,

inhuman monarch has caused the death and the madness of millions. Oh cruel monster! If there be a God, then his punishment is assured.

Often I thought of this aspect of war. At night there passed before me the ghosts of my dead comrades—line after line of clean-limbed, open-eyed, fresh-faced heroes of battle. I had marched with them, supped with them, danced with them. Their lives were an open book. No deceit. No camouflage of the roué or the sneak. Their dreams, their loves, their passions, good and bad, I had known. While few were saints in any sense of the term, none were hardened sinners. Their patriotism and self-sacrifice had ennobled them. And they had gone—gone, I believe, to higher and better realms. But what a passage! Crucified on the altar of *Kultur*—gassed, bludgeoned, mangled, tortured, and maddened by the German rules of war. I had seen them go; seen them fall in the trench, with that groan which tears the heart; seen them stagger back while attempting to go over the top. And in that awful No Man's Land, where bullets hum like dragon-flies, and shells scream like drunken sirens, I had seen them stagger, clutch, and writhe in the agony of death.

How true they were! How brave! Boys of every class and calling. Duke's son and cook's son, charging, cheering, fighting, and dying in the breach. Ah, how glad I was to have met them, but how sad to part! True, they have not died in vain, but they left on me, a youth, marks akin to those of sorrowful old age. I was haunted by their eyes, sometimes unnerved when I thought of their screams. And yet I was proud. They had played the game; played it as no troops of Clive or Wellington were ever asked to play it; played it against the most brutal foe this world has ever seen. Your Trojans and your Spartans are mere tyros compared with our men to-day. Far better to be clubbed and speared than suffer the horrors and the madness of modern war.

When I thought of the murdered manhood, the slaughtered genius, and the wiping out of such noble sires, I felt afraid—afraid for the Old Land, the Old Flag, the Old Home by the hillside. Would all these things remain? Could we still carry on? Would the hog-like Huns, who breed as the vulgar always breed, be able to win 'the war after the war'? Beaten in the field, robbed of victory, would this coarse-grained tribe cunningly exploit the survivors of a finer race? I wondered. For this is a serious aspect of the war. There was no conclusion to my musings, but somehow I did believe that Providence protects the clean. The Empires of Hannibal, Nero, Napoleon, and the Romanoffs are no more. They outraged the laws of peace and goodwill. So I believed that this unfailing law would cripple and dissolve the Empire of Wilhelm. Right is might. That has been our slogan in this great crusade.

Yet we are not a perfect people. The war has tested us and found us wanting. But the war can save us—*if we are wise.* We must search our hearts. The dear boys have died that we might live. How shall we live? Must we go back to the parish pump? Is there no avenue of escape from class war and the devilish tricks of the political machine? Shall the remnants of our army return to be tools of the men who never fought; tools of those who quarrelled for place and personal gain; mere puppets, hounded to the polling-booth to vote for sneaks and rogues? God forbid! Our slaughtered boys must form the rampart wall against the selfishness and the pettiness which mar our otherwise beautiful country. The old order will *not* do. The eyes of 'The Boys' have been opened. They are thinking; and sometimes their thoughts are bitter. If these thoughts were printed in full, our proconsuls would be staggered. There is no hope for Britain if soft-handed, soft-job mandarins retain the reins. Yet 'The Boys' are mute, for they have no Press. They require none. When they return in force they will sweep away the fools and build a happy land. They are not Bolsheviks, not 'Tories' or 'Radicals.' They are patriots. The patriotism born in suffering is a product of God. You cannot define it, and you can never master it. Do not attempt it. Should you warp, twist, or bend it for mere material ends, you will rouse a bitterness and a madness which may destroy you, as Trotsky has destroyed the real soul of a noble nation. Only honest men can deal with 'The Boys.' Brave men can lead them. Clean men can inspire them. But these leaders will not be found in great numbers amongst the old mandarins—the men who stayed at home. Ah, no! 'The Boys'' standard is bravery. 'White men' they know and understand. The puppets of the party whips they will blow away like chaff whirled before a storm. And out of their suffering will come sanity, peace, goodwill to men and nations.

This is no dream. Those who scoff misunderstand the mentality of our men. The men of Grade I. can dominate Grade II. and Grade III. The five million fighters are men of will. A will steeled in the furnace of 'Hell' can pierce and master the will created in the soft lounges of Mayfair or the I.L.P. halls of Clapham. The veterans of the American Civil War united, rejuvenated, created the wonderful America of to-day. Our veterans can also rebuild the suffering British Empire. Open out your arms when they do come home. Do not disguise your aims. Speak like Lincoln or Lloyd George. Ask for the truth, and they will deliver it. Kill the fatted calf, and when the feast is done, place the laurels of power upon their brows. They will never deceive you. While they may smash old and useless traditions, they will guard the Flag, respect the Monarchy, and develop the

finest, fairest Democracy this world has ever seen. Far better to have the Democracy of the Trenches than the Anarchy of Trotsky. *For Heaven's sake, be wise!*

Such is the mentality of our brave boys. Fools may fear it, but straight men will rejoice. The Church can take heart, for the university of war has quickened spiritual thought. Blind as many of 'The Boys' are, they are seeking, groping for light. Their eyes are scanning the horizon for the idealism which can heal their sorrows and lighten the daily load. The madness of war is causing them to search for gladness. Old theological tricks will not suffice. A broad-based creed, aided by the finest music and social joys, may capture their souls. Women, too, must figure in the scheme. These men, many of them broken, desire to slip into an ivy-clad cottage where sweet Love shall reign, and the prattle of the child drown the memories of the shambles. From their windows they shall gaze in search of the beauties of the valley, the strength of the hill, and the soothing ripples of the ever-rumbling brook. This is the only cure for the horrors of war. Should you give them the pub. and the music-hall, you will perpetuate the follies of Bacchus and the creed of the courtesan.

All this I have learned in billets, camps, and the stricken field. From the stench of the trenches, the oozing blood of the shambles, and the agonised features of the dead I have plucked a moral and a great philosophy. The vanities have departed. Deceits are unmasked. Mammon is exposed. While horrors have unnerved, even unmanned, me, I have found a new Love—Love of 'The Boys.' It is a wonderful Love. It thrills and holds. It rouses and cheers. The soul is filled with better things. Great visions pass and repass before my eyes. One feels determined to leave the world a little better than one found it. Yea, one becomes resolved to fight, to suffer, be a martyr, if need be, for the men who have fought and won. Great is our opportunity, great our responsibility. We stand at the cross-roads of morality and materialism. Let us consecrate our lives for these brave men.

My heart swells with a bursting affection. My eyes are dimmed as I think of the dead. I am young, yet I feel old. But my soul is cleaner, stronger, greater, through contact with —'The Boys.'

The Brave, Dear Boys!

(*Continued on page 424.*)

THAT BLESSED FOG.

By JOHN S. MARGERISON, Author of *The Sure Shield, Action! The Navy's Way*, &c.

I.

CRACK! The Vickers semi-automatic three-pounder gun perched on the forecastle of His Majesty's armed motor patrol-boat *Chi-Chi* leapt back a foot, and a thin cloud of whitish smoke issued from its muzzle. But no shell splashed into the sea ahead; the barking was but a signal—a graceful intimation—that *Chi-Chi* desired the pleasure of the company of the big cargo-vessel flying the ensign of a neutral country for just so long as it would take to examine her for contrabrand of war.

The routine of examination service was all too familiar to the motor-boat; for months she had done the job—done it daily. The regular practice was to fire a round of blank from the gun, when the hailed ship would politely stop; *Chi-Chi* would then cruise over, and, while three of her crew ran through the ship, searching for things she ought not to carry, Temporary-Lieutenant Roderick Frazer, *Chi-Chi's* owner and commander, would inspect her papers and exchange news and notes with her officers. The thing usually ended in friendly farewells, as the ship—found 'clean'—and the motor-boat parted company, and passed on their lawful occasions.

Accordingly, when the big neutral stopped, Frazer turned his boat, intending to run alongside her. And it was this turning movement that saved *Chi-Chi*.

The neutral had no sooner checked her way than a dozen yards of her false bulwarks dropped, exposing to view three of the latest and most efficient six-inch quick-firing guns, all of which came into immediate action with the intention of lifting the inquisitive patrol-boat well above the scheme of things.

'Oh!' ejaculated Frazer. 'So that's your little game, is it? An armed raider masquerading as an innocent neutral. I've heard of your kind, but never met one of the type before. And now that I have made your acquaintance so suddenly, I'm disposed to like your room better than your company; so, if you've no objections, and I can get away unhit, I'll leave you. Good-bye.'

He nodded to his engineer, who immediately gave *Chi-Chi* her head, and the little craft, remembering sudden calls upon her for speed in the otiose days of motor-boat racing when she had pulled so many critical races out of the fire, put her nose down to it, and literally ate up the sea.

The shells fell all about her as the three six-inch guns spat fire and death as fast as they could be loaded, but her speed and her insignificance rendered her exceedingly difficult to hit, and she came through it all unscathed, though

there were times when Fraser and others of her crew of six felt the wind of the shells, so close was their passage.

Of course, as she ran, she spat back. The Vickers three-pounder crackled sharply—not with blank this time—and the perky brass-jacketed Maxim perched on her stern chattered insolently. But neither weapon could be expected to do much damage; the range was increasing too rapidly as the wild-cat boat sped away from danger. The three-pounder did, however, manage to drop a shell on the steamer's bridge and disable her steering-gear, so that she yawed off her course and gave *Chi-Chi* a breathing-space from those terrible guns.

Petty Officer 'Jumper' Collins, *Chi-Chi's* gun-layer, and the only pukka navy man among her crew of six, all told, spat on his hands, and apostrophised the supposed neutral vividly.

'What rotten shooting!' he concluded. 'You ought to be sent to Whale Island for a proper course. Lumme! if you couldn't shoot better than that, they'd boot you out of the Service.'

Frazer grinned, in spite of his chagrin.

'They don't seem very expert with their big guns, Collins,' he observed.

'Expert!' snorted Collins. 'If they were shooting for coco-nuts they wouldn't get a smell of the whiskers. Now, if only I was behind one of them big pieces, I'd have knocked this hooker into splinters long ago. But Fritz never could shoot anything worth while.'

Frazer looked at the big ship, now silent, though the muzzles of her armament still pointed in *Chi-Chi's* direction. Then his eye swept around his own craft, taking in the three-pounder, the Maxim, and the twin fourteen-inch torpedoes which reposed in the Admiralty-pattern picket-boat dropping-gear cluttering her narrow deck. Suddenly he spoke. 'I'm rather inclined to agree with you, Collins,' he said. 'Also, I'm rather inclined to take another chance at that raider. I don't exactly care about running away from a chap who's been so rude to me. Look here, Jumper; do you think if we were steaming fast towards that hooker you could manage to keep his guns busy?'

'I'm sure of it,' sir,' responded the gun-layer. 'Just give me the chance, that's all.'

'Well,' continued Roderick, 'I'm going to take the boat down upon him at top speed, and, as soon as we get close enough, smack a torpedo off at him. He won't have a great target to fire at if we keep bows on, and if you can manage to slap shells all round those guns you ought to demoralise his aim. See the scheme?'

'As clear as mud, sir,' retorted the gunner.

Jumper spat on his hands once more, and turned to the two men who formed his gun-crew.

'Now, you two lads are really going to see what might be properly called rapid firing,' he said. 'And, also, you're going to earn fully that enormous screw you're paid for your job. I want shells hustled into this weapon as fast as you can hustle 'em; and if I'm kept waiting a single second, I'll have something serious to say to you after the scrap is over. The whole thing depends on us, because if one of those six-inchers catches us a wallop we'll all be hoisted to the edge of a cloud, where we'll sit in our shirts and play banjos for ever and ever. And now, chuck off your chests all the prayers you can remember—and stand by!'

II.

Chi-Chi slewed in her stride and sped off towards the steamer. Frazer, so as to be near his torpedoes, dropped down into the well alongside the engineer; Collins and his trusty helpers swung the gun round and commenced to fire as fast as possible; while the remaining hand passed a cartridge-belt into the Maxim, and stood by to commence operations as soon as such a proceeding became necessary, which was exactly at the moment when the range narrowed down to the extreme distance of flight of his bullets.

The three-pounder, firing faster than ever before in her short life—*Chi-Chi* had drawn her from store only some three months previously, to take the place of one that had been knocked out by an aggressive U-boat—sprayed her tiny shells all along the steamer's three-gun battery; and though the six-inchers recommenced their clamour, the buzzing of the puny hornets around the crews' ears and the fumes thrown off by the shells as they exploded made the raider's shooting far from accurate, and *Chi-Chi* remained unhit.

Right on she dashed, till she was within two thousand yards.

'What about torpedoes, sir?' yelled Collins, without taking his eye from his sight.

'A little nearer first,' responded Frazer. 'I can't afford to risk missing her.'

A thousand yards, and still the gear had not dropped a tin-fish into the water. Frazer, however, deciding that the next minute would offer his opportunity, bent to the firing-lanyard. His eye measured the distance to the steamer, saw that the direction was exactly correct. He bent to make a final adjustment, and then stood up for a last look before pulling the lanyard which would drop the automobile torpedo into the sea, where she would steer a straight course towards the enemy.

But he never fired that torpedo. As he looked for the last second the steamer suddenly disappeared behind a colossal upflung gout of spray; a dull, shuddering explosion followed a vivid tongue of flame. Then the sea fell back, and the steamer listed heavily over to port; while those who had lately belched forth shell from the six-inchers abandoned their posts and fought for places in the rapidly filling boats.

'That's curious,' gasped Roderick. 'That explosion was exactly like that caused by a hitting torpedo; and yet I haven't fired.'

I was just going to compliment you on a good shot, sir,' put in Collins. 'But it appears that somebody 's got there before you, and robbed us of our prey. I wonder who it was.'

'Periscope off the port beam!' The hand by the Maxim pointed towards where, through the sea surface, the pole-like head of a periscope grew momentarily longer and longer.

'There 's something familiar about that thing,' mused Frazer. 'I 've seen it before, I 'm sure.'

'It 's not our navy pattern, anyway,' put in Collins. 'Reload! I 'm going to get a bead on that chap in case he turns out to be a Fritz.'

While the three-pounder waited to bark, the periscope elongated itself, broadened out into a conning-tower—a conning-tower of German pattern, but bearing a British letter and number. Then the hatch was thrown back, and a head appeared—an unmistakably British head—crowned with the laurelled cap of 'The Trade.'

'Hallo, motor-boat!' it called; 'who are you?'

'We 're *Chi-Chi*, for the time being an examination vessel,' responded Frazer. 'May I ask you a similar question?'

The figure laughed, drew itself up to the conning-tower top, and gave certain orders. The submarine turned and cruised slowly towards the motor-boat, utterly ignoring the steamer, which at that second canted her stern to the skies, and slid downwards to the place whither she had intended to send many an innocent non-combatant ship—the sea-bed.

'Take a good look at us,' counselled the submarine officer. 'Surely you 've seen us before?'

'I rather fancy I have,' said Roderick. 'But I can't quite place you.'

The other laughed.

'Well, once upon a time this craft was U 73,' came the reply. 'And, if you 're the one and only *Chi-Chi*, she fell captive to your bow and spear.'

Collins gave vent to a great laugh. 'That 's the chap we had an argument with, sir,' he explained. 'The one the paddle-steamer told us about, and towed home for us. Surely you remember?'

It was Frazer's turn to laugh. 'Well, I 'm blest!' he ejaculated. 'To think that a hooker we 'd taken ourselves should come and torpedo another that we were having an argument with—it sounds like something out of a book! But, old man,' he continued, addressing the submarine, 'I can't say that I exactly thank you for slamming your tin-fish into that steamer. I 'd got a lovely bead on her with one of my own torpedoes, and would have smashed her myself in another minute.'

'I quite agree,' said the submariner. 'But, you see, I happened to have a new type of torpedo-tube built into this ship, and I was anxious to see if it did all they claimed for it. It works very well,' he added. 'Besides, you must remember that if you 'd fired one torpedo at that chap, you 'd have had a very heavy list till you got another to balance you, and you 'd have been exceedingly uncomfortable for several days. I hope you 'll forgive my butting in, anyway.'

'Certainly, old man,' responded Roderick. 'If you can stand tea brewed in an empty petrol-tin, come alongside and have a cup.'

III.

Exactly a week later *Chi-Chi* was feeling her way through the folds of a dense, black sea-fog that had descended with strange suddenness upon the North Sea. She was no longer an examination vessel. Those responsible for varying the jobs of motor-patrols had bestowed upon her the duty of carrying certain mails to outlying submarines—submarines whose wandering proclivities led them to work off the mouth of the Elbe, where occasionally enemy warships might be expected to roam.

'Like trying to look through a blanket,' moaned Frazer, rubbing his smarting eyes. 'At times like this all shipping should be stopped. It 's a positive danger to move about in this sort of fog. Ten knots to *Chi-Chi* is crawling; yet if we go any faster we 're bound to hit something, and split like a sardine-can; and, personally, I 've no relish for a wet shirt to-night.'

'Boat ahoy! Boat ahoy!' The hail came through the fog. Roderick stopped his grumbling and strained his eyes afresh. All hands peered into the fog, trying to discern from whence men were hailing in English. It fell to Collins to find them.

'There, off the port bow,' he called at last. 'A bit of a smudge in the fog.—Ahoy, there!'

'Ahoy!' the hail was repeated, and *Chi-Chi*, now scarcely moving, edged over towards it. Ten minutes sufficed to bring her alongside the smudge, which developed into a tiny folding Berthon boat, such as is carried in submarines, containing seven men and an officer.

'Hallo!' said Frazer, as he surveyed the group. 'This is hardly the sort of weather I should choose for boating in the North Sea, and I can't say that I admire the stoutness of your craft. Who are you?'

The officer turned and peered through the gloom. Frazer, the better to assist sight, risked quite a lot by switching on a small pocket-torch he carried, and shining it upon the upturned face.

'Good Lord!' he exclaimed; 'it 's our pal the submarine chap—the fellow who torpedoed the neutral for us the other day! What the dickens are you doing there? What have you done with my submarine?'

'If you 'll take me and my crowd aboard out of this rotten little boat,' said the lieutenant, 'I 'll explain. But, first of all, allow me to remark that I didn't choose the weather, and that I 'm not floating around here in a tub of tarred canvas for the benefit of my health.'

The eight scrambled aboard the motor-boat,

crowding her already confined space. They huddled in the well with the motors; they dived down the forepeak, where the men lived when off duty; they lay on the upper deck, with the torpedo-dropping gear for company. Frazer led the lieutenant into his own tiny cabin aft, and, setting before him spiritual refreshment, demanded the yarn.

'We were being chased by an enemy torpedo-boat in the fog,' explained the submariner, 'and we couldn't submerge because something had gone wrong with the works. We thought we'd shaken him off, when all at once we went high and dry on the mud-flats off the mouth of the Elbe—just here.' He reached over and indicated a certain spot on the chart. 'There's a big shore battery just above there, and a trawler was nosing round,' continued the lieutenant, 'so I thought it policy to abandon our hooker. But I couldn't quite see making Fritz a present of her, especially as she's chock-a-block with all sorts of tricky little devices that are more or less experimental, but which our Service regards as dead-secrets. I knew that if she lay there when the fog cleared, or if Fritz found her, he'd refloat her and take her into harbour; so, after the last man had gone, I shoved an explosive charge under the motors, fitted a slow match, and, hanging around in the Berthon, waited for the bang.' The speaker reached over and drank deeply of the whisky-and-soda. 'There was no bang!' he snapped angrily. 'That infernal fuse refused to work; and when I found her in the fog again, a blessed Hun trawler was squatting alongside and holding her hand, just to encourage her in case she should be frightened of the dark. And now, to think that this, the first command I've ever had, should fall intact, secrets and all, into the hands of the folks that built her! It's the absolute limit; and they'll shoot me, as sure as eggs.'

'Cheer up!' consoled Roderick. 'I may be able to do something for you, after all. Just show me again where she lies.'

The lieutenant put his finger on the exact spot. Roderick marked it with his fountain-pen, then performed a host of abstruse calculations on the back of an envelope.

'Yes,' he said at last; 'I'll promise you one of two things. Either we'll get her off, if Fritz hasn't shifted her already, or we'll demolish her for you. And now, help yourself to the whisky, but be careful of the soda—it's the last siphon I've got. I'm going to be busy.'

IV.

Two hours later Frazer called down to the tiny cabin. 'I say,' he remarked, 'if you want to see your little hooker again, just hop up here and plant your peepers on her for absolutely the last time.'

The lieutenant hopped up, and through a rift in the fog saw his submarine, lying on a shoal like a stranded whale. And sheer alongside her was the enemy trawler, keeping guard till opportunity should allow of her being refloated. The sight was maddening.

'And now, hang tight,' ordered Frazer.

Chi-Chi slowed and crept on, her motors humming softly. She got to within four hundred yards ere the trawler, sensing danger, switched on a searchlight and tried to pierce the thick vapour. The light was about as effective as if a blanket had screened it, but it served Frazer for a much-needed point of aim.

'Now!' he breathed softly, and bent to the torpedo-dropping gear. He tugged on the lanyard. There was a faint splash overside, then the twitter of a pair of screws revolving at high speed, and the fourteen-inch torpedo steadied itself on a dead course towards the derelict submarine.

There followed a thudding crash, and the fog was rent by a vast tongue of orange flame. The trawler became alarmed, and switched on a second searchlight.

'And, so that we sha'n't be lop-sided through having to carry one torpedo about,' muttered Roderick, 'we'll present it to you, Mr Trawler!'

He aimed at a point exactly between the two redly-burning moons in the fog, and three seconds later both were blotted out by a second flash. The fort on the shore, meanwhile, had got busy, and, although no target could be seen, was firing all its guns at once, perhaps believing that the accursed British were making an attack in force.

Chi-Chi, however, was far beyond reach, having sped off at the second explosion. While His Britannic Majesty's Submarine Q 37—late *Seiner Deutschen Majestäts Unterseeboot 73*—sank in small pieces to the bottom of the sea, accompanied by the trawler who had held her hand in the dark, the lieutenant and *Chi-Chi's* owner-commander pledged each other in the last of the whisky-and-soda, the one using as a tumbler an empty jam-tin, while a cracked mug served the other as a triumphal goblet.

RONDEAU.

'Now there is peace.' Oh hearts that bleed,
Will that suffice—be all your meed?
Who, at the earliest behest,
Gave of your dearest and your best—
Will peace atone for all your need?

No shout of victory you heed;
Still to the past your thoughts recede;
With cypress yet your walls are drest;
'Now there is peace.'

War-wearied nations truce concede.
Hope comes again—a captive freed.
May you who passed the bitter test,
Whose loved, long sleeping, lie at rest,
Have strength to live! For this we plead,
'Now there is peace.'

THE HEART OF THINGS.

By Henry Leach.

London, Yesterday.

AN assurance has been offered in certain places that, whatever social trouble may befall us in any unhappy turn of events, it is nearly impossible for anything resembling the madness of Bolshevism, as it has raged in Russia, to seize the Western states. Two reasons are given, the first being that in countries like ours the people think more and have better sense than Russian peasants, and the second that the case is such that leaders like Lenin and Trotsky could not be evolved in more enlightened countries or be enabled to impose their will upon masses of the people. Besides circumstances in Russia being calculated to assist their strange development, it is suggested that Lenin and Trotsky themselves are most remarkable human and intellectual phenomena, such as are unlikely to be repeated for long enough. It may be so; civilisation may devoutly trust it is. But though we may have no Lenins and Trotskys budding in our midst—and truly the most rabid of Maximalists west of Russia seem of the innocence of lambs in comparison with those dictators—it is perceived that distant influence and secret missions work effects that indeed are bad enough; that blood is a strong drink, and those who sip it at the start soon change and develop mightily for evil capacity, as has been shown in the persons of Lenin and Trotsky themselves; and, again, that in the last five years the practical value of that word 'impossible' has been much discounted, since many things once rated high in impossibility have happened definitely and with emphasis. Thought and apprehension in these present times continually await the unexpected. But the production of these remarkable Russians, their evolution, has been a curious business, and it might benefit the proletariat of other lands to reflect upon the process as it has occurred. Slight personal sketches, indicating in some measure the nature of the men, the sources whence they have derived their force, and the impulses by which they have applied it, have already been offered. But it is interesting to see how, in the case of Trotsky at all events, the Bolshevist leader has been an evolution, largely as an ingenious opportunist, who, having adapted himself as best he could to new situations and policies as he perceived them, found himself confronted with novel and gigantic situations into which he must make new and desperate plunges, tumbling himself into unknown anarchic depths, trusting always that something would occur to set himself and his own world, as he viewed it, to rights again. That is why, as has been declared, Bolshevism depends for its existence on being dynamic. It must be doing, acting, forcing, horrifying all the time, maintaining itself by its own feverish action. The moment it stands still, ceases to force, to terrify, to attempt to spread abroad the false basis on which it stands, it must collapse. It is held by the most careful and impartial thinkers to be a false and impossible doctrine, the utmost violation of economic principles; and those strange, mysterious, economic principles, based at the bottom on two great laws of the world and life, that men must work and that they must eat, are like natural laws. The laws of economics will, like water, always force their own level.

* * *

Lenin was in some measure the man for the red dawn of Bolshevism. He is narrower in his studies and conceptions than Trotsky; he was the Bolshevist from the beginning of his time, trained himself for the part he was to play, and at the hour took the lead, declaring that it was only by one being the harshest and most imperious dictator, and through civil war and blood and suffering, that social happiness, equality, and right could be achieved. Thus he opened with paradox and contradiction. In his reports he preached the necessity of the single controlling will, an absolute dictatorship. He urged that, for the success of the new Russia and all its works, there should be the strictest unity in the will that guided the common labours of masses of men. So in the industrial world, so in the political. Industries must have their dictators; the State must have its own—himself. The will of thousands must be subordinated to the will of a single being. 'When ideal recognition and discipline on the part of all who are engaged in a common task are in existence,' says Lenin, 'this subordination may somewhat resemble the persuasive leadership of the conductor of an orchestra; when they are not present it may assume the form of a dictatorship. In either case the unquestioning submission to a

 [*All Rights Reserved.*]

single will is unconditionally necessary for the success of industrial processes organised after the type of a great mechanical industry. The Revolution has just struck off the oldest, strongest, and heaviest fetters with which the masses were bound under the knout. That was yesterday; but now the same Revolution demands, and that in the interests of Socialism, the unquestioning subordination of the masses under the single will of the director of the process.' How grotesque is this contradiction! When Gonzalo set out to imagine his ideal republic, he found that he should make himself 'king of it. So here, when Lenin would carry Socialism, the doctrine of liberty and equality, to its uttermost point, plumb freedom to its farthest depths for the sake of the hopeful proletariat, he is faced by the circumstance that for that glorious consummation he must crush all freedom as never before, and set up the most tyrannical autocracy! Starting thus with a contradiction, a negation of reason, the strange structure which he builds is maintained only by the constant practice of other acts which are negations of life and progress also; and that is how Bolshevism for a time plunges madly in its course of blood and ruin. Everywhere Lenin finds the new paradox demanded. He suppressed the financial and the industrial experts along with the bourgeoisie; but then he found, curiously, that he could not run his State without financial and industrial experts who were not induced to work by the mere threat of punishment. In this case it seemed to Lenin that, unfortunately, the end could not be achieved by shooting them—they were needed. So they had to be paid, and well, or else they would not be sufficiently expert, and the State would lose. In logical consequence Lenin decided that their services must be hired at the highest salaries—twenty-five thousand roubles a year; and if the rouble were what it used to be, that would be between two and three thousand pounds a year. Lenin, musing upon this situation, agreed that it was somewhat reactionary; but it could not be avoided, he said. It would cost much money to obtain these financial and industrial experts such as his country, under its new ideal conditions, needed; perhaps it would cost a hundred millions a year. But the Government must have them—until, perchance, it had trained experts of its own. There Lenin had one of his first encounters with the impossibilities of advanced Socialism, and was worsted. If all men are equal and are to share equally, who then shall be the better—and more expensively—equipped for the most difficult and most intellectual work? And with the equipment and the intellect and the absolute personal necessities that they demand, how then shall such men be sustained upon the allowances made to the drawers of water and the hewers of wood? Lenin cannot answer; he can only proceed with terror. But it is little wonder that peoples' idealists who have prided themselves on being advanced, looking upon this strange spectacle in the east of Europe, feel that shallower levels of Socialism are better for their kind than the majestic depths into which the Bolshevists plunge.

* * *

Now, the evolution from plain but strong democratic thought and tendency—with some action in the way of violent revolutionary protest against Czardom—of Leon Braunstein, the alert, studious, thoughtful journalist-adventurer calling himself Trotsky, has been a very different process. Life in the world has always been just a splendid game for Leon Braunstein Trotsky, and despite its overwhelming magnitude, its terrifying seriousness, one cannot resist the fancy that this Russian tragedy itself is also but a game with him, and not perhaps so monstrous either to one whose taste for adventure has been somewhat dulled by hot experience in many countries as it might have been to others who lead tranquil lives, and whose exhilaration is confined to the political feuds of home. Each successive chapter of Trotsky's career assists to prove the proposition. He was always restless, always seeking trouble, darting amid flying adventure from one country to another, and in the true manner of the adventurer taking all his worldly belongings with him in a small valise—just a few papers, a dark suit, a clean shirt, and some collars, with his night-clothes, and no more. That valise, which the Spanish prison authorities marvelled at so much, makes a suggestion of Trotsky's life and character. Those were his special possessions, his movables, the requisites which attached to him, at so weighty a period of his life. All who are shackled by convention, properties, domiciliary points, houses, business premises, relatives, or even at the least perhaps by a few shelves of favourite books, know that feeling of being attached, bound, enslaved in chains of circumstance to one small spot of earth, and the yearning that sometimes flickers through the mind for a full freedom and unhindered liberty, such as can never be attained. To be free of Governments! To be just a citizen of the world, and with risk and rollick to run in and out from the attempted rule of one to that of another, and laugh at all of them! Trotsky was such a libertine. It happened inevitably that his original affections and enthusiasms for democracy and its enhancement of its situation, his love of the revolutionary attitude, partly because of political conviction and partly for the excitement of it, were increased by much. The man who does his world-wandering with but a valise for property, and has twice tasted Siberia, loves neither aristocrats nor bourgeoisie, but is all for his own freedom. Again, it became a natural habit, a fixed system, for Trotsky always to view life and the world from the outside, almost as a kind of entertainment offered to

him for his pleasure or his edification or instruction. It was a thing in which his part was that of observer and critic. This is the natural disposition of an alert and thoughtful journalist; no man feels himself less a part of grand events than one whose lifelong business it is to watch and criticise. The further result of this again should have been—as evidently it was—to convince him more than ever not only of the rights and the necessities of democracy, as every honest man to some degree must be convinced, but also of human weaknesses and limitations by which the advances of democracy must be restrained.

* * *

Trotsky knew more than Lenin, but in the end he had to do as Lenin did, to co-operate with him, even to vie with him in callous determination and disregard of fearful consequence, or quit the most thrilling adventure of his life. So he proceeded to a quick evolution. But if one follows his affairs in the last four or five years, and examines closely his writings at different periods, the change in them—and these writings are good pieces of work, full of acute thought and reasoning, and evidently sincere—one sees the transformation, and has a glimpse of Trotsky wincing at some sharp spasms of change that came suddenly upon him as he realised the price he was being called upon to pay for his experiences. It is said that on returning home after the preliminary conference with the Germans at Brest-Litovsk with the object of making peace, he was in a state of hysterical collapse, due to the sudden full realisation of what it was to be under the military heel of Germany, where he was depositing his country. So overcome was Trotsky that, half in delirium, he shut himself in a room at Petrograd for an entire fortnight, and refused to see any one. He would not return to Brest-Litovsk; he feared too much those awful German terms. Knavery, ambition, adventure were well enough; but . . . Yet Lenin, the cold, practical realist, recognised the inevitable, and called for the treaty to be signed. Afterwards Trotsky knew that he was committed to the utmost. He steeled himself, stripped from his spirit the last shreds of conscience and pity, and advanced to all the sensations that ruthless authority over the life and death of a whole people could afford. He competed with Lenin in cruelty and in the wildness of political adventure in Bolshevik Russia. When they felt their scheme falling into more serious difficulties than before, Trotsky, with Peters, Radek, and Zinovieff to support him, advocated stronger and more desperate measures. He counselled the continual irritation of the Allies in every way and to the utmost extent, believing that in different fashions it would further the Bolshevist cause and help them to escape from their dilemma; but Lenin was more for conciliatory measures which might lead to a kind of compromise. So sharp was the division of opinion that there was a serious quarrel between Lenin and Trotsky, and there is said to have been a certain distance between them since. Much has been revealed by correspondents and others returning from Russia about the Bolshevist horrors, the fearful sufferings of the people, on the one hand through privation and hunger, and on the other through torture by the tyrants. Probably some of these stories have lost nothing in the telling. There have undoubtedly been many exaggerations of what has been happening in Russia, just as from the beginning there have been stupid minimisations about the degree of success achieved by the Soviet Government, which was always reported to be on the point of collapsing, but somehow kept strangely on. It has not been the business of other peoples to palliate in this affair. But Trotsky himself seems to have been the direct instigator in some cases of the most terrible punishments. Thus one account, which at least seems as reliable as the rest, tells us that ferocious and sanguinary discipline surpassing the methods of Ivan the Terrible was exercised by him in order to restore the shaken discipline of the Red Army, torture and capital punishment being applied in the fullest measure. Flogging took place on a scale unknown even to the serf army of Nicholas. It was the punishment for breach of orders, for neglect of weapons, for supposed anti-Bolshevist tendencies, and for failure to keep up on the march. Peasant soldier-lads were flogged simply in order that they might be sent back to their villages to tell, as a warning and a threat, of what they had suffered. By Trotsky's orders 'Chinese punishment,' a mysterious form of torture, the exact nature of which is unrelated, was employed in order to terrorise. There were Chinese executioners attached to every battalion, and the alleged offender was delivered to them with the simple instruction that they were to do what they pleased with him for three days. He was then dragged by these Chinese fiends into a dark room, and there for those three days they amused themselves with him, so that he was, as it is said, never in a position afterwards to tell what happened to him. For no fewer than twelve kinds of offences was merciless flogging the punishment, one of them being 'unworthy and disrespectful conduct.' Trotsky gave orders that soldiers must spy on one another in order to obtain political convictions, and any man who failed to report anti-Bolshevist manifestations by a comrade rendered himself liable to be shot. To this in little more than a year had Trotsky arrived, the little man with the woolly head of black hair, the small mouth, and the slight moustache—a figure that with a little making up might have been presented as a fair imitation of Charlie Chaplin; the man who had loitered in those Spanish *calles* gazing at the monuments of Spanish kings and generals (who knew something about cruelty, one recalls), had scribbled

his articles in the cafés, and then, for the ease of the Spanish mind, had been marched away to prison.

* * *

See Trotsky again in calmer and better mood as political philosopher and ardent Socialist—revolutionary, yes, but not then so far advanced as now—in New York ere the new madness seized him. He was fierce indeed at that time against the bourgeoisie, yet there was a certain reason in his views. He realised the necessity for the overthrow of Germany and Austria in the war if the world was to be made good for democracy. He yearned for it. But afterwards he was bought with German gold. He wrote that the real objective significance of the war was the break-down of the existing national economic centres, and the substitution for them of a world economy. He said that whichever country won the war would become the World-Power; nations might continue to exist as cultural units, but their economic individuality would disappear. This new state of things would represent the suicide of capitalism. 'All the historic forces,' he wrote, 'whose task it has been to guide the bourgeois society, to speak in its name and to exploit it, have declared their historical bankruptcy by the war. They defended capitalism as a system of human civilisation, and the catastrophe born out of that system is primarily their catastrophe. The first wave of events raised the national governments and armies to unprecedented heights never attained before. For the moment the nations rallied round them. But the more terrible will be the crash of the governments when the people, deafened by the thunder of the cannon, realise the meaning of the events now taking place in all their truth and frightfulness. The revolutionary action of the masses will be all the more powerful the more prodigious the cataclysm which history is now bringing upon them.' He held that Czarism—this was just before the Revolution—had become the indispensable military reservoir for the financial imperialism of France and the conservative colonial power of Britain, Austria-Hungary being the mainstay of Germany's imperialism. He said that while the simpletons and the hypocrites prated of the defence of national freedom and independence, the war was really a life-and-death struggle between Britain and Germany for the economic hegemony of the world. The objective of the revolutionaries in the war must be the break up of Austria-Hungary and Russia, and, with the imperialism of the two major culprits paralysed by the destruction of these sources of assistance, the task of the proletariat would be to create a far more powerful fatherland with far greater power of resistance, the Republican United States of Europe, as the foundation of the United States of the World. Then listen to him further on the point of his attitude towards Germany, the attitude of revolutionary Russia towards imperial Germany- by which later, as it must be recalled, he was bribed. Waiting in New York for the great something to occur, he wrote: 'In our war against Czarism, in which we have never known a "national" truce, we have never looked for help from Hapsburg or Hohenzollern militarism, and we are not looking for it now. We have preserved a sufficiently clear revolutionary vision to know that the idea of destroying Czarism was utterly repugnant to German Imperialism. Yet even if it were otherwise, even if it could be assumed that, in obedience to the logic of military operations, it would deal a destructive blow to Czarism, in defiance of the logic of its own political interests—even in such a highly improbable case we should refuse to regard the Hohenzollerns as an ally by sympathy or even by identity of immediate aims. The fate of the Russian revolution is so inseparably bound up with the fate of European Socialism, and we Russian Socialists stand so firmly on the ground of Internationalism, that we cannot, we must not for a moment, entertain the idea of purchasing the doubtful liberation of Russia by the certain destruction of the liberty of Belgium and France, and—what is more important still—thereby inoculating the German and Austrian proletariat with the virus of Imperialism.' He was all for a French victory in the war. 'Germany's victory over France, a deplorable strategic necessity, according to the German Social Democrats,' he wrote, 'would mean not only the defeat of France's standing army; it would mean primarily the victory of the feudal monarchical State over the democratic Republican State.' Yet this same Trotsky, so well assured, later opened the negotiations leading to the peace which might have brought about that German victory, and almost did so.

* * *

In the far future, when the world may have settled down again and have opportunity and mood for calm and dispassionate study of the abnormal characters of these tremendous times, it will devote close and varied consideration to Trotsky. He and Lenin, with all their crimes about them, will assuredly stand out among the most picturesque figures of a flaming period. In a different way—they are surely not so honest and sincere—they will appear as the figures of an age of blood like Robespierre and Danton in the French Revolution. There will be many readings of their strange characters, as many as of Prince Hamlet. The impulses that moved these extraordinary products of the revolutionary spirit will always be speculated upon. None can estimate them correctly now, but such a view as that presented here is formed from facts and reports upon them which have emanated from several European and other countries over a long period and from authorities of different sympathies. Trotsky is shown as the man capable of serious and lucid

thought, sometimes correct enough, led on by lust of adventure, and turned mad by it. Yet the strength and the determination of him and Lenin are points for a certain qualified admiration in a period when strong men have been so few. One might fantastically try to imagine at some crisis these two being hired, not by Germany, but by the Entente, for the purpose of suppressing the public unrest. Trotsky, at least, might find such a *volte-face* no more difficult than his peace-making with imperial Germany, nor the departure from his principles wider. And he would bring to that problem with which the Entente has been so seriously concerned some striking qualities of imagination, determination, and efficiency. He would assuredly begin by a merciless crushing of the Bolshevists among us; he would apply a remedy quick and stern to strikers. Let those in western Europe who would follow the strange pretensions and proclamations of Trotsky and Lenin think upon the manner of men they are, and contemplate what they have made of the country in their fiendish grip.

THE SEARCHERS.

CHAPTER XXV.

BY a little birch-fringed loch that sleeps near the forest stand the ruins of a chapel, round it many green mounds where generations of the folk of the Glen, laird and crofter, rich and poor, mingle in humanity's ultimate dust; and there the hush of a summer afternoon was broken by the sound of the Lament when his clansmen and neighbours laid Colonel Ewan Forbes beside many another of his name.

Besides my uncle's will (which made me his heir), the solicitors were custodians of a sealed envelope endorsed in his handwriting: '*For my nephew Neil, in the event of my death.*' To my unspeakable relief, it contained the copy of the paper I had sent him from Ubriano, which I feared had been stolen on the night of the burglary. It was evident that my uncle had not kept a duplicate at The Bield, for there was also a memorandum of his which ran: 'I am not at ease with this in the house, and have, therefore, deposited it with my solicitors, with instructions regarding its safe keeping.'

This lifted a load from my mind; and I was further relieved by a message from the watchers up the Pass. Rob Macbain, who had left Finlay there, and was to rejoin him immediately, came to report that neither of them had seen a soul near Sron na Leirg.

Three days passed. There had been numerous meetings with the police and the Procurator-Fiscal (*Anglicè*, the Crown Prosecutor for the district), but all efforts to get nearer the heart of the mystery had failed.

Tony was not himself. His cheerful alertness had disappeared, and I had become accustomed to seeing him sitting in silence, lost in thought. He showed no desire for talk, and complaining of sleeplessness, had consulted Dr Hall, who, to my surprise, told me that he was very highly strung, and was allowing the affair to absorb his thoughts too much. Tony, of all men, with a fit of 'the nerves'!

'Don't let this business worry you, Tony,' I said to him one morning after breakfast.

'My nerves are O.K.,' he replied, briskly enough. 'I dare say I'm concentrating a good deal, but the good doctor forgets that it is my job to concentrate. I'm used to it. Don't worry about me, Neil. I'm all right, and I'm not going to be beaten. And I think,' he continued, lowering his voice, 'that I am nearer laying my hands on "The Searcher" than you think. I believe that he is still near The Bield, skilfully hidden. More I can't and won't say, but I am going to make sure in a couple of days.'

'To make sure!' I said incredulously.

'One way or the other. I may be wrong, but I think I'm right.'

'Can't I be of any use to you?'

'I was just about to ask you to do me a favour. I want you to do nothing, to ask no questions, and to allow me to go my own way.'

I suppose I looked a little puzzled and dissatisfied, for Tony went on: 'I'm sorry if you feel a little "out of it." But the fact is, Neil, that you are not a good actor, and you're inclined to be hasty.'

'You mean that I can't control my face any more than my temper?'

'Rather less, I should say. Let me put it that you are too honest. The practice of dissimulation is not generally admired, but it is sometimes necessary. I want you to rest content, to "mark time," to behave exactly as if you were beaten and sick of the whole affair, and *to say so.* I expect that you'll be of considerable use to me before the finish. But for the present, give me a free hand for a day or two. Don't ask any questions. If I disappear, I'll turn up all right.'

'Chief of the Staff, it is an order! I am in your hands. I'll ask nothing and expect nothing.'

'Therein lies a beatitude! It's good of you to agree. I have my own reasons for asking you. For one thing, I am not dead certain of my man. I am only morally certain (a phrase which I detest, because I have seen so many "moral certainties" result in nothing but disappointment). But I think that I am on the

right track, and that we shall crumple up the plans of a most capable villain. The most trifling circumstance might put him on guard, and then —good-bye to our hopes of seeing him in the dock, and, what is worse, to the prospect of getting his half of the secret paper.'

'You mean that we may collar him with his half of the paper in his possession?'

'I do. I want to prove by his actions that he is the same man who entered the colonel's room.'

'Do you mean to say that he will try again?'

'I propose to give him the chance; and when he appears somewhere up there'—he pointed towards the hills—'it will be a hundred to one that he will have his own part of the paper with him. It will then be our pleasant duty to relieve him of it, and after that a judge and jury will have a comparatively easy job.'

'And how is all this to be done, my friend?'

'I promise you that shortly after midnight to-morrow I shall be more explicit. Meanwhile, this is imperative. You and I are to give out that we have abandoned hope of tracing "The Searcher," and are leaving soon for the South. Tell this to the servants, and to one or two gossipmongers in the neighbourhood. Get it well ventilated all over the place.'

'I don't half like leaving you to "carry on" alone, but you give me no alternative. I'll see that the programme is carried out.'

'Thank you, Neil,' said Tony. 'Your face advertises that you think I have queer methods; but this is a queer case, and, on my soul, I think the scent is breast-high. And now I am going to write a few notes in the library.'

Just at that moment Dr Hall was announced. He entered hurriedly, his thoughtful face unusually animated.

'Phew!' he said, mopping his brow, as he sank, panting, into an arm-chair. 'The car is laid up, and I've raced down. I am glad to find you both in, for I have something of extraordinary importance to tell you. Last evening, about eight o'clock, a man called at my house. I happened to be in the garden when he arrived. He asked to see the doctor. I gave him my name, when he said that he wished to consult me professionally. We went into the house, and I treated him for a badly sprained wrist, which he said he had got through a fall when he was fishing at Loch Afries. His name, he said, was Lee, and he was at the Glen Afries Hotel for a week, trying the hill lochs. Now, perhaps you know there is a short cut from the back of my house through the Afries Wood to the Glen Road. I showed it to him, and saw him out at the wicket-gate. As this gate is kept locked, I took the key with me, and having opened it and seen him off, I locked the gate again.

'This morning, about an hour ago, I was finishing my rounds, and called at the Glen Afries Hotel to see old Clarke, the proprietor. When there I casually referred to my patient of the previous evening, and was surprised to hear that there was no one at the hotel answering to his description, nor had there been any visitor of the name of Lee.'

'What was he like?' Keene-Leslie asked, intense excitement in his voice.

'A clean-shaven, presentable man of medium height, in a blue-serge suit. He spoke and looked like a gentleman. I put him down as a professional man on holiday; but I didn't pay particular attention to his appearance. What electrified me was a discovery on my way home. I took the short cut back from the hotel to my house through the Afries Wood. It had been raining a little last evening, as you know, and the path was soft. I was picking my way through a shallow puddle, when I saw a print of a large foot near the edge. Instantly I stopped dead, for in the centre was the distinct mark of a rough triangle!'

'By Jove! the man has courage,' said Tony. He began to pace the room, his usual composure struck out of his face. 'When did you see the footprint?'

'A quarter of an hour ago. I came here at a run, after I had had a good look at the path, and found that the footprints go from my gate towards the Glen Road. They must be those of the man whom I let out by the gate last night. It has not been opened since.'

'It's now nearly eleven o'clock. He was at your house fifteen hours ago. He can't be far away,' said I.

'He must be in hiding. The prints are visible from the wicket-gate to about three-quarters way along the path. Their owner had then cut into the wood, and although there are some slight traces of him there, I lost sight of the tracks. Better come and have a look at them.'

We hurried out to the path mentioned by the doctor, and there, true enough, found the tell-tale footprints. They were plainly those of the man who had entered The Bield.

The doctor pressed his boot into the soft earth alongside one of the prints. 'He must have a large, unusually broad foot,' said he. 'See!'

The difference between the footprints was marked. The impression of the doctor's long, narrow foot could easily have been put inside the other. We followed suit, and although Tony's feet and mine are by no means on the small side, the stranger's prints dwarfed ours too. We followed the bootmarks along the path to the point where, as the doctor had said, they disappeared in the wood.

The police were telephoned to, and in an hour we were searching the neighbourhood along with them. But again the result was *nil*, and late in the evening we returned empty-handed. I was tired and depressed. Not so Tony. There was a marked change for the better in his

spirits, though he did not say much, but busied himself with his notes in obvious satisfaction and with a smile in his eye. It was late when he ceased work.

'How does this last development square with your notes and your theory of the man in hiding?' I asked him, not without a spice of mischief.

'I 'll tell you to-morrow at midnight or shortly after, Didymus,' he said. 'And now I am going off to bed. I shall sleep well. To-morrow you won't see me until the evening. I am going to disappear and nurse a little scheme of my own.'

Sure enough, next morning he did not appear for breakfast. Janet told me that he had risen early, and was off for a day's fishing. I carried out his instructions, letting it be known to every one that we had given up hope of finding any clue, and were about to leave for the South as soon as possible.

In the forenoon the stalkers again reported that no one had been seen at Sron na Leirg; and as it was raining heavily, I spent a boring day indoors, curbing my impatience until Tony's return in the evening.

A telegram came for him in the late afternoon, but the hours passed and there were no signs of him. Dinner was postponed until I could hold out no longer, and about nine o'clock I sat down to my solitary meal, not without some anxiety regarding Tony's absence.

(*Continued on page 421.*)

A SCIENTIFIC METHOD OF TEACHING.

PART II.

IV.

THE fundamental aim in teaching should be not only to provide the young mind with necessary learning, but to present the acquisition of knowledge in a way which will inspire the pupil with such a love of learning as will induce him afterwards, when the printed form of language has become sufficiently familiar and teaching is no longer available, to seek and find pleasure in independent study. There is a notion with many that a *habit* of study formed under compulsion will be carried into after-life; but profitable study is not a matter of habit, but of strong desire or appetite for what is found to be enjoyable in feeding the mind. I think it will be generally admitted that the drudgery of lesson-learning tends very much in the opposite direction.

After food has entered the stomach, it passes, under normal conditions, altogether beyond our ken or control, through the wonderful laboratory of the alimentary system. Anatomically and chemically it can be traced in all its stages, but the process of digestion and assimilation is carried on with closed doors, and can be judged of only by its general effect. The case is different with mental pabulum. Here neither anatomy nor chemistry throws any light upon assimilation by the mental organism; but in the young its evolution as thought by the mental faculties is very much in evidence. We can, by observation of the talk and chatter and the play of young persons, know very fully what is going on in the mind, and thus judge of the efficacy of teaching. It is not immediately after the lesson that we may look for its manifestation in talk and play. A seed planted in the ground does not immediately burst into leaf and flower; neither does the germ of knowledge at once take on active life. The first effect of good teaching is to set the young mind *thinking*, the various faculties and the associated ideas already existing in the mind being brought to bear upon the new-comers, which are thus fixed in their place in the general mental economy. It may not be until after some hours or a day or two that we find the lesson taking its place in play and talk, thus showing that it has taken root in the brain-cells. Some repetition, with perhaps further illustration and explanation, will tend to promote the process, but any attempt to drag the new ideas into premature action will hinder rather than help. Automatic activity or exercise commences as soon as, but not before, the ideas are organised in the brain.

Without activity of an organism, although vitality may continue, there cannot be development or maintenance of functional power. With the alimentary, sanguinary, nervous, and other vital functions activity is entirely automatic, and, under normal conditions, goes on continuously without any consciousness or concern on the part of the individual; but the muscles and the mind are more or less dependent for action on external conditions, and are under control of the will. Some guiding and controlling influence is, accordingly, necessary to direct the will in accordance with organic conditions and requirements. With the young the whole organism is *in the making*, and responsibility for its completion and full equipment for all requirements of adult life still rests with the Maker. We may be certain, therefore, that full provision for this necessary exercise up to the highest potentiality is to be found in the instinctive promptings of Nature (I use the term in its highest sense and with all reverence) impelling and guiding the will to the required end, with safeguards—as disinclination and fatigue—against injurious excess. Such provision is amply demonstrated by the great and

otherwise purposeless activity of body and mind, which is such a marked and pleasing feature of the spring-time of life; and its complete efficacy for the purpose intended is seen in all cases where it is allowed free scope, as in wild nature. Like a flowing stream, it may be aided and guided to such definite ends as are required, but cannot be forced against natural law.

Organic growth is no less essential to adult strength and stamina than is functional development, and, in the young, demands a certain share of available vital energy, thus putting a limit upon exercise considerably short of actual power at the time. This reserve force is, however, available in case of emergency or upon compulsion to prevent actual injury from overstrain; but if persistently drawn upon, it must be at the expense of growth and ultimate strength. A colt of two years, beyond its capering and frisking in the field, would, if put to it, be capable of a good deal of useful work; but his owner would never think of exacting this, well knowing that he would lose in the value of the horse much more than he would gain from the work of the colt. In certain districts of the country where, in comparatively recent years, the boys were put to hard bodily labour, the men were found to be stunted in growth, of poor physique, and short-lived. The boys did not appear to suffer in health, but had the appearance of *little men*, Nature, as it were, making the best of a bad business by hurriedly finishing off her work to meet present exigencies, and leaving the future to look after itself. There is much in connection with the competitive system for prizes, medals, and bursaries at school, and for Civil Service appointments later, which points in the same direction with regard to overstrain of the young mind. It is run upon very dangerous and, for those who enter at all keenly into the competition, almost certainly injurious lines, which, I hold, should be altogether barred.

V.

How, then, are these complex and mysterious conditions with regard to exercise to be gauged at all times and under all circumstances, and the well-being of all the muscles and of all the obscure and little-understood mental faculties and powers to be promoted and safeguarded? We can conceive of a deep and thorough study of anatomy enabling a gymnast to contrive a system of exercises which would bring every muscle—there are some two hundred of them—into action; but this could give no indication of the functional condition and capacity of any at any given time. Arbitrary dictation and compulsion by any outside authority are, therefore, utterly untrustworthy, and should not be attempted. Nature, on the other hand, acts from within each individual muscle in full cognisance of every condition and requirement, and with power to regulate exercise in strict accordance with such conditions and requirements, in association with a keen sense of pleasure. The effect of this impelling and guiding influence is seen in the young of all the higher animals, where the wanton exuberance of gambol, fun, and frolic, bringing every muscle into action with little or no reference to external conditions, continuous for periods, but with frequent intervals of rest, is the most familiar and pleasing aspect of young life, with the result of full and vigorous development in all cases where such instinctive exercise or play is given full scope. With this supreme and all-wise preceptor within there is need for outside interference only in the way of affording facilities. A gymnasium by all means, but Nature as the master and monitor in charge. Safety will be sufficiently ensured by the instinct of self-preservation, while courage and self-reliance will be inspired by freedom from outside interference.

The same reasoning holds good with regard to the mind; but if there could be degrees of the absolute, our entire dependence on Nature should be here even more pronounced. The muscles are all visible and tangible entities, and their mode of action is easily understood; but no anatomical study of the brain throws any light upon the action of the brain-cells in the evolution of mind. We can judge of the mental powers only by their outward manifestation. We know, however, that they are generated by, and are entirely dependent upon, a certain portion of the brain, any injury, disease, or congenital defect of which has a corresponding effect upon the mind. They are, therefore, subject to all organic conditions, requirements, and limitations. While we cannot differentiate organically between the various mental faculties and powers, we must realise that it is only through the organism, and thus under organic conditions, that they can be dealt with. As with the muscles, they can be developed in the young and kept up to strength in the adult only by exercise regulated in accordance with the vital and organic conditions existing at the time. Without exercise there can be no development and no mind; while action carried beyond the limits of exercise in the young must interfere with growth and ultimate strength and stamina, as we have seen to be the case with the muscles, and as there is much in the results of competitive and otherwise forced school-work to demonstrate.

In conclusion, I would suggest, as a ready means of giving effect to the foregoing principles and, I believe, providing a remedy for many of the ills that school teaching is heir to, the entire elimination of everything in the way of punishments and prizes as incentives to learning. Their only purpose is to drive the educative process on purely arbitrary lines, in total ignorance of the vital and physical conditions which, for safety and success, must rule at all times.

THE END.

THE LONG TRAIL.

By L. B. THOBURN-CLARKE.

I.

'*MAUSH!*' shrieked Chico, as, whirling his whip around his head, he brought the quivering lash with a swish upon the side of a big black dog that sat sullenly in front of the team.

The great brute snarled and showed his sharp white fangs in a savage grin, but did not move. Instead, he glanced with almost a contemptuous air at his companions, who were quarrelling angrily among themselves, in their wild frays mixing up the traces in the utmost confusion. Chico cursed in a *patois* of Indian, French, and English, as he untangled the traces and once more arranged the dogs.

'*Maush!*' again echoed over the silent, ice-bound river, but the great dog still remained sullen and motionless. In vain Chico thrashed, cursed, or entreated; Le Roi sat and snarled.

'Chico!' called a voice, and a tall, yellow-haired man came swiftly out of the gloom of the trees and hurried up. 'What's the matter?'

'Le Roi won't start,' growled Chico sullenly.

'Won't you, old fellow?' and Abe Smith turned and patted the black dog. 'You're a queer mixture, Le Roi. Which are you, dog or demon? Yet you're a faithful animal. I'd rather trust you than half the men I know. I guess you weren't going to start without your boss. Eh, old boy?'

The dog rose, and, wagging his great fluffy tail, drew his trace taut. In a few minutes the loaded sleigh was gliding swiftly over the frozen Paradise River. There was just enough snow upon the gleaming ice to make the going easy.

Abe Smith laughed gaily as he sprang rapidly forward, his snowshoes making a sort of rhythmical echo as they clicked lightly over the snow. It was a clear day, the sky a blue of an indescribable tint that heralds a still day amid the ice-bound regions of Labrador. It was early, the day having hardly more than dawned, and before its short course had been run he hoped to be up amid the forests, miles from his starting-point.

Again he laughed. For years the trappers had tried in vain to solve the mystery of the 'long trail' which began in Labrador and ended at St Johns. It was known only to the Indians, who came and went mysteriously, doing the seven hundred miles in ten days. Nothing would make them divulge the secret. No white man had ever solved it. Some had started, and had never returned to tell the tale. Others had penetrated the long chain of lakes which formed the river for thirty or forty miles (one man had accomplished ninety), but all had had to turn back—except the few, and no one knew where their bones rested.

Again Abe laughed. His laugh had a triumphant ring in it. He was to learn the secret at last. Chico, who had traversed the 'long trail' many times, would be his guide.

His fellow-trappers had warned him in vain of the dangers of the way; talked of Indians who would be jealous of his fathoming their cherished secret, and would probably take care that he never returned to betray it.

But he had laughed as gaily then as he did now, and repeated again and again, 'What an Indian can do, I can.'

'Chico,' he called to the Indian in front, 'what's the hunting like along the Paradise?'

'Plenty good,' replied the Indian stolidly. 'Plenty good all round here.'

'Of course I know what it's like around here,' Abe replied impatiently. 'But up in the mountains?'

'I don't know,' replied the Indian sullenly, glancing furtively about him as he spoke, and flicking a sulking dog with his whip. 'Indians hunt around the islands, and not in the mountains.'

Abe began again: 'Well, I will try next year. Now I'm going to St Johns. But, if the hunting's good, I'm up in the mountains next fall.'

Chico gazed ahead of him solemnly, as if he were debating some knotty point. His face grew sombre.

'No man hunts there,' he said. 'The head-waters of the Paradise are no good, and the mountains are bad—much bad.'

'What's the matter with them?' Abe asked; but Chico would only answer gloomily, 'Much bad.'

At last Abe grew tired of asking, and scanned the broad river for signs of game. The air was so clear that, except where the wooded islands obscured the view, they could see for miles. Suddenly a herd of caribou scudded past at a marvellous rate, but they were too far off for Abe to shoot.

Mile after mile was traversed until the wide lakes which composed the lower reaches of the Paradise ended and the river lay like a frozen torrent between high cliffs.

Chico paused, and called to the dogs to halt. They sank on their haunches, eyeing him expectantly.

'We'd better camp here to-night,' he said, pointing to a recess a few feet up the face of the cliff.

The dogs were fed and unharnessed. They disappeared to forage for themselves, but Le Roi sidled up to Abe's side and crouched

patiently while he gathered together sufficient drift-wood to light the fire.

'Well, old chap,' said Abe, laying a caressing hand on the dog's black coat, 'you're fond of me, and no mistake. Will you and I go hunting up among the mountains? Up where no white man has ever trod?'

The dog solemnly wagged his tail and watched his master prepare the simple supper, while Chico collected a pile of wood to keep up a roaring fire during the long winter night.

After eating their supper they rolled themselves in fur rugs and lay cosily under the sheltering roof of the cavern, screened by the fire beyond its mouth. The Indian smoked stolidly, but Abe soon dropped to sleep. Le Roi crouched beside him, half-sleeping, half-waking. Away in the pine forest the wolves drearily howled their hunting-cry.

The night passed slowly. Every now and then Chico rose and piled the wood high upon the fire. At times he listened, as if expecting to hear something.

At intervals the crouching dogs howled weirdly in answer to the distant wolves. Abe slept on unheedingly.

II.

Day after day passed in the weary ascent of the frozen river. Sometimes the stages were long, sometimes short, for Chico insisted on camping in spots where probably his race had camped for generations.

Instead of being situated as usual under the wide heavens, with a skin rug between two stakes for a break-wind, and a great fire in front, these camps were always in a recess under a cliff, or close in the lee of some rocks, which formed, with the great fire in front, a secure retreat, cutting off the outside world and the denizens of the forest.

Great pines towered on both sides of the river, and the tangled brushwood looked as if it had never been disturbed by man.

Abe scanned the snow to see if he could detect any trails. Occasionally on the broad frozen surface of the river the tracks of a sleigh or the prints of snowshoes were to be seen. Yet these never penetrated the primeval forest beyond the margin of drift-wood that marked the height of the spring floods.

The footprints of fox and other wild game were plentiful, and the animals were very tame. Several times Abe shot a fox quite close at hand. In spite of his wishes, Chico would not pause to set traps.

'It's not good,' he said. 'Not good. No Indian ever stay. No one ever hunt. It bad—mighty bad.'

He emphasised his words with a curse, and lashed at the dogs. For hours he maintained a sullen silence, broken only by the cry of '*Hu!*' or '*Chau!*' as he directed the team.

At last they reached the head of the river, and the trail branched off through the great pines, which looked as if they had stood, hoar and grim, since the days of the Flood. Underneath their shade a twilight lingered, and Abe felt awed by the sombre silence of the scene. Chico never spoke, beyond commands to the dogs. Even these were uttered in a low tone, as he urged them to their utmost speed. Every now and then he would pause and peer anxiously into the dim, twilight shadows, as if dreading something; then he would hurry the dogs on again.

Abe grew impatient under the sullen bearing of his guide, and purposely lingered behind, heeding not Chico's urgent injunctions to quicken his pace.

'We must make the Todaustock to-night,' Chico said anxiously. 'If not'—— He shrugged his shoulders, and made the sign of the cross.

The trail wound in and out of the giant trees. The tracks of game were plentiful, and Abe, cross at Chico's silence, determined to make a stand.

'I'm going to camp here for a few days and trap,' he said with decision. 'You can talk as much as you like, Chico. Here I stay.'

Chico eyed him angrily. 'No, no,' he said, glancing fearfully around. 'No, no; come on!'

'Why shouldn't I stay?'

The Indian did not answer for a few minutes. He stood as if turned to stone. To Abe's astonishment, the brown face wore a terrified look.

Away in the distance something crashed.

'There!' cried Chico in a tone of anguish.

'Well, what of that?'

The Indian did not answer, but, turning his dogs, fled madly back along the trail, leaving Abe gazing in astonishment after the fleeing form.

While he looked Le Roi came trotting back, the gnawed trace trailing behind him.

Abe laughed in his usual light-hearted fashion at the sight of the dog. Yet, though he felt no fear, he was glad of the company of the great 'huskie,' who was big and strong enough to pull down a large wolf.

'We're not frightened, old boy, are we?' said Abe, patting the dog. Then he examined his rifle.

Suddenly across the silence swept the sound of another crash, as if a tree had fallen. The air was so still that the sound echoed weirdly.

Abe walked some distance off the trail, but could see nothing. Here the forest was so dense that he could hardly make out objects a few yards distant. The sun was sinking fast, and the lengthening shadows warned him that unless he wished to be bushed he must regain the trail before darkness set in.

Even as it was, he had only just reached it when the sudden night came on. All around

the ground was strewn with giant trunks of trees which had hindered his progress during the search for the cause of the Indian's alarm. He piled up a mass of wood against a huge log, and setting fire to it, sat within the radius of its warmth, Le Roi crouching beside him.

Suddenly from all around came the crashing of timber. It appeared as if some giant beings were rending branches and tearing up trees in every direction. Even Abe began to grow alarmed, while Le Roi cowered shiveringly beside him.

There was not a sound to be heard for a moment, not even the tread of the softest foot-fall. Then the echoes would resound with the sudden wild crashing of trees and the swish of branches as they struck the earth.

It seemed for a few minutes as if unseen hands were wantonly destroying the forest. The succeeding silence was that of the grave. The wolves, which had haunted their steps for days and waked the echoes with their howls, were silent. Nothing broke the stillness but the weird, awe-inspiring crash of falling trees.

Abe felt his hair standing on end, and he piled on the firewood until the mounting flames cast strange fantastic shadows upon the snow around and lighted up the grim tree-trunks.

In vain he peered into the darkness—there was nothing to be seen. He could only hear the mysterious, ominous sounds. Sometimes these receded into the distance, then appeared to be close at hand. Once he fancied the firelight gleamed upon something white that reflected the ruddy glow; but in a second it had vanished, and he thought he had imagined it all.

The time passed like a nightmare, fraught with horror and unspeakable terror; but at last the grey dawn crept up over the trees and the weird crashings ceased. Worn out with the night's watching, Abe replenished the fire, and burying his face in his hands, dropped asleep. Le Roi crouched with head laid upon his paws, and half-slept, half-watched the awakening forest.

III.

The day had hardly dawned when Chico came hurrying along the trail, driving his team at a gallop. He paused in astonishment as he caught sight of the sleeping Abe.

'What!' he asked; 'he not get you?'

'No!' said Abe crossly. 'No thanks to you, Chico. Why did you run away?'

'No Indian live here. He die.'

'Nonsense!'

'No nonsense. He catch him. He crush him to death. Quite flat.'

'Who would?'

'He. All same *le Diable*. He live here.'

The terror upon Chico's face was very real, and Abe was, in the face of his own experience of the night before, fain to believe that there must be something to account for the man's fear.

'Look here, Chico; it's all moonshine your talking like this.'

'No moonshine,' returned the Indian stolidly. 'He here. He here every night. If Indian camp, he trample him to death.'

'Have you seen him?'

The Indian shook his head, glancing around him in terror. 'No one seen him.'

'Well, Chico, I heard "him," as you call the thing, last night, and I'm going to pick up his trail. I'll take Le Roi with me, and three of the fiercest of the team. You go back to the last camping-place, and I shall join you before it gets dark.'

Chico groaned, but silently bent and loosed three of the traces, which he handed to Abe. Then he piled some more logs on the fire, and seated himself with folded arms in front of it.

'I stay here two hours,' he said.

Abe walked rapidly away, turning once to gaze at Chico. He looked like an image cast in bronze, so stolid was his attitude.

The dogs trotted beside Abe fast enough, and he soon reached the spot where he thought he had seen the glimmer of white the night before. Nothing but rotting, frozen trunks of trees met his gaze—tree-trunks that had lain decaying for generations. He strode rapidly through the undergrowth until he had penetrated far into the forest. Suddenly the dogs shrank cowering back, and growled fiercely.

On the soft surface of a plain patch of snow was distinctly marked a huge footprint. It was so large that Abe gazed for minutes at it in awed astonishment. No animal that he knew could make a track like this. At first he thought it must be the trail of some monster bird, but he soon saw that, like all four-footed animals that walk through snow, this one had carefully placed its hindfeet in the tracks made by the forefeet.

Abe sat down on a log and viewed the prints, half-afraid to proceed, half-anxious to solve the mystery. He felt sure the creature that had left the tracks was close at hand, though he could neither hear nor see anything.

The dogs cowered close to him, whining miserably. He knew that the traces alone prevented them from fleeing back towards Chico, probably never to rest until they had returned to their kennels at the mouth of the river.

The indescribable sensation of being watched made Abe glance uneasily around.

'It's all imagination,' he asserted firmly, but all the same he peered into the forest with straining eyes. Setting his teeth and holding his rifle ready, he sprang from the log and strode forward.

An immense windfall of shattered pines, piled high by some fierce tornado, barred his way. He scrambled over the huge trunks.

Suddenly he saw a gleam of white. A vast unwieldy form confronted him—what, he could

hardly make out, for it vanished instantly. He heard a sound behind, and turned—to see looming up before him a great hairy monster. He was too astonished to do more than gaze up at the creature towering above him. His hands dropped nervelessly to his sides. Instinctively he still gripped his rifle, but the traces that held the dogs slipped from his fingers.

In an instant, with a wild, terrified howl, they dashed madly away, the forest echoing with their cries. Le Roi alone remained.

As if suddenly awakened to activity, the forest appeared to be peopled with hundreds of the enormous monsters. In every direction branches and undergrowth crashed as if torn by gigantic hands.

What happened Abe could hardly tell. Two wicked eyes gleamed angrily. Something white flashed backwards and forwards. Automatically he raised his rifle and fired. The great object shook its head furiously, and then something long, dark, and sinewy swept out and wound quiveringly around him.

It grew tighter. He fought frantically with both hands to loosen the great trunk that was crushing him in its strong embrace. All was in vain. Above him a red, open mouth yawned, and he was jerked against immense tusks on both sides.

Was the monster going to eat him? he wondered, even in that moment of awful terror remembering that elephants usually throw human beings with a crash away from them. But was this an elephant—this awful thing, covered with long hair that brushed his face?

He tried to reach the tomahawk he carried in his belt, but the animal's trunk was too firmly wound around him to permit him to get at the handle.

He was swayed roughly to and fro. Soon he felt he would be hurtling through space, to be dashed against the great pines that towered around him. In frantic despair, he tried to crush the trunk with his hands, but apparently the monster cared nothing for his puny efforts.

The long sweep of the trunk grew wider and wider. His eyes swam and his brain reeled with the wild movement. Suddenly Le Roi uttered a fierce cry of utter despair, and sprang furiously at the trunk that imprisoned his master. The sharp, wolf-like jaws closed upon the end of the trunk and snapped to like a trap.

The monster gave a snort of pain, and dropping Abe, turned on the dog. The force of the impetus threw Abe into the recesses of the windfall. He was bruised and shaken, but unhurt, and quickly scrambled under the sheltering logs. Fortunately they were large enough to form some protection against the fury of the animal.

Le Roi had his work cut out, for the monster thrashed around in wild rage, endeavouring in his unwieldy way to catch the dog, who edged nearer and nearer to where Abe lay hidden.

Suddenly, with a final snarl, Le Roi retreated, tail first, into the hollow under the windfall, and, still growling, crouched down beside his master.

The huge animal attempted to reach them, trying vainly to pull aside the giant logs which formed their hiding-place. Every time the trunk came near enough Le Roi buried his teeth in its sinewy length, until, snorting with rage, the animal rushed madly from the scene.

Abe could hear the whole herd crashing wildly through the undergrowth. Then all was silent.

He waited for a while in case they should reappear; but, finding that they had apparently stampeded, he crept out, bruised and weak from the conflict.

With many a backward glance he hurried to where Chico still sat, like a stolid bronze statue, beside the burning fire.

Chico looked up with dim, terrified eyes when Abe came up. 'You saw *him*?' he asked.

'Saw him, felt him,' muttered Abe; 'and you can go for all you're worth. The sooner we're off this darned trail the better I'll be pleased. Why didn't you tell me your *le Diable* was a great woolly elephant with curly tusks?'

But Chico only groaned and harnessed up the team. 'I never see him,' he said softly.

. . . . . .

Abe's tale was laughed at by men who knew better than to believe that the mammoth still lived. The trappers and the Indians, however, believed his tale, for haven't they seen the tracks and heard the crashing? But, they add, *le Diable* takes many forms. And Abe cannot convince them that the monster he met was a living animal.

THE MONTH: SCIENCE AND ARTS.

SCREW PLUGS FOR PLASTER WALLS.

MOST of us at one time or another have been 'up against' the difficulty of hanging heavy pictures safely on a plaster wall, or of fixing thereto shelves which can be relied upon to carry any considerable weight of books. It is true that large holes can be made and plugged with wood to take the nails or the screws, but unless the work is very carefully done the result cannot be depended upon, while the wall is often disfigured. To overcome this difficulty plugs of stiffened fibre have been invented, which are driven into holes in the plaster. It is essential that a clean hole of the correct size should be made, and for this purpose a spoon bit or

a bullet-nosed bit is recommended. The plug should be gently tapped in, and it is then ready for the screw. A small hole is provided for the screw, which, as it goes in, expands the fibre, and causes the plug to take a firm hold of the wall. For fixing thin articles, such as name-plates, it is advisable to open out the screw-holes in the plugs with a gimlet; otherwise the plugs may be split by the thicker plain parts of the screws as they enter, and the edges of the holes in the plaster chipped away. These plugs are also suitable for fixing articles to brick walls or for taking pins to hold down carpets on stone or tile floors.

ANOTHER FIRELESS COOKER.

New fuelless cookers, which work on the principle of the now well-known hay-box, still continue to make their appearance on the market, and it is evident that this idea, which was imported from Scandinavia, has come to stay. One of the most recent of these cookers is known as the 'British Queen.' It is made of tinplate throughout, with a myrtle-green hard stove-enamelled outer shell. It is cylindrical in form, and the smallest size—suitable for a household of three or four persons—measures externally eleven and a half inches in both diameter and depth. A space of about two inches between the outer shell and the inner container is filled with material specially selected for its heat-retaining qualities, while the top is closed by a push-in lid constructed in a similar way. An extra refinement not found in other fireless cookers is a cork disc, of the same diameter as the lid, which is sewn up between two discs of unbleached calico, the latter extending a couple of inches beyond the cork. This contrivance is laid over the mouth of the cooker, and the lid is pushed down over it, with the result that the cork disc gives extra heat insulation, while the edge of the calico makes an airtight joint between the lid and the container. Two four-pint saucepans and a six-pint porridge-pot are supplied for use with this size of cooker. A deeper model of the same diameter is made, also a double cooker with two inner containers side by side in one outer shell.

A NEW KNIFE-SHARPENER.

Many devices other than the well-known steel or carborundum rod have been invented for the purpose of sharpening the domestic knife, the object, of course, being to produce a tool that will do the work quickly, while demanding a minimum of skill from the operator. Of these devices perhaps the most successful is that which consists of two or three hardened steel discs, mounted upon two spindles so that their edges slightly overlap, the discs of one set being interposed between those of the other. The action on the knife-edge when it is passed across between the discs partakes more of the nature of *rubbing* than of *cutting*; hence the appliance soon ceases to be effective. An improved adaptation of this principle is found in the 'Sharpquik' knife-sharpener, in which only two discs are employed. The edges of these overlap, as in the multiple disc device, but do not touch, being about one-sixteenth of an inch apart. By passing the knife across at a small angle the sharp corners of the discs are brought into play, and actually cut the steel. The discs turn stiffly, and may be moved round occasionally to give fresh cutting-edges.

SALVED PARTS MAKE ONE WHOLE SHIP.

The cutting in two and joining together again of a steel ship offers no difficulty; nor is the vessel weakened by the process, being as strong after the operation as it was before. Many ships have been cut in two and lengthened by putting a piece into the middle, the most noteworthy example being one of the Union Castle liners; while during the war ships were so urgently needed that many of the steamers plying upon the great lakes of North America, which are practically identical with ocean-going vessels, were cut in two to allow of their being brought through the Welland Canal to the Atlantic seaboard. Here they were joined up again, and despatched to Allied ports, loaded with food or war material. Astonishing as is the feat of joining together two halves of the same vessel, a still more extraordinary operation was carried out during the war—that of patching the bow half of one ship on to the stern half of another. The British Navy at one time contained the two destroyers *Zulu* and *Nubian*, which were almost identical ships. Both were unfortunate enough to strike mines, with the result that the bow of the former and the stern of the latter were blown to pieces. Owing to the strength of the water-tight bulkheads, however, neither vessel sank, and both were eventually towed to the same dockyard. Here the salved portions were docked in their correct positions and joined together, the result being known as H.M.S. *Zubian*—a happy combination of the two original names.

BREEDING FISH TO EXTERMINATE MOSQUITOES.

That the larvæ of mosquitoes breed in water is now common knowledge, as well as the fact that these insects are responsible for the spread of malaria. It is most important, therefore, that they should be reduced in numbers, even if their total extermination cannot be effected. Until recently the only method (apart from drainage) of keeping down the mosquito pest was to pour paraffin into the pools of water in which they breed, a very small quantity being sufficient for the purpose, as it spreads in a thin film over a large surface, and prevents the development of the larvæ. Unfortunately neither of these preventive measures can be applied to many waters for obvious reasons, but it has been found that

certain species of fish, by feeding on the larvæ, are most helpful in combating the scourge. According to its last annual report, the United States Bureau of Fisheries, co-operating with the Public Health Service in protecting soldiers from malaria, made every effort to encourage the growth of top minnows (Gambusia) in the waters of the district, it having been fully demonstrated that this species was most effective in destroying the mosquito larvæ under certain conditions. These conditions, which include the presence of various plant-growths, rise and fall in water-level, wave-action, and other factors, are being made the subject of further investigation.

NEW HEAT-RESISTING ALLOY.

Most people are aware that the frequent placing of a poker in the fire until it is red-hot leads to a wasting of the poker. This wasting is due to oxidation, or what we should call rust if the poker were cold, and it goes on very quickly under the influence of heat. In fact, if the poker be heated up to a bright yellow, actual flakes of rust will appear when it cools. Again, the poker when red-hot is very easily bent, which means that iron and steel lose their rigidity at high temperatures. Hitherto all the commoner metals and alloys have been affected by heat in these directions, and only some very costly alloys of steel retain their rigidity and resist oxidation at high temperatures. Platinum, of course, withstands almost any temperature; but as it costs more than gold, its commercial uses are limited to small crucibles for chemical laboratories, and to the connections through the glass in electric glow-lamps. Recently a new alloy has been introduced which retains its rigidity at high temperatures and is hardly oxidised at all. According to the *Scientific American*, it contains about 60 per cent. nickel and 14 per cent. chromium, the remainder being chiefly iron. It can be cast easily, and is tough at high temperatures, the latter fact being often demonstrated by the makers on a three-quarter-inch plate, which is made red-hot and struck in the middle with a twenty-pound sledge-hammer when supported only at the ends. Under these conditions the metal shows stubborn resistance to bending. At temperatures of eighteen hundred to two thousand degrees Fahrenheit a bar of the new alloy one inch square can be pulled in two only by a strain of thirty thousand pounds; when cold its tensile strength is increased to from forty-five to fifty thousand pounds. It melts at two thousand eight hundred degrees Fahrenheit (a dazzling white-heat). Many uses can be found for an alloy with these qualities—for example, in the construction of exhaust-valves in motors for cars and aeroplanes, and of the corresponding parts in large oil-engines, which at present are made of iron or steel, and have to be continuously cooled by circulating water through and around them. Boxes for containing small parts to be annealed in furnaces might also be made of it, the fact that it does not waste allowing of thinner and lighter containers than are ordinarily employed. The makers of the new alloy utilise it in the construction of the chain necessary for carrying wire slowly through the annealing-furnace. Last, but not least, experiments have indicated the possibility of using the alloy in place of plumbago in the manufacture of crucibles for melting brass, copper, and other alloys and metals.

A NEW MILK SAUCEPAN.

The ordinary milk saucepan has retained its present form of an inner pan fitting into an outer container for so many years that one might be excused for assuming that it was incapable of improvement. Such, however, is by no means the case, an improved utensil for boiling milk, known as the 'Melton Milk-Boiler,' having lately been put on the market. Instead of the inner and outer pans being separate, they are permanently fixed together. The outer pan is cylindrical, and is fitted with a lid and a handle. The inner pan fits the outer at the top, where the two are soldered together; but it becomes smaller towards its bottom, which is rounded to facilitate cleaning. Owing to the fact that the inner pan is not so deep as the outer pan, while the former is in the shape of an inverted cone, a considerable space for water is left between them. When the saucepan is held by the handle, a pipe will be found on the right-hand side, which springs from the side near the bottom and rises upwards to a little above the lid. This pipe somewhat resembles the spout of a watering-can, but as it rises nearly straight upwards, the joint extends almost to the top of the pan. At the bottom of this pipe is a hole into the outer pan for allowing water to be poured in, while near the top a smaller hole lets out the air. When the saucepan is tipped over to the left to pour out the boiling milk, the water cannot escape, as the filling-pipe is uppermost; but if it is desired to empty out the water, the boiler can be tipped towards the right. This utensil is made of stout, heavily tinned plate, and can be obtained in several sizes.

CONSCIOUS INSENSIBILITY.

The local application of cocaine is a well-known device for deadening the pain of minor operations, and many readers of this Journal must have experienced the beneficial effects of such treatment when having their teeth attended to by a dentist. Some years ago this process was carried a stage farther by the injection of cocaine or some similar drug into the spinal column, whereby all sensibility was removed from the lower limbs. Dr Le Fillatre, a French surgeon, has lately discovered a method of rendering the whole body insensible to pain,

while leaving the patient fully conscious. A puncture is made with an injection-needle at the lower end of the spinal column while the patient is seated upon a table with his legs stretched out before him. The liquid surrounding the spinal cord begins to issue from the puncture, and when a sufficient amount has flowed, depending on the degree of insensibility which it is required to produce, says the *Scientific American*, the surgeon applies the syringe with the cocaine or other solution and pushes in the contents. This action is repeated until the requisite mixture of cocaine and spinal fluid is obtained. Almost any kind of surgical operation can then be performed on the patient without his feeling any pain, although he retains full consciousness.

MOTOR-SPIRIT FROM PEAT.

Various uses for peat and the products to be obtained from it have been alluded to in these notes on several occasions. One of the most recent of peat derivatives is alcohol, which is largely used in Sweden for motor-cars and motor-boats. According to the *Svensk Handelstidning*, a little over one and a half gallons of alcohol can be obtained from two hundredweights of dried peat, a yield which differs little from that secured from potatoes. The treatment consists in boiling the peat with sulphuric acid under pressure, thus producing a sugar solution, which is transformed into alcohol after lime has been introduced to neutralise the acid. The solid matter left over is utilised as fuel in the form of briquettes. This process having proved successful experimentally, a factory is to be built for working it, and the Swedish Government has conceded to the shareholders the right to buy the alcohol for their motor-boats and cars without reference to Government prohibitions and maximum prices.

THE EQUIVALENT OF A TWENTY-SIX-THOUSAND-MILE RUN WITHOUT MOVING.

A run of many thousands of miles by a motor-car, either on the road or on a prepared track, in order to test its powers of endurance, can be carried out only at a high cost; while little publicity accrues from a trial of this character. With a view to reducing the cost of such a test, and at the same time securing a considerable amount of public attention, some Boston manufacturers of motor-cars recently hit upon the plan of testing a car by making the back-wheels drive a dynamo instead of carrying the car forward. This test was carried out in a large show-room fronting upon a busy street, and attracted large crowds. The back-wheels were provided with flat rims for a belt in place of the usual tires, and all the wheels were, of course, packed up clear of the ground. The power required to drive the dynamo was equal to that needed on the road when the car was climbing a 10½ per cent. gradient at about twenty-two miles an hour. The test undergone was much more severe than actual work on the road, where a car is often coasting downhill or using only a very small amount of power on a good level road. The trial was continued without a stop until the total number of revolutions corresponded with a distance of over twenty-six thousand miles, the consumption of petrol being one thousand one hundred and sixty-three gallons, or almost twenty-two and a half miles to the gallon. A record was also kept of the quantity of lubricating oil used, which amounted to twenty-seven and a half gallons. A considerable monetary saving is effected by this form of endurance trial as compared with one on the road, as the chauffeur need not be in constant attendance, and no additional expense is incurred owing to his absence from home. Moreover, the electric current generated can often be utilised for providing light and power in the showroom or factory, thus effecting a saving in another direction.

THE GERM OF YELLOW-FEVER.

The medical correspondent of *The Times* has recently drawn attention to the description given by Professor Noguchi of a germ discovered by him which he believes to be the cause of yellow-fever. This organism belongs to the class known as spirochaetes, of which the spirochaete of syphilis and that of relapsing fever are other members. 'If the discovery is confirmed,' the correspondent goes on to say, 'it will add another link to the wonderful chain of discoveries forged in connection with this disease. The fever was first described in Barbados in 1647. Its dreadful virulence soon earned for it an evil reputation, and became a matter of world-wide concern when in the so-called "great period" of the fever it visited Cadiz in five epidemics, Malaga, Lisbon, Seville, Barcelona, Palma, Gibraltar, and other European towns. At Lisbon in 1857 some six thousand persons died in a few weeks. The fever remained a mystery up till 1881, when Dr Charles Finlay, of Havana, propounded the idea that mosquitoes carried the infection. The view found small support at first, but later Sir Ronald Ross's work on malaria reawakened interest in it. Then came the Spanish-American war, and the appointment of a commission by the American Government to investigate Finlay's theory. The workers began by collecting the suspected mosquitoes, allowing them to feed on yellow-fever patients, and then submitting themselves to the bites. Their labours were crowned with immediate success, though lives of great value were heroically sacrificed. It was proved that the mosquito *Stegomyia fasciata* is the agent of infection, that the virus of the disease is present in the blood during the first days of infection, and that "the germ is so small that it can pass through a Chamberland filter." In-

fection could not be produced till after several days from the time when the mosquito had bitten the yellow-fever patient, so that it was evident that the germ underwent some change in the body of its insect host. This work furnished the material of the wonderful campaign by which Gorgas cleansed the Panamá Canal zone of yellow-fever, and so made possible the completion of that work. Gorgas came to Panamá from Havana, from which he had driven the scourge in about a year, though the place was a famous hotbed of this dread disease. His method was to attack the mosquito in its breeding-places, and to exclude it, so far as was possible, from contact with fever cases. Professor Noguchi's work on "filter-passing germs" is well known. It is also a matter of common knowledge that from time to time the suggestion has been offered that the spirochaetes pass through two stages of development, one of these stages being of an extremely minute type. Whether or not this view will receive confirmation through the new discovery remains to be seen. In all matters bacteriological it is necessary to keep an open mind until proof of an absolute kind has been forthcoming.'

THE REMOVAL OF LARGE BUILDINGS INTACT.

The Americans have always been noted for the movement intact from one site to another of buildings which other nations would pull to pieces and reconstruct. Not only is this operation carried out on land, but also across water, the structures being floated on pontoons and towed to their destinations by powerful tugs. A recent enterprise of this nature was the removal of one of the San Francisco World's Fair buildings from the Exposition grounds twenty-three miles down San Francisco Bay to San Carlos. This structure weighs over one thousand tons, and measures one hundred and thirty feet in length, is forty-five feet high, and eighty feet wide. It was towed to its new site by two tugs, and placed in position on shore, where it is to serve as a clubhouse, the task being performed without injury to the building. Another interesting American removal was that of a complete railway-station brick building measuring over two hundred feet in length, but with a width of only thirty-three feet. The *modus operandi* was to lay a massive wood and steel frame below the bottom of the foundations, this part of the work being done in short sections, so that only very small lengths of wall were left unsupported at one time. Jacks were then used to raise the building up to ground-level, where it was placed on steel rollers and moved along on a prepared track to a site fifty yards away. Pulley-blocks and windlasses worked by hand-power were used to haul the structure along, and the removal proceeded at the rate of about thirty feet an hour. The operations were handicapped by adjacent buildings, the existence of which involved slewing round the station to obtain a straight course.

To Correspondents who wish fuller information regarding new inventions, publications, &c. mentioned here, addresses will be furnished, when possible, provided a stamped and addressed envelope or post-card be sent to the Editor, 339 High Street, Edinburgh.

MARTHA.

A BUSY soul was Mrs Brown;
She tidied up, she tidied down.
Never more vigilant a warder
Challenged the forces of disorder.

Her swift, exploratory broom
Ravaged the corners of the room;
She scrubbed and scoured, she swept and polished,
Till dirt was glad to be abolished.

Her homing husband she would greet
With, 'Are you *sure* you wiped your feet?'
She cleaned in spring, she cleaned in autumn;
She squashed the beetles when she caught 'em.

The famished cockroach fled the hall,
Where no neglected crumb could fall;
The spider sighed, and took his rigging
Away to some securer digging.

The sunshine always caused her pain—
It made the motes so very plain;
And what's the use of woman's working
When microscopic foes are lurking?

The country, to this critic's eye,
Lacked tidiness and symmetry;
She very much preferred the city
As being, on the whole, less gritty.

The fields, there was much cause to fear,
Had not been swept for many a year.
The cow was an uncleanly critter.
And why were woods in such a litter?

So, in the end, it broke her heart:
She died, still true to Martha's part,
Renouncing, at the age of thirty,
A world that's obstinately dirty.

And now—just think of her disgust
If she but knew!—she, too, is dust;
And, stultified in their last slumber,
Her ashes swell the great world's lumber.

PETITE SIMUNDE.

By ARTHUR BEVERLEY BAXTER, Author of *The Blower of Bubbles; Mr Craighouse of New York, Satirist;* &c.

PART I.

I.

THREE hundred miles north of Toronto, the Cobalt mining country surrenders its daily toll of silver to the world. In that region there is mostly rock. Where woods exist, the trees are gaunt and defiant, as though resentful of the approach of man; in winter they stand like white-shrouded ghosts, and the wind howls dismally through them until in the little settlements across Lake Timiskaming men draw closer to the fire, and women croon comfort to frightened children, yet half-believe, themselves, the Indian legend that another soul is on its way to the Great Unknown.

Five miles north of Cobalt the town of Haileybury straggles down a hill to the lake, on the other side of which can be seen the blue shores of Pontiac, Quebec, where lies the sleepy little hamlet known as Ville Marie, possessed of its church, its wayside public-house, 'Les Voyageurs,' and a few vagabond frame buildings. The ring of the blacksmith's anvil can be heard throughout the day, for there is little else to drown the noise. But when the lumber-jacks come in from the woods, or the river-runners from their convoys of logs, there is always the sound of a noisy chorus from 'Les Voyageurs,' led (in the times we write of) by Pierre Generaud, who knew that singing a constant fortissimo stimulates thirst in participants and auditors alike. On Sunday there is the sound of the organ, and the villagers walk about in ill-fitting garments of respectability: a simple God-fearing community, knowing no world but their own, and finding their joy of life in mere existence.

It was gathering dusk, one summer evening in the year 1914, when the figure of a young officer wended its way towards 'Les Voyageurs.'

He had crossed from Haileybury on the afternoon boat, causing not a little comment by the uniform he wore. All in the mining country knew him as 'Dug' Campbell, manager of the Curran Lake Mine—they were hardly prepared for the sudden transition from his usual costume of riding-breeches, brown shirt, and lumberman's boots to the trappings of a British officer. He was a young man of big stature, with broad, restless shoulders that seemed to chafe under the bondage of a tunic, and he had a long, loose-limbed stride oddly at variance with the common conception of military bearing. His eyes were light blue, his hair an unruly brown that flirted with red—and his name was Campbell. Such men do not wait for the second call when there is war.

Wherever civilisation is forcing her right of way, wherever she is fighting for her existence, the descendants of Scotland will be found. When a new railroad struggles over unnamed rivers and through untrodden forests, somewhere ahead there is always a son or a grandson of old Scotia, whose eyes are a humorous blue and whose hair has more than a tinge of red. There is no part of the world to which the Scot is a stranger, but he rises to his best in a new country where waterfalls must be harnessed to give power, where great rocks must be blasted from age-old foundations, where rebellious nature in her primeval state must be taught that the world was made for man.

On that August evening in that most fateful of years, the figure of Captain Douglas Campbell, tall and somewhat rugged, like one of the northern trees, might have served as a sculptor's model for the spirit of Scotland confirming and strengthening the purpose of young Canada.

Rich in tradition as she is, what glory of her past can Scotland have that is greater than this—that, strong in the manhood which seems to spring from the soil of the country, she sent her sons to every corner of the world; and when the shadow of war fell upon her—they came back? Sons, grandsons, those to whom their Scottish blood was little more than a family legend, *they came back.*

Scotland needs no other monument than those three words.

II.

Nearing 'Les Voyageurs' the young officer paused at a sudden burst of sound that came from the inn. In place of the usual chorus, one voice, a slovenly but powerful one, was bellowing forth a ribald song, remarkable only for its noisy coarseness. Reaching the hostelry, Campbell hammered at the door, which was opened by mine host himself.

 [*All Rights Reserved.*]

'Ah!' he gesticulated eloquently; 'Monsieur Cam-pell!' (Pierre Generaud, like other French-Canadians, invariably reversed his accents on English words). 'For why you come, eh?'

'My dear Generaud, must I give a reason for visiting the famous "Les Voyageurs"?'

'Ah! By gosh, no!' Generaud beamed welcome from every pore—then struck an attitude of despair. 'You come, is it not, as an *officier*, perhaps no—yes?'

'Yes. I want to speak just for a minute to the men inside.'

'Oh, *mais non!*' The good host's gesture was a masterpiece, even among a race of gesticulators. 'Not to-night, monsieur.'

'And why not?'

'By Gar! Who you theenk is inside now? Listen—she sing!'

Campbell was too well acquainted with the universal French-Canadian use of the feminine pronoun to express any surprise when 'she' proved to be the possessor of the aforesaid raucous, bass voice, which had broken into some song anent the passion of a sailor for a Portuguese young lady of great charm but doubtful modesty.

'Who is our friend?' asked the officer.

'What! you know not? She is the terrible Des Rosiers!'

'Well, I don't like Mr Des Rosiers's voice.'

'You nevair hear her name, monsieur? Sometime she is call "Jacque Noir." *Mon Dieu!*—she sleep with *le diable*.'

The landlord's eyes grew wide with horror; his shoulders contracted until they touched his ears.

'Look here, my friend,' said Campbell, with a touch of impatience, 'Jacque Noir or Jacque Rouge or Jacque Blanc is not going to keep me out here.'

'But, monsieur, once she *keel* a man.'

'My dear fellow'——

'One winter a man has insult Des Rosiers, and—*voilà!* Jacque Noir *burn* her house—*keel* her family—*murdair* her'——

With a laugh, the newly created officer thrust the little man aside and entered the sacred precincts of 'Les Voyageurs.' A big, dirty, bearded fellow, of about thirty years of age, was leaning against the counter, waving a mug and bellowing a song. He looked formidable enough, but hardly justified the diabolical qualities attributed to him by Pierre Generaud. In spite of his unshaven face with its bloodshot, inebriated eyes, there was something not unpleasing about the man, and when his lips parted they disclosed teeth that were gleaming white.

A group of villagers sat in open-mouthed admiration beneath the singer, for Des Rosiers's reputation had gathered velocity like a snowball rolling down the side of a hill, gaining in size every time it came into contact with the drifts of rumour, until it had become almost a legend of wickedness. His audience felt a timid pride in the event. It was almost as if his Satanic Majesty himself had condescended to appear from below and sing comic songs for their benefit.

On the entrance of the officer the song ceased, and all eyes were turned to the new-comer.

'*Hola!*' said Des Rosiers, with extraordinary resonance. 'You drink by me, *eh bien?*'

'No, thanks. I must only stay a minute.'

'You no drink?' roared the lumber-jack, whose hospitality was not unlike the forcefulness of the muscular Christian in 'Androcles and the Lion.' 'You drink, or, by Gar! I brak your neck.'

A hum of admiration rose from the villagers. They bore no possible malice towards the officer, but it was gratifying to find Jacque Noir living up to his reputation.

'*Messieurs*,' said Campbell, ignoring the gentleman in question, 'there is a war. *La belle France* fights for her life, and Canada must help. She needs you—and you—and you.'

With their meagre knowledge of English, he was forced to a simplicity of language that depended for effect almost entirely on the personal appeal. 'Come with me to the war. We pay you one dollar ten a day, and your wife and *garçons* get money too.'

Mr Des Rosiers laughed, scornfully and sonorously. 'I laugh,' he said. 'You theenk we go to war, and you English, by Gar! no leave Canada, but steal all we leave behind. The French-Canadian—he go; the English-Canadian, *non*.' He roared a vile oath, and laid his hand on Campbell's shoulder. 'I brak your neck,' he said comfortingly.

In a moment Campbell's tunic was off and he was facing Jacque Noir. 'You are a liar, Des Rosiers,' he said. 'You are the greatest liar and the worst singer in the province of Quebec.'

The Frenchman tore the red kerchief from his neck and hurled his mug to the floor, where it broke into a hundred pieces. 'By gosh, me!' he bellowed in a voice that would have terrified a bull; 'I *keel* you!'

He advanced in windmill fashion, but his opponent, who had been the best boxer of his year at Toronto 'Varsity, stopped him with a blow known technically as a 'straight left to the jaw.' Des Rosiers paused to collect his thoughts. He was wondering whether to kick with one foot or with both, when something happened, and oblivion settled over him like the curtain on the last act of a melodrama. Campbell had stepped forward, and, putting his shoulder behind it, had delivered a blow on the lower part of the jaw with force enough to fell an ox. For Des Rosiers the rest was silence.

Concluding his recruiting speech to the dazed villagers, Campbell put on his tunic and strode quietly down the street. . . . But the fall of Mr Pecksniff in the eyes of Tom Pinch was not more complete than the collapse of their idol, Jacque Noir, in the eyes of the inhabitants of Ville Marie.

III.

A sky that was hung with stars looked down upon the shimmering roof-tops of Haileybury. The streets were deserted, except the main thoroughfare, where a group of men were seated in an irregular line, their pipes glowing in the darkness. They had been there since dusk.

Midnight passed, and the shadowy line grew longer as each hour struck. Men with heavy packs; men with the mud of the northern wilderness still on their boots; men who had walked for sixty miles; men whose beardless chins bespoke the schoolboy of a year before; men whose faces would have looked coarse and cruel in any light but that of the stars; one by one or in pairs they came. For each there was a yell of welcome, a ribald jest or two—then silence once more, and the glowing pipes. The first glimmering streaks of dawn showed the queue in all its picturesque grotesqueness. The man in front was leaning against a frame store that bore the placard, 'Recruiting Office.

Some three thousand miles away, a Hohenzollern Emperor had said that the British Empire would crumble into disintegration at the first sound of war. And through the forests of the north and over weary trails men were staggering on, mile after mile, fearful of only one thing—that they might be too late to answer the call which had come from across the Atlantic, speeding over forests, cities, prairies, lakes, and mountains, until echo answered from the shores of the Pacific coast.

The early boat from Ville Marie discharged its half-dozen passengers. A powerfully built French-Canadian strode up the hill, and stopped at the crowd of men. With a worried contraction of his heavy eyebrows he surveyed the formidable length of the line.

'Godam!' said he.

Heedless of the jests and the comments of the mob, he went slowly down the line, carefully scrutinising each man, until he stopped at a half-breed Indian. For a moment only they argued in French; then he produced a roll of dollar notes in one hand, and brandished the other hand threateningly in the half-breed's face. The combined arguments proved too much; when the enrolment of recruits took place, number eighteen was Jacque Des Rosiers, sworn to serve His Majesty the King for the duration of the war and six months afterwards—in witness whereof he had drawn an inky cross after his name.

It would be difficult to give the exact motive for his action. He probably had never heard of Belgium, but—well, take horns and tail from the devil, and what is left?

Three weeks later the company of amateur soldiers were warned to proceed to the concentration camp. Willing, but puzzled by the infliction of army discipline, they had struggled past the first pitfalls of recruitship. For the sake of Captain Douglas Campbell, their 'boss,' they suppressed their grumbling and submitted to the rites and ceremonies of military routine, arguing that, inexplicable as it was, it had some connection, however remote, with the ultimate goal of warfare. The afternoon before their departure Campbell addressed them for exactly five minutes. His hair looked redder and his eyes seemed bluer than before. With his powerfully built shoulders and the rhythm of his muscles that lent a grace to his entire body, despite its ruggedness, he recalled the Athenian age of physical perfection.

'Look here, you fellows,' he said, 'you signed up to fight—so did I. We will fight, too; but Kitchener can't use us until we're ready. You wonder what all this drill is about. Well, here's my idea about it. There isn't a coward in this crowd; there isn't a man who wouldn't go down a shaft after a pal, even if the chances were a hundred to one against his coming back. But you're not ready for the front. You've got the heart, but your bodies must have training and discipline. Watch me with this cigarette. In flicking the ash I burn my finger; the next time I want to touch the ash, my finger avoids it by a quarter of an inch. I laugh and try again. You all know what I mean. I am not afraid of the cigarette, but my finger is. If you've ever been kicked in the leg by a horse, the next time that horse kicks, which of your legs is drawn back first? In some strange way your body has instincts of its own, and though you might have a heart like a bull, your muscles and nerves—your body—might fail you when you needed them most. As I understand the army system, it is to train you to obey, not only mentally, but physically. Eight months from now we may be lying half-dead, with the enemy's guns playing hell all around us. We may want to quit, we may be "all in," but if the order comes to advance, we'll go forward, because our bodies will be disciplined to obey.

'Be patient then, men, and just smile when things go wrong. I would gladly have gone with you in the ranks, and there are lots of you chaps better able to lead than I, but a commission was given to me, and I'm out to do my best with the finest company of men in the Canadian Expeditionary Force. I'm learning all the time—as you are. You will have bad times, and so shall I; but let's help each other to grin and make the best of it, for, after all, we're just great big children playing a mighty big game. . . . And when we reach France, we'll show them all that the old Cobalt gang is afraid of nothing in this world or the next.'

They cheered—and the man who shouted loudest was Jacque Des Rosiers. . . . And somewhere in the speech *esprit de corps* had been born.

THE GROWTH OF TROUT.

By A. T. JOHNSON.

ALTHOUGH romance has invested the trout with a reputation for living upon flies, thus elevating it to a plane which is as far removed as can be from that of the unclean, grovelling chub and his tribe, practical anglers know full well that the trout is at heart a 'bottom-fisher.' His tastes may be rather more refined than those of the eel, his instincts superior to those of the chub; but the fact remains that flies form a comparatively small part of the trout's daily fare. True, the coming of the March Brown to our more northerly streams, and the Mayfly's appearance on the more idle waters of the south, may synchronise with the periods at which trout in those areas reach the zenith of their condition. And we cannot deny that fish which have the good fortune to stuff themselves to the gills with Green Drakes and Spent Gnats are rendered more fat and lusty thereby. But these feasts are things of a day. That which is the prime factor in promoting the welfare of the trout must be looked for below the waters.

Most anglers are well aware that, whilst the trout of some little brook which wanders slowly through meadow-land are frequently plump and hearty in March, or even earlier, those in the rapid waters of the adjacent hillside are often thin and not worth taking at the end of April. The determining factor here in the quality of the fish is undoubtedly bottom-feeding. Slow-running streams naturally provide more aquatic insect life than streams with rocky beds. Not only do they afford more congenial breeding-haunts and homes for the innumerable little water creatures which constitute the bulk of the trout's bill of fare, but they usually flow through land which is richer in vegetation and in terrestrial insects. When mountain trout are poor and flabby, it indicates that they are the victims of spare diet. 'It is,' as the late Mr Andrew Lang used to say, 'the *grub* that tells.' Or, to quote another good and witty sportsman and writer, Mr G. S. Marryat, 'while floating food (that is, flies) is *caviare*, sunk or mid-water food is *beef* to the fish.'

It will, however, be necessary, before going into the question of how we can provide our ill-conditioned trout with a more generous living, to make clearer what its present food actually is. The trout's larder is the river-bed. There the staple diet of the fish consists of caddis, the larvæ of ephemeridæ, perlidæ (the Stone-fly of the north), and of numerous other water-bred insects, fresh-water shrimps, water-fleas, shell-fish, molluscs, and many such lowly forms of life. Now, most of these creatures require, for some part of their career at least, rather deep, quiet waters in which to live. If such places possess a bottom of muddy sediment in addition to vegetation, living and decayed, aquatic and otherwise, so much the more numerous will be the 'small game' which provide dinner for the prince of sporting fishes.

This bottom-feeding has so great an influence upon the growth of trout that some of the best authorities contend that, while a six-year-old fish which is well fed will often weigh three pounds, another in poorer water may scale only a few ounces. Food of this class, moreover, has an immense effect upon the quality of the flesh. It appears probable, for example, that fresh-water shrimps are influential in producing that pink or salmon tint in the flesh of trout which is the hall-mark of a well-conditioned fish.

It is obvious, therefore, that if this bottom-feed is the main influence in determining the weight and the quality of trout, it is for the angler or the owner of fishing-waters to encourage the development of that feed by every means in his power. This may be done in various ways. A comparatively simple expedient would be that of slowing-down shallow, rapid waters by making rough dams of boulders or other débris at favourable intervals. In large and powerful streams such efforts would often be short-lived; but I am here speaking not so much of rivers of that character as of those smaller hillside tributaries which are now the haunt of so many anglers, and which, with comparatively little trouble, might be made productive of far better sport and much more nutritious food.

The presence of pools, even if these were of only temporary duration, would materially assist in the successful oviposition of many insects (the parents of the pupal and larval creatures of the river-bed) whose eggs must in rapid currents be swept away in millions ere they can find a resting-place.

Next comes the question of maintaining these 'water-babies' upon which the trout feed, for here, in the underworld of the waters, the rule of life is much as it is on earth; that is to say, the beast which is greatest eats the beast which is less, that which is less devours that which is lesser, the lesser eats that which is least, and the least fares as best it may. We must feed the prey of the trout before the trout itself can prosper, and, since many of the larvæ and other aquatic creatures mentioned exist upon still lowlier forms of organic life, which here we may group together under the general title of infusoria, it follows that it is to the culture of these teeming legions that the fisherman must turn his attention if he would improve the condition of his fish.

Experiments have proved that where weighted bundles of vegetable matter, such as bracken or hedge-brushings, have been submerged, both in natural pools and where the water has been slowed-down by the method suggested, the trout invariably improve in condition. Here the effect of the infusoria, which are propagated by the sunken vegetation, is obviously an indirect one, in so far as the trout are concerned. Yet by catering for the creatures upon which the fish live, by providing them with a diet of organisms still lowlier than themselves, we are actually enriching the waters somewhat after the manner in which the farmer fertilises his land by fostering the development of soil bacteria upon which crops so largely exist.

A striking instance came under my notice a few years ago, demonstrating the extraordinary effect of submerged vegetation in the feeding of trout. The water of a rocky mountain tarn, in which the fish were invariably poor, was raised by damming, thus causing the tarn to overflow a considerable area of grass and heather along its banks. Less than two years after this was done there was a remarkable improvement noticeable in the trout. They not only lost much of their black hue, common in fish in such tarns, assuming a more golden, silvery, and dappled tint, but they increased rapidly in size and quality, and came into seasonable condition several weeks earlier than they had been wont to do. That this result was brought about by the agency of under-water vegetation, serving as a propagating-bed for the production of bottom-feed, there can be no possible doubt.

THE SEARCHERS.

By JOHN FOSTER, Author of *The Bright Eyes of Danger*, &c.

CHAPTER XXVI.

THE footprints of the man who had lied to the doctor stamped him as 'The Searcher.' True, his description was different from the one with which we had become familiar, but it was highly probable—almost certain—that he had shaved his beard, and was still lurking about, as likely as not, bent on further mischief. His injured wrist had tempted him to take the risk of consulting the doctor.

Such thoughts kept running through my mind as I dined in lonely state. I grew more uneasy as the night wore on, and at half-past eleven I went to the hall door to see if there were any signs of Tony. To my relief, just as I opened the door, I heard his steps, and he appeared with rod and creel.

'Sorry I'm late, Neil!' said he; then, without waiting for a reply, 'Is there a telegram for me?'

The anxiety in his face and voice was apparent. I handed him the waiting telegram, and watched him devour its contents. Then his curiously wide-open eyes sought mine, and in them I read strange matters.

'I don't think I ever received more welcome news. It is in cipher, but I'll decode it for you afterwards and explain. Just now I can think of nothing but food.'

Some cold odds and ends were laid out for him, and these he attacked with the silent concentration of a hungry man. I went to the Laird's Room, and by the time he joined me there it was almost midnight.

'Your face is a note of interrogation,' said Tony, as he drew his chair to the fire. 'But, except for the receipt of the telegram, my chronicle of the day isn't exciting. If you want to know how I spent most of the time, look into my creel, and you'll find nine pounds of excellent trout, which I pulled out of Loch Ruie.'

'The deuce you did!'

'Yes. I wanted to be alone. Fishing suits me when I am thinking hard. Besides, had I been here, I should have been on tenter-hooks until the telegram arrived. I fished until evening, when I walked over to the inn at Ardruie. Then the rain came down hard. I waited on the chance of its stopping, but it didn't, so I tramped back the ten miles in the dark.'

I looked at the clock. It was on the stroke of midnight. I was on the point of reminding him of his promise, when it struck me that he was listening intently for something, and the feeling grew upon me until it became uncomfortable. Next moment the sound of stealthy tapping at the window lifted me to my feet in a gust of suspicion and alarm.

'Compose yourself, Neil,' said Tony, smiling. 'I am expecting a visitor. The hour is a little unconventional, but you have met him before. I'll be back in a moment with him.'

He left the room, and I heard the hall door open and close again. In a few seconds he reappeared, along with him a man in toil-stained clothes and muddy boots. His hands were grimy, his face was unshaven, and he wore a wisp of a loose cravat in place of a collar. Manual labour was written all over him.

Tony locked the door after him and drew the curtains closer, the man meanwhile regarding me with respectful curiosity, turning his cap slowly round in his hands.

'Well, how goes the work?' asked Tony, with an amused glance at me.

'I'm getting used to it, but it's the devil and all for a man's back if he is new to it.'

I thought I knew the voice.

'Come into the light,' I said.

He grinned, and came forward out of the

shadow. '"Where shall I drive you, sir?"' he quoted. 'Do you remember?'

Instantly I recognised him.

'Sparke, by all that's wonderful!' For the manual labourer was none other than the excellent Sparke of the C.I.D.

'Yes, Mr Forbes,' said he, as we shook hands heartily, 'here we are again!'

'Sparke has, for a day or two,' announced Tony, 'torn himself away from London and automobiles. He is now, at twenty-two shillings a week, engaged in lumber-work in the Forest of Rothie. In his leisure hours he continues to study the habits of the criminal classes.'

'He is helping us?'

'That's it,' said Sparke. 'Mr Keene-Leslie asked me to join him, and he worked the oracle with the "heads" of the Yard. I'm very glad to be here, for ever since we met I have been anxious to rope in the beauties who bolted from No. 9 Duff Avenue. I've got a room near the village, and go to my work early in the morning; but I have my evenings to myself.'

'Which,' interjected Tony, 'have been most excellently employed.'

'Glad you think so. Did you get the telegram, Mr Keene-Leslie?' he asked.

'I did. Here it is. Wonderfully lucky, isn't it?'

Sparke read it, and his face lit up with the joy of an artist.

'Call it lucky if you like; but there's more than luck in it. You're wasted—absolutely wasted. You ought to be with us, Mr Keene-Leslie,' he said, regarding Tony with reverence.

'You could not have paid me a higher compliment, Sparke,' said Tony, well pleased.

Sparke produced a pocket-book and tore out a leaf, which he handed to Tony.

'I have brought you a few notes. You can read 'em over after I leave. Beyond these, I don't think I have anything to add to what I told you to-day.'

'I met Sparke this afternoon, on my way to the loch,' explained Tony.

'Accidentally, by appointment,' added the detective. 'Now, I have something to do to-night yet, and my plans won't give me another minute.'

'I know. Now, let me see. This is Tuesday. Can you turn up here on Thursday morning early—say at seven o'clock?'

Sparke nodded.

'Good! Meanwhile "carry on," and we'll have everything ready, bar accidents, for the setting of the rat-trap by Thursday morning.'

Tony went with him to the hall door, leaving me in a fever of curiosity. When he came back his face was very grave, and there were harder lines than I had ever seen in it. The telegram was in his hand. He looked from it to me, and his first words left me dumbfounded.

'Neil, "The Searcher" and the red-haired man in Edinburgh are one and the same,' he said. 'His finger-prints are identical with those on the blood-stained front of the shirt you wore that night.'

I was too amazed to speak.

'This telegram proves it,' he went on. 'It is from my friend of the Habitual Criminals' Register at Scotland Yard. It is in code, but, interpreted, runs: "Prints beyond doubt same as Nos. 213177B and 213178B." These are the prints of the right thumb and right index-finger of your terror-stricken red-haired clerk. But I hold you to your promise—in your own words—"to ask nothing and expect nothing." I can say no more; but, take my word, you and I are to meet him soon, Neil.'

Most unjustly, for a minute or two I suspected Tony of posing, of weaving unnecessary mystery for the sake of gratifying a hidden streak of vanity—a desire to have all the *kudos*, or at best of pandering to a secret melodramatic hanker for a good 'curtain.' But I had given him my promise, and therefore I bridled my tongue.

Nettled and disappointed, 'Very well. As you wish,' was all I said; and if there was a hint of sulkiness in the reply, he forbore to make any comment on it. Soon his cool and level voice, sketching his scheme—'the rat-trap,' as he called it—for outwitting 'The Searcher,' drove everything from my mind except one thought, the perfecting of the plan. If he kept me—as I think—too much in the dark, he did so for what seemed to him good and sufficient reasons. Let a man's acumen and resource be judged by the results. Tony's bold and ingenious scheme justified its inception, and, among other things, made me agree unreservedly with the verdict he gave after dinner on the eventful foggy night in Edinburgh: 'I have found man-hunts more interesting than searching for beasts or jewels, and I have chased all three.'

After he had indicated the general plan, he produced his notes, a lot of careless-looking jottings in pencil.

'The details and the mechanism are as important for the carrying out of this business as the laying of the fuse to a mine. First of all,' said he, 'give me the names of some places near the summit of the Pass; places with well-known distinctive names and characters—not too near Sron na Leirg—spots which can be easily watched.'

A map of the hills was brought out, and half-a-dozen names discussed in turn. In the end we fixed on Coire an t-Oranaiche (the Chanter Corrie), a wild *cul-de-sac* in the solitudes of Braeriach.

'So be it! "The Searcher" shall be lured to the Chanter Corrie, and we shall be there to receive him. This is part of my little scheme,' he continued as he produced a copy of our half of the secret paper. 'In this writing the only mention of a place-name, apart from the Larig itself, is Sron na Leirg. Now, we'll substitute the words "The Chanter Corrie" for

"Sron na Leirg" in a "cooked" facsimile of our paper, and give our friend an opportunity of stealing it or copying it. He will read this "cooked" half along with his own genuine one, and his heart will rejoice, for he will, to all appearances, have in his possession the thing he has schemed and sweated and sinned over—the completed guide to Father Hamilton's grave. Of course, it will be nothing of the sort. He may hunt the Chanter Corrie till the crack of doom and be none the wiser; but the main point is that he will be drawn to the Corrie like a bit of steel-filing to a magnet. He will have his own half of the paper with him, and it will be our business to relieve him of it."

'And how are you to throw the fly over him?'

'I want you to have some business which will take you from home to-morrow, say to Castleton, for most of the day. I think that when you return the initial trap will have been set, and in all probability the bait been nibbled at. After that we must pretend to leave for the South. In reality we shall be in hiding in the Chanter Corrie. When he thinks the coast is clear, "The Searcher" will find his way there at once. And now let's think out some plans for the expedition on the assumption that he takes the fly.'

These plans included arrangements for sending the keepers and the stalkers, all armed, to watch the Pass near the Chanter Corrie until our arrival; the selection of observation-posts for them and us; a pretended start by us in the South train, and a swift doubling back on our tracks. Possible tactics for the encounter up the Pass were discussed; a time-table was drawn up; nothing was left to chance. The dawn, stealing through the curtains, found us still busy at the details, and the cocks were crowing long before we thought of sleep.

(*Continued on page 436.*)

CHARING CROSS TO CALCUTTA OR CAPE TOWN.

IT may sound like a fairy-tale to suggest travelling by rail from Charing Cross to Calcutta, and it may seem altogether impossible to reach Cape Town by the same method. Yet if, looking forward, we indulge in speculation as to some of the railway developments that are likely to take place during the first few decades succeeding the declaration of peace, such suggestions will be found anything but pure fantasy.

The Bagdad Railway, for instance, is destined, under Allied auspices, to form a link between the progress and civilisation of the West and the mysteries of the Orient.

The controversy which raged for many years over the Channel Tunnel is ended, owing to the changed conditions which now obtain. A rival scheme was that of the Channel Ferry. This was one of the favourite projects of the late Sir John Fowler, of Forth Bridge fame. He advocated the building of a covered-in water station at Dover Harbour, wherein trains from London were to be run bodily on to specially designed boats of high speed and, for those days, great size. A similar station on the French coast was to receive the steamboat, whence the train would be landed on the soil of France, the passengers resuming their railway journey in but little over an hour from the time of their arrival at Dover. No leaving of seats, no exposure to cold or rain, and comparative immunity from *mal-de-mer* were among the allurements held out by the promoters. The scheme, of course, was perfectly feasible, as similar train-ferries were in existence both in Denmark and in the States. The mechanical details were fully worked out, but need not detain us here.

It is interesting to note that, under the stress of war-time conditions, the cross-Channel ferry became an accomplished fact. From Richborough, in Kent, trucks loaded up with munitions and stores were run on to a low-built ferry and transferred bodily to the French side. It is possible that this may become a permanent factor of cross-Channel traffic in the future. Fortunately the standard gauges of Great Britain and France are almost identical. The difference between the 4 feet 8½ inches of the one and the 1·44 metres of the other is less than one-sixth of an inch, which is quite negligible in practice.

The traveller would now follow the familiar route through France and Switzerland into Italy, and so on to Brindisi. Here would be found another ferry to convey the entire train across the Strait of Otranto, a distance of about sixty miles. The journey would then be resumed to Salonica and Constantinople. The distance across the Bosphorus is here about a mile, and a bridge similar to the Tay Bridge or the Forth Bridge would meet the case.

We now proceed by the Anatolian Railway to Konia, where we enter upon the Bagdad Railway. No serious physical obstacle is encountered till we reach the Taurus Mountain range, through which over ten miles of tunnelling have had to be bored. For the greater part of the seven hundred miles between Aleppo and Bagdad the railway has been laid, and from the latter important commercial centre, and city of Eastern romance, it has been practically completed to Basra, a port with good access to the Persian Gulf, as an urgent strategic necessity during the war.

From Basra to Karachi is a long stretch of over twelve hundred miles of wild and inhospitable country, which is likely to be the last link to be forged in our railway to the East. It is certain

to follow when through rail communication reaches the Persian Gulf, as the Indian military authorities are fully alive to the advantage of having overland transport in addition to that by sea.

We are now entered upon the railway system of India, with its thirty to forty thousand miles of open line, and a run of fifteen hundred miles brings us to Calcutta, one of the largest cities in the world, and the terminus of our long journey of over seven thousand miles from London. It is not, of course, to be supposed that goods will ever make much through use of this important highway, nor will the Anglo-Indian traveller elect to traverse the burning plains of Persia and Beluchistan during the summer months. On the other hand, the mails will come this way, and commercial and official India will welcome the acceleration. From the strategic standpoint, also, it is impossible to over-estimate the value of this direct route between India and the capital of the Empire.

Returning now to Aleppo, in the north of Syria, we find a line running south to Damascus, and thence continued under the name of the Hedjaz Railway to Medina, its present terminus. It will no doubt before many years reach Mecca, its real objective, and may possibly be continued to Aden.

It is interesting to reflect that an outcome of our Palestine Expedition, the strategic railway connecting Cairo with Jerusalem, is destined to become in the not far-distant future an extremely important line, whether regarded from the political or from the commercial point of view. It unites the continent of Asia with the continent of Africa; and, what is of more immediate interest to ourselves, it joins up London with the Cape to Cairo Railway.

In order correctly to appraise the significance and value of the Cape to Cairo Railway, it is necessary to bear in mind that branch-lines running from the centre of the African continent east and west to the coast are of vastly greater importance than any through line of communication can ever be. It is such branch-lines that open up the country to trade and civilisation, and afford the necessary means of cheap transport whereby the calicoes and the metals of Manchester and Birmingham respectively can be exchanged for the tropical products of Central Africa. These lateral branches require some means of intercommunication, and also a backbone for the whole system, and this is the chief justification that can be urged on behalf of the Cape to Cairo Railway scheme.

The total distance between these terminals is about six thousand miles, and it will come as a surprise to many to learn that seven years ago the rails had actually been laid over more than two-thirds of this distance.

Another point which is not usually appreciated is the enormous development of inland water communications which has recently taken place in conjunction with the various African railway systems. The facilities provided by such magnificent water-ways as the Nile, the Congo, and the Central African lakes have all been zealously exploited. So much is this the case that, with the completion of one or two missing links, amounting to less than five hundred miles in all, there would be through rail and river communication between Cape Town and Cairo to-day. There is at the present moment a through route from the Cape to Boma, at the mouth of the Congo, first by rail to Bukama, the present northern terminus of the line from the south, and thence either by steamer on the Congo, or by stretches of railway that have been built along the river at points where navigation is obstructed by cataracts.

An interesting link in Central Africa is the line running east to Albertville on Lake Tanganyika from Kabalo on the Lualaba branch of the Congo, a distance of one hundred and sixty-five miles. This line was built during the war, and afforded the only means by which Allied armed steamboats could be placed on the lake. These very soon justified their existence by driving the German flag from this inland sea. Thanks to this short railway, a through rail and steamboat route is now open between Cape Town and Dar-es-Salaam on the east coast, near Zanzibar.

Such is the present position on this great trunk-line traversing the African continent from end to end. There can be no doubt that its completion will not be long deferred. One of its most important branches is that under construction from Benguela on the west coast to Katanga in the southern Congo, where are the largest copper-mines in the world. This branch will bring northern Rhodesia some two thousand miles nearer to London than by the Cape route.

JOHN BROWN.

By R. W. CAMPBELL, Author of *Private Spud Tamson; Dorothy, V.A.D.; Snooker Tam;* &c.

CHAPTER XX.—A JOLLY RAG.

WHEN all had returned from leave, Dame Rumour got busy. Some of the lads had been going it, and their exploits had got abroad. Even Billy, the padre, was in the gossip-market, and Ginger was alleged to have been seen in a two-seater with the famous beauty from the hotel. As for Tosher, it was said he had been doing the heavy with the ladies of Glasgow.

To amuse ourselves, we called a secret meeting and decided to hold a court-martial, Nobby being elected president. The following notice was posted up in the hut:

COURT-MARTIAL.
A Court-Martial will assemble in the Hut
on Friday Evening for the Trial of
BILLY GREENS,
GINGER THOMSON,
and
TOSHER JOHNSON.
All witnesses are warned to attend.
JOHN BROWN, Adjutant.

There was a great rush on the 'early doors.' At 7 P.M. Nobby appeared, dressed up as a stout colonel, with a moustache like Ole Bill. He looked most impressive, and roused a cheer. The members of the court followed. All took their seats, and Billy Greens was ushered in by the court-martial orderly.

'Before proceeding,' said Nobby, 'I should like to know if the accused has any objection, either to me, as president, or to any member of the court.'

'Yes, sir; I object to you,' answered Billy.

'Why?'

'You 're a rotten old Radical and—a lawyer.'

'Your objection is out of order. This is a military court, and politics do not enter into the matter. If I am a lawyer, I can assure you there will be no charges. I mean—no six-and-eight.'

'Question!' shouted Ginger.

'Please bludgeon that Imperialist,' commanded the president.

Ginger was gagged. The case was proceeded with.

'Corporal Billy Greens, No. 1 Company of the —th Cadet Battalion, you are charged with (1) Giddiness on leave; (2) Appearing in public with a formidable female; (3) Holding her hand in a tram-car; (4) Acting the goat in a taxi-cab.'

'Do you plead guilty, or not guilty?'

'Not guilty.'

'Evidence, please,' ordered the president.

Beefy stepped forward with a ponderous-looking document like the Magna Carta. It was really one of Harrods' voluminous catalogues. Opening it up, he commenced: 'Sir, the accused, who is a gentleman in holy orders, but meantime a soldier, has hitherto borne an excellent character. But we have received reports from the Platoon Secret Service men stating that on his last leave he has been "going it." Apparently he went to a small town near London, and commenced to pay attention to a lady of blameless character, but of formidable appearance, and inclined to be frisky and sentimental when receiving the attention of man.'

'Keep to the point, Mr Jones. Please deal with the first charge, remarked the president.

'I 'm just coming to that, sir,' replied Beefy, turning over the pages of Harrods' catalogue. The first charge is, "Giddiness." Our agents state the accused was wearing a field-marshal's trousers—an offence punishable by death, according to the Manual of Military Law. He also wore bright-yellow shoes and white socks, ornamented with yellow flowers, which I contend betrays a shockingly frivolous mind. Above the neck of his tunic appeared a white india-rubber collar, and sticking out from under his tunic-sleeves were white cuffs, ornamented with a balance-sheet of his holiday expenses. He also carried an enormous malacca cane studded with brass knobs, of the type used by lion-tamers and wealthy Jews. In fact, his whole appearance was of the Bank 'Oliday kind. Instead of looking like a harmless and shuffling cadet, he really resembled Ole Bill on the burst. So startling was his appearance that a terrier dog fell off a tram-car, and an ancient cab-horse jumped into an egg-merchant's window. To save further calamity, the local police had to hide Corporal Greens in a furniture-van, and remove him to his lodgings.

'The second charge is, "Appearing in public with a formidable female." The lady in question is of uncertain age, but of great stature—six feet high, three feet broad, and built in proportion.'

'Weight and style, I presume,' said the president.

'Yes, sir. I also understand she is the commandant of a V.A.D. Hospital. Prior to the war she was a suffragette who achieved fame by burning down the local bishop's bathroom.'

'Has the bishop used Pears' since that event?' inquired a member.

'No, sir. I understand he uses the wash-house. But to resume. When she appeared in public with the accused (she being of massive mould, and he being of bantam measurements), the contrast was striking. In fact, the difference in height was so great that it is stated she carried a small portable telephone to carry on the conversation. He called her "Gertie," and she called him "Pickles." While attempting to enter a very narrow gate in the public park the lady got wedged, and it is alleged she shouted, "Push me—push me, Pickles." The corporal nobly responded, and relieved the lady from an embarrassing position.'

'Was the gate damaged?' asked the president.

'Slightly bent, sir.—Now for the third charge. The lady, who has been trying to "get off" for quite a number of years, was apparently so bucked with her capture that she aired him on every public occasion. They were always riding in tram-cars. On one occasion a local alderman, who has a reputation for "picking up" unattached females, entered the car they were travelling in. The lady, persumably nervous about getting the glad eye from this civic Lothario, muttered, "Hold my hand, Pickles—hold my hand." Like a brave man, he did so. In this simple and trusting manner they completed their journey, to the amusement of all.

'The final charge is, "Acting the goat in a taxi-cab." Apparently the dear old girl had been overhearing some of the younger V.A.D.'s, her

subordinates, relating thrilling experiences of taxi-cabs. She decided to try the experiment, and Pickles drew a pound note from the Penny Savings Bank for that purpose. To avoid observation, they ordered the taxi to meet them in a quiet thoroughfare. But a local press photographer witnessed the amusing struggle of the lady to get inside.

'"Pickles!" she shouted.

'"Yes, dear," he replied.

'"The door is too small. Push me."

'Pickles pushed again, and the lady fell inside. At that moment the camera clicked. Here is the photo, sir;' and Beefy handed over a charcoal drawing of Billy heaving an enormous lady into a vehicle.

Loud laughter in court.

'The taxi man then received secret instructions from the accused to drive ten times round the park —DEAD SLOW. During this performance several of the local special constables saw the lady with the accused in her arms. At intervals they kissed each other. When they alighted from the cab, our Secret Service men discovered a hair-switch and an upper set of false teeth among the cushions. This, sir, is, I think, complete evidence of frivolous conduct.'

'I see! I see!' muttered the president, tugging his false moustache. 'Now, Mr Jones, have you any evidence as to how the accused met this lady? Was he introduced, or was it what we in the army term a "pick-up"?'

'So far as I know, they were properly introduced. Some years ago, when the accused was a student, he saw the lady bathing in a crimson dress with lace-curtain frillings. He secured an intro. by the aid of a member of a local Dorcas Society.'

'What about his character?'

'Hitherto most respectable; but I imagine his association with my friends Messrs. Ginger Thomson and John Brown has, unfortunately, caused him to fall from grace. That's all, sir,' concluded Beefy.

'What have you got to say, my man?' said Nobby, with the air of a Lord Chief-Justice.

'Nothing, sir.'

'Nothing! My dear old Pieface, this is a serious business. You go on leave; you wear a field-marshal's trousers, a padre's white shirt, shop-assistant's yellow shoes, and you carry a ship-pole for a walking-stick. You cause an innocent dog to fall off a tram-car, and a hitherto respectable horse to jump into an egg-merchant's window, and yet you say, "Nothing." Worse: you try to outdo Charlie Chaplin in a tram-car, and Ole Bill in a taxi. This, from a future officer, an ordained padre, and a Tory gentleman, will *not* do. It is preposterous! You *must* be shot! *Must* be shot!' roared Nobby with dramatic fervour, which reminded us of the old com. on the bench.

'You're a silly old ass, Nobby!' said Billy.

'That's contempt of court.'

'You're a rotten old Radical!'

'That means execution.'

'And here goes your bench,' shouted Billy, making a running jump at Nobby's table, and kicking it up in the air, sending ink, pens, paper, books, &c. flying right and left.

'Remanded! Remanded!' shouted Nobby, brandishing a poker.

The prisoner was seized and put in 'quod,' or, in other words, let go. His ragging was over.

(*Continued on page 446.*)

MY OLD GREEK COINS.

By EDWIN WOOTON.

IT has been well said by a great authority that the chief value of ancient Grecian coins is in their being original works of art, and in their recording the successive phases and the local varieties of Greek art.

The designs found in the coinage of classical Greece exceed numerically those of any other country or empire within a given range of centuries. This is a direct consequence of the fact that minting, instead of being confined to one town, or even to a few, was a privilege possessed by some hundreds of localities. For example, Sicily had at least fifty minting centres.

There are coin-collectors whose aim is to form a complete series, whether of a dynasty or a locality; and if one looks to ultimate monetary value, it will be wise to proceed on this principle. But to the student of humanity an appeal will be made not so much by perfection of series, rarity of specimens, and excellence of preservation as by the knowledge that the collected coins have been worn by the hands and in the marts of a once pulsing civilisation.

Upon the table at which I write lie two score of my treasures. Sold at auction, each would realise only from a few pence to a few shillings; but to the lover of antiquity they are priceless eloquent.

The first I take up has a bee on one side, and on the other a stag. This was a coin of Ephesus, and had been minted some five hundred years when Paul wrote his epistle. Another piece of money bears a scallop-shell and a dolphin. This is a yet older specimen, and was struck in Sicily. The crested head of Pallas Athene and a winged horse point to Syracuse or to Corinth. The coinage of Syracuse resembled that of Corinth. This was a compliment paid to Corinth in return for the Corinthians having liberated Syracuse from the tyranny of the Dionysian dynasty.

These five pieces are intruders. They were purchased in a wrongly classified lot. They belong to the later Greek—that is, the Byzantine—Empire. We observe on all coins of Byzantium some indication of the Christian faith. On many it is a cross; on some the bust of the Virgin, with the Holy Child; and on a few the head of our Lord.

Look at these two specimens. The surfaces are green, yet unlike the green of verdigris. The coins have the appearance of having been enamelled. This green is called *patina*, and as it results from the prolonged deposition of copper, bronze, or brass coins in special soils, it is regarded as a proof of genuineness. Patina is most difficult to imitate successfully, and in the case of cheap coins success would not be worth the trouble.

Of the specimens on the table we note that those free from patina are (1) of common brass, or (2) of reddish copper, or (3) have a colour closely resembling that of well-worn modern 'bronze' coinage, or (4) are distinctly yellow, like gold.

This brings us to the metallurgy of the samples. Most of the reddish coins are very crudely designed. They are of unalloyed copper, and probably were made of that metal alone because of the scarcity of tin and similar alloys. The browner specimens do contain an alloy. If you look very carefully at the surface of some, you may notice how in the course of the twenty-three or twenty-four centuries that have elapsed since their minting the alloy has separated wholly or in part; and if you hold a specimen by pincers over an incandescent gas-flame, you may presently see the alloy sweat out, forming globules.

The yellow coins are of a peculiar bronze—a mixture of copper and silver known as *billon*.* Here we have no example of debased currency. The purchasing value of billon coins was low; but they were very beautiful, and are evidence of the beauty-loving soul of the people that made them.

He who begins to collect old Greek coins must look beyond the geography of the Greek Empire. I once witnessed a verbal battle between an expert in numismatics and a Greek historian who knew nothing of coins. The collector produced a specimen, and vaunted it as having been made in Gaul in the fourth century B.C.

The historian scoffed. 'Gaul!' quoth he. 'The Greek Empire did not embrace Gaul. Your coin must be an impudent forgery.'

But it was not a forgery, although it would puzzle a college of antiquarians to decide whether it should have been called Greek. Not in Gaul only, but scattered widely over districts far outside the imperial confines, were towns that had dealings with Greek traders. These traders paid in Greek money, and local mints in the regions dealt with imitated the money, not fraudulently, but for the legitimate currency. In some cases the imitation was faithful in result; in others the features of the Greek coinage became reduced to absurd, meaningless marks.

Here is a very beautiful coin of the Empire, showing a galley and tiers of rowers. Here is another coin minted in a barbarous town of what is now Spain. It has lettering identical with that of the imperial coin, but the galley and the rowers have been beyond the skill of the die-sinker to reproduce, so they have become a series of more or less crooked lines.

When one confronts the historic splendours of a race unexcelled in philosophy, sculpture, and the cult of personal beauty, one must search for the inspiring soul; and if we do this, we shall find that the Greeks transcended all races in raising humanism to the height of positivism. Qualities desirable became personified, not as the grotesque hybrids of Egypt, but as the divine human. The Greek took all he knew of psychology, of ethics, of physical science, and of art, and moulded each into the likeness of his highest concept.

And these old Greeks believed in the powers beyond. Until the time of Alexander the Great (inclusive), they would have shuddered at placing a king's head upon the coinage. It would have seemed a presumptuous challenge to the gods. Whenever a coin bore a head, it was that of a deity.

Of all the gods, Apollo seems to have been the favourite. Usually he is laurel-crowned. Now and again one sees him at full length and undraped. Sometimes he carries a lyre and is robed, being then termed Apollo Musagetes—the leader of the muses. Apollo is always youthful. Zeus (Jupiter) appears to be somewhere between thirty and forty-five. He nearly always wears a beard, and is wreathed with laurel or olive. Jupiter Ammon is Jupiter with ram's horns. This head is common on coins of Cyrene. Serapis, an Egyptian deity of the Ptolemaic age, is very like Zeus, but his head is surmounted by a lofty *modius*—a measure for corn.

The sun-god, Helios, is known by the rays which encircle his head. Poseidon (Neptune) resembles Zeus, but is without a laurel-wreath, and his hair falls in dank masses. Often he is seen on horseback, when he is called Poseidon Hippios. Dionysus (Bacchus) is sometimes mistaken for Apollo—a blunder that would have made an old Greek blush. Dionysus, even when beardless, looks the debauchee. The wreath he wears is one of ivy. Hermes may be mistaken for Apollo. Hermes is youthful, but he wears a closely fitting head-covering, called a *petasus*, which frequently, but by no means always, is adorned with two miniature wings.

As all the world knows, there are three chief periods in Greek art—that of the evolution, from about 700 to 400 B.C.; that of the finest art,

* The term *billon* has been wrongly applied to debased silver coins.

from about 400 to 336 B.C.; and after that, the period of decadence. For only some sixty-four years did Greek art remain at its zenith. This period is contemporary with Philip of Macedon.

Dates are not found on coins before the time of Alexander the Great. Even subsequently they are of rare occurrence. Dates are indicated by Greek letters, some standing for hundreds, some for tens, and some for units. Far more common was it for the local great folk—the magistracy—to impress their names on the coinage.

In handling these old coins I reach over the dead centuries to a once living people, for I hold what they held—the reward of labour, that which secured them the common things of life.

THE 'TWINS' OF BRYAN BROADWATER.

By Mrs W. F. IRVINE BELL, Author of *The Forester's Girl*, &c.

I.

WHEN Dad Junior was born he was so precisely the 'spit and image' of Dad Senior that Sir Gilbert Greatree—who, having less than twenty years before stood sponsor for the father, now assumed ghostly responsibility for the son—dubbed them 'The Twins.' The nickname stuck—unwarrantably, declared Dad Senior; but we shall see.

The marriage of Dad Senior, or, to give him his proper name and title, Sir Eric Bryan of Bryan Broadwater, with Lucy Templeton, an Anglo-American orphan and heiress, had been one of those boy-and-girl plunges into matrimony which cause wise heads to shake ominously, and are the despair of guardians and trustees. Eric, vowed all and sundry of those interested in the lad, had ruined his career and his prospects by marrying at nineteen—his 'career' in prospective being a military one, and his 'prospects' the inheritance of a fine estate and the 'wherewithal,' if meanwhile he should walk warily in ways prescribed by a devoted but dictatorial godfather.

As to Lucy—clad in a very short skirt, and with waist-long ringlets falling like a golden cascade on the shoulder of her legal guardian, she had perched on the arm of his great leather chair and made good her case not only to be allowed to marry forthwith 'that boy,' but to have a 'real wedding.'

'Yes, I *know* I'm only sixteen, Punkie dear,' she had urged, impressing a kiss on the baldest bit of Mr Horace Punk, Q.C.'s very bald head;' 'but aren't you always telling me how much more serious-minded and sensible were our grandmothers, who married lots younger than that, and had rows and rows of little children carved around their tombs?'

So Lucy bundled up her shining curls for the first time, to crown them with orange-blossoms; only, however, to let them fall free again so soon as she and her 'boy' arrived to 'honeymoon' at beautiful Broadwater Hall, lent for the occasion by Sir Gilbert Greatree to those 'ridiculous children,' as he sardonically described the bride and groom.

Sir Gilbert had been very angry with his godson, or, rather, he cherished the conviction that he *ought* to be angry; but when Lucy, with her great violet eyes, hair like tendrils of spun gold, and cheeks which a hedge-rose might envy, floated up the Abbey aisle in her bridal white, he lost his heart to the lovely child, and promptly forgave the youthful bridegroom. Moreover, when it was presently divulged that Lucy's fabulously rich American mother had bequeathed a fortune for her daughter's disposition when she should be twenty-one years of age, or on the day of her marriage, it seemed scarcely worth while to alter his own will to the exclusion of Eric, notwithstanding that the latter had disappointed his hopes of military name and fame; for that Eric should leave Woolwich had been the sole condition for which Lucy's guardian, the estimable Horace Punk, Q.C., had held out. 'If I permit you to marry that child, your business will be to stay at home and take care of her and of her property. Some other man can fight for her if needs be.' Such was his ultimatum.

So they bought a charming little place marching with the wide acres of Broadwater, and called the house 'Bryan Towers' because of its clustering turrets. Upon one of these, some months later, a flag flapped merrily, while the bells pealed in Broadwater church, and Dad Senior, white as a ghost, bare-headed, breathless, but bursting with pride, rushed into the library of Sir Gilbert Greatree, and announced to him the birth of Dad Junior. That shortly the flag would fly at half-mast, the church bell toll, and Dad Junior, with a pathetic little black bow on his wee cap, receive the names of Gilbert Eric Templeton beside the coffin of his child-mother never crossed the mind of Dad Senior that fair May morning. Yet so it befell, and Dad Senior, barely out of his 'teens,' found himself staring with tear-swollen, incredulous eyes at the scrap of humanity which was all that survived of his married life and of Lucy.

II.

Straightway flowed to Bryan Towers a steady stream of sympathetic sisters, cousins, and aunts, intent, tacitly of course, upon rescuing the motherless babe from a too youthful father and a big

household of irresponsible servants. One and all, however, departed discomfited and minus the baby. Dad Senior was duly grateful, but—determined. 'Junior' was Lucy's child. Lucy was not there to mother him. Therefore he—Dad Senior—must be mother and father in one.

From the cottage in a neighbouring village where she was spending the residue of her days, comfortably pensioned, but lonely, his own old 'Nanny' was uprooted, and, to her great joy, installed in the nursery of Bryan Towers, there to reign supreme in spite of the baby's female relatives, who prophesied the complete spoiling of the child until, at all events, the advent of an inevitable step-mother. This prediction, however, entirely failed of fulfilment. Not only did old Nanny's rule prove as wise as kind, but all aspirants (and there were not a few) to Lucy's place at Bryan Towers were doomed to disappointment. In the meantime, while Dad Junior successfully passed through the first of the 'seven stages,' his father won a recognised place as an ideal country squire, with the result that when the boy was ready for an Eton jacket and 'topper,' his home was filled with all manner of cups and trophies, the owner thereof being J.P., M.F., golf champion, and best shot of the county; and Sir Gilbert Greatree, the day having come when he must take a long, last leave of Broadwater Hall, did so with a mind quite satisfied as to his godson filling his place.

Up to this time the 'Twins' had never been separated, all of Dad Senior's spare hours being devoted to his offspring, who, in consequence of this close companionship, rapidly developed. From the start the 'Twins' were the best of 'pals,' one fact alone disturbing the perfect balance between Dad Senior and Dad Junior—namely, that the former, try as he might, could never contrive to look old enough to be the duly accredited father of his own boy! Of fair complexion, fair hair, and a round, boyish face, Eric Bryan had always appeared years younger than he was. At twelve he passed for nine; at sixteen, well-disposed parents of First Form boys patted him on the shoulder; and when, at the mature age of nineteen, he aspired to enter the holy bonds of matrimony, nothing less than his birth certificate availed to prove that he was not annexing several years to those to which he was entitled. Add to all this, smallness of stature, a quiet country life, with abundance of friends, sports, and money, and, last but not least, the daily assumption of an infantile rôle, playing 'bear,' circus, soldiers, cricket, according to the progressive demands of Dad Junior, and it need not be deemed altogether improbable that it taxed the credulity of strangers to believe that the two were not brothers, but parent and child.

Presently, too, Dad Junior, taking after his mother's family, began to shoot upward so rapidly that Dad Senior felt the race between them was no longer an even thing; he grew positively shy of visiting his son at Eton, and nearly tore his hair (still fair and plentiful) when a slim young undergraduate, with a dark, downy shadow already on his upper lip, came to Bryan Broadwater for the 'long.'

III.

Dad Junior was still the 'spit and image' of Dad Senior—only, he looked *older!*—when war was declared. Dad Junior nearly fell over himself in his haste to enlist; but when, a few months later, he bade his father good-bye at Waterloo, he exclaimed fervently, 'Thank God, Dad dear, you 're too old to fight!'

Now, any other parent than Dad Senior, who all his life had suffered from the gift of apparent eternal youth, might have winced under this implication. Not so, however, Dad Senior. No sooner had Junior's train pulled out than he called a taxi and bolted to the nearest recruiting-office. 'For once in my life,' he muttered viciously, glaring at his reflection in the taxi mirror, 'my silly, infantile expression shall do me a good turn. I 'll camouflage the weight of my years' (he was just forty-two), 'enlist, and turn up in a trench alongside of the boy. No use my going down to Broadwater,' he continued ruminating as the taxi buzzed along. 'Those beastly volunteers would run me to earth; and there isn't a soul down there who doesn't know the dates of me and my entire family a jolly sight better than those of the kings and queens of England.'

And somehow he managed it so successfully that he completed his training, got sent 'out,' distinguished himself, was badly wounded, and back in a London hospital almost more quickly than it takes to tell. Thence, with a decoration and a very game leg, he was despatched to Lady Stratton's Convalescent Home, with nothing to do but rest or wander about the beautiful lawns and gardens; and it was then that poor Dad Senior got into the first real trouble of his life.

Lucy's death had been a terrible grief to him; his son being suddenly torn from his side, to be peppered day and night with shot and shell in those awful trenches, was a trial the possible outcome of which he could not face; but neither of these things could will or word of his own have availed to prevent or help. But the trouble which now all at once confronted him, and shook his soul, was, so he kept telling himself, wholly of his own making. Dad Senior had fallen in love.

Among the glorious, glowing masses of Lady Stratton's rhododendrons he limped up and down, endeavouring to diagnose the symptoms of a malady from which he had suffered only once in his life, and had never expected to suffer again. At first he was incredulous. Then, as the certainty was forced upon him by an increasing dread of the approaching day when he must leave Stratton Park, he sank in an abyss of self-reproach, because, at a time when, more than ever before, his

thoughts ought to be full of Lucy and her son, they were centred upon another woman. Even in the contemplation of a second marriage after the war he found little relief, as the vision intruded itself of a third party coming between Dad Junior and himself just when the former, his education completed, would be free for that unbroken companionship to which both had always looked forward—to travel together; to hunt, fish, shoot together. No, such a step was impossible. Later on, by-and-by, the boy himself would marry, and then—— Dad Senior heaved a sigh. By *that* time, doubtless, Sybil Asche would also be married. She was, of course, years younger than himself—young enough to be his daughter.

So ran his thoughts in merciless analysis, until, all at once, he caught sight of his reflection (vivid with the bright-blue garments and red tie of a convalescent hero) in the still, clear waters of a lily-pond, to the edge of which he had wandered. Halting abruptly, he studied, for the first time in his life with undisguised satisfaction, the boyish physiognomy looking back at him from among the lily-pads. '*You!*' he exclaimed, pointing a severely judicial finger at his watery self; '*you*—old enough to be Sybil Asche's father! Ha! ha!' and he flung back his head, laughing loud and long, while in a certain spot between the curve of his pleasant mouth and his nicely rounded chin twinkled a fatuous dimple, which only a beard of Jove-like proportions could have hidden.

'Good-morning, papa!' rang out a clear, sweet voice. 'You seem to be in splendid health and spirits to-day. We shall be giving you your discharge in favour of some *real* invalid if you go on improving like this.' And Dad Senior, reddening violently, and looking for all the world like a schoolboy caught stealing apples, found himself face to face with Sister Sybil (in pre-war days the Honourable Sybil Cicely Asche), rosy and radiant as the rhododendrons from among which she emerged, fresh and sweet in her nurse's uniform. 'I'm dreadfully sorry,' she continued, mischief and manners contending in the tones of her voice, while pure fun danced in the frank brown eyes with which she regarded her quondam patient, confused and speechless, 'but I simply couldn't *help* hearing you take my name in vain. And, in any case, why *should* you be old enough to be my father? A *boy* like *you!*'

Dad Senior suddenly felt inconsequently, idiotically elated and happy, but, before he could recover himself, he heard her call, 'Bye-bye!' and her footsteps rapidly retreating around a bend in the path. Eagerly he essayed to follow, but crutch and crippled leg were, alas! no match for her flying feet; so, perforce giving up the chase, he sank, baffled and breathless, upon a garden bench, and cudgelled his brains as to why she had thus taken flight, at one moment his heart thumping hard over the conviction that she had guessed his secret, and perhaps reciprocated his feelings; at the next, upbraiding himself as a conceited ass to imagine such a thing.

IV.

One fact, however, was now indisputably clear to his mind. He really *did* love Sybil Asche—could not brook the thought of never winning her; and as for Junior, if he were made of the stuff his father believed him to be, he, Dad Senior, would soon make it all right with *him*. At all events, he would—he simply *must*—speak to her at the first opportunity, perhaps in the afternoon, when she would bring him his tea beneath a great elm where once in a while he had contrived to detain her for a little chat in her least busy hour—the hour towards and from which he had unconsciously grown to watch the progress of the hands of the clock.

But to-day when the time came, and with it fragrant tea, cream, bread-and-butter, cakes, and all the other delicious things which eagerly unselfish civilians denied themselves in order to lavish them upon their heroic soldiers, Dad Senior, sitting disconsolate under his favourite tree, left the dainties all untouched. A strange nurse, swarthy and capable, but in his disappointed eyes as earth to heaven compared with the expected one, set down the tray; reflected that he seemed to be a gloomy, ungenial sort of man; and when, some half-hour later, she passed by and observed the meal untasted and an extraordinary number of cigarette-ends thrown about, at once reported to the matron that So-and-so didn't seem well. Followed such anxious inquiries from the matron that Dad Senior had to pull himself together sharply; explained, laughing, that he had perhaps over-exercised his crutch; and when she departed, cursed himself for an imbecile because he had been utterly unable to make his vocal cords frame the trifling question, 'Where is Sister Sybil this afternoon?'

It was not until the following day that he learned (inadvertently, for he could not bring himself to ask) that she had gone to some other hospital, where she felt she could be of more use, but in which direction of the compass he did not gather. Needless to add, he proceeded to torment himself with the iterated question: Why had she not told him? They had been such good friends; and although he had not revealed to her his identity as the squire of Bryan Broadwater, she, of course, had quickly divined that his rôle as Tommy Atkins was one assumed for reasons best known to himself. And now she had slipped away without even a word of good-bye! To discover her address would, of course, be an easy matter; but—well, it seemed as though she had intentionally hidden herself, and perhaps, after all, it were best for him to think the whole matter out.

He *did*. Returning home a few days later, he put in four miserable weeks trying his best

to feel contented and satisfied in the old lonely life, and buoying himself up with the anticipation of a complete reunion with his son when the nightmare of war and of waiting for a dreaded telegram were things of the past. But it was no use. Nor time nor place could make any difference—in his thoughts Sybil Asche had come to stay. And so at length Dad Senior succumbed. At his desk, in the centre of which for a score and more of years the photograph of Lucy in her wedding-dress and veil had stood, to be gradually flanked, year by year, with pictures of her son, he seated himself to write to the girl who, at long last, bade fair to succeed her.

Then—a knock at the door, and his servant with the long-expected telegram. Nerving himself to open it, he read: 'Severely wounded.'

'Thank God, not *killed!*' exclaimed Sir Eric, and ten minutes later was on his way to London.

v.

Dad Junior, a very ghost of his former self, but head shorn and chin shaven once more, and some of his bandages removed, grinned broadly from among his pillows, and in a limp but eager grasp seized the hand of Dad Senior, who looked scarcely less haggard than himself. The 'Twins' had passed through some terrible weeks, but of the two the elder had perhaps suffered the more; for, while Junior, more or less unconscious, was enduring bodily anguish, Senior, his mind and every nerve on the stretch with sickening dread as to what the next moment might bring forth, seemed to have lived years since the arrival of that momentous telegram. Across his smooth forehead fine lines had at last begun to furrow their way, an anxious fold appeared between his eyes, while any one who searched diligently might perhaps have discovered traces of silver here and there among the crisp, fair waves of his hair. Had the Fates decreed that during that nerve-racking time he should be at the bedside of his boy, the mental torment would have been lessened; but wires from France had kept him daily expecting the arrival of the invalid in London, and no sooner was he, in sheer desperation, on the point of starting than another message deterred him. At long last, however, here Junior was—the dear fellow—getting stronger every day, although (to his father's infinite relief) the doctors declared he would need at least three months' sick-leave before he would be 'fit,' and then probably only for 'light duty' for some time to come.

Dad Senior's mind was already careering joyfully forward in glad anticipation of having Dad Junior all to himself in the seclusion of Bryan Broadwater, when his thoughts suddenly collided with the image of Sybil Asche. Impatiently he thrust her away, despised himself for thinking of her, then equally despised himself for *not* thinking of her, and presently became acutely aware of an intangible, shadowy something, which seemed to lie between himself and his boy. The latter was just as affectionate, just as keen for his father's company, just as eager to get home again and to 'do the same old things in the same old way,' as he expressed it. Perhaps it was only weakness, or a haunting remembrance of recent fearful experiences, but without doubt, noted Dad Senior regretfully, Dad Junior seemed preoccupied and detached as he had never been before. That the boy was himself covertly studying his father, and trying to account for a certain unwonted air of abstraction and gravity completely foreign to him, never entered Sir Eric's mind; but it made Dad Junior all the more reluctant to reveal a very special Something, with a big capital S, which had weighed on his conscience ever since his return to England. Dad and he had always been such chums—Dad was such an altogether top-hole sort of chap—that it seemed somehow to be not quite playing the game to let anybody else—even *Her*—fill a place in his thoughts without sharing the secret with Dad.

The pair were still longing to break the thin sheet of ice which seemed mysteriously to have formed between them, yet were fearful of doing so, when the invalid was pronounced well enough to go home to convalesce (one *did* go home to convalesce in those first years of the war).

Bryan Broadwater was now at the height of its midsummer beauty and prodigality, affording everything, one would suppose, that the heart of a young man could desire, from early peaches to a new litter of pointer puppies! But although for a few days Dad Junior seemed to be happy and content, his father soon detected signs of restlessness and even of slight irritability; while, on the other hand, the son kept asking himself impatiently, 'What the dickens has got into Dad that he looks so glum?' The simple truth was that, whereas Dad Junior was fretting his soul because *She* did not write to him as he had begged her to do, Dad Senior was equally fretting because he could not make up his mind to write to *Her*, without first taking the 'boy' into his confidence.

An opportunity was offered, but weakly allowed to slip, when, during the twilight of a rather heavily long day, as the 'Twins' paced slowly up and down in the yew-hedge garden, Dad Junior suddenly burst out, 'How damned *still* it is down here, Dad—not a soul except our two selves to speak to!' Dad Senior, instantly taking alarm lest the boy had overtired himself, laid his hand on his shoulder and said gently but cheerily, 'I fancy you are still missing your *nurse*, my dear boy.'

'*My nurse!* Missing my *nurse!* Why, how the deuce di-d-d *you* know?' he stammered, blushing furiously and hastily searching for his cigarette-case.

'Eh? *What?*' queried Dad Senior in incredulous staccato, a ray of light suddenly

illuminating his mind and simultaneously lifting a strange weight from his heart. But before Dad Junior could answer, the dressing-gong boomed through the still air, and Dad Junior, seized with sudden panic, fled precipitately. Dad Senior would not force his son's confidence; so, although they played billiards violently all the evening, they parted for the night with the intangible ice wall between them a trifle thicker.

VI.

'The post, sir,' said Dad Junior's servant the next morning, presenting the tray and covertly noting the look of sharp disappointment on his master's face as he glanced over a pile of dull-looking envelopes. 'Here, Dudley; take *The Times* to Sir Eric,' he said, and tore open a letter, censored and minus a stamp, which, though it was not *from* Her, might perhaps contain news *of* Her; for it was from Hugh Stafford, his particular friend 'out there,' who had been wounded in the same attack, laid up in the same hospital, but not considered bad enough to be sent home.

Dad Junior's eyes ran rapidly over the first page or two of inquiries, of envyings of his luck at being home, of news, sad, glad, bad and good, of the regiment; and then he came to this: 'I have one bit of news, old thing, which, judging from certain signs while you were in hospital—signs I couldn't help observing out of the tail of my eye, so to speak—you won't especially relish. That awfully pretty, jolly nurse who looked after you is engaged to the big Highlander who was in the cot next to yours. The affair, it appears, was a very old one; but although she wouldn't have him until he had won his spurs, she contrived to get sent out here on the bare chance that if he were wounded she might be at hand to nurse him! Of course, he'll be sent home now, and perhaps her people will wangle a cushy job for him—if he's that sort, though somehow I don't think he is. At any rate, they're going to be married as soon as he can hop about, so you had better begin saving up for a wedding-present! Never mind, old boy. Don't be down-hearted. There are lots more nurses,' &c., &c.

But Dad Junior read no further. Deathly pale, and with a strange numb feeling all through him, he sat for a time staring at the letter; then suddenly a quiver ran over his face, and a deep flush, while below his breath he exclaimed, 'Thank Heaven, I didn't worry *Dad* about it!'

Reaching for his hat, he dashed out of doors, and making his way to the kennels, extracted a not wholly unwilling pointer from the onslaught of her voracious progeny, with set intent, for probably the first time on record, of avoiding his father by losing himself in the copse.

No need, however, was there for him to be at such pains. Alone in the library, the key turned, sat Dad Senior, thinking hard, and utterly heedless of the passing hours. Beside him lay a sheet of *The Times*, in one of whose columns appeared the following announcement: 'A marriage has been arranged, and will shortly take place, between Captain Alistair Gilfillan of Heath House, Aberdeenshire, and the Hon. Sybil Cicely Asche, youngest daughter of Lord Stratton and of Lady Stratton of Stratton Park, Kent.' At last, as the clock struck noon, Dad Senior roused himself, and, folding the news paper, might have been heard fervently ejaculating, 'What a providence that I had said nothing about it to the *boy!*'

A moment later, as, through the long, ivy-framed window, he saw Dad Junior sauntering towards the house, alone, and looking unmistakably white and weary, a sudden most contradictory sense of relief took possession of him. Stepping out on to the terrace, redolent of late roses and of newly mown grass, he held out the paper towards Dad Junior, and, with a display of as much indifference as he could muster, said gaily, 'Another war engagement, Junior: the Honourable Sybil Asche—Lord Stratton's daughter, you know—and some Hielan' chap. Suppose I must send her a wedding-present. She was my nurse at Stratton Park.'

'Sybil Asche was *your nurse*, Dad!' exclaimed Dad Junior, turning violently red, and steadily regarding Dad Senior's too tell-tale countenance. 'Good Lord, *she was mine too!*'

For the space of a second father and son looked each other in the eyes; then, 'Come along to the kennels, Dad, and let's pick out the best puppy. There is just time before lunch,' quoth Dad Junior heartily, linking his arm in Dad Senior's. Together the 'Twins' trotted away.

LINES WRITTEN IN THE INDIAN OCEAN.

THE mystic stillness of the evening tide
Has hushed to silence nature's every breath,
And all creation's splendour, vast and wide,
Is wrapped in quietness, calm as peaceful death.

A lonely sea-bird, swift, on tireless wing,
Still skims the dark'ning sea with graceful sweep—
The music of the water's murmuring
Is all that breaks the quiet of the deep.

The colours of the sunset, one by one,
Are deep'ning as they slowly fade from sight,
Till all the fiery splendour of the sun
Has yielded to the dusky shades of night.

The evening star, the herald of the night,
Whose timid beams the earth sought to embrace,
Is lost amid the million points of light
That deck the wondrous realms of endless space.

And so the night wears on, till with the morn
The twinkling stars fade slowly from the view,
And nature's thousand voices greet the dawn,
And this our wondrous earth is born anew.

A FALLACY IN TACTICS.

By R. P. HUGHES.

In an entrenched position the ability to repulse the enemy does not depend on the number of men in the trenches before the bombardment begins, but on the amount of fire that can be delivered against the enemy when the barrage lifts, and his infantry advances.—Extract from *Notes on Recent Operations in the Field.*

I.

WHEN the 'Iron' Brigade came to Mound Top they found themselves in possession of the one eminent feature in an otherwise very flat Flemish landscape: a gentle roll or fold in the ground, roughly a kilometre from end to end, in the shape of a crescent moon with the horns towards the enemy. The British trenches were dug along the top of this ridge. Parallel to them, in No Man's Land, a rusty causeway of wire, twenty to thirty feet in width, snaked its devious course. Beyond, a quarter of a mile distant, a broken brown line, which disappeared gradually to the north and the south, indicated the German front trench.

In days gone by the Boche had been wont to grudge us our possession of Mound Top, and had made vigorous use of his mailed fist to lend weight to his protest. Savage Bavarians, employing the fearsome saw-bayonet, hurled themselves repeatedly in bloody assaults against the crest, then in the hands of some battered, hard-eyed remnants of the grim 'Old Contempt-ibles.' The story of each effort, with its price, emerged only by degrees from captured documents and prisoners' statements. They form a significant and sufficient explanation why we were allowed to retain our hold of Mound Top unchallenged for the next two years.

Our presence there must have sent the German High Command into a paroxysm of rage each time it pored over the maps of that sector. Conceive the indignity of having miles and miles of one's back-areas under the daily surveillance of keen-eyed hostile gunners. During the day-time not a single fly-like dot of a transport-wagon crawled along a single road between the British front-line and the distant German horizon but its progress was observed by some gunner subaltern in his O.P. On rare red-letter days a dust-whirling staff-car might be caught racing along a far-off bit of road. The telephone to the gun-pits hung handy to the watcher's mouth, and the flying car rarely outstripped the message that kindled quick gun-flashes amongst the trees at the other end of the wire. On one memorable occasion a British shell actually exploded on a vanishing gray hood!

The 'Irons' filed up the devious communication-trenches leading to Mound Top in late June. Before July was half over the regular monotonous round of trench routine held them in full thrall. Trenches were re-revetted and deepened, and fresh duck-boards laid down. The belt of wire in front swelled nightly to more and more formidable dimensions. Patrols crawled in all directions, seeking whom they might devour. And already a big raid on the enemy lines was being secretly and carefully planned. The brigade was feeling at home in its new quarters.

It was on a hot, oppressive day towards the end of the month that one of the battalion commanders, a cigarette between his lips, was taking his morning constitutional along the front-line. In a musing moment he paused to regard a tall, blackened tree-trunk that rose out of the German parapet opposite. He stared pensively a while at the dead, denuded skeleton, picturing it in its green and lusty days, when it towered nobly against the sky, a thing of beauty and utility, providing shelter for bird and beast, of all objects in the world the least likely, one would have thought, to fall a victim to war's blasts.

Suddenly, as the colonel gazed, his features changed, and an exclamation of mingled astonishment and incredulity fell from his lips. His hands went with a quick movement to his binoculars. He directed them, staring long and earnestly, towards the tree. When he had stared his fill he replaced the glasses and wiped his forehead, looking about in a half-bewildered way for a seat. He sat on the fire-step, and out of his tunic-pocket took a field-service pocket-book, in which he began to write.

II.

The brigadier, who had just finished lunch, was smoking one of his friend the R.A. colonel's excellent cigars, and listening with an expression of good-natured tolerance to the battalion commander's amazing tale. The R.A. person, with his belt comfortably slack, leaned back in his chair, and placing together the tips of his well-

 [*All Rights Reserved.*]

kept fingers, nodded now and again as if in confirmation of the other's points.

'It was by sheer good luck, sir,' the colonel was saying, 'that I happened to be looking at the tree from that particular angle, and the sun, shining almost directly overhead, just struck one gleam from the eye-piece of the periscope. Even when I turned my glasses on to it, I confess I could hardly believe my eyes.'

The R.A. colonel took up the tale, and discoursed, from an artilleryman's standpoint, interestingly and at some length on the subject.

'A most ingenious dodge, sir; and I must say, to give the blighters their due, they display wonderful ingenuity in making the dummy tree as like as two peas to the original. Their pioneers are the beggars who do it. They 'll go up to the trench, make a drawing of the tree they want to reproduce, take the necessary measurements, and then, one night, the pukka tree comes down, and the hollow one takes its place. An observer crawls within, places his periscope against an aperture at the top—and there you are!

''Twouldn't surprise me in the least, after what Cholmondeley has been telling us, to find that brother Boche has been studying our system and back-areas for months past. You may depend upon it, if he 's got one camouflage tree, he 's got a dozen of 'em, erected against all points of our front.'

The brigadier puffed thoughtfully at his cigar, staring in silence out of the dug-out window. After a while he rose briskly to his feet, and called for the staff captain.

'We 'll go up to the line,' he announced to the other two, 'and have a look around for the rest of these queer things.'

The little party returned in the evening in a somewhat chastened mood, having 'bagged'—to use the R.A.'s expression—'seven of the spying blighters.'

That night a howitzer battery received instructions from Group H.Q. that caused the officers concerned to gaze questioningly at one another, and then bend over their trench-maps with eager eyes. The subalterns at dinner added zest to the occasion by preparing a sweepstake to cover the event.

Towards noon next day the German casualty totals received an unexpected fillip in the addition of seven extraordinary cases, and, incidentally, the German Intelligence Department lost an equal number of perfectly good camouflage 'trees.' The lucky battery added to its laurels a new record for fine shooting.

The process of immolation, breathlessly observed, sent a deep and satisfying thrill throughout Mound Top. Even moist and inexpressibly grimy cooks were not above struggling for places at loopholes whence to drink in the dramatic spectacle.

III.

Following swiftly upon the heels of the first came a second diversion for the brigade. The general, after a hurriedly summoned conference of all senior officers, suddenly converted his entire command into two great working-parties. It was an admirable piece of organisation. Without any further warning the blaspheming 'Irons' found themselves strenuously digging dug-outs of unprecedented depth in every part of the line. Picks and shovels rang nightly in all directions. The brigadier, accompanied by engineer officers and machine-gun officers equipped with compasses and maps, would proceed to a spot, hold there what had the appearance of a brief funeral service—and the next arrivals in the vicinity came armed with the implements of the occasion, spat upon their hands, and, full of strange oaths, forthwith commenced to dig.

They dug—perhaps harder than their forebears dug at Torres Vedras, with the harryings of fiery-headed Masséna to lend strength to their elbows—for a month; and at the end of that period, thanks to the galvanic energy imparted by the brigadier to all ranks, the entire system of Mound Top found itself turned completely upside-down and made out afresh. For the general was unable to dissociate in his mind camouflage 'trees' from a sure promise of Teutonic unpleasantness.

Strung in echelon fashion across the whole brigade frontage, a system of twenty-foot dug-outs had sprung into being, immensely strengthened at their entrances with facings of solid concrete, six feet thick.

Into these subterranean fortresses descended machine-gunners with their ordnance, and commenced to pile up about them, in belts and boxes, and even loose in sandbags, stacks of ammunition. Such portents could not escape observation. Faint electric currents began to invade and charge the atmosphere of the sector. 'Old soldiers' with experienced olfactory organs sniffed the air, and declared that they scented symptoms of a coming 'stunt.'

One day, like a bolt out of the blue, came a chit to H.Q., revealing in terse, grave phraseology the imminence of a powerful Boche attack against the position. 'It is intended that the assault shall be no less sudden than crushing.' Guns in unguessed numbers (it seems) had quietly been assembled against the front, and already carefully chosen units of *sturmtruppen* lay behind the German lines, in readiness 'to do the dirty' on Mound Top.

The brigadier was a proud person when he received that message. In his eyes was the glad light of a man who had been able to see a day ahead of his fellows, and to read correctly what he saw.

'Let 'em do their dam'dest,' he exclaimed,

pitching the chit to the staff captain; 'we're ready when they are.'

In the candle-lit depths of the twenty-foot dug-outs news of the warning administered a final fillip to the energies of the toiling occupants. Guns were generously oiled and overhauled. Ball ammunition was cleaned and burnished, and stacked carefully in belts and boxes and bandoliers.

IV.

The attack opened as suddenly as a lightning-flash. It came at midnight, on the stroke. One moment the night was still and windless, faintly starlit, disturbed by hardly more than a distant murmur of gun-fire from the south; the next, a violent, sustained tremor ran through the earth, accompanied by deep, muffled reports. In an instant the starry sky was alive with trailing red sparks travelling in curved lines towards the British trenches.

It was not upon the expectant front-line that the force of that terrific bombardment fell, but upon the wire. With earthquake explosions and volcanic flamings the great barbed belt was ripped and torn asunder like so many skeins of wool. Yard by yard it was blown and shattered out of existence, and the way made clear, with Teutonic thoroughness, for the passage of the waiting *sturmtruppen*.

Next morning a misty red sun rising behind the German lines revealed to the deafened garrison of Mound Top how completely in one night the most formidable wire entanglements may succumb to heavy minenwerfers, timed to burst on impact. Of all that splendid obstacle scarcely a strand remained. In its place appeared a black, twisting line of yawning craters.

'To-night,' said the brigadier, surveying the mess with hard eyes, 'the devils will attack.'

In their deep dug-outs the machine-gunners oiled the frictional parts of their weapons lovingly for the last time—and lit cigarettes.

Exactly half-an-hour after midnight the watching double-sentries in the British front-line yelled at the top of their voices for every one to 'stand-to,' and then crouched to a man beneath the parapet. They had seen the whole of the dark skyline in front of them silently stabbed by a multitude of red flashes. They waited breathlessly for three seconds, and then, rushing down out of the black heavens to the accompaniment of a swelling, deafening hurricane roar, came the first German shells. Beneath the force of that terrific impact Mound Top shook from end to end, and a flash of ruddy light leapt wildly skywards. The trenches in an instant filled with an infernal, winking glow, a fantastic glancing and dancing, like the shimmer, as it were, of a brimstone lake in spate! Shrapnel flashed crimson, blinding the stars; while white searing flames leapt and spouted savagely in every direction. The torn earth diabolically bubbled fire. The ground quivered as if alive, writhing in torment; it flew apart in violent disruption, reviving ancient foulnesses. Geysers of dirt and débris soared in dark columns. Heavy 'minnies,' piercing the tenebrous depths, exploded far below, and rent the bowels of the earth with volcanic violence. Puffs of hot air, commingling the stink of cordite with the odour of forgotten burial-places, impinged with incessant soft blows against the bodies of the few breathless soldiers surviving above-ground. It was as if the quiet starry night had suddenly gone mad—frantically, screaming mad—with some primordial terror. Without a pause the roaring orchestra of battle-sounds shook the skies, the whistling rush of shells blending furiously with the crash and din of explosions.

Regarded dispassionately, as a demonstration of war conducted on scientific principles, it left nothing to be desired. It was a perfect example of what on the morrow would be dismissed in one line of print as 'an outburst of enemy artillery activity.'

V.

For four hours Mound Top was drenched with fire. At the end of that period the barrage lifted with the precision of a drop-scene, and descended on to the back-areas to stem any rush of reinforcements into the hapless front-line; and the Boche climbed out of his trenches. It was the first peep of day. A few dazed and shaken sentries, raising their singing heads over the remains of the British parapet, saw the gray hordes moving leisurely towards them across No Man's Land. For a second they stared, and then disappeared. The Boche came forward without haste, bayonet in hand, picking his way through the shell-holes, marching with aplomb to take possession of his prize. . . . .

Something moved in the British trenches; something glinted stealthily; here and there amidst the smoking wreckage a white face showed for an instant, and vanished.

On marched the Germans, each man jostling the next, grunting guttural jokes, their non-commissioned officers continually running out in front to preserve the dressing of the line.

Overhead continued the steady roar of shells rushing furiously through the air; below, the ground trembled to the volcanic crashings and eruptions of the missiles bursting in the British support-trenches. Smoke mingled wildly with flame, rolling and angrily spouting in every direction.

Suddenly, with the speed and directness of lightning, two startling things happened. Low over the British parapet swept a shrieking tornado of steel, a withering blast of shrapnel that burst full in the faces of the advancing Boche. At the same instant the snarling rattle of machine-guns leapt out.

These machine-guns were trained so that each

fired diagonally to its front. Where one blazed to the right, the other blazed to the left. All lines of fire converged upon one another, and meeting about the centre of No Man's Land, formed a whistling belt of death.

As the first of that wicked blast caught them, the leading gray lines swayed limply, and stumbled, then fell forward on their faces, and lay still.

The battle had opened!

The second wave, fifty yards or so to the rear of the first, following a moment's involuntary start that sent a perceptible ripple through the ranks, came on grimly to take their fallen comrades' places. They did not reach so far, for the hail of bullets caught them almost at once, and fiercely mowed them down *to a man*. The third wave followed in short, stumbling rushes, and the fourth, and the fifth. . . . .

Fresh droves climbed out of their trenches and swarmed forward, trampling the dead and the dying underfoot. They came blindly on, rushing frantically towards the shelter of the British lines, heads bent instinctively to the singing blast, arms flung impotently out. Sometimes an ashen, distorted face would be raised wildly to the skies, and a piercing shriek mingle with the growing tumult. But most died without knowledge of the fact.

VI.

It is a common fact, known to all machine-gunners, that their weapon is capable of sustained fire for a limited period only. Beyond that point the barrel grows overheated, and by its expansion puts the gun out of action. It then requires, in most cases, half-an-hour in which to cool down to its normal condition. In their desperate resolve to carry their objective the German High Command conceived a brilliant notion. They thoughtfully committed themselves to supplying human targets for the enemy machine-gunners in such vast numbers as to bring about this fatal overheating of the guns in the quickest possible time. Unfortunately for the fruition of so original a scheme, the possibility of it had been vaguely present for some time in the mind of the brigade machine-gun officer, and he had provided against the contingency by instructing his teams to fire in relays, allowing one set of guns to cool while another 'carried on.'

For an hour the Germans held to their bloody idea. Then the battle suddenly came to an end. The human margin was exhausted, and with it went a generous overlapping from ill-starred reserve units. The ecstatic British machine-gunners got no more targets; the murderous shrapnel madly lashed the ground and all its gray litter for a little further space, and ceased. A grim silence fell on both sides, the exhausted silence of a dog that licks its wounds. . . . .

Later the skies broke, and emptied themselves in torrential downpour on to the battlefield. Straight and thick as Norman arrows the rain fell, darting down savagely on the sprawling gray heaps that lay between the lines, drenching them in a moment, then forming slowly in stained, glistening pools about them.

THE SEARCHERS.

CHAPTER XXVII.

IN the morning we agreed that the bogus copy of our half of the paper (with the words 'Chanter Corrie' substituted in it for 'Sron na Leirg') should be in my handwriting, and in the Laird's Room I wrote it out and gave it to Tony. In a corner of the room was a little escritoire, which I unlocked at his request. There was nothing in it except two or three bundles of receipts and some household account-books. Tony overhauled it, opened and shut the lid several times, locked and unlocked it twice or thrice, and carefully examined the key. Then he folded the faked paper and put it in an open envelope, which he deposited in a little drawer inside the escritoire.

'"With your kind permission," as the conjurers say, I shall keep the key to-day, Neil,' he said, as he shut down the lid. 'Nothing further can be done until your return from Castleton.' It was important, he emphasised, that I should make a point of not turning up until the evening.

I left him busy in the writing-room making a rough sketch map of the lie of the ground near the summit of the Pass.

While I was pacing the platform awaiting the train, a rough-looking lumberman asked me civilly for a match, and, as he returned the box, whispered, 'Tell Mr Keene-Leslie that all goes well.'

At Castleton I lunched with the Chief Constable and the Procurator-Fiscal, who read me various reports and their private notes. They were still hopeful, but their tone lacked conviction; and I passed the rest of a dull day in the club, spinning all sorts of theories concerning Tony's scheme, and counting the minutes till train-time. It was close upon seven o'clock when I got back to The Bield, to find Tony stretched in a deck-chair in the garden, placidly enjoying a cigar.

'Behold me on great good terms with myself! I am at peace with nearly all the world. Smooth the wrinkles from your brow, my lad,' was his airy greeting, but under it I suspected a current of suppressed excitement. 'The scheme has

prospered amazingly. Il Signor Searcher is, I think, in a cleft stick. Come with me.' He swung his long legs out of the chair, and I followed him into the house.

'By the way,' I said, as we entered the Laird's Room, 'a toil-stained lumberman, otherwise friend Sparke, contrived a word with me at the station this morning. He sends a message that all is well.'

'Good! Sparke will require two days' sleep after this business. He has been working overtime.'

Tony locked the door, and then went to the escritoire in the corner of the room.

'I want you to examine the lid of this desk without touching it,' he said.

I looked carefully at its dark mahogany surface.

'I can see nothing,' I told him.

'Nor can I. I didn't expect to. I left the key, carelessly enough, lying here.' He pointed to a little bookshelf which ran along the wall behind the desk.

'And it is still where you left it.'

'Not quite. Take this lens and examine the surface of the woodwork near it.' He handed me a powerful lens, and I bent over the shelf.

'See anything?' he asked.

'A few scratches and a little faint bluish line.'

'Just so! The scratches are old. The line is new. I pencilled it there this forenoon. Then I laid the key exactly on the top of it, and *I have not touched it since.* Therefore, some one has been in the room and has handled it. Observe that it is now lying at least a couple of inches away from the line.'

I took up the lens again. It was as he said.

'But whoever touched it must have had precise knowledge of its whereabouts. How did he get that knowledge?' I asked, mystified.

'I helped him considerably,' was the unexpected reply. 'Now I am going to try to reconstruct the scene.'

He unlocked the escritoire and opened the lid of the desk. This done, he slowly and carefully pulled out the little drawer inside, and from it took the open envelope containing the bogus paper. It was lying in the place where I had last seen it in the morning.

'Everything as I left it, Neil?'

'Um—er—apparently.'

'You are becoming cautious. But you are right. It has only "apparently" been untouched. Watch!'

He took the envelope to a table by the window, and holding it in the horizontal position in which he had found it in the drawer, opened it and drew out the paper, which he unfolded. Then he carefully shook both envelope and paper above the dark surface of the table. I was looking over his shoulder.

'Did you see anything fall out of either envelope or paper?'

'Nothing. That I'll swear to. I was watching most attentively.'

'Excellent! The paper has been tampered with.'

'Are you *sure?*'

'I don't often use the word "sure." But I am as sure that the desk has been opened as I am sure that you and I are alive. The little drawer has also been opened. So has the envelope, and the paper has been taken out and replaced.'

I drew a long breath. We had struck the trail.

'And I am going to prove all this,' Tony went on, a confident ring in his voice. 'After you left this morning I made some experiments with the lid of the escritoire and the drawer inside it. After half-an-hour of these, I put two little specks of blotting-paper, not much bigger than pin-heads, inside the paper in such a position that they would inevitably fall out if anybody unfolded it. Similarly, I put other two below the drawer, just at the edge, and on the lid of the desk (which, as you see, opens upwards) I laid three other specks of paper coloured in exact imitation of the dark brown of the mahogany. Lying on the lid, they were practically invisible. Now!'

He crossed the room and pointed to the floor near the escritoire. There I saw two little specks of reddish blotting-paper, no bigger than ladybirds.

'If you pick these up, I think you will find them marked. The paper was taken out and opened where we stand.'

I picked up the specks, and, sure enough, on each was a pencilled dot.

'Call me Didymus no longer,' I said, staring at them.

'Now for the escritoire. Before I opened it just now there ought to have been three little dark brown specks of paper on the lid. I put them near the edge. They were no longer there—you will find them now on the flat surface close to the hinges.'

Again it was as he said.

'The lid had been opened, and the specks, of course, ran down its slope. The displacement might have happened through a draught of air or a housemaid's dusting, but inside the desk'—he opened the lid—'were the two specks which I put below the little drawer. They are unmarked. See!'

Lying at the bottom of the desk, just below the drawer, were two more specks of paper. He lifted them out and handed them to me.

'My only fear was that I had overdone it—that I had "planted" too many of the tell-tale specks, and that "The Searcher," an abnormally cunning and intelligent scoundrel, would spot them and suspect a trap. But evidently he didn't.'

'He has read the bogus paper?'

'No doubt. And he has probably taken a copy of it.'

'Then he may have started already for the Pass.'

'I don't think so. Sparke is watching him. I have a record of his movements for some days; and if he starts, I shall be told instantly. But I fancy that he won't start so long as he thinks we are here.'

'So the sooner we pretend to take our departure for the South the better?'

'Yes. This is Wednesday evening. We want a day to solder up the plans we sketched last night.'

'We can start on Friday. To-morrow I shall bring the keepers and the stalkers here quietly, and explain what is wanted. They will be as keen as beagles, and they will hold their tongues. No one can gabble like a Highlander if he chooses; but if he doesn't choose, a Trappist monk is a chatterbox by comparison.'

'The men can't come with us on our pretended start South, of course. They must be sent on before us.'

'The stalkers are on the watch already, as you know,' said I. 'Angus and the two keepers can steal up the Pass and join them. That would make five allies in their places before we come on the scene.'

'Are they good shots?'

'Ross and the two stalkers are excellent. The other two are above the average with either rifle or shot-gun.'

'Good! You and I can run the revolver department.'

The time-table and the map were consulted, and finally we decided to take our pretended departure for the South by the afternoon train on Friday. At Ardgarry, about forty miles down the great curve of the Highland line, we were to leave the train, double back up Glen Tilt by motor-car as far as we could, and thereafter push on with all speed from the south end of the wild Larig.

I undertook that a motor-car and chauffeur would meet us at Ardgarry. As we wished to be at the Chanter Corrie by daybreak, part of the climb would be by night, and although the weather promised well, a good guide was desirable. I knew one—Malcolm Cameron, an experienced and tireless mountaineer—who lived near Ardgarry. A guide is not indispensable, but he saves time and is a stand-by in case of accidents. Many a climber has rued having started without one, for the Larig, even in June daylight, let alone after sunset, can be a place of moods, of blinding mists or black roaring tempests.

(*Continued on page 452.*)

MORE SCOTTISH STREET NAMES.

By G. M. FRASER, Librarian, Aberdeen Public Library.

IN a previous article (*Chambers's Journal* for May 1918) I opened the ground a little on this subject. To judge from many letters received since then—kind and most interesting letters—there is need to deal with the matter a little further, for, although certain difficulties in our street nomenclature have already been discussed, many points of interest had to be passed over for want of space, and to some of these my attention has been drawn by correspondents in widely different parts of the country.

For example, correspondents in London, Lancashire, Pittenweem, Newport (Fife), and Hawick offer particular examples of street names containing the expression 'gate,' with the inquiry if such come under the rule formerly stated with regard to this term—namely, that in Scotland (and northern England) in a street name it represents the old Anglian *gate* (spelt *gait* in Scotland later, from about the fifteenth century), meaning a road or way, and not an entrance gate to a burgh, which was invariably spoken of as *port* (French *la porte*, the gate). Such names in question are the Deansgate in Manchester; the Kirkgate of Leeds and other English towns; the Howegate of Hawick; Marygate, near the old abbey of Pittenweem; and so forth.

Now, as to all such cases two things have to be said. In the first place, the rule is invariable, so far as I have found, that 'gate' in a street name in Scotland and northern England means, not an entrance gate, but 'road' or 'way,' the Seagate of Dundee meaning the Sea Road; the Trongate of Glasgow, the road to the tron; the Sandgate of Ayr and of Berwick, the road to the sands or beach; the Stonegate of York and other English towns, the paved street; the Marketgate (now the High Street) and the Wellgate of Dundee, the market street and the road to the (Lady) well respectively. In the case of entrance gates to a burgh, on the other hand, we have these designated *port* in plenty of burghs whose ancient streets are known—or were formerly known—as *gates*. An admirable example is found in Peebles, with its streets the Northgait and the Briggait, and its four entrance ports, the East, West, North, and Briggait Ports. We have the same thing in Edinburgh, and other towns that need not be specified.

The other point to be kept in view is that only careful research on the spot can elucidate very difficult local cases of unusual street names, for you must have regard not merely to the

philology of the name, but to all the personal and historical associations of the road and the town.

The Deansgates are all of the same type, and conform to the above rule. The Deansgate was the dean's road, usually the road where the dean had his residence. We have in Scotland the Canongate of Edinburgh, and the same in Jedburgh, meaning the 'gait,' or road, where the canons of the abbey dwelt. In 'Old' Aberdeen, near St Machar's Cathedral—the only granite cathedral in Europe, I think—the name takes the form of the 'Chanonry,' nearer the French form of *chanoine*, a canon. Aberdeen likes to cling to the old French form in certain of these designations. It is the only town in Scotland that spells 'bailie,' a magistrate, with double 'l'—Old French, *baillif;* and in Aberdeen alone are what are called solicitors in England styled 'advocates'—a usage which probably came to Scotland through the French *avocat* (primarily, of course, L. *advocatus*), when the Court of Session was formed on the Parisian model. Sir Walter Scott was well aware of the practice, and liked to tell the story of Lord Elibank, who put down an eminent English lawyer who thought that at the Union English law should have been extended to Scotland, by observing grimly, 'If that had been so, it would have settled your business, for by this time the Aberdeen advocates would have possessed themselves of all the business in Westminster Hall.'

But take the interesting instance of the Howegate of Hawick. It has been supposed there to mean the site of an ancient gateway. In that case, however, it would have been the 'Howe Port,' or something of that kind, like the East Port of Dunfermline, or the West Port of Cupar, or the Seagate Port of Dundee—still standing, one is glad to say, although in a somewhat neglected state for what is, perhaps, the most interesting historical relic in that city. And as historical research would show that the Moat is in the region of the Howegate, the idea of a 'port' there is scarcely valid. It is evident that the Howegate of Hawick, like the Howegate of Kilwinning, is really the Howe Road (the road of the hollow), and is properly treated at the present day, in the numbering of the houses there, as an ordinary 'gait' or street.

Another curious name at Hawick—more of a place-name than a street name—is the 'Vertish,' the meaning and the derivation of which have so far eluded local research. It may be helpful to try the comparative method of inquiry. In Aberdeen, the designation of the Green-gait in the old Latin charters was *Vicus Viridis*—the road of the green; and examination of the feu charters of Hawick would probably reveal this to be the origin of the corrupt vernacular form 'Vertish.'

Again let it be said, however, that in all this matter, as in the equally fascinating study of place-names, one must never allow one's self to be misled by apparent similarity in names or expressions. Guessing is inadmissible—it has been the bane of place-name studies in Scotland—and only painstaking inquiry into individual names, tedious although it often is, will help in this instructive but neglected field of research. A few years ago, in the delightfully quaint, historical town of Hexham, I was interested to come on the street named 'Gilligate.' It looked, at the first glance, like our Scottish 'Gallowgate,' which always led to the Gallows Hill, but it is really St Giles's Gait, the road to St Giles's Hospital. That is well enough known in Hexham; but even there they have never solved convincingly the name of 'Priestpopple,' their fine old High Street—as we should call it—and they probably never will solve it.

Sometimes one is asked if an apparently difficult street name may not be Gaelic. Here, too, there is a sound and invariable rule for our guidance. There is not in Scotland—nor in England either, so far as I know—a single street name derived directly from the Gaelic in the times when street names grew up naturally, and were significant. Like Roman bridges (which are popularly supposed to be found in almost every district), Gaelic street names—that is, names directly and significantly derived from the Gaelic—are non-existent in this country. The reason is historically of interest. We have plenty of Gaelic place-names, right down from Celtic times—they are all over Lowland Scotland; and when competently handled they are most enlightening as to the ancient Celtic culture of the country. But the Celtic hamlets must have been, at the best, mere collections of huts, and only with the coming in of the Anglian immigrants, with their dialect—the dialect, in the main, of Lowland Scotland still—their names, their customs, their trade, and their business ways, were 'burghs' formed, with regular streets, and consequently with Anglian street designations. The remarkable fact that our ancient street names in Scotland are, without exception, English, as far back as our written history goes, is helpful not merely in getting at the meaning of these street designations, but in our moving towards a solution of the problem of our origin as a race. We have in Scotland plenty of street names that have been taken from the Gaelic, but these have all been applied since the middle of the eighteenth century, when the formal naming of streets began, and have no significance. They have been taken from some adjoining place-name, or river-name, or some pre-existing designation of that kind, the proper Gaelic meaning of which—or even the fact that it was Gaelic—probably nobody then knew.

In my former article I mentioned that every historical town in Scotland had its High Street or an equivalent—with one notable exception,

Aberdeen. Two correspondents have written to me from Stirling pointing out that there is no High Street—or Main Street—in that ancient burgh, and one of them enclosed a cutting from a Stirling newspaper, the editor of which, in a kind notice of the said article, remarks: 'What about Stirling, perhaps the most historical of all Scottish towns? It has no High Street, nor ever had.'

Unfortunately my correspondents are right as to the present; but they are wrong as to the past. I say 'unfortunately,' because it shows that the ancient street names of Stirling are being allowed to pass away, or are being modernised, to the detriment of the historical interests of that most fascinating burgh. Stirling *had* a High Street. It was at the head of the High Street that, in the thirties of last century, the ruins of 'Mar's Work,' that curious palace, were still to be seen, and in the middle of the High Street then stood the town-house of the burgh. In Stirling the authorities might do worse than carry out a suggestion once made in Brechin that the ancient, as well as the modern, names of the streets should be painted up to keep them in remembrance. As all visitors to the old towns of Belgium know, duplicate names of streets were often shown there—in modern French and in the old Walloon dialect; and they added to the interest and the charm of these ancient places, over the fate of which we mourn so much to-day. I am not sure that Brechin ever, in any instance, carried out its own suggestion—I have never seen duplicate names of streets in that little town—but the visitor can easily see that Brechin has not modernised all its ancient and suggestive street names. Like Elgin, it still has its Maison Dieu Lane—although not quite correctly painted up (it reads Maisondieu)—to remind us of the kindly hearts there in the old days as well as now:

> A record which together binds
> Past deeds and offices of charity
> Else unremembered.

An incidental reference in my last article to the ancient Bowl-gate, or Bowl Road, of Edinburgh has brought me not only letters but visits from esteemed friends—gentlemen from the capital who concern themselves with the historic past of the city—to whom the old Bowl Road was unknown. I have been asked so often for my authority for the existence of a Bowl Road in Edinburgh—the road leading to the public bowling-greens—that it seems in order to state that authority here. In Robert Chambers's delightful little volume, *Reekiana*, published in 1833, will be found a reproduction of Edgar's Plan of the City and Castle of Edinburgh, 1742, with the bowling-greens marked; and in John Spalding's *History of the Troubles*—all editions, but particularly the Spalding Club edition of 1850–51—reference is made repeatedly to the 'Bool-rod' of Edinburgh. Spalding was a quaint but an accurate historian, even in the matter of obscure street names.

I refrained in the earlier article from dealing with the designation 'wynd,' so common in the older burghs, but now disappearing with the straightening and the widening of streets, and I did so because I considered that the meaning of the term was fairly obvious. But there is evidently a desire to know something definite with regard to it. The derivation of 'wynd' is obscure, but there is little doubt it is the Middle English *winden*, to turn round, to twist, applied substantively to a narrow, crooked street. The strange thing is that in our best English dictionaries—they are very limited in number—the expression is always put down as 'Scottish,' and as meaning an alley in a (Scottish) town. Nowadays, indeed, its use is mainly confined to Scottish towns, but the expression came from England, and, as a glance at Dr Joseph Wright's English Dialect Dictionary shows, it is still in use as a street designation in the northern English counties.

In the older burghs the use of 'wynd' as a street designation takes us as far back as the beginning of our written history. It is always accompanied by some modifying expression. This may indicate situation, as in the Upper and the Nether Wynds of Brechin and Cupar, the Back Wynds of Glasgow and Aberdeen, the Castle Wynd of Stirling, or the Lossie Wynd of Elgin; it may imply the character of the street—for instance, the Windy Wynd of Aberdeen; often it is a feuar's name—for example, Downie's Wynd, Annan, and Bell's Wynd, Glasgow. The Mary Wynd of Pittenweem, St Mary's Wynd of Stirling, the Kirk Wynd of Hawick and other towns are all found in the region of the church, and are all ancient descriptive designations.

The most curious street name of this group that I know of is the Bobber Wynd of Cupar. It is an old descriptive name—spelt 'Bober' sometimes in the ancient titles, but there is no significance in that. 'Bobbery' is an old English expression denoting a noisy disturbance, and as the entrance to the Tolbooth and prison of Cupar is from the Bobber Wynd, this may be the origin of the name. Cupar is distinguished among ancient Scottish burghs for the retention of its historical street names. Its longest and finest street is the Bonnygate—the Beautiful Road; and the next best is the Crossgate—the 'gait' or road of the (Market) Cross, which stands at the head of the street.

The most puzzling street name in Scotland—perhaps in England as well—is Rotten Row. It occurred in many of the old burghs. We had Rotten Row in Aberdeen—often, as elsewhere, spelt Rattoun Raw and Rattenraw—well into the nineteenth century. Glasgow had the same; and I have notes of Rotten Row as a street name in Arbroath, Menteith, Ochterlony

(Forfarshire), Pittenweem, Sanquhar, Jedburgh, and as far as Somerset. The Rotten Row of London is the aristocrat of the family, famous all the world over.

Many explanations of the name have been offered, but none has been convincing. Mr Johnston of Falkirk, in his admirable and interesting, but not invariably accurate, *Place-Names of Scotland*, derives it from French *routine*, rendered 'common highway or thoroughfare.' This derivation is open, I hold, to instant and fatal objections. The name Rotten Row was common in the north of England, and is always associated with the Anglo-Saxon *Raw*. I know of no single case in which it was the 'common highway' in the sense of the main street; and, besides, that use of *routine* would be most unusual, I think, even in France. Often the suggestion has been made that it may be the *Route du Roi*, the King's Way; but, while that might answer for Hyde Park, it would hardly explain the Rotten Row of Sanquhar, or Pittenweem, or the east end of Glasgow. The German *reiten*, to ride, has been suggested, plausibly; but again we have to face the historical fact that these — with one great exception—were all little 'slum' streets, not more suited, or used, for riding purposes than the 'vennels' they resembled and adjoined.

Not every Scots town had a Trongate, although in the old days every one of them had a 'tron' of one kind or another, where goods were weighed for town's or other dues. Tron—from the Old French *trone*, a weighing-machine—was a public weigh-house, and the Trongate was the 'gait,' or road, of the weigh-house. In Aberdeen, although from the days of Bruce we had a tron (where actual stone weights were used till 1625, when iron weights from Flanders were substituted), we had no Tron-gate, for the tron was situated in a large space near the harbour, which took the name of Weigh-House Square. Glasgow and Edinburgh, as we all know, not only had a Tron-gait —the Tron Street—but in each case took from the tron the designation of a parish.

The street names of Glasgow offer a most tempting theme for discussion, but one or two typical examples must suffice.

I suppose the best-known street of Glasgow is Sauchiehall Street, the name of which embodies a curious error—not confined to Glasgow. When it was formed through the lands of Blythswood, in the later years of the eighteenth century, it was known as the 'Sauchyha' Road'—meaning the road to the haugh, or hollow, of the sauchs (willows); and the same idea is found in the name of the residence there, Willow Bank Gardens, of William Harley, the successful weaver, the first, I think, to develop that part of the city. Sauchieha' Street, then, is really Sauchiehaugh Street. In Aberdeen, one of our finest west-end streets is Fountainhall Road, formed near the Fountain-ha', the haugh, that is, where the town's water-cisterns were situated in the second half of the eighteenth century. Here, too, the error is permissible; at all events, it has to be accepted.

The only other Glasgow name I can discuss is the Candleriggs—properly, and formerly, the Candlerig. It is a good example of a supposed Scottish expression turning out to be really English. In Glasgow plans of the early years of last century this thoroughfare was set down as 'Candlerigg Street;' and we find, away still farther back, in 1668, that the town council determined to take down a tenement at the fleshmarket so that 'ane fair and commodious entrie be made ther to the Candlerig.' It was the 'rig,' or path (Anglo-Saxon, *hrycg*), where the candle-works began. The name was not applied; it grew up in the old natural descriptive way, like the Candlemaker Row of Edinburgh, and the less ancient, but still fairly venerable, 'Cannel Close' of Aberdeen (near the candle-works), over the closing up of which the town council of this northern city had recently to face a strong popular movement of opposition.

All the street names mentioned hitherto have been names within towns, and it was my object to deal with such only when I began these papers. But we must not forget that many of our country roads and lanes have names, or designations, that are also enlightening as to former historical conditions. Indeed, a 'street' need not be within a town at all. Many readers of these lines must have walked, or cycled, along part of Watling Street, or the 'Stanegate' in the north of England, where you are properly on a 'street'—a paved road, the *strata via* that gave us the very name—but where you may not be within sight of a town or a village for miles. There is a 'Hardgate' in many a county, English as well as Scottish, and it always tells of the hard, or 'made,' road, the highway, in many cases maintained for purposes of traffic by special enactments. Sometimes these country roads and lanes have personal designations, of interest to the locality only, as a rule. But there are exceptions. An old road in the moor of Arbirlot, Arbroath, is known as Heckenbois Path, a meaningless designation until you know that Hector Boece, the historian, the first Principal of King's College, Aberdeen, was born in that region four hundred and fifty years ago. Then you understand how living and permanent is the interest that attaches to our streets and roads and bridges, of which we have so many distinctive examples in this old historical country.

PETITE SIMUNDE.

PART II.

IV.

FOUR winters came and went.

France lay in the warmth of a late spring evening, like a stricken deer that has thrown off its pursuers momentarily, but is bleeding from a hundred wounds. Month after month she had endured the invader, and the cycle of years, instead of freeing her, had only deepened her agony. What had she left? The next attack might see Arras and her remaining coal-fields gone, the Channel ports captured, and then . . . Paris? . . . Paris?

Unperturbed, however, by any such thoughts, Petite Simunde—no one thought of her by any other name—was driving four cows home from pasture. The setting sun shed a kindly hue on her gingham garment that was neither a frock nor an apron, yet served as both. Nor was the mellowing sunlight unkind to her face, for the racial sallowness of her cheeks, accentuated by too constant exposure to the elements, was softened and shaded into a gentle brown. Her shoes, which were far too large, were in the final stages of disrepair. About the brow her hair was braided with a simplicity that was by no means devoid of charm. Her eyes—but there she was really French. Simunde had never been farther from the village of Le Curois than the neighbouring town of Avesnes Le Comte (unless one counts the momentous occasion, a year after her birth, when she was taken to Arras for exhibition before an esteemed and wealthy relative, who was so little impressed that he bequeathed his entire estate, consisting of eight thousand francs, to a manufacturer of tombstones); but a French woman does not acquire coquetry—she is born with it. Even in church Simunde would cast such languishing yet mischievous eyes upon the curé himself that the poor little man, who had never liked Latin at any time, used to stammer and mumble his orisons like an over-conscientious penitent at confessional.

When her two brothers went to war, Simunde, who was then sixteen, assumed their tasks in addition to her own, in all of which she had the able direction of 'madame,' her mother. Between them they performed a day's work that would have exhausted two husky labourers. As is the custom in most of northern France, their home was not on the farm, but in the village, for one of the first essentials of existence to a Frenchman is companionship. On the outskirts of Le Curois, just on the hill, there was a great château, beautifully, gloomily aloof; but in the one street of the village itself pigs, cows, hens, and their offspring wallowed in mud and accumulated filth.

It is difficult to know which is the more striking—the French peasant's stoicism in the presence of war, or his indifference to dirt.

On this particular evening in May of 1913 Simunde was frankly regretting the absence of men. Not that she had ever been in love or known the rapture of wandering in the moonlight with a man (France is almost the only civilised country remaining that has not relegated chaperons to the realm of fiction); but she wanted to use her eyes on something more susceptible than a cow or a curé. It was spring, and she felt pretty, and when a woman is conscious of her own charm she seldom wishes to prove miserly with it.

She had just run across the road to convince a cow of its loss of the sense of direction, when she heard the neighing of a horse. Glancing behind her, she looked directly into the eyes of a mounted British officer, whereupon that gentleman brought his steed to a standstill.

'*Bon soir, mademoiselle,*' said he.

'*Bon soir, monsieur,*' she answered demurely. Her eyes were lowered shyly, and her fingers played over the stick she was carrying, like a flute-player caressing his instrument. The officer bowed slightly and tried to recall his French vocabulary, though it must be admitted he was never loquacious in any tongue when conversing with a daughter of Eve. As for her, since it is a woman's rôle, she waited. Would he speak again, or would he pass on, leaving the memory of yet one more meeting with a gentleman of adventure—one more roadside drama in which the dialogue consisted only of an exchange of salutations? Most men who have returned from France will recall for years to come how, a few kilometres back from Hell, they often caught a glimpse of two dark eyes and a tender smile. Just that and—

'*Bon soir, mademoiselle.*'

'*Bon soir, monsieur.*'

Commonplace, perhaps, in the telling, but in France it was the commonplace that became romance.

A smile crept into the officer's eyes, which were blue and kindly, though they had a glint in them—something like metal—a look that a mother always noticed first when her son returned from the line.

'*Où est le village?*' he ventured.

'Le Curois?'

'*Oui!* Le Curois.'

'*Mais, monsieur*'—her eyes widened and her hands indicated the village dwellings—'*c'est ici Le Curois!*'

He breathed deeply and ventured again: '*Connaissez-vous un billet pour dix officiers?*'

He felt rather pleased with the sentence; it was true, he had intended to get accommodation for eleven officers, but it was moderately accurate for a foreign tongue.

For answer Simunde led him, preceded by the four cows, to her domicile. 'Madame,' like all French housewives, had received billeting instructions in the first year of the war. In conjunction with her neighbours on either side, she speedily arranged accommodation for eleven officers in their cottages, and for the officers' *domestiques* in the barns.

One hour later the guests of war, their battalion having come out for a rest, were dining comfortably in the home of Petite Simunde; while a sow, attended by ten small pigs, snorted approvingly outside the door.

Less than an hour afterwards Private Des Rosiers, acting as temporary batman to Major Douglas Campbell, was sitting on a chair in the farm-yard, in the glittering moonlight, regaling Simunde and her mother with grossly exaggerated stories of the mining country of Cobalt. He told them of his misdeeds, not in humility, but with much braggadocio, and his auditors listened, lost in gesticulatory admiration. Simunde was thrilled from her ill-shod feet to her braided brow. Jacque Des Rosiers was the first really wicked man she had met, and, woman-like, she was fascinated; also, he had nice teeth and flashing eyes.

The picture of a young officer on horseback, whose brown hair was almost red, and whose humorous blue eyes had a glint in them like metal, faded as completely from her mind as the memory of the sunset that had thrown its spell upon them.

Unromantic? . . . *Que voulez-vous? C'est la guerre!*

V.

Two weeks passed, during which period the placid fields about Le Curois resounded to the shouts of Canadian troops rehearsing open warfare (for rumour had it that the hour was almost at hand when Foch was to release the forces of retribution). For pastime, the troops played baseball and held field-days of many and varied sports. Whatever they did, they shouted lustily and continuously while doing it, for they had mastered one elemental truth—that nothing can be accomplished without intensity.

Des Rosiers explained baseball to Simunde, who enjoyed the description without allowing it to interfere with her innumerable domestic and agricultural duties. It was quite true that Jacque Noir had never played the game or even mastered its rudiments, but he had the narrator's instinct that rises above mere accuracy of detail.

Every evening he accompanied Simunde to the pasture-land, and together they guided the patient cows homeward. When darkness set in and Simunde's tasks were finished for the day, he sat with her in the farm-yard and told lurid tales of northern Canada—to all of which 'madame,' whose tasks were never finished, lent a delighted and adjoining ear.

He pictured to Simunde the snow—how it filled the rivers till they ran no more; how it covered the great pine-trees until, as far as eye could see, there was nothing but white; and he told of the wind that was never still. And she listened, as only a Frenchwoman can listen, with every emotion he called forth registering in her face, as clouds racing across the sun will throw their shadows on the ground.

Just before the battalion was to return to the line, the second-in-command, Major Douglas Campbell, was called to Divisional Headquarters for a prolonged conference. As a result Des Rosiers was returned to his company for duty, though he contrived to spend every free hour with the little belle of Le Curois. As the time for parting approached with cruel celerity, he talked less and took to long spells of moody silence. His heart had been melted as completely as the snow in his Northland is thawed by the sun in spring. As for her, the little artifices of gesture and the ceaseless coquetry of the eyes became less noticeable. For the first time in her life she felt the anguish of a woman's tears; Petite Simunde's guileless and innocent heart had been won by Jacque Des Rosiers, the bad man of western Quebec.

In a tempest of passionate ardour, but with becoming deference, he addressed his suit to the mother, who promised consideration that night, and her answer on the morrow.

It was hardly twilight when he wandered back along the main road towards the fields where his battalion was bivouacked. Full of the picture of the little woman who had bewitched him, he failed to notice the approach of an exceedingly smart young staff-officer, ablaze in a glory of red and brass. With unseeing eyes, Des Rosiers looked directly at the young gentleman, but failed to make any sign. The officer, fresh from a staff course in England, stopped him with a sharp command.

'Just a moment, my man. Don't you know enough to salute?'

Des Rosiers awoke from his dream, came to attention, and saluted very badly.

'I no see you, sair,' he said.

'Don't lie to me,' snapped Brass Hat (who wasn't a bad chap on the whole); 'of course you saw me. Damn it! you looked right at me. It's fellows like you who give the corps a bad name.'

He was wrong there. It was the presence of several thousand men like Des Rosiers that had given the Canadian Corps a wonderful name—but let that pass, as Jack Point would have said.

The element of tragedy seldom enters the lists of life with a fanfare of trumpets. It steals in

unobtrusively, like a poor relation. It comes in the garb of the commonplace, or masked in triviality or gaiety. One is unaware of its presence until it throws off concealment and points its yellow fingers at the throat of its victim. What dramatist would have read tragedy into the absurd tableau presented by a slouchy French-Canadian soldier and a youthful staff-officer? Yet, as inexorable as Fate, it was approaching Jacque Des Rosiers, and only a few yards away, hiding its skeleton's grin behind the mundane countenance of Sergeant Smith, returning to the battalion after a day's work in the orderly-room.

The officer, who had just made a move to resume his walk, noticed the sergeant, and called him over.

'You are from the same battalion as this chap?'

'Yes, sir.'

'Report him to his company commander for failing to salute an officer. Impress upon him that I would not have made this complaint, but your man looked directly at me, and—well, discipline must be maintained, especially out here.'

Whereupon, feeling that he had rendered unto Cæsar the things that were Cæsar's, the youthful captain sauntered on to the château occupied by Divisional Headquarters, and dined with extra zest. And lest it be thought that this narrative treats him unkindly, let it be written that, three months later, he was badly wounded while performing a very gallant action. He was a professional soldier, somewhat lacking in psychology; that was all.

A little later Private Des Rosiers was arraigned before his company commander, a gentleman who was neither a soldier nor a psychologist. The heinous crime of passing an officer without acknowledgment was laid to the charge of the battle-worn and love-lorn villain from Quebec.

'What have you got to say for yourself?'

Des Rosiers said it. The officer shook his head.

'It 's not good enough,' he said. 'You French-Canadians seem to think there 's one law for yourselves and one for everybody else. You throw all your comrades down by deliberately insulting an officer—a staff-officer, who reports it to the G.O.C., and there you are. We 're known as a bad battalion just because of a few slackers like you. Put him on the horse line picket for two nights, and confine him to camp during the day.'

The prisoner started. 'Sair,' he said, 'I can no be here to-morrow night. *C'est impossible.*'

'Oh, is it emposeeble?' answered the officer, who prided himself on a gift of neat retort. Des Rosiers's eyes protruded to their utmost.

'By Gar!' he cried, 'and nex' morning we go back to the line *encore*, yes?'

'Well? Have you any objections? If so, I am sure the divisional commander would appreciate hearing them.'

'Ah, but *monsieur l'officier*'—his hands were stretched forth in an agony of appeal—'Petite Simunde, she wait for me. I promise to come—I no come—it is terrible!'

The judge in khaki laughed.

'I am fed up with the stories of you French-Canadians and your village sweethearts—and, confound it, stop waving your hands about!'

'Standt'attenshun!' bellowed the sergeant-major.

'Consider yourself lucky to get off so lightly, my man.—That will do, sergeant-major.'

'Escor' a'prisoner—ri' tuh—qui' mawch!—Lef' ri', lef' ri', lef' ri'—Pawty, ha't!—Report to horse line N.C.O. right away.—Escor', dees-mi'!'

Rather late for mess, by reason of holding orderly-room at an unusual hour, the company commander sat down to dinner with a glow of virtue in his bosom. He had been a lawyer-politician in a small Ontario town, and it pleased him to find that he had not lost the art of Buzfuzian browbeating.

And through it all the Fates had woven a thread of tragedy about the life of Jacque Noir, using in their scheme of things a non-psychological staff-officer, a non-military and non-psychological company commander, and a sergeant whose name was Smith.

'There is humour in all things,' said Jack Point. Gilbert would have been equally correct if he had substituted the word 'tragedy.'

Before sundown of the next day the prisoner was reported absent, and when the battalion marched away for the line Jacque Des Rosiers was not with it.

(*Continued on page 454.*)

THE QUININE HABIT.

THE value of quinine in cases of fever has been known for nearly three hundred years. Its virtues were first brought to light in Europe by the Jesuits, one of the brotherhood having been cured of fever in Peru by administration of cinchona-bark by a South American Indian. There is also a well-authenticated instance of the medicinal use of cinchona-bark for fever in 1638 by the Countess of Chinchon, wife of the Governor of Peru; and the name given to the bark is said to have been derived from the connection of this lady with the remedy. Sir Clements Markham, who in 1860 superintended the first consignment of these plants from South America to India, thought that the term should, therefore, be written *chinchona*.

The trees in the Government plantations in India now number several millions. The culture has spread over a wide area in southern India and in the Himalayas, and the plantations are highly prosperous and remunerative.

In 1870 the Government of India had to purchase eighty one thousand six hundred ounces of sulphate of quinine to meet its requirements; it is now able to satisfy its needs from the febrifuge prepared at its own plantations in India, and to distribute annual supplies of tablets free of cost to the inhabitants of the most malarious districts. The cheapening of this valuable remedy has doubtless done good, and has helped to reduce the suffering and the mortality caused by malarial fever. It is said that in malarious districts persons have been exposed to miasmatic influence without danger after taking a dose or two of five grains of quinine once or twice a day.

In the smallest doses quinine is purely tonic, in larger doses it is a stimulant, in big doses it acts as a sedative, and in excessive doses it is poisonous. Large doses sometimes produce deafness, and act injuriously in all inflammatory states of the mucous membrane. A doctor who says he has had six years' experience writes of the difficulties encountered in cases of those accustomed to daily prophylactic doses when they really get fever. It would seem that there is always this danger, that people may acquire the 'quinine habit' just as they do the 'opium habit,' the 'morphia habit,' or the 'whisky habit.'

In some parts of Austria and Hungary arsenic, which is well known as an irritant poison, is regularly eaten by peasants to give plumpness to the figure and beauty and freshness to the complexion; whilst it is also said to improve the breathing and give length of wind, so that steep and continuous heights may be climbed without difficulty or exhaustion of breath. The habit soon becomes a necessity of life, and the habitual user will die if it is not continued, although the ordinary amount eaten daily would poison any one unaccustomed to arsenic.

There are comparatively few things to which the human body cannot accustom itself by constant use. Some of them are good things, like quinine, which in malarious places in small doses doubtless has a beneficial effect in warding off attacks of fever. The danger is, however, that the user will take to increasing his daily modicum, and then, when he requires quinine as a medicine and not as a prophylactic, will find that he has to take a much larger dose if it is to be of any service, and that may bring on deafness or otherwise act injuriously. We should all guard against using 'too much of a good thing.' Moderation in everything would seem to be the great secret of keeping one's health, and the daily use of any medicine as a preventive, unless it is taken by medical advice, is a habit which should as a rule be avoided.

A great deal may be done in the way of drainage and judicious planting to improve malarious localities, and this is certainly better than swallowing medicines of any sort or kind. The common sunflower plant is said to have a very beneficial effect in improving malarious localities. Many police-stations in India have gardens, and it would be easy to have all of them provided with this cheap and luxuriant plant. The seeds are largely eaten in southern Russia, are of agreeable flavour, and are also a valuable food for poultry. The 'Jerusalem artichoke' belongs to the same genus. The tubers are rich in inulin and sugar, and the plant deserves attention at the hands of cultivators. The effect of eucalyptus-planting in Italy is well known. The tree grows well on the hills in India, and is not unknown in several stations on the plains. It should certainly be tried at every Indian police-station.

After American success in abolishing malaria in the Panamá isthmus, we have no reason to despair of India, although the problem there is so very much bigger. If we achieve success, it will be by sanitary measures, and not by dosing people with medicine. And outside the larger Indian towns sanitary measures, draining, and judicious planting can hardly be said to have been tried. Distribution of quinine tablets is no doubt cheaper, and statistics show that in many provinces deaths from malarial fever have diminished in the last three years, so that quinine may be credited with having done some good. There are no statistics, however, to show the numbers of people who have suffered from deafness or a disordered stomach from having acquired the 'quinine habit.' We have heard of one doctor in the Deccan who last year, because fever was prevalent in his station, prescribed two to five grains each to be taken daily by every man, woman, and child in a whole household, consisting of five Europeans and some fourteen or fifteen Indian servants. Surely this was giving 'too much of a good thing' in the way of a prophylactic.

Those who have spent many years in the East know that a good deal of the sickness Europeans suffer from is brought about by their mode of life, the food they eat, and the times of taking it, often more adapted to a temperate climate than to a tropical one. It is the fashion in most Indian households, where doctors are commonly paid by the month, to call them in on the most trivial occasions. In the districts people frequently have to doctor themselves, as well as any of their servants who may happen to be ailing. In all except really serious cases the old adage about a man over forty being his own best doctor is as true in India as in Britain. To keep one's health in either country moderation in everything is the golden rule, but it is perhaps more absolutely necessary in a tropical climate than in a temperate one.

JOHN BROWN.

CHAPTER XX.—*continued.*

'THE next prisoner!' demanded the president, when the table had been restored to its feet and the papers had been tidied up.

Ginger Thomson was marched in, guarded by an escort, who were armed with wet mops. We knew Ginger!

'Sergeant Ginger Thomson, No. 1 Company, —th Cadet Battalion, you are charged with (1) Posing as a woman-hater; (2) Declining to wash; (3) Joy-riding in a Ford car.'

'Evidence, please, Mr Brown,' ordered the president.

'Sir, this youth, for the past two months, has been posing to all as an enemy of the opposite sex. In a recent discussion he declared that women were soulless, inconstant, mercenary, and loved us only when we had chocolate or plenty of the golden goblins. We believed him to be sincere, and he received homage as the great monk of our platoon. Other remarkable attitudes in controversy convinced many of us, however, that this brilliant but erratic gentleman was simply pulling our legs. By accident we discovered that he is an ardent admirer of the beautiful lady who dispenses ale and bitters at the local hotel. In fact, our agents have procured a gramophone record of a conversation with this fair lady. This is the record,' I added, turning on the gramophone, the record of which had been faked for the occasion.

'Edison Bell Record.'

Gur-r-r-Gurr-r-r-r.

'Hello, old girl! how are you?'

'What cheer, Ginger?'

'Gin and ginger, quick—awful thirst, old girl! Bring it up to the private room.'

'Right-o, dearie!'

Gurr-r-Gurr-r-r-Gurr.

'There you are, Ginger. . . . Don't! . . . The master 'll hear us. Oh, my hair! . . . You've broken my comb. You mustn't kiss me. Oh, Mr Thomson! . . . Oo'd a' thought it?'

Gurr-r-Gurr-r-r-Gurr.

'You're a dear old thing!'

'And you're a giddy boy. . . . You mustn't! . . . If the master sees me sittin' on your knee, there 'll be trouble. . . Ah, don't!'

Gurr-r-Gurr-r-r.

And the record ended, just in time, for Ginger let fly and kicked the gramophone to the other end of the room.

'Tie him up! Tie him up!' ordered the president.

It was a tough job, but we managed to get his feet tied, then stood him up before the 'beak.'

'Carry on, Mr Brown,' commanded Nobby.

'That record, sir, absolutely proves that this man deals in terminological inexactitudes.'

'You mean he is a common or garden chancer?'

'Yes, sir. The second charge is equally serious. He has an objection to soap, and loathes water like a Bolshevik.'

'Has he no soap in his possession?' asked a member.

'Oh yes, sir, a small piece, which he received three years ago on enlistment. This is it:

GINGER'S SOAP.

1915–1918.

'Note the size. He keeps this for kit inspections, and I understand he is to make it a family heirloom after the war.

'Now for the third charge—"Joy-riding in a Ford." During his leave he was seen several times in a palatial petrol tin-can, accompanied by a fair lady. The lady was holding his hand, and the car was doing a cake-walk down the road. Several roosters and pet-poodles are at present in the mortuary. Two maiden ladies demand the prisoner's life, and the town council have sent in a bill for two policemen and three lamp-posts. That 's all, sir.'

'Very serious! Very serious!' muttered Nobby, chewing his Ole Bill moustache. 'What about his character?'

'He lost it at St Omer.'

'Oh!'

'Found by the A.P.M. (Assistant Provost-Marshal) singing "Home, Sweet Home," on the top of a lamp-post.'

'Then he is hopeless?'

'Absolutely, sir.'

'Ginger, you are a bad lad,' commented the president. 'Have you anything to say?'

'Yes, sir,' shouted Ginger, seizing a mop out of the hand of one of the escort and charging full tilt at the president. He caught Nobby in the chest and heaved him over in excellent style. But the valiant president arose and shouted, 'Duck him! Duck him!'

Ginger was seized and promptly heaved into the company bathroom. 'You are a lot of blighters,' said he, on emerging. However, Ginger was a sport, and took it merrily. When he returned to the courtroom he exchanged the rôle of prisoner for that of prosecutor.

. . . . . .

'Next prisoner,' ordered the president, after shaking himself and wiping the traces of the mop off his face.

Tosher Johnson was marched in, guarded by

two hefty lads. We were taking no risks with the wild Canadian.

'Corporal Tosher Johnson, No. 1 Company, —th Cadet Battalion, you are charged with (1) Worshipping the almighty dollar; (2) Pulling a railway alarm-cord; (3) "Swanking it" in Glasgow.'

'Evidence!' commanded the president.

'Sir,' said Ginger, 'the accused is a Canadian, and therefore a mystery. He blew in about 1915 from out West, and reckoned he was *the* man to win the war. His career, like that of all back-blockers, has been most varied and adventurous. He commenced life eating pork-pies in Nova Scotia. At the age of twelve he was assistant to a negro medicine-man, who sold corn-cure at a penny a time. The corn-cure, I may say, was made out of wagon-grease stolen from the C.P.R. Having done in the son of Ham for about a hundred dollars, he went West, where he started a shoe-shining parlour and a horse-betting booth. Next he was seen in a fat-reducing advertisement; after which, he floated a company to supply the ladies of Winnipeg with imitation busts.

'In these ventures he was, like all Canucks, highly successful, and therefore plunged into real estate. This is a get-rich-quick scheme. Tosher was a star-turn. He took double-page advertisements in the home papers, and sold corner lots to dukes, commoners, and simpletons. When these "duds" went out to stake their plots in Paradise Alley, they discovered their land was in the Arctic regions, and tenanted only by Eskimos. What did Tosher do? Why, he simply apologised, and said his clerk had made a mistake by *turning the map upside-down!*

'Since then he has had a dollar for his crest, a dollar for his god. He has got money in everything from corn-plaster to chewing-gum, and he reckons to fizzle off this 'ere planet (as he calls it) with about a hundred thousand dollars earned while chewing cigars and drinking cocktails in Montreal, Toronto, and the mixed-bathing cave up in Banff, Alberta. The fellow 's a marvel!'

'Look here, Mr Thomson; this is a court-martial. Evidence! Evidence! We're not here to get the story of how we all lost our money before the war.'

'Very good, sir!

'The second charge is, "Pulling a railway alarm-cord" while on leave. Apparently the accused got into the company of a simple old Scottish gentleman, who was accompanied by his wife and a rather charming daughter. Tosher took the corner seat like a conqueror; and muttered, "It was real fine to get away from the blasted Boche."

'"Are you just from the front?" the old gent inquired.

'"Yip!" he said, lighting a twopenny Havana.

'"You 're a Canadian, aren't you?"

'"Sure!"

'"You fellows are winning the war."

'"I guess so."

'And in this vein he went on. He spun them yarns as tall as a wireless mast, relating how he had missed the V.C. by going round the wrong corner, lost the D.S.O. because the durned officer wasn't there, and was recommended by Joffre for the Legion of Honour for holding up a German army corps with a Woodbine and a six-shooter. These poor innocent mortals were bewildered. The accused is greater than Louis de Rougemont. He then showed them nicotine-stained fingers, and said it was blood; his vaccination-mark was a cut by a shell; and a birth-mark on his chin was a bit sliced off by a prince in the Prussian Guard.

'The old gent and his party were thrilled.

'"But say, old friend, have a cigar to chew," remarked Tosher.

'"Thanks, I will."

'Tosher opened his case, but found it was empty.

'"Sorry. I guess I'm run out. Where can I get some?"

'"Not till Carlisle. We have two hours to go yet."

'"I reckon we pass other bum towns *en route*."

'"Oh yes."

'"Well, I guess I'll call the guard," he said, jumping up to the alarm-cord.

'"You can't pull that—you 'll be fined."

'"What? *I'm a Canadian!*" And he pulled the cord. The brakes went on with a bang, and the old guard hurried up along the line.

'"Say, old Father Time," shouted Tosher.

'"What 's up?"

'"Stop yer old bus at the next bum town. I want some cigars to chew."

'"I'll shove ye in jail!" roared the guard.

'"Easy, old child."

'"What 's your name?"

'"My mother christened me Johnson."

'"You 're a Canadian, I suppose?"

'"Yip!"

'"All right. I'll show you I'm a Scotsman."

'Tosher didn't get the cigars. He got "Five quid or twenty-one days" at the Police Court.'

'What did he say to that?' inquired the president.

'Oh, he reckoned it was durned stiff that a bloke who was winnin' the war couldn't get out of an express for cigars.'

'I see! I see!'

'The final charge, sir, is, "'Swanking it' in Glasgow." He had a maple-leaf in his cap about the size of a young fir-tree, smoked evil-smelling cheroots the size of a submarine, stopped the traffic when he wanted to cross the road, and

tried to elope with all the best-looking women in the town.

'"Who are you?" asked an interested lady.

'"Tosher Johnson, real prime, and the best kid out of Tauruntoe."

'"All right! There's my card. Call and see me to-morrow."

'When Tosher got there her father was waiting for him. *The old man was a brain specialist.* That's all the evidence, sir,' concluded Ginger.

'Johnson,' said the president, 'your career and exploits resemble those of the Arabian Knights and the adventures of Baron Munchausen. What have you got to say?'

'Well, boss, I guess Ginger is the brother of Ananias, and the uncle of the Kaiser. He's just real good at the story-faking business, and after the war we'll get him to run the *Real Estate Noos*, and the selling of corner lots in Greenland and Hudson Bay. As for the "Canuck" being top-dog in the lead-swinging business, I reckon that's fizzled out. If Oxford can pan out liars like this 'ere child in the future, we from out West will have to take a back-seat in the boosting business. Why, the fellow 'ud make his pile hanging around a Calgary beer-bar, telling them how to make a nigger into a white man.

'In this old country you are a long-faced lot o' wowsers, tied up by regulations and B.C. institooshuns. When you want to meet a prime girl, you need an intro.; and if you're keen on eating with a duke, you've got to show your birth-certificate. It makes me real tired to walk around and see your orders: "Keep off the Grass;" "Keep to the Right;" "No Smoking Allowed;" "Private—Trespassers will be Prosecuted."

'That's your whole durned system. You ain't a free-thinking crowd; you're a bunch of kids kept in order by bamboo canes and laws made by Moses. Even your little rabbits, that we gives to our dawgs, are protected by ancient statoots with about a ton of sealing-wax hanging on the tail.

'As for your women, you don't know how to make them smile. They're the best-lookin' kids on the planet, and they're just real glad that we wild men are over to tickle them up and make them dance. Say, boys, but you are just dead slow. Why, I can get anything in petticoats from an heiress to a barmaid by giving them a Tauruntoe glad eye, and saying, "Come on." You fellows are the fag-end of an old system, and if it weren't for us prime hustlers from out West, you'd be losing this fightin' business.'

'Look here, old cow-punching Bill, this isn't a bally entertainment. It's a court-martial. You're on trial for your life. What have you got to say?'

'We never says anything out West.'

'What do you do?'

'Shoots!' And Tosher banged three rounds of blank ammunition in the air.

'Seize him! Seize him! He's an outlaw and a desperado,' roared Nobby!

We rushed Tosher, but he let fly at his escort, and caught Nobby in his powerful arms and dumped him out of the window.

Ginger then caught the Canadian's legs and threw him.

'*Kamerad! Kamerad!*' shouted Tosher.

'All right, we'll let you off, if you stand drinks.'

'Sure! Come on, boys;' and off we went to have another jolly hour at the canteen.

Tosher was a sport, and he kept us laughing all the night.

There's nothing like the army—for jolly good fun!

(*Continued on page 471.*)

AUSTRALIA—THE SPIRIT OF THE BUSH.

No one yet has ever seen her
When her beauty she unveils,
As the dusky shadows lengthen
And the sunset glory pales.
Only sometimes, through the gum-trees,
In the silent twilight hush,
We may glimpse her, shyly peeping,
Our sweet spirit of the Bush;
Sometimes, 'mongst the golden wattles,
As the sunlight ripples there,
I have seen it flashing, glinting,
On the yellow of her hair.

In the violet shades of night-time
I have seen her soft eyes shine,
Like the tender eyes of angels,
With a light of eyes divine;
Or among the water-grasses,
Where the idle breezes dream,
I have seen them through the water,
Two reflected stars agleam.
'Mongst the fruit-trees in the orchard,
On the margin of the creek,
Nestling in the arms of autumn
Lies the brown curve of her cheek,
With the red of warm lips smiling—
Sweetest smile that lips have worn—
Love and hope and gladness in it,
And the radiance of the morn.

Never grows she old or weary;
Naught she knows or dreams of death.
Like the scent of brown baronia
Is the fragrance of her breath.
Many-toned and sweet her voice is,
Laughing through the kissing leaves,
Crooning in the swaying she-oaks,
Sighing sadly as she grieves
When the bleak winds come and gather
All the flowers she loves to tend—
Early blossoms on the fruit-trees,
Violets in the river-bend;
Glad, exultant with the spring-time,
Rich and full with summer's love,
Low and mellow with the autumn,
When the ripe fruit hangs above.

AN ENGLISH GIRL'S ADVENTURES IN TURKESTAN.

I.—TASHKENT DURING RAMAZAN.

By FLORENCE FULLER-NEARY.

I.

OUR first impression of Tashkent was an exceedingly happy one, for we arrived at half-past six on a sunny July morning, after six weary days in the train from Moscow. The air was still fresh and exhilarating, the nights often being cool, though towards noon the city is oppressed with tropical heat. Life was just stirring, and we saw a few laden carts coming in from the country, and troops of about twenty camels roped together in single file, in the charge of one driver seated upon the first.

The Hotel Regina, where we stayed, fronts the street at a busy corner; but the absence of cobbles, heavy wagons, and motor-cars makes the noise of the passing crowds soft as the pattering steps of unshod beasts. My room had two big windows looking out on to the scene, and it was difficult to tear one's self away from the strange sights. Strings of camels, stately Sarts in flowing robes, market-carts with wheels disproportionately large, pedlars, beggars, passed in endless procession.

One of the pedlars, seeing me look out of the window, came up smiling, and offered me luscious peaches and apricots and plums, laid out on dewy leaves in a flat basket which he carried on his head. Fruit is plentiful in Turkestan, and even though he knew I was a newly arrived visitor, the price he asked was ridiculously small. I bought up a good portion of his stock for a few kopecks; but when I gave him one of the stamps which had been the small currency in European Russia since the outbreak of the war, I could see that the paper meant nothing to him, and he explained in his weird dialect of Russian that he must be paid in silver. One never saw metal coin in Russia at that time, and it was with the utmost difficulty that I persuaded him to accept a rouble note, for which he unwillingly produced the change in silver. Nothing showed more clearly how little Turkestan had been affected by the war than this ignorance of paper money and the survival of the metal coinage.

By nine o'clock the sun was high and the heat intense. However, we went out into the shady streets of the new (or Russian) quarter of the town. This part of Tashkent is clean and well planned. Every main thoroughfare is an avenue of tall acacias, and on each side of the road, as one sometimes sees in Holland, runs a canal. But here the canals, fed from the Salaar, a swift-flowing river, are crystal clear, and the roads are washed down several times every day with the clean water.

The heat became unbearable, and soon there was nothing for it but to return to the hotel. The whole town grew drowsy, and there was hardly any one in the streets. From one to five every afternoon all shops and offices, public as well as private, are shut; the world retires to rest, and the streets are quiet as in the hours that follow midnight.

II.

Tashkent is mainly a Mohammedan city, and as we had arrived during the feast of Ramazan, when the true believers fast till sundown and feast through the night, we were determined to explore the big Mohammedan area.

We set out at dusk, and as we were unable to find a carriage, boldly entered the electric tram that penetrates the native quarter. The native population, even to the most sympathetic European, appears to greater advantage at a distance. We never repeated the experiment, but in future were careful to order a carriage beforehand at the hotel.

When we alighted from the crowded and evil-smelling tram-car, dusk had fallen and the feast was being prepared. Boys were moving about the lamplit verandas that stretch out over the canals, which even down here bordered the main roads. Every house has a veranda, and the room behind is open to the street, like the stage of a theatre. Not a woman was to be seen, but some men were already on the verandas, lying on divans and cushions, smoking opium, and drinking a kind of green tea called *kok-chi*, which is taken without milk or sugar or lemon. The boys flitted in and out noiselessly, carrying plates of cut-up sweetmeats and green water-melons with red flesh. The men would pass the whole night there, falling asleep where they lay. The streets were narrow and winding, and the moving stream

 [*All Rights Reserved.*]

under the overhanging verandas was black and sinister.

Sometimes we would emerge from the dark streets into squares with gardens hung with Japanese lanterns, which threw shadows on trees and flowers and tiny jet fountains. It was not yet dark, and there was a strange unreality in the fading light and the faint rays of the paper lanterns. I felt a sudden hatred for this place; it was all so small and tinselly, and yet it seemed as though some malevolent power were lurking there, and waiting to break through and shatter these gaudy trappings. Evil djinns seemed to hang in the air, and gibber among the trees and in dark places. And through it all was a disquieting familiarity, as though I were returning to some forgotten horror of babyhood, or entering in waking moments a land of haunted dreams. The sight of these people, the winding streets, the distinctive odours, the little squares with the Japanese lanterns, lacked the element of surprise. I came upon them with the apathetic anticipation of one passing through the familiar places of an unhappy childhood.

Once I saw a veiled figure hurrying along a narrow street, clad in black, and seated on a donkey, led by a small boy. I had imagined such a shadow, and now it had materialised, I looked at the veiled woman as one would gaze at some expected ghost flitting down the corridor of a haunted castle. She stepped so naturally into the setting where I had awaited her coming, and yet the sight of her passing down the winding street and disappearing into the gloom caused a cold depression to creep over me, and increased the unreasoning repulsion that was mastering my senses. The silent figures on the verandas of the larger houses, the laughing faces in the street, and the robed forms stalking down the alleys had no relation to human beings, but were like devils, hostile and steeled against pity. As yet it seemed that, like creatures in a dream, they had not seen me; but a dread came that one of them might at any moment awake to my presence, and that then they would beset and torture me.

At length I could stand it no longer, and I asked my companion to return to the hotel. Soon we were in wide European streets, with windowed houses. The nightmare of the East, with its alternate glare and darkness, was far behind. We had fled to ground where its evil could not pursue. It was like passing out of some fetid Satanist meeting into the quiet moonlight.

I cannot explain this weird repulsion, which never returned, though subsequently I made several visits to the native quarter; and now, in the damp Northern winter, as I write down these experiences, I look back with longing to the gorgeous brightness, the colours, the light, the laughter, of those far-off Eastern towns. Perhaps it was the Western woman's instinctive horror on finding herself in a land where men are the enemies of women, regard them as no more than chattels or slaves, and subject them to a mechanical and soul-destroying oppression.

III.

I woke several times that night, and could hear through the open window weird monotonous music, reminding me that the unreal scenes that I had witnessed were still in progress, not a mile away. There was a regular beat of drums, mingled with wailing instruments never heard in the West.

But with the coming of day and the cessation of this music, the spell was broken once and for all.

We spent the morning in the shop of a wealthy Sart merchant, who lived on the border between the old town and the new. Hardly more than the door seemed to front the street; but behind, the high room—lit by a lamp suspended from the ceiling—expanded, and we found it closely packed with rich stuffs and Oriental ware of every variety. He showed us silk bed-spreads, and scarves, and Sart dresses, and heavy bracelets of gold and jade, worn by native women, and fans, and vases, and Egyptian curios. We passed several hours there, and came away with our carriage laden, our purchases including two of the inimitable Bokhara carpets.

Business was conducted according to the immemorial custom of haggling and beating down prices. I longed for one piece of Sart embroidery, gold on crimson silk. The merchant first asked one hundred roubles, and at last came down to fifty. Finally, never expecting an acceptance, I told him I had twenty roubles left, and he could take it or leave it. To my surprise, he flung the embroidery at me, saying that during Ramazan ready money was essential, and he must obtain it, even at a loss.

In spite of my assurances that 'I would not be silly again,' my companion insisted on spending the evening in the European quarter. The East was indeed very far away as we sat in a lighted public garden that might have belonged to any large town in Europe, and listened to a first-rate string orchestra, made up entirely of Austrian prisoners of war.

The new town is of considerable extent, well laid out, with fine buildings, the chief of which congregate about a great square, where stands a statue of General Kaufmann, who as Governor-General (1867–1882) added greatly to Russian Turkestan.

For me, the day at Tashkent opened with the arrival of the Sart fruit-seller, who came faithfully every morning, bringing on most days at least one new variety of fruit for me to try. He was a picturesque figure in his bright clothes of various colours that never seemed to clash. We became quite good friends, though his dialect would have been difficult even for a Russian to understand.

On the second morning of our stay in Tashkent we visited the old town by daylight, and

spent several hours rummaging about stalls and bazaars and little shops. Most of the goods were of inferior quality to those we had bought from the Sart merchant, but now and then we found a treasure—something genuine that had become mixed with spurious goods from Berlin and Birmingham.

There are several mosques with nests of white storks on their roofs. The birds are more interesting than the formal buildings, which are not very large, the domes and the minarets being all of a drab yellow colour.

That evening we drove out of the town to the river Chirchik, a swift mountain tributary of the great Sir Daria or Jaxartes, which flows into the Sea of Aral. The dusty road led through cotton plantations, and we passed two native villages, clusters of mean huts round a little mosque. The river has the swiftness of rapids, and its waters, between deep and wide banks, swirl angrily round great boulders. The wooden bridge is very narrow and rickety, and in mid-stream it turns at right angles to the left, and then after six paces as abruptly turns again towards the farther bank. Our driver told us that the bridge was not safe, but it looked as though it had been there a good many years, and the chances seemed heavily against this being the end of its existence. We decided to risk it, and crossed and recrossed without disaster. A half-moon was now floating high above us, and by its light we could see the dark Pamir mountains, one jagged peak towering above the rest, crowned with glistening snow.

IV.

We went down into the old town one evening when the feast was at its height. A reaction to my old repulsion had set in, and both of us were eager for another taste of the unique and unforgettable atmosphere of the East. We took with us, as guide, a Sart boy who lived in the town, and could show us everything worth seeing. We drove through a winding maze of windowless streets, and finally drew up at what we thought was the towered gateway of an immense mosque. But it was only an entrance to a large square, like a big bazaar. Here there was great noise and bustle among the crowds, where Europeans and Asiatics jostled together. The weird native music that I had heard every evening, soft in the distance, was now loud and harsh, rising above the jabbering voices of the crowd. All round was a line of stalls where dealers, some strident and excited, others sitting with Eastern immobility, sold wares of every kind, cheap jewellery, scarves and hangings, sweetmeats and fruits. At many places men were toasting over charcoal-fires pieces of mutton on wooden skewers. The passers-by bought readily, and ate the meat off the skewer as they stood in groups or moved on with the crowd. There were also men moulding little cakes with incredible deftness, and roasting them in pans over charcoal-braziers.

I felt no trace of the sense of malevolent gloom which had oppressed me on my first visit. Every one seemed in the highest of spirits, and friendly and harmless. They were very willing to talk to us, and the booth-keepers were the most winning of salesmen, persuading us to buy many things that even at the time we felt to be utterly useless. It was difficult to refuse, and impossible to do anything disagreeable. From one corner of the square we heard the most dismal howling, and on approaching and inquiring, we found that it was a singing competition. The competitors made the most extraordinary facial contortions, and produced curious noises from their throats, which to our ears had no relation whatever to music. The spectators, however, were much impressed, and evidently considered it very fine. To complete the strange medley contained in that square, there was a large mosque, and we saw grave turbaned figures making obeisance at the door before they entered.

We might have been transported by magic back through time to the great days of Baghdad and Damascus. It was fascinating to think that Haroun al Raschid might have wandered a spectator of just such scenes as we were witnessing. But the illusion was broken when we found a crowd fighting for admittance to a little hall where a cinematograph, brought to Tashkent for the feast-time, was installed. Sad it was to see these Orientals, in their flowing robes, crushing to see films of Red Indians and cowboys, and a domestic drama of New York society.

Perhaps the revolution has saved Tashkent and Samarkand from picture-palaces. As an experiment the cinematograph seemed as great a success there as it is among the educated proletariat of civilised Europe. Our guide, having shown us everything to be seen, took us out by a different gate from that by which we had entered. We met a native here, evidently undecided whether to enter or return home. Our guide went up and spoke to him, and tried to persuade him to let us visit his house. But he refused; and there was indeed little chance of a favourable answer, for, though the natives are quite friendly to Europeans, it is exceedingly rare for any stranger to enter the closely guarded houses. Again we found ourselves in the maze of narrow streets, but our Sart boy knew his way, and soon we were standing by our waiting carriage.

It was a lovely night, warm and fragrant, with a full moon suspended in a starlit sky; so we drove once more out of the city. We passed through a still fairyland of trees and fields and hedges, silvered by the moon and set with glow-worms, which sparkled like strange gems. The road, gleaming white, wound towards the mountains, far away in the distance.

We stopped by a little hill, and the driver told us that from the top of it we should obtain a fine view. I found on the slopes of the hill,

growing amid the prickly turf, a strange star-like flower with four petals, whose colour I could not determine, and a bright-yellow heart. Its trailing stem ran along the ground, and when I stooped to pick it I found it had sharp thorns. Its perfume was heavy and exotic, but the blossoms were so fragile that they soon withered and drooped limp in my hand. From the top of the hill we saw once more the jagged Pamir mountains, with the one snow-clad peak thrusting its sharp point into the clear sky.

We left early next morning, and it was that glimpse of the lonely mountains that I carried away as my last memory of Tashkent.

THE SEARCHERS.

CHAPTER XXVIII.

SPARKE turned up punctually at seven o'clock next morning, and was closeted with Tony for an hour. He had, of course, been given the details of the scheme. He was not to accompany us. His part now was to remain in the valley to look after (as he put it) 'his end of the net.' Having jotted down an approximate time-table of our movements on the morrow, off he went in great good spirits.

Angus had gone to seek Duncan Ross and Hector Matheson, the two keepers, and before his return with them, Finlay Mackenzie appeared from the hills. He and Rob Macbain had been in hiding night and day near Sron na Leirg, but had seen no one. I sent him for some breakfast; and when Angus returned with Duncan and Hector, I took them all into the library, where the plan was unfolded to them. The heartiness and the promptitude of their offer of help could not have been bettered. Duncan, senior and spokesman, assured us at the outset that although they 'kent fine' there was something 'no very chancy' afoot, they were asking no questions. They would do anything for the sake of the old laird and myself. There was no hesitation, no doubts, no 'ifs' or 'buts.' If ever I am in a tight corner, I shall wish no better allies than these deep-chested, sun-bronzed hillmen, keen, intelligent, loyal, and men of their hands. Even Angus, in spite of his years, would have been an ugly customer to tackle if his blood was up. They listened intently, now and then throwing in a question or a suggestion, until each man had grasped the scheme, and knew thoroughly his place and share in it.

Finlay was to rejoin Rob Macbain, and thereafter the two were to take posts in the Chanter Corrie. Next day Duncan, Hector, and Angus, with spades and picks and plenty of provender for the party, would join them in the afternoon. A simple code of signals was arranged, and to every man was assigned a watching-post. Hector and Angus were to spy the northern approach, while the others, distributed in the Corrie, waited until our arrival by way of Glen Dee. The strictest secrecy was laid on them, but they were instructed to make it known to all and sundry that Keene-Leslie and I were leaving for the South by the afternoon train next day.

'You will see, Duncan, that all take their rifles. They may have to use them,' I said.

Duncan nodded. 'Very good, sir,' said he, as composedly as if he had been asked to arrange a morning's ferreting; but after I had taken him aside and given him fuller instructions, his eyes met mine with understanding and his mouth was set hard.

After they left, Tony and I walked down to the village, where, by telephone, I engaged the car and a chauffeur to meet us with the guide at the Stag Hotel on the arrival of our train at Ardgarry. On our way back to The Bield, near the lodge, a boy on a bicycle overtook us. He was the bearer of a note for me.

'From the doctor, Tony,' I said when I had read it. 'I asked him to dine with us to-night, but, much to his annoyance, a visit to a country patient makes his acceptance of my invitation impossible. He says, however, that he will look us up after dinner if he gets back in time. And that reminds me. Are we to take him into our confidence?'

Tony considered for a moment.

'Well, I recognise that he is *amicus curiæ*, and he certainly might be useful if there was any blood-letting up in the Corrie. But that would mean asking him to come with us, and we can't very well suggest to him to share a risky job which is no business of his. Besides, I am all for secrecy. There are five men (not counting ourselves) "in the know" already. The fewer the better, to my mind. On the whole, I don't see why any one except the actual participants in the "scrap"—if it comes off—should know anything about it.'

I agreed. After all, it was our affair. The doctor, although no doubt much interested, would have no reason to be offended if he afterwards discovered that we had hesitated to subject him to unnecessary risks.

Dry, sunny weather in the afternoon promised well for our adventure next day. The branches of the trees tossing lightly in a fresh wind beckoned us out of doors. By consent, further discussion of the eventful to-morrow was tabooed. The map of the hills was rolled up, our oft-conned half of the paper pocketed, and a brisk three hours' walk over the moor in the fine June weather gave our minds and bodies a much-

needed tonic. I sat down to dinner that evening in better spirits than I had known since the colonel's death.

The doctor came in after dinner, and we chatted over our cigars for an hour. He was surprised to hear of our proposed departure next day.

'Your affair, of course,' he said; 'but I think it's a pity you can't remain for a few days. I'm convinced that the man whose footprints we saw in the Afries Wood is somewhere near, and will be found.'

'You're probably right, doctor,' Keene-Leslie answered. 'Indeed, I go further. I think that you are certainly right, and that sooner or later Mr Searcher will be found. But it may be later rather than sooner, and Forbes and I can't remain here indefinitely.'

'I understand. But it's a pity. It's hardly probable that the man will turn up to consult me again, is it?'

'I doubt it.'

'Still, it is possible, for, like most criminals, he shows a streak of stupidity. It has evidently never occurred to him that his footprints are distinctive.'

'That is so. To change his boots would have been an elementary precaution.'

'Yet the man I saw looked like a person with more than one pair! However, there's no more to be done meanwhile except to say good-bye. I'll try to get back from my round in time to see you off at the station, and hear if you have any news, and I'll wire you at once if anything turns up,' he said, and rose to go.

The night was deliciously cool and full of scents of the summer dusk, and I accompanied him as far as the lodge. I had not covered twenty yards of the way back towards the house when I fancied that I heard a rustle in the shrubbery. Eyes and ears on the alert, I slipped into the shadow, but I saw nothing, although twice I imagined that I heard a stealthy step. For a minute or two I waited, listening, but the only sound that broke the hush of the night was the mournful call of the owls. I dismissed the incident as a trick of the nerves, and returned to the house.

We did not sit up late, for everything was now in train, and the next day's business demanded a good night's rest. The weather signs were friendly. My last look through my window showed me the country bathed in silver moonlight, so bright that in its wizardry the sleeping woods round The Bield looked as if cut out of cardboard, in sharp relief against a clear and starry sky.

(*Continued on page 469.*)

A BEE AND A BEETLE.

IT is one of those fascinating bits of natural history brought to light by that prince of entomologists and charming writer, Henri Fabre.

One of the earliest bees to appear in spring is a small black insect with a little patch of red on each hind-leg. At first you would think it had been gathering red pollen; but if you look closely, you will see the patch is a part of the bee itself, formed by tufts of red hair. A black bee with red patches on the hind-legs! You can't mistake it; there is no other native bee like it. You will probably see it on the polyanthus flowers. If you watch it you will very likely see another bee, a brown one, hovering over it, and following it as it goes from flower to flower. This is the male pursuing the female. And the fact that they are so dissimilar in colour makes it again easy to recognise the species. About the same time of year a small *brown* bee may be seen in a similar manner rifling the polyanthus flowers. It also is shadowed, as it were, by a brown bee ready to pounce upon it. Again a male pursuing a female. Both of these belong to a small group of our native bees to which the name Anthophora has been given. For want of another, we will continue to use this word.

It is a species of Anthophora which is associated in such a remarkable way with a minute beetle. Many beetles are parasites, but none, in the matter of parasitism, excels in wonder this parasite of the bee Anthophora. It is one of the blister beetles, the precise name of which we need not trouble about. Fabre, in his wonderfully detailed and painstaking way, found out its extraordinary life-history.

When the tiny beetle is hatched out in the autumn it is not as other young beetles are, a fat little grub, like the 'worm i' the bud.' It is an active creature with the proper insect supply of six legs. The first marvel in its life-history, perhaps, is that it can do without food until it has met with its bee; and this will not be till the following spring. The bee Anthophora burrows in the ground in the spring, and lays up stores of honey and pollen for her offspring. In each little store she lays an egg. The object of the beetle is to breakfast—a very long fast—on the egg, followed by unlimited honey. It arrives at the entrance of one of the numerous burrows of Anthophora. It is a sunny day in spring, and presently a *male* Anthophora emerges, and perhaps stays to sun himself at the mouth. The beetle is on the alert, and promptly attaches itself to some of the hairs on the bee. So the beetle is carried about by the bee. But still it seems no nearer breakfast. The male bee gathers no honey, nor provides the desired egg.

Soon, however, the females emerge from the burrows, and seek the flowers—perhaps the polyanthus-blossoms in your garden. They are sought out by the males, some of them carrying beetles. When the bees mate, the beetle transfers itself to the female! By-and-by *she* goes to a little store that she has laid up, and lays an egg in the honey. The beetle then cleverly manages to drop off on to the egg. If it got into the honey it is said it would be drowned. Well, it eats the egg, and having done so, it acquires the power of feeding on honey for the rest of its grub life.

Such is the story of the wonderful association of a bee and a beetle, as related by the brilliant Frenchman, Henri Fabre. If our natural histories were full—as they might be—of such wonders as this, then, surely, the rush for them at the libraries would be as great as it is for popular fiction.

PETITE SIMUNDE.

PART III.

VI.

FOUR days had passed before the second-in-command rejoined his unit in the trenches. He had been held at Divisional Headquarters, and now for the first time learned of Des Rosiers's desertion. With a stiffening of the jaw and an ugly contraction of his shoulders, he quickly interrogated tragedy's mummers—a sergeant named Smith and a politician-lawyer company commander. To the former he said nothing; the man had done his obvious duty. To the company commander he gave a careful hearing; then, in short staccato sentences that had an odd resemblance to a machine-gun in action, subjected him to a brief questioning.

'What is Des Rosiers's conduct-sheet like?'

'Pretty bad, sir.'

'What were his crimes?'

'Oh, the usual things—dirty on C.O.'s inspection, equipment missing, late for parades, and generally slovenly. If he hadn't had such a poor sheet, he would have been decorated.'

'In other words, his crimes are rest-billet ones. Is that correct?'

'Well—yes, sir.'

'But in the line he earned a decoration?'

'Yes—at Vimy he'——

'Have you known him to lie?'

'Well, you know what these French-Canadians are like.'

'You understand what I mean. Have you ever known him to lie when put on his honour?'

'Er—no.'

'When he told you that he had to see this girl, did you find out if he was speaking the truth?'

'No, sir; I'——

'Did you look for him at this girl's place when you were coming away?'

'I sent a picket through the village.'

The blue in Campbell's eyes became unpleasantly light. 'I had Des Rosiers in my company at Ypres when the Hun sent over his first gas—you were addressing meetings in Canada at the time—and I know him for a brave chap, as faithful as a dog. It's men like you, with a sense of vision no better than a mud-puddle, that are making the French-Canadian question another Irish one. They are like children, these French-Canadians—easily swayed, yet true as steel to those they trust; but as long as you and your kind make a political cat's-paw out of them, alternately yelling "*Kamerad!*" and "Traitor!" according to the political exigencies of the moment, so long will Canada be without the sympathy and the enriching of a wonderfully virile race.'

The junior officer's face flushed. 'I acted according to the evidence,' he persisted hotly.

'Damn the evidence!' said Campbell furiously. 'Play the man, not the charge-sheet. Does Des Rosiers strike you as a chap who would deliberately insult a staff-officer? When he is caught, he will be shot. It can't be helped—discipline must be maintained; but I tell you, when, every few days, I read in the adjutant-general's orders that Private So-and-So, charged with desertion in the presence of the enemy, was apprehended in a certain village, tried by court-martial, and sentenced to be shot, sentence duly carried out at 4.15 A.M. on such and such a date—you know the ghastly rhythm of the thing as well as I do—I never read one of these announcements without having a bad ten minutes afterwards. I don't question the decision of the court—a deserter must pay the penalty—but, mark my words, behind every one of these offences there is the unseen part played by some officer or N.C.O. who punished at the wrong time, or failed to punish at the right time, as the case may be. There are far too many machine-made, routine-fed chaps in the army, with stars on their cuffs, who don't know that there are times when the grip of a hand on a Tommy's shoulder, and a few words as man to man, free from any cursed condescension, are worth all the conduct-sheets in existence.'

'You are making a mountain out of a mole-hill, sir. I consider you are very unfair to me.'

'You do, eh? . . . What about your unfairness to Des Rosiers and his little French girl, when he faces a firing-squad in the early morning?'

With an angry gesture, Campbell left the

dug-out and hurried to Battalion Headquarters. For twenty minutes he and the colonel, a gentleman and a soldier, quietly but firmly discussed the case of desertion.

'I agree with everything you say, Campbell,' said the older man, 'and I will strongly recommend mercy to the court; but I am commanding a unit made up of many personalities, and I must think of the example to all.'

'Very good, sir. By the way, colonel, I know where Des Rosiers is.'

'You do? Then send word to the A.P.M.'

'Excuse me, sir—may I go and bring him myself? I ask this as a very great favour.'

The colonel pondered for a moment. 'When will you be back?' he said.

'Before "Stand to" in the morning.'

'Right—but, Campbell, my boy'——

'Sir.'

'Whatever you have in mind, remember that your duty and mine is to think of the example to the battalion.'

The blue in Campbell's eyes deepened; then, with an imperious gesture of the head, like that of a horse which hears the sound of galloping hoofs a mile away, he saluted.

'I shall not forget what you say, sir.'

'Thank you, Douglas.'

With a restless impatience for delay, he left the dug-out and climbed from the trench to open land. Heedless of a machine-gun that spat at him from the enemy lines, he hurried on until he reached the brigade transport lines, where he secured a motor-car.

'Where to, sir?' asked the driver.

'Le Curois,' said the major; 'and drop me just before you come to the village.'

VII.

In the scorching heat of a summer afternoon Petite Simunde was washing some linen outside her cottage home. The silence, like the heat, was oppressive, and seemed more so by contrast with the noise of the troops who had been there a week before. An apple falling from a tree to the ground; the restless pounding of a horse's hoof in its stall; the distant hum of an aeroplane; the rumble of guns, faint but ominous—these, and the sighs of the little woman at her task, were the only sounds that broke the stillness of the air.

She heard footsteps, and her heart, more than her eyes, told her that the man she dreaded had come. Her face blanched, and she caught her breath with a spasm of pain.

'Simunde'—Campbell's voice was gentle but firm—'where is Jacque?'

She continued her work without looking up.

'Simunde'—again the quiet monotone—'where is Jacque?'

She shook her head. 'No compree,' she faltered, falling into the jargon of war.

'Simunde!' There was an inflection in his voice, an almost imperceptible note of severity, that set her heart throbbing with fear. This was a new person to her, this calm, stern, blue-eyed man who showed no excitement, no anger, only a quiet, kindly severity that gave her no chance for subterfuge. She hated him for his calmness—because he was English—because he was unfair. If he had only shouted or gesticulated—but this brown-haired giant! To oppose him was like trying to stem the incoming tide.

She looked up suddenly, and her dripping hands were clenched in a fever of supplication. Madly, passionately, she pleaded for her lover, as a woman will plead only for the man she loves or for her child. Tears ran down her cheeks, and her voice was choked with sobs.

Patiently he listened, gathering from the anguish more than from her words the story he had already guessed. In a climax of grief, she groped for him with her hands and would have cried on his breast. But he made no move; only, his eyes were very grave and tender.

'Simunde,' he reiterated in English, 'where is Jacque?'

With a shrill cry of rage, she stamped her foot on the ground. This great iceberg of a man was a devil! He had come for her lover. He would take him away to be shot. With an involuntary instinct of dismay, she glanced at the barn a little distance away; then, fearful that he had read her meaning, she forced a smile with her lips, only to find that her fear was correct.

Without a word, he put her gently aside and started for the barn. He had gone ten steps before she moved; then he heard her hurried breathing, and her hands were on his arm.

'*Monsieur*,' she cried—'*monsieur le major*—Jacque—Jacque *keel* you!' She spoke in broken English, remembering one of Des Rosiers's stories of his misdeeds. Releasing her fingers, he reached the barn in a few swift paces. Opening the door, he cautiously entered and tried to accustom himself to the semi-darkness—and saw the barrel of a rifle in the loft slowly aligning itself in his direction.

'Des Rosiers!' His voice rang out like a pistol-shot. 'It is I—your officer!'

There was no sound for almost a full minute; then the rifle was withdrawn, and the unshaved, dishevelled French-Canadian stood before him.

'Why you come?' he said brokenly. 'I can no shoot my *officier*. Why you come, eh?'

'Because you will go back with me, Des Rosiers.'

The deserter's eyes filled with tears. 'By Gar!' he said, 'it is not, what you say, play fair. I say I shoot who come, and Jacque Des Rosiers, he is no afraid. But you—my boss—*mais non!* Maybe I go back with you, and maybe they shoot me, yes?'

'You have deserted, and the punishment is—well, you know as well as I. If you come with me now, there is a small chance of mercy.'

The man's eyes flashed. 'I no ask for mercy,' he cried. 'I, Jacque Des Rosiers, want mercy? Pouf! I laugh. They tell me I no see Simunde again, when I do nottings wrong. *Très bien*—I say sometings about it too. I go, I stay—*mêm' chose;* I am shot. Good! I stay with Simunde.'

Campbell took a step forward, and there was metal in his voice as well as in his eyes. His hand fell on the other's shoulder and gripped it like a vice. 'You will come back with me,' he said, and again there was the strange similarity to a machine-gun; 'not that you may receive mercy, but because you are a coward, and must take your punishment for desertion in the presence of the enemy.'

Des Rosiers's face darkened.

'Now, at this minute,' went on Campbell, 'the battalion, your battalion and mine, is in the line. Because you were not there, another man is in your place, perhaps at sentry duty. He may be dead by now—and why? Because he did his duty, and took the place of a man who was afraid.'

The French-Canadian's breath was hot with fury. He clenched his fists, and great veins stood out on his forehead. 'By gosh, me!' he yelled; 'who say Jacque Noir, she is afraid?'

With apparent calm, but his muscles poised for action, the officer looked squarely at him. 'I say you are a coward,' he answered. 'You were afraid to go to the line with your comrades. You are afraid now to face your punishment.'

Campbell noticed that Jacque was crouching for a spring. With a shrug of his shoulders, he produced a cigarette-case and put a cigarette into his mouth.

'Well?' he said.

It was the second time he had beaten Des Rosiers. The poor fellow paused, then knelt at his feet and exhausted his passion in a sobbing explanation that would have been ludicrous but for the sincerity of anguish behind it.

A few minutes later they went together from the barn. Simunde was standing by her door. From the interior of the house the lamentations of 'madame' could be heard. With a simplicity that strangely ennobled the rough fellow, Des Rosiers stopped and spoke to Simunde in French, then kissed her on the lips with a reverence that was more moving than the deepest passion. Without a word, he walked to the motor-car and stared fixedly ahead at the road which climbed by the château. With a half-sob, Simunde turned to the officer. She said nothing, but her tears spoke a language that needed no words. The metal in his eyes melted into a deep compassionate blue; and Petite Simunde's troubled little heart thanked God for the great, broad-shouldered man with the hair that was almost red.

The two men slept in a deserted hut that night, but ere daybreak they were making their way through the communication-trenches to the front line. It was half-an-hour before 'Stand to' when the major and his unkempt companion reached the last dark trench where sentries were straining their eyes at the blackness of No Man's Land. A junior officer stepped up to the major and reported, quietly, the situation during the night.

'They've got a machine-gun post,' he said at the end, 'somewhere over by those three trees. Can you see them, sir? They got five of our chaps last night, and two the night before.'

'Humph! They tried for me too, yesterday afternoon. Can't the guns do anything?'

'They've tried, sir; but the rise in the ground seems to protect the post from anything except a direct hit.'

Even in the darkness the young lieutenant could notice the sudden look of decision which flashed into Campbell's eyes.

'Give me an A form,' said the senior officer tersely.

The lieutenant handed him a message-pad, on which he wrote a few words.

'See that the colonel gets this,' said Campbell, 'and pass word along to the other companies that Private Des Rosiers and I are going to get that machine-gun post. If we come back, don't give us too hot a reception from your sentries.—Sergeant, some bombs.—And let Des Rosiers have that revolver, old chap. My batman will give you one of mine. Right—thanks.'

'But, sir'—the young officer was vastly troubled—'it's not up to you. I'll go, major. Honestly, I want to'——

'Thanks, old man; but this is a bigger job than it looks. Not that you couldn't do it as well or better, but—well, I've set my heart on going, that's all.'

He glanced at Des Rosiers, and noticed that his face was grim and set.

'But, my *officier*, it is not fair,' began the French-Canadian; 'it'——

'Not fair?' There was a rasping sound in the major's voice.

'For me, *mais oui;* but for you, *non*. Please—I do my bes'—I go alone.'

Without a word, the second-in-command put out his hand and grasped that of the deserter; and Des Rosiers felt that death for the other would be easy. Truly, as Campbell had said, war is a great big game, and men are like children.

Three minutes later two figures were crawling like panthers towards the German lines.

. . . . . .

The colonel of the battalion took the message from the runner's hands. It contained seven words:

'*As an example to the battalion.*
'CAMPBELL.'

'What's that noise?'

'Sounds like Mills bombs,' said the adjutant.

'And revolvers,' muttered the colonel, and swore softly to himself with a lip that quivered strangely.

VIII.

If ever you go to the Cobalt country, do not fail to take the boat to Ville Marie, on the blue shores of western Quebec.

There is an excellent hostelry at Ville Marie called 'Les Voyageurs,' where a little lady, known as Petite Simunde, has worked wonders in making it the cosiest, snuggest, neatest little place that ever warmed the heart of a lumberjack or a mining-prospector. At night her husband leads the singing with a mighty voice that shakes the rafters; for did not the former proprietor, Pierre Generaud, say that singing encouraged thirst?

At times, when Madame Des Rosiers is away for a day, Jacque Noir will regale his old friends with tales of his past life—tales that differ with every telling, and seem to indicate that the narrator himself is beginning to doubt their accuracy. At such times, too, he has been known to sing of a sailor who loved a Portuguese maid; but at the first sound of his wife's footsteps outside Monsieur Des Rosiers is the model husband—a rôle, to be frank, which suits him quite well.

When the snow is very thick on the ground, and the wind howls mournfully over the lake, Jacque Noir talks of France and the weary years of war. He will point with pride to his artificial foot, and then to his decoration, and slowly tell how two men went out into the dark after a machine-gun post.

And when the guests are gone and the fire is low, when the wind is moaning quietly, while the snow falls thick—thick—thick, they speak to each other of the officer who will never come back; of the one whose hair was brown, almost like red; whose blue eyes were stern, and yet so kind.

Hand-in-hand they sit close together, and the only sounds are those of the crackling logs and the wind that is never still.

THE END.

SOCIAL, MENTAL, AND MORAL EFFECTS OF INTERNMENT.

By Tom Govett.

IN the first days of November 1914 several thousand men were collected together in the stable compound of the trotting race-course at Ruhleben, on the outskirts of Berlin, and distributed in the horse-boxes and stables themselves, to remain there, for the greater part, until a week after the signing of the Armistice. Such close and continual confinement could not fail to exert a considerable influence on the men interned, and it is not without interest to note what the principal effects of this internment were.

In the first place, men of all ages, professions, and colours were mingled together. Stokers shared boxes with their former skippers; elderly professors were thrust in with blacks from the West Coast of Africa; business men and stable hands, Government officials and Continental crooks, public schoolboys on holiday, trawlermen from Grimsby, artists, musicians—all were mixed up and packed in at the rate of six men to a horse-box measuring ten feet square, there to eat, sleep, live, and wash—if they felt inclined.

The effect was quickly noticeable in the speech of the better-educated men, which rapidly degenerated, till in many cases it became as bad as (or worse than) that of the sailors, whose coarseness is proverbial. This lasted for three years, when, curiously enough, there came a reaction, and many attempted to drop the vile vocabulary they had acquired.

At the same time, this mixing up of all classes (which, by the way, had been done by the Germans with a view, as they openly stated, to causing additional hardships to those who possessed finer sensibilities) was in some ways highly beneficial. The callous and equal treatment of every one eradicated any tendency towards strict class distinctions, which were desired by some, but would have been intolerable to most of those in the camp. The intimate conditions under which men in the same box lived gave all a broader outlook on life, and a deeper understanding of, and sympathy with, the pleasures and the troubles of those with whom, under ordinary circumstances, they would never have come in contact. It cannot be denied, however, that while this condition of affairs lasted it entailed great discomfort. Fortunately we were afterwards enabled to sort ourselves out and get together with friends and acquaintances.

Our outlook on life was further broadened owing to the lack of any restraining social conventions. It is obvious that a community consisting of men of every description, suddenly thrown together as we were, could have no traditions of thought and but few points of common interest beyond the desire to get out; while, as already stated, the mixture of all classes made real social distinctions impossible. There was, then, to all intents and purposes no 'public opinion' on any subject whatever that might tend to impose conventional standards on thought and ostracise those who would not, at least outwardly, conform thereto. I am convinced that we were far more free in this respect than any other country on the face of the earth. The military regulations had nothing to say on such matters;

and there were no censors in that sense to attempt to influence thought for the benefit of any particular caste or form of government. We had only one unwritten law on the subject: 'You can do as you like, and speak as you like, and think as you like; but don't interfere personally with me!'

The result was the free expression of all kinds of theories on all subjects, political and artistic. It was, for instance, the custom here in the United Kingdom to respect the news published in British papers, and condemn anything that contradicted it in the German papers, this without even having seen the latter. In the camp, where we had both German and English papers (English journals being smuggled in regularly about a week old), and where we also had time to study them, a comparison enabled one to detect the errors in both; and if the Germans sinned more frequently than we did, we were ourselves certainly not immaculate. Such things led among the more educated to a scepticism that spread to many things besides war matters; and it was just this sceptical frame of mind which seems to me to have been one of the chief results of our internment. Whether it will be permanent, now that we are hemmed in once more on every side by written and unwritten codes, depends, of course, on the age and the temperament of the individual.

To this freedom of speech there was one exception. Just as in British concentration camps there were a number of Germans who desired Britain to win the war, so in our camp there were a number of Britons—mostly naturalised Germans or the sons of naturalised Germans—who were in sympathy with the aims of Germany. They were expected to keep their views to themselves, and to endeavour at any rate to talk English in public; though even here too there was a great deal of tolerance as time went on.

The third great factor in influencing the character of the interned men was the lack of necessity to work. We were packed into vile quarters, but at the same time we did have lodgings, and a little ingenuity and disregard of military regulations went a long way towards improving them. Food and clothing were sent from England in adequate quantities, and each man could, if he desired and had no private means, borrow money from the British Government to the extent of four marks per week. It was then possible to exist in absolute idleness, and this a number of the men did. There were old sea-captains who hardly even moved during their internment, and boasted that they had never been twenty yards from their barrack, except when compelled by the military. There were scores whose daily programme was as follows: morning muster, preparation and consumption of breakfast and 'washing up the things' afterwards, a stroll round the field, preparation and consumption of dinner, washing up of dinner-things, an afternoon nap and a little novel-reading on their beds, preparation and consumption of supper, washing up, cards and bed, varied only by letter-writing and an occasional visit to our theatricals.

But, on the other hand, there were large numbers whose innate energy would not allow them to take life so easily. They had to occupy themselves in some way, and moped when occasionally out of a job. Many of this type turned to whatever offered itself, careless of *what* they were doing, so long as they were doing *something*. Many found employment in the camp administration, which was entirely in the hands of the prisoners, and employed working-gangs to clear away rubbish, bring in parcels, &c., besides salesmen in the canteens, hairdressers, accountants, and even dentists. Most of the posts had salaries attached to them, but in no case were they large enough to tempt a naturally lazy man from the idle existence he could lead if he chose.

All the various camp activities, education, sport, drainage, entertainment, &c., were under the control of unpaid committees, and attendance at these committees (and incidental duties involved) provided work for more men. Most of the committees had stormy careers; there were innumerable quarrels between the committees and in the committees themselves. The quarrels were mostly about nothing, and arose from the amount of time at our disposal, and from another more interesting reason.

At the commencement of the camp we had all been more or less united as prisoners suffering a common lot, but very soon we began to split up into two rival groups. These were none other than the conservatives and the progressives (the terms are used in their primary and not in their political sense). The conservatives desired to do everything in the good old traditional way; the progressives maintained that the sooner all traditions were thrown overboard the better for all concerned. Distinct points of practical difference were naturally difficult to find except in the realms of art, but each party nevertheless spent much energy and thought in the attempt to obtain control of the different activities. It would seem that wherever men are thrown together, these two tendencies will sooner or later come to the surface and divide them into two opposed camps.

The amount of time at our disposal led to another very bad habit, that of procrastination, which is difficult to shake off.

Among other activities to which men devoted themselves was the pursuit of sport. We had facilities for almost every game that is played in England. We had rented a field, and the necessary apparatus was sent from England. Some spent the whole of their time playing something or other.

Music, painting, writing, and acting attracted a large number of people, whose tastes had probably always lain in those directions, but whose careers had not permitted their pursuit before they were interned. I do not think that any hitherto undiscovered genius was discovered, though some of the men themselves would perhaps hardly agree. It is certain at any rate that the success they achieved in the camp led some of them to an exaggerated opinion of their own artistic capabilities, and they considered their name and fortune as good as made in the new careers they had determined to follow on their release. This loss of all sense of proportion was not limited to those engaged in artistic activities, but was quite general among all who worked there; there was no measure to enable us to judge the real value of our work. Some must already have suffered a bitter disillusionment, though others may have been enabled, as a result of what they did in Ruhleben, to exchange their old profession for one more congenial to their tastes and suited to their capabilities.

Another little characteristic was the general desire as time went on to make out that one had filled a better position in one's profession than was actually the case, or that one had had altogether a 'nicer' occupation. The curious thing about this was its absolute futility; there was a register compiled at the commencement of the camp, containing every one's real occupation, and this register was open for any one to see at any time.

The monotony of life in Ruhleben, and the conditions of existence there, made it difficult for those who did not possess unusual pertinacity and strength of will to do much real study; though every encouragement was given by the authorities at home, and it was even possible to take some of the English examinations. The mind grew dull there; moreover, though there was plenty of time, it was split up by the necessity of doing one's household duties. I knew the case of one man who took nearly two years to prepare for an examination for which he was allowed six months at his university, where he would have had to do other work as well. That we did not get even duller is probably due in some degree to the never-ending arguments in which we indulged. After a time, as can be imagined, we grew to know as much about our messmates' lives as we wanted to, and our conversations were limited to impersonal subjects in which we were interested at the time. Small-talk was uncommon, and I used to wonder what I had found to say to casual acquaintances before my arrest, and what I should talk to people about when I got out again. We argued, then, upon the most impossible subjects, and descended only too frequently to quibbling about the very finest points; but we did set our minds against those of other people.

The absence of womenfolk of any kind was naturally not without effect, but it is not necessary to go into that here, as the results were not different from those familiar at the front, in Polar expeditions, &c. I will only say that the absence of women had the effect of bringing out the effeminacy of men inclined that way. This was especially noticeable with the younger men, and was further increased in the case of those who were accustomed to take the female rôles in the plays we produced. One unusually observant youth gave up acting these parts because he had noticed the effect upon himself of the continual use of feminine clothing and mannerisms.

What will be the lasting results of our four years' internment it is yet too early to decide. The older men should quickly drift back into their old habits and frame of mind, but the younger men will bear deeper marks, some of them beneficial, though mostly, I fear, such as will not make them the fitter for the lives they must now pursue, after wasting in idleness and makeshift work four years of their youth—years that should have given them the experiences essential to the parts they must play in the future, if they are to live up to their reputation as Britons.

SUGAR-CANE GROWING IN NATAL

By James Paterson.

THE cultivation of sugar-cane is carried on throughout almost the entire length of the Natal North Coast Railway, which extends north-eastwards along the South African coast from Durban to Somkele, a distance of one hundred and sixty-seven miles, and the plantations cover a large part of Zululand. Cane is grown also in the vicinity of the South Coast Railway, which runs for about eighty miles from Durban in a south-westerly direction along a seacoast famed for its beauty.

At Inverugie, a railway stopping-place not far from the middle of the South Coast line, is to be found the unusual combination of tea-planting, cane-growing, and cattle-farming—thus providing, with water, all the necessary ingredients of the 'cup that cheers.'

The quantity of sugar-cane treated last season at the dozen or so sugar-mills located along the North Coast Railway was not far short of a million tons, two-thirds of which was transported from the plantations by railway engines and trucks, and the remaining third by mill or planters' tram-lines and trollies. From this cane

were manufactured about one hundred thousand tons of sugar, which, with the thirty thousand tons of sugar milled on the South Coast line and in districts adjacent thereto, represent the annual volume of one of Natal's 'essential' industries, of an approximate value of two and a half million pounds sterling.

The planters and the millers are, of course, interdependent; and this was strikingly illustrated after the heavy floods in February 1917, when, in addition to the railway station at Umfolosi being washed completely away and a number of people drowned, the local sugar-mill was so badly damaged that it had to suspend operations for a long time, thereby debarring the Matubatuba and Umfolosi planters from the usual outlet for their cane, as the more distant mills had their local cane to deal with before they could accommodate any from outside.

Periodical floods are not, however, the only drawback with which the Zululand sugar-planter has to contend. North of the Tugela River fever is rife at times, although of a mild recurrent nature rather than virulent; but with the cleaning up of swamps and other insect-breeding grounds this menace to health and comfort will disappear.

The financial results to be obtained from cane-growing outweigh, evidently, the disadvantages above referred to, as the Zululand and South Coast sugar-belts are well settled, and estates change hands at large figures—from five to ten thousand pounds being a not uncommon price to be paid for a developed cane property of very moderate acreage.

After the pioneering work in connection with house-building, cane-planting, and the provision of tram-lines and roadways throughout the estate has been accomplished, the planter's life cannot be termed a hard one, especially if he is on good terms with the local sugar-mill authorities. The cane is cut every eighteen months or so, a conservative estimate of production is two tons of sugar per acre, and the price of sugar is about twenty shillings per one hundred pounds. Labour costing what it does, even a small estate should yield a handsome financial return; and it is common knowledge in Natal that many men have become independent, or at least well-to-do, after only a few years' sugar-farming in Zululand.

At Amatikulu, sixteen miles beyond the Tugela River, a commencement has been made with the growing of cotton, alongside the cane-fields, and the initial success attained will probably lead to considerable development in the production of another 'essential' commodity which seems to be getting insufficient now in other parts of the world.

Railway business in connection with the sugar industry is considerable, as, in addition to the transport of cane from the plantations to the mills, and of sugar from the mills to Durban and other large South African trading-centres, there is a heavy inwards traffic, consisting of rice for the Indian coolies and mealies for the Kaffirs on the estates, machinery for the sugar-mills, manure and fertilisers for the land, and general goods for the European population. The number of engines constantly employed in the haulage of raw cane and manufactured sugar during the nine months' season on the Natal North Coast Railway alone is not less than twenty.

About two years ago a private commission made an extensive and exhaustive inspection trip through part of the native territory lying between Somkele and the Portuguese border, and reported to the Zululand Planters' Union that this territory included an area of seven hundred and forty thousand acres, most of which was more suitable for the cultivation of sugar-cane than a great deal of the land already planted. After allowing one-third of this figure for the sites of homesteads and the grazing of stock, about half-a-million acres would remain for the cultivation of cane; and if we assume that the cane is cut every two years —a longer period than is necessary in Zululand—the total annual production of sugar in this new district, at the fair ratio of two tons per acre, would be five hundred thousand tons, which, at, say, twenty shillings per one hundred pounds, would represent an increased annual wealth to Natal of ten million pounds. The commission added that the settlement of this land would require, on five-hundred-acre farms, one thousand five hundred European settlers with their families, and considered that to manufacture the sugar at least thirty large mills would be required, which, with the stores, &c., necessary for such a population, would mean a livelihood for probably as many tradesmen, traders, and other Europeans as settlers.

A concomitant part of the scheme is an extension of the North Coast Government Railway for a distance of one hundred and eighty-five miles, through easy country, beyond its present terminus; and the commission forecasted that the cost of such an extension would be entirely covered by one year's excise, estimated at five hundred thousand pounds, on the sugar to be produced annually in the tract of country opened up.

Is this one of the solutions of the post-war problems of increased production of the necessaries of life, and the settling on the land of those men who have rendered yeoman service to their country on the battlefields of Europe, Africa, and Asia?

THE DARK PATCH.

By Bart Kennedy.

I.

IT was my own fault. I had tried to do two days' climbing in one day. I ought to have stopped where I was advised to stop. The innkeeper in Andorra had impressed on me to be sure and stay at Soldao, and wait there for a party of four who were going to L'Hospitalet the next morning. They were to start from a place near to Soldao.

But when I got to Soldao that afternoon I felt —after I had had a hearty meal and a bottle of stout red wine—that I could step over the mountains with the seven-league boots of the fable.

It was the beginning of winter, and the first snow was falling in the Pyrenees. But I felt free from all care as I stepped along. I had tucked the noble dinner securely under my belt, and I was as right as a trivet. The trail was easy to follow, and I went up and up like a climbing god. I cared less than nothing for the light snow that was falling. I should be in clover when I got to L'Hospitalet in France! There I would take it easy. I would rest on my laurels, so to speak, after my long journey afoot through Spain.

Up and up I went blithely. Up and up. The clear, cold air invigorated me. It was as if I were inhaling the very spirit and essence of some glorious champagne.

Up and up. Up and up. The scene around me was splendid and wonderful. I was on the roof of the world.

Here was the summit. And here was something else! A faintness had come into the trail. In places the snow had drifted over it, though I could still see it, as it stretched along. I went forward quickly; but my enthusiasm began to wither slightly. I soothed myself, however, with the idea that the trail would surely become more distinct the farther I went. It was an idea, of course, for which there was no particular foundation. But I forced myself to believe that things would be all right.

Yes, it was all right. The trail was clear now, and I went swiftly on.

There was still plenty of daylight. It would be some time before the sun went down. And I began to sing. Yes, all would be well. I had taken a chance, but in life one must take chances if one is to accomplish anything.

My voice rang around and around. I was singing an air from one of the Italian operas, singing gaily as a lark. And here was a great boulder, a vast boulder shaped like the head of a giant. The trail ran to the side of it. I followed the trail, and—well, my song stopped suddenly. The trail ran no more! It was swallowed—eaten up by the snow. I stopped and looked out over the snow to see if it were showing away in the distance. No, it gave no sign. It was gone—gone utterly!

I held swift counsel with myself. I was beaten—done. I had been too confident. And there was but one thing for me to do—one thing only. I should have to eat the leek. I should have to go back to Soldao. I, the wondrous mountaineer! I, who could do two days' journey in one day!

I should have to go back.

So I faced about, this time not singing. And it is needless to say I went as quickly as I could. It would take me all my time to get back to Soldao before the night fell.

At first it was easy going. The print of my own footsteps helped me. They had not yet become obliterated, for the snow was falling but lightly. The wind had begun to rise, however. And it was this that did it. For the trail was again covered!

I was lost!

There was no use beating about the bush. I was lost. I could make my way neither back to Soldao nor forward to L'Hospitalet!

I stopped and began to reflect upon my own foolishness. But this could not help me. I was lost. And there was the beginning and the end of it.

I turned and began to walk again in the direction of L'Hospitalet. There was no particular reason for my doing this; but I did not like to stand where I was. And there came to me the wild hope that the wind might have cleared, or partly cleared, the snow from the trail. My reason told me that this was impossible. The wind would only drift the snow over the trail all the more deeply. But I hoped that this might not be so. The truth of the matter was that I was becoming confused.

And then I became afraid.

Fear comes to every one who is lost. For the consciousness loses its moorings, so to speak. The mind gets out of its balance. If it may be so put, there is no fulcrum from which it can work. And fear comes.

There is no use denying it; I was very much afraid. All sorts of fancies and imaginings came to me. I began, for instance, to think of wolves. And the memory of a story that I had heard—not long before—of a party of travellers being eaten up, here in the Pyrenees, came vividly back to me. Perhaps the same fate would happen to myself. True, I was armed; but that would help me but little.

I began to think of other things. Perhaps I should die of the cold, for I should have to pass

the night out here in the mountains. It was not very cold now, but there might come a sudden fall in the temperature at any time. If it went down below zero, I was done for.

II.

Suddenly a wonderful glow lit up the mountains. The sun was just setting. But the beauty of the sunset did not especially appeal to me. What struck me with force concerning it was that it might be the last sunset I should ever see. Mixed-up, jumbled ideas were rushing through my mind.

Darkness began to come now, and then it was that I made a strong effort to pull myself together. 'If you become afraid, you will be done,' I said to myself. 'Look out, man. Take it easy.'

And, after a while, I mastered the fear and got control of myself.

What was I to do? If it had been day-time, I should have known well enough. All that would be necessary would be to follow a water-course as closely as I could, and in time I should get into touch with some one or another. It is the way to do when one is lost among mountains.

I still kept going along in the direction of L'Hospitalet. I had come to the conclusion that it was better to keep moving. Perhaps if I went on long enough I should see the lights of the place for which I was making!

Slowly I went on. And then I saw out ahead of me the reflection of a light. L'Hospitalet, I thought. Things would turn out right after all. I made my way cautiously, and I came to the edge of a torrent. It made a great deal of noise, but I knew that it was not dangerous, for the sound of it told me that it was shallow, and that it was running over a bed of gravel. I should have to ford it, if I were to go in the direction of the reflection of the light.

For a moment I hesitated. There might be a hole in the middle of it. But it was necessary for me to ford it, and I stepped into it boldly. It was only about ten yards across, and the water came up no higher than my waist. It did not touch the knapsack that was strapped to my shoulders. I got up on the opposite bank, and went on in the direction of the light.

And then it was that I felt a stiffness around my waist and my legs. My clothes had suddenly become frozen. It was colder than I had thought. Yes, much colder. It was useless to bother about that, however. The thing was to keep on.

It had stopped snowing by this time, and the stars came out. How clear they were! There was now a fair amount of light. I could see well enough. The snow seemed to have disappeared. The travelling was hard and awkward, and as near as I could make out I was getting to the slope on the other side of the summit. There was the danger of my falling over some steep place. But there was nothing for me to do but to keep on. If I were to stop, the cold might get me.

I was surely going down the slope of the summit! The wind had died down by this time. This was all to the good, for if it were blowing I might not be able to stand the cold. I was not bothered by the cold as yet. My exertion had kept me fairly warm. Besides, I was as fit and as strong as possible. And I comforted myself with the thought that I should soon see the actual lights of L'Hospitalet. L'Hospitalet! When I got there, I should have supper and a bed! If I were late, I would rouse up the people. Yes, everything would be all right when I got to L'Hospitalet.

I was going towards the reflection of the light, when it faded away all at once. I stopped, and wondered. What could it be? What was the matter? The reflection must surely have come from lights in the distance. I couldn't make it out. I turned round and looked in the direction from which I had come. No lights there. Nothing but great, dim, frowning masses of rock. In a way, I was lost a second time. My objective was gone, and with it my sense of direction. But this time I felt no fear at all. If I was done for, I was done for. And that was all there was about it.

But I should have to move on. I should have to keep going. Stopping would be dangerous. I should have to manage to keep on the move till daylight came. There were a good many hours to pass between now and then. I should have a hard time. But there was no help for it. I should have to do the best I could.

I came to another torrent. It seemed bigger than the last one. And I turned from it. There was no point in fording it. I was as well off on one side as I would be on the other.

The night became clearer, and colder. I was really in danger now. It looked as if the chances were against my lasting through the night. And I was beginning to feel tired. I had had a hard day. I thought of the fine dinner I had had, hours ago, in the *posada* at Soldao. If I were only back in Soldao now! If——

I sat down on a ledge of rock. I felt tired. But I got up at once. My clothes were frozen on me. If I could only have changed them, things would not have been so bad.

There was another thing, too. I ought to have carried some food with me from Soldao. I should need it before the night was out. But how was I to know, when I was there, that I should get into the pass in which I found myself now? I had felt then that making L'Hospitalet would be an easy matter.

III.

I was trapped right enough, and the fact that I had got into the trap myself was no consolation. I felt that I had been an over-confident fool. I had gone in the face of advice that had been

given me by one who knew these mountains. He had told me that I ought not to attempt to make L'Hospitalet in one day. But I had paid no heed to him.

There came to me a curious sensation of being watched. But I forced it from my mind, for there could be nothing round here. I felt certain of that. If the wolves had been around, I should have heard them long ago. No, there was nothing watching me.

I was still moving about. It was the only thing to do. And, all at once, I felt that there was something near me. I got out my revolver so as to be ready to deal with it, whatever it was. But it was nothing. My imagination was playing me a trick. It was odd. My imagination was weaving and working in a curious way. But I had absolute control of my mind at the same time. It was as if I were two men. One of them was subject to the dominion of strange, wild fancies. The other was resolute, calm, and alert. He kept the first man in check.

Two men! The feeling that I was two men became most vivid. As I moved about, I could feel that the other man—my other self—was moving by me. It had a weird effect upon me. But I was in no sense afraid. I was able to control this man of phantasy and imagination. If I had not, he would have led me into the realm of fear. And then certain death would have come upon me.

The fancy passed away from me suddenly. And slowly there came to me the conviction that I should somehow manage to weather the predicament in which I was. How, I knew not. But I felt that help was at hand.

It was. I noticed, some distance away from me, a round object. At first I thought it must be a rock. But I was impelled to go towards it. Some sense that I could not define urged me on.

I was close up to it now. It was not a rock. It was a hive-shaped structure that had been built by man, built out of square stones that had been mortared together.

I walked slowly around it. I was expecting to find something—and I found it. It was an entrance into the structure. It was about two and a half feet in height, and about the same distance across. Evidently a storm-shelter. It had been built in the shape of a hive so as to resist the wind when a storm was raging here in the mountains.

I wondered if there was anything inside it. 'Hulloa!' I shouted into the entrance. 'Hulloa!'

I waited. But no response came. And then I thought it was time to chance it. I crawled through, holding my revolver ahead of me in my right hand. It was as well to be ready in case. If a man had been there, he would most likely have answered when I shouted; with an animal it would be another matter.

I was through the entrance now, and I got suddenly to my feet. With my left hand I got a match out of my pocket, and, after feeling cautiously for the wall, I struck it.

It was a wax match, and it gave out a clear, full light. For a second or so it dazzled my eyes; and during that short lapse of time my nerves were jumping. There might be something or some one in the shelter after all. But it was all right. There was nothing.

Well, there was nothing save some ashes that were close to the wall. The remains of a fire! Some one had been here. But how long ago I was unable to tell. The ashes were quite cold. They might have lain there for months.

The floor of the shelter was earthen and quite dry. Near to the middle of it was a round, dark patch. I wondered vaguely what it might be.

IV.

I was safe now. Even if it got very cold, I should be able to manage till the coming of daylight. The first thing to do was to get off my frozen clothes. I had some dry underclothes in my knapsack. I stripped, and put these on; and then I lay down with my knapsack under my head. I covered myself as well as I could with my coat, which was dry.

It was cold, of course. But I lay with my body as much in a circle as possible—as animals lie. It was the best way to keep the warmth within myself. Stretching myself was out of the question.

The only thing that really bothered me now was the hunger that had come upon me. If I had had something to eat, I shouldn't have minded things at all. But to think about that was useless. I should have to wait till I got to L'Hospitalet the next day. The next day! It was a long way off. The hours through which I should have to pass would be hard, long hours.

I tried to sleep. But it was useless. The cold was not dangerous here in the shelter, but it was enough to keep me awake. I was lying with my face turned towards the entrance, so that I could see any one who might try to come in. It would not be an animal—of that I was sure—for an animal would know that a man was there already. It could only be one of my own kind who might disturb me.

I began to wonder what the time was. It was perhaps somewhere between seven and eight o'clock. It could hardly be more. Daylight would not come before six in the morning. Perhaps not even then. It would, therefore, be ten hours at least before I could go forth. Things might have been much worse, however. I was lucky to have found this place. And I began to try to define the power that had guided me towards it.

Did this power come from myself, or did it come from outside? I wondered. It might be that there was in the mind of a man a power that consciousness knew not of—a power that

only asserted itself in times of extreme stress and danger. Or it might be that there were agencies around us that were outside the scope of ordinary human knowledge. I had been as surely guided to this shelter as if I had been definitely told of it in spoken words. It was strange. And, as I lay, there came to me all sorts of curious notions and ideas. I was here, alone. But was I alone? Were there things around me? Were there things with me here in this very shelter? And my mind ran from one thing to another.

'Yes, there are things about you,' said a deep, peculiar voice. 'You were guided here by me.'

I woke with a start. I had fallen into a doze, despite the cold. It was an odd voice that had spoken to me. And even though I was now wide awake, I had a strong feeling that something or some one was with me here in the shelter. It could not really be so, of course. But still I had the feeling.

I got a match, and I reached out and struck it on the wall. It flared up. And it seemed to me as if a shadow passed out through the entrance of the shelter as it flared. For an instant I felt frightened. But it was nothing. It was only my imagination. At least, my reason told me so.

But did reason know of everything that was around me? Perhaps it did, and perhaps it did not. I felt strangely nervous. It would be better for me not to fall asleep.

I felt very cold. I had no sense or suspicion of numbness. It was not cold enough for that. But I felt great discomfort. And I wondered how I had come to fall asleep.

Perhaps I had been asleep a long time. It might now be near to the dawn of day. I should be glad if it were so. For as soon as the dawn came I would get up, dress myself, and proceed on my journey.

I was looking at the entrance of the shelter. Light came through it, but it was the darkly clear light coming from the stars. In it there was no hint of the softness of dawn. It was just a hard, darkly clear light.

At any moment! The dawn might appear at any moment, for there was no telling how long I had slept. What I had to do was to wait and watch for the dawn.

v.

All at once a change came into the shelter. It was filled with the light of a fire that had appeared suddenly. How it had appeared I could not tell. All I knew was that it was there. And there was something more. Two men were in the shelter. One was lying prone. The other was bending over him, rifling his pockets. I knew what had happened. He had just stabbed the man who was lying prone. I wanted to stop him, to interfere. But I could not move. I——

I was awake again. Once more I had been dreaming. And I felt that the scene I had witnessed in the dream was a scene that had actually happened. I was certain of it. Absolutely certain. A murder had been committed here in this shelter. That was the meaning of the dark patch! And the picture of the whole thing had appeared before me. My mind had sensed the terrible happening of the past as I slept.

A strong desire came upon me to get up and leave the place. But it would not do. I should have to stay where I was till dawn came. There was nothing else for it. I should have to stay where I was.

There was no sign of dawn yet. The light that came through the entrance was still the light of night. It was not as clear as it had been, however. It might be nearing dawn.

Who were the men of the scene that had come to me in the dream? Who was the one who had been killed? Who was the one who had done the killing? I was sure that the sinister drama had occurred exactly as I had seen it.

Surely this shelter was haunted! In a way that it was given to no one to understand, it held the records of the things that had happened in it. These records were there to be read at certain times, and in certain states of mind. Perhaps it would have been as well if I had not heeded the power that had directed me to it. Perhaps it would have been as well if I had remained outside it. And then the power of connected thought left me suddenly.

'If you had remained outside, you would have perished,' said the deep voice again. 'I, the spirit that guides, directed you here.'

'But the place is haunted,' I cried.

'True. But it has given you life. Accept the gift as it comes.'

Here was another scene. A dreadful scene—not to be described! I awoke, trembling with horror. And I got to my feet, and struck a match. I could stay in the place no longer. It would be better for me to go out into the cold and the darkness.

There was no sign yet of the coming of the dawn. But I must go.

I dressed myself as quickly as I could, and I got out through the entrance of the shelter. It was very dark, and very cold. And a numbing wind was blowing.

And suddenly a sword of light flashed into the mountains. The dawn! At last it had come. The wind was cutting me to the bone. If I had remained in it through the night, I should have died.

Full dawn. It was now here. I was stiff, and I went stumbling along.

A golden, glorious tone was now in the light. And there—shining down in the valley beneath me—was my destination.

THE HEART OF THINGS.

By HENRY LEACH.

LONDON, *Yesterday.*

ONE has heard it said, with some subtle (but perhaps bitter) cynicism, that the system of teaching modern languages in our preparatory and other schools to-day is in its objects not merely not positive or neutral, but directly negative. In other words, the bodies and persons responsible for the system and its application, it is contended, not only desire that when the willing but bewildered pupil has completed his course of education in such languages, and goes out into the world where skill of tongue is put to practical test and men do not speak with grammars in hand, he shall not be encouraged to make any use of such knowledge as he has acquired, but that, negatively, he shall have been impressed with so deep a sense of the difficulties—overwhelming difficulties—of learning languages, and the almost impossibility of using them freely and easily when acquired, that an absolute distaste of linguistic study will be experienced, and the task abandoned entirely, never to be resumed. The great labour of learning languages is always instilled into the student. Difficult they may often be, but the preceptors make the difficulties out many times greater than they really are. In this suggestion some seem to desire to maintain a certain professional dignity, and to encourage the belief that all learning, however elementary, is a more fearsome business than those who have not been engaged in professional instruction can imagine. As with the doctors, the lawyers, and many others in real possession of special professional and technical knowledge, it is part of the game to pretend that it is vaster and even more mysterious than is generally known; a pose is adopted, solemnly and seriously. It is good for the cause. From this point the tremulous but heroic student, hopeful despite all official discouragement, strikes out into the deep and turbulent waters of grammars whose compilers have agreeably entered into the teachers' conspiracy of mystification and terror. Pages of exceptions to easy rules follow fast upon each other. The rule is simple; it applies to the majority of the words; but the teacher exalts the exceptions. He sternly sends to the bottom of the class, with scorn upon him, the pupil who has forgotten the feminine of *ambassadeur*, and the pert youth, suspected of murmuring that a woman ambassador is unknown and uncontemplated, is ordered to write out a hundred lines of—not of French (for thus something might fasten in his memory), but of Latin or Greek. The remotest intricacies and subtleties are worked upon in this system of instruction; the main rules and the simple but thorough practice of the speech and use of the language are comparatively neglected. By all means, let the grammar and the syntax be studied to the farthest pages, so that the student may possess a defter knowledge of certain points than even educated persons who were born to that particular tongue; but it should be understood that this study is meant to be a form of mental gymnastics and memory practice, and is not by way of equipment for the practical needs of life. Delightful as the study of languages may be (but is usually prevented from being), it is too often forgotten that, after all, language is but means to an end.

* * *

Now, it has been said that the study of languages with the special object of bringing about the general acquisition of one that may serve as a universal means of communication between persons of different nationalities is the most important thing in the world to-day. The suggestion is that every person ought to acquire, and be given the means of acquiring—and perhaps not that merely, but be obliged by law or national system to acquire—the use of two languages, that of his native country (or the one in which he lives and works) and one other, the latter to be the language designed for universal intercommunication. The second language, if acquired upon such a system and with such an ideal, would not be merely a language chosen by the individual because it happened to suit his own particular needs or tastes, for the ideal of the human race established upon a complete system of intercommunication is not approached by an Englishman learning Chinese or even Russian or Italian. Obviously regard must be paid to the extent to which certain languages are already in use in countries other than those to which they belong, and also to the tendencies or the intentions in this matter of nations bent on progress. While the suggestion that the acquisition of a second language with

 [*All Rights Reserved.*]

this object by all peoples is the most important thing of all—superior even to leagues of nations and other ideals and schemes of the kind—may appear at first thought to be a fancy flight of exaggeration, such an impression is largely dispelled on further consideration. For it is argued, and with seeming fairness, that one of the reasons why nations go to war is because they do not understand each other; and they do not so understand each other because they cannot converse or read one another's newspapers. Thus they are entirely dependent for their understanding on what they are told, and those who tell them, human nature and politics being what they are, have their own fine fish to fry, and so relate that which suits them best. By omissions truth is distorted and suppressed. There would be smaller need for frontiers and guards upon them if all men could speak to each other and understand. Sympathy is not conducted through interpreters; its heavenly potency is lost in the transmission. And in these days, when it is made necessary by the inexorable demands of economics that all men and all peoples should work more and produce more to repair the sad wastage of over four years of war, an immense gain would be accomplished, work would be speeded up, posts, cables, telephones, and all other instruments of communication would be rendered immensely more effective, if there were a common tongue for all—or, failing all, for as many as could be brought into a system. More could be gained by this, more work done, more money earned, more prosperity and comfort achieved, than by all the legislation that any Parliament or international conference could effect in any other direction. For each and all the resources of the world would be vastly increased by such a state, and not only the material resources, but those of the intellect, and those for the more elementary pleasures. Travel would become a different thing. It is not so far from London to Madrid as it is from New York to San Francisco, but how immensely farther it seems, and for practical purposes really is, because of the language difficulty that exists and has always existed, making this immensity of distance a traditional and accepted principle! The United States would not have been united, and would not have remained so, if divisions, restraints, coldnesses, suspicions, and misunderstandings had been fostered by differences of language; nor would the country have achieved its marvellous prosperity. One common language makes it cohesive and compact. To Britain the necessity is not less than to any other nation—even though the English language is established in so many parts of the world; perhaps it is greater. During and since the war our British insularity has been manifested as a fault and a source of weakness even more than before. At this present time the difference between our most frequent conception of the views and the attitudes, the modes of thinking and the instinctive tendencies, of even our closest allies, the French, and the real truth as it is expressed in their newspapers and by other means, impresses all who have an opportunity of studying the contrast. Our conceptions of some other nations, like the Spanish, are ludicrous. When peoples know nothing of each other, they presume the worst; if they know but a little, they presume some ill. It is obedience to a racial law of suspicion contributing to self-preservation. When the Millennium approaches, the Englishman and the Russian, the Spaniard and the Chinese, the Persian and the Moor, will have acquired the means of conversing intelligibly with each other, and will no longer be in the difficulty of beasts and birds of different species—if indeed *they* are in such difficulty, as some may doubt.

* * *

One of the most remarkable publications in this country during the period of the war was a work entitled *Report of the Committee Appointed by the Prime Minister to Inquire into the Position of Modern Languages in the Educational System of Great Britain.* It consists of eighty closely printed foolscap pages, costs only ninepence, and ought to be in the possession of all persons interested in the progress of this country, who at the same time may be duly warned that a certain proportion of the many statements contained in the publication should be received with caution. For any hesitation they may have as to the advantage of a study upon which such reflections are cast, they may find a possible balance in the assurance that it is exceedingly fascinating and extraordinarily good value for the money. The committee in question, composed of most eminent persons, sat long and laboriously, and arrived at a large number of conclusions, some of which many authorities will consider to be unsound. It seems to have been very ingenuous, too much addicted to a child-like (not to say 'judge-like') attitude of mind which has to have facts revealed to it that are quite well known by the multitude. Thus we find the committee blandly remarking: 'We were told that the distributing trade of South America had largely passed from English to German firms, even where British goods were concerned, and this because the Germans took the pains to learn Spanish.' No committee should have needed to be told such a thing, or that the general British ignorance of Spanish is one of the greatest handicaps to our progress in a country to which an impoverished world turns its attention hungrily, in the hope and the belief that from that Spanish-speaking land it will recover more of its losses than from any other. The committee should have known and deeply reflected upon the fact that at all the internment camps in this country during the

war there were classes of Germans for the intensive study of Spanish, that these were the chief and the most popular classes, and that it was not possible, despite large importations—the wonder of it!—to cope with the heavy demand for German-Spanish dictionaries by these wise and far-seeing students. Yet in face of this fact, confronted by overwhelming evidence of the importance of Spanish, the committee nowhere dwells as it should on the exceptional value of this language.

* * *

The committee takes five modern languages as being in varying measure desirable studies at British schools and universities, in addition to the native tongue—French, German, Italian, Russian, and Spanish. There can be no question about French being first. This and English are the most widely spoken languages in the world; French is the language of culture and diplomacy, and the world events of the last few years have only enhanced its importance. If a living tongue ever obtains mastery in the world as a universal language, or one is chosen for promotion to universality by some united policy, it is very possible that it may be French. The value of German and its rightful place in the scale of importance are much more disputable points. The violent and perhaps inevitable prejudices that were expressed during the worst of the war period, when truth and facts were obscured, and it was considered patriotic to advocate the total abolition of German from all our language schemes, systems, and habits, were, of course, like most other war prejudices, merely ridiculous. German is a great tongue; it is great in its literature, and it can no more be abolished than Germany can be removed from the face of the earth, while those who know it are richer than those who do not. Exactly to what extent their commercial and other prospects are enhanced by such knowledge is the point upon which there is some doubt. The committee, in weighing the pros and cons of German, Italian, Russian, and Spanish, hesitates to assign definite relative values till 'the political situation is more settled;' but it enthuses more over the scholarly value of Italian than over the commercial advantages of Spanish. Now, Italian on the cultural side is most desirable; it is possibly superior to Spanish, but only by a little, if at all. On the commercial side it is vastly inferior, and it is that side with which the committee ought to have been most concerned. Italy has no South America given to its tongue, or any other great patch of earth which famished peoples would now exploit. Russia, again, is a doubtful quantity. It is a huge country of enormous resources, which the hungry millions would feed upon when it is somewhat 'pacified,' but the position here is not the same as in South America. The Russian language is isolated in its own country, presents unusual difficulties, and it is highly probable that the Russians themselves, when they are sobered, will commonly acquire another language for purposes of foreign intercourse, and that language is likely to be French. It were, therefore, better that the enterprising British subject should master his French, and then, if time permits, acquire Spanish, than that he should labour heavily and perhaps to small advantage with Russian. The need of a universal language will soon be felt in Russia, more than in any other country in the world, for all peoples with their different tongues will be vying with each other there. The Russian cannot learn all their languages; he may learn one of them, and the others must follow his example.

* * *

The decision of the committee in bracketing Spanish with German, Italian, and Russian is the more amazing after its own statements and admissions. Thus the report declares: 'Of the four languages Spanish has perhaps the greatest commercial importance, owing to the size and growing wealth of the Spanish-speaking communities of Central and Southern America. We have had conclusive evidence of the damage suffered by British trade in America through British ignorance of Spanish. We are told that the Latin races of America are unwilling to learn English or any other foreign language. The citizens of the United States, although themselves not much inclined to study foreign languages, have not only been alert to see a likely advantage here, but have displayed, no less than the Germans, an intelligent anticipation of a possible renaissance of Spain herself. We learn that the supply in North America of text-books and handbooks for the study of Spanish is far superior to our own. Spain has a striking and romantic history and a fine literature.' Yet with all this, with the vision of South America and the riches that may be gathered from it, and, most significantly, the knowledge that Germany and the United States are both cultivating Spanish with great zest and to the neglect of other linguistic studies, Spanish is given no preference in this British commission's list! Can, then, the example of Germany and the United States be so lightly ignored? Are those nations generally so short-sighted and stupid that it would not be remunerative to follow them in such a matter? Those who, like the writer, have travelled and inquired in Spain herself have been assured on the best and most extensive authority that one of the main reasons why American and German traders have gained on the British there is that the two former send their catalogues to Spain printed in Spanish, and they are read and acted upon, while the British send theirs in English, and they are thrown into the waste-paper basket. What one suspects on perusing this report is that the committee felt out of its element in considering the purely business aspects of modern languages, and prosecuted its inquiry from wrong standpoints. Its sympathies are predominantly

cultural; and while at present we are, and must be, materialistic upon this language question, and the thing we seek most is commercial advantage, and therefore the speedy acquisition of a working acquaintance with foreign tongues, the committee thinks too much of schools and their systems, professors, universities, and so forth. It does not properly envisage the sternly practical. 'The educational system of Great Britain' considered in its present connection, is, of course, not a system only of schools and universities for the young. The rising generation must be put right, but the generation that is in commercial action also needs attention, and must be encouraged. A tendency of the report is to magnify the supposed difficulties of acquiring a foreign language after one is grown up. That the difficulties are often (not always, for the study is approached with better understanding and more enthusiasm) greater is, no doubt, true; but they are not so great as the report appears to suggest, and the student, especially one who reads and works alone, should not be discouraged. The value of class tuition, slow and needlessly complicated as it always is in these cases, is enormously exaggerated. Those who say so know it from their own experience, and not from such hearsay as the committee not infrequently relied upon in its gathering of 'evidence.' Listen to the committee: 'We hear of men and women who have fitted themselves to become commercial correspondents solely by private study assisted by these classes'—evening classes. Why should the committee appear surprised? There are many thousands of persons who have thus qualified themselves; perhaps they constitute the majority. More than that, the person who could not very easily by private study qualify himself thoroughly for such work would be lacking in simple intelligence.

* * *

Men and women should now by every means be encouraged to make such study, and so equip themselves with a strong arm for personal and national progress. The average individual, school-days over and work begun, is not often much of a serious and regular student of anything except politics, the newspaper, and forms of entertainment, including (to be fair to him) the arts in the last-named section. This is because studies that smack somewhat of school have become distasteful or seem unprofitable, and languages are instinctively avoided because of the grammatical terrors that were encountered in the mistaken school systems. The truth is that modern and much-used languages are the most interesting, most thoroughly practicable, and by far the most profitable study that a person without a special mission demanding other studies can engage in. They open new worlds, and no other study can be so well prosecuted without outside or professorial assistance. The study of a language yields an immediate return to the student. He possesses an advantage or quality which he can in some form immediately turn to account. No other study furnishes him with such a constant and regular measure of his own progress and his sense of it. The man who has two languages to his lips is better than other men; the world is larger to him; he is clearly a superman of sorts. He is envied, appreciated, and often sought. Anyhow, the committee produced, as we have said, a most interesting report, deeply entertaining. It might be taken away upon a holiday. No other official report ever presented can quite match it in some respects. It is historical at times; with all its faults, it embraces a mass of information as the result of special investigations; and occasionally it is delightfully philosophical. 'No country,' it truly declares, 'can afford to rely on its domestic stores of knowledge. The whole civilised world is a co-operative manufactory of knowledge.' Or again: 'Knowledge and training have a clear value in the struggle for existence; and in order to live well, it is first of all necessary to live. Practical education is the only foundation on which idealistic achievements can be raised; to neglect the practical ends of education is foolishness; but to recognise no other is to degrade humanity. Moreover, it is to ignore a most powerful motive. Art, poetry, the drama, history, philosophy, may have no "survival value;" but men will work for the joy of comprehension, for the joy in beauty, for the joy of creative construction, as they will not work for less inspiring ends. The desire to live well is a most potent force; and it has done, and will still do, as much to modify the aims of men as the struggle for existence. Culture and civilisation are by-products of life; but, like some other by-products, they may yield a greater return than the parent industry. What gives dignity and splendour to life may be more precious than the life itself.' The committee expresses many profound truths very well. Here and there are pretty passages, almost purple. There are epigrams, and such dissertations as are not to be discovered in other reports. This one is unique. For the committee clearly said unto itself that, as it was treating of languages and literature, and only incidentally of markets, tonnages, exports, imports, and the like—perhaps more incidentally than should have been—here was an opportunity. Avidly it was seized. Our committee was determined that, whatever might be said about, or done with, other languages, this body of scholarly persons would for themselves demonstrate the possibilities, the flexibility, the many charms of our own dear island tongue. At times it soars to enthusiasm in this endeavour; some of its constructions are subtle and charming. The report becomes a classic. And if it does not further the great cause of a universal language or even assist our own people to a more extensive expression of their mean-

ing among foreigners, it will achieve no less than was ever expected of any committee, and there is the consolation that the cause is so good that it must ultimately triumph. Did not a noble lord, satirical upon royal commissions and committees, declare that if the great Creator had entrusted to a commission the task of preparing a report upon the proposed construction of the world, we should, for lack of earth to walk and live upon, all have missed existence?

THE SEARCHERS.

CHAPTER XXIX.

NEXT morning tatters of mist, high up on the Cairngorms, stirred and took changing shapes, like smoke-puffs, in the slight June wind; but they were fleecy as the clouds above them, for, though the glass had fallen a little, sunlight filled the sky, and there was not a stain on the company of clouds, a full-sailed white fleet, signalling fair weather, in stately motion across the blue.

Duncan and his men had started early by different roads for the Larig, and beyond a few details of our packing, Tony and I had little to do in the way of final preparation. I was on thorns of impatience and excitement. What Keene-Leslie's emotions were no man could have told—he went about his business as imperturbable-looking as an Indian sachem. Outwardly he was as calm as I was unsettled. At luncheon he drank 'Confusion to Sempronius! We'll do more than deserve success, Neil! We'll command it!'

In the afternoon there was no one at the little station except the railway officials and two or three dawdling rustics. We took our tickets for Edinburgh and London respectively, and the station-master found an empty compartment for us.

Just as the train started, Dr Hall's little two-seater came swiftly up the slope of the country road parallel to the line. The doctor had evidently been unable to get back from his long round of country visits in time to see us off, for he scanned the train, disappointment on his brow; but I waved a hand, and was in time to see him signal a good-bye. Keene-Leslie was apparently not inclined to talk. He stared stonily at the country-side, and I fancied there was now a hint of anxiety in his eye.

'Cheer up, Tony,' I said with a laugh meant to mask my own concern. 'You're a bit under the weather, surely!'

'Maybe! By nature I am neither a pessimist nor a fatalist, and I don't think I am unduly careful of my skin, but I believe that the two of us will see some queer things in the next forty-eight hours.'

'But we hold good cards.'

'We do; but'—he shrugged his shoulders—'you never can tell.'

'Do you think that "The Searcher" smells a rat?'

'No! On the contrary, I think that our little trap will give him the surprise of his life. But mark my word, as soon as he sees the game is up, look out! However, there's no good in picking ourselves up before we tumble. I'm going to forget about it for an hour or so. Let's dismiss the subject until we get to Ardgarry.'

He lit a cigar and opened his newspaper. I followed his example, but failed to galvanise myself into any interest in current affairs. After ten minutes' mental confusion, I laid down the paper and looked out on the familiar surroundings. A burst of sunshine lit the landscape; the river was in half-spate, rich in magic gradations of light and colour; amber depths starred with bells of foam; shallows where the sun-sparks glittered; still mirrors of pools under the banks; here and there the snowy dazzle of a check in mid-current. The tranquil green valley looked a thousand leagues away from dark adventure. Through some refraction in the atmosphere, the mountains which I knew so well, and which were now to be revisited on so strange a quest, held the illusion of nearness; the shoulders of these neighbourly giants were playgrounds of cloud-shadows, the lines of their fastnesses softened and mellowed in the sunlit distance; and high up, near the crest of Braeriach, a snowdrift lingering in a hidden corrie, caught by a vagrant sun-ray, gleamed with the splendour of a lonely star. In the sincerity and the majesty of these high places, man's puny spider-webs of evil seemed remote and futile. Yet evil there was, watchful, resourceful, near at hand.

At the thought I lifted my eyes again to the uplands, and as I looked a shadow crept into the sky. The sun withdrew. The serrations of the hills were dislimned, and the great star of snow dulled and vanished.

Keene-Leslie was absorbed in his newspaper. Beyond a glance now and then out of the window, and a growl at the fickleness of the day, his demeanour was irritably stolid. Not once did he refer to our mission, and after one or two fruitless attempts to lead him into conversation, I relapsed into silence, staring at the snow-fence slipping past as we neared the smooth tops at the summit of the Drumochter Pass, and for the thousandth time linking together the chain of events of the last few months, tormenting myself with the thought that our plans might come to naught, and our adversary and the secret slip through the net at the last moment.

The inaction of the journey chafed me, and I

was heartily glad when the summit was reached and the train gathered speed down the gradient. Here the outlook became less wild. Brown empty moors gave place to the charm of woods; a great Highland castle reared its stately head amidst the trees; smoke rose from the haunts of men. There were few people at Ardgarry station—some countryfolk back from the market, a bagman or two, a handful of nondescripts. We kept a wary eye for any one who might have been dogging our movements, but saw nothing to rouse the slightest suspicion; and after the train left, we made our way down the quiet street to the Stag Hotel, where the car and the chauffeur were waiting in the courtyard. Malcolm Cameron, the guide with whom I had tramped many a mile in the solitudes of the Cairngorms, was there also, and five minutes sufficed to instruct that hardy Gael in what was required of him.

'All speed to the top o' the Pass, Mr Neil?'

'That's it, Malcolm. I'll tell you the rest as we go along. Meanwhile, let the chauffeur know that we are out for a tramp in the hills, and that we are in a hurry.'

'*Tha mi 'tuigsinn*' ('I understand'), said he.

A few minutes after four o'clock we swung out of the village. Taking no risks of espionage, I ordered the driver to run southward, and after three or four miles had been covered, told him that we had changed our minds. By a road on our left we doubled back, and in a few minutes, under the spell of a liberal tip, the driver was exceeding the speed-limit up the wild and beautiful Glen Tilt, through a fine forest flanking both sides of the road. Far below us, the river, broken here and there by glittering cascades, hurried over its curiously bright and polished channel to swell the music of the Garry. The road steepened as the car began to climb the valley and we neared the green mass of Beinn a' Ghlo. Here we drew up near the lodge, a thousand feet above sea-level, girt about by great rugged hills. These rose on every side, Beinn a' Ghlo and Carn nan Gabhar towering on our right, to the northward stern slopes unrelieved by a touch of colour, and away beyond these, as far as the eye could view, hills stretching, billow upon billow, to the Mar country and the great southern gateway of the Cairngorms.

The car was sent back, for the road now dwindled to a bridle-path. Keene-Leslie and I turned eagerly towards the narrowing riband of track pointing towards the wilds.

'What lies beyond?' said Tony, his eyes on the inscrutable heights. The words gave voice to my own thoughts.

'Come no farther, pigmies! What seek ye? We have our ancient secrets. They are ours, not yours. Come no farther!' Thus might some spirit of the wilds have greeted us.

'You are off on one of your mystical flights, Neil,' said Tony.

'I can't help it. I was born in the shadow of the mountains, my friend. I have drunk of the magic heather ale.'

'See!' said Tony, pointing to the skyline. 'Your mood has infected me. Your Cairngorms look like the rim of another world. Their "Come no farther!" is a challenge. *En avant!*'

He hitched up his rücksack, and the three of us struck up the track towards the mountains. A cool, westerly breeze was blowing, and although there were a covey or two of clouds flying rather low, the evening was pleasant enough for our tramp. The stream rumbling below was the only sound, except our footsteps and the wind's voice strengthening as the ascent steepened to the Falls of Tarf, fifteen hundred feet up. Then the track fell to the county march and Glen Tilt was left behind. The face of the country became wilder as we neared Glen Ey Deer Forest, where my eye caught the dark green of a little company of trees in a fold of the uplands, and set in their midst, unspeakably lonely in the frowning wilderness, the gray gable of a house.

(*Continued on page 487.*)

FISHING WITH WATER-BOMBS.

By ÆSCULAPIUS.

NOW that military considerations no longer stand in the way, it is possible to say something about an anti-submarine device which played a decisive part in overcoming the U-boat menace.

The ordinary depth-charge has, of course, been known for some time. For the last two years of the war nearly every torpedo-boat destroyer, cruiser, or armed merchant liner putting to sea carried these heavy canisters of explosives. First of all, they were 'hand-release' depth-charges, held suspended over the stern end of the ship. A voice-pipe number stood by. It was that rating's sole duty to let them go on an order from the bridge.

The disadvantages of this method of attacking the lurking submarine are obvious. It is true, these infernal machines of the sea were supposed not to detonate on contact, but to attain first a certain depth, so that the full violence of the explosion might be exerted under the enemy boat. All the same, they had a nasty way of 'going off' as the result of concussion. This was especially liable to happen in the case of a convoy, where ever so many ships might be steaming in close proximity to each other, without lights. Under such circumstances collisions could not altogether be avoided in the dark; and when they did occur between

ships carrying depth-charges, the latter were responsible for sterns being blown away and terrific damage generally.

Moreover, even when these deadly drums did behave themselves, the ship dropping them on a submerged target ran grave risk herself from the ensuing explosion. In other words, unless her speed were high, it was touch-and-go as to whether she had time enough to clear out of the affected zone.

That was the original state of affairs. Releasing the canisters hydraulically from the bridge while the ship was steaming at full speed effected some improvement. This was followed by an apparatus shaped something like the silhouette of a champagne-glass, in which the awful things lay until they were suddenly and forcibly hurled away from the end of the ship by compressed air. Undoubtedly this contrivance signified a considerable advance, and made it much safer for the ship dislodging them. Nevertheless, the situation was far from satisfactory for everybody concerned in overcoming the menace until something new was evolved which foreshadowed the failure of the U-boat campaign. It consisted in the perfection of a depth-charge so stable in its character of only detonating at a certain depth of water that it could be fired from an ordinary howitzer. The howitzer is mounted in the same way as any other gun on board ship, and requires a cartridge of specially low velocity to send the fearsome invention on its submarine-seeking errand.

These howitzers, which look not unlike some of the Mall trophies, increased rapidly in size and range, until not so long ago we tested an 11·5-inch one designed to fling its peculiar ammunition anywhere up to three thousand yards away.

The trial in question took place 'somewhere in the offing.'

Instead of lying about the stern end of the ship, the depth-exploding shells were snugly stowed away in the magazine. As soon as we had got out far enough, half-a-dozen rounds were brought up by the ammunition-hoist. Then the blessed howitzer was loaded. On an order from the gunnery-lieutenant, the gun-layer pulled the firing-lanyard. There was a burst of yellow flame, an ear-splitting crash, and our immediate vicinity became enveloped in smoke. Observers in other ships told us afterwards they were able to discern the water-missile's course through the air from the time of the flash until the moment it plopped into the sea. We ourselves did not see anything of its aerial flight. All we saw was the sea torn up into a mighty column of water after the explosion had occurred sixty feet below the surface. Then came the 'kick,' when it seemed almost as if some sea-going Titan had seized our comparatively small ship in his grasp, and given us a good shaking for disturbing his peace.

But all these details were as nothing compared with the big question that rose uppermost in everybody's mind: 'What about the fish?' We had not long to wait before there were joyous cries of 'There they are!' 'I see them!' 'Hundreds of 'em!' Sure enough, countless white specks began to gleam on the otherwise blue sea. After steaming cautiously in their direction, we lowered our dinghy, and the boat's crew proceeded to collect the fish. Gradually, too, we drifted in among the 'field.' Many queer 'catchers' were improvised on the spur of the moment; and soon the fish were flopping about our decks in all directions. We could afford to dally there only a very short time, however, and a good few had to be left to the sea-gulls. Apparently the dull boom of the howitzer was the signal for these winged opportunists to muster in swooping hundreds. As for us, we had dory, whiting, sole, conger, and goodness knows how many other varieties. Still living when picked up, they were as a rule beyond recovery. It is not a case of their suffering from mere concussion, as some people seem to suppose, but of the poor things having sustained a more or less complete dislocation of the internal organs. The all-essential swimming-bladder is perhaps dislodged through a gaping wound in the side, or the stomach is found displaced into the widely distended mouth. Usually, too, the piscine eyes are blown out to such extraordinary dimensions as to give the finned victims a preternatural look. Nonetheless we thoroughly enjoyed eating them in those days of not over-plentiful fish.

Needless to say, these injury-phenomena are not limited to the natural denizens of the deep—a submarine's 'vitals' are just as vulnerable in proportion; and even if the pirate managed to limp back to his base, one can appreciate to some extent the effect of several such shocks on his *moral*.

The great feature about water-bombing is that only reasonable proximity to the enemy is required; and under such circumstances U-boats were not particularly given to coming to the surface again.

JOHN BROWN.

CHAPTER XXI.—HISTORY AND ESPRIT DE CORPS.

'IT is a good thing, gentlemen, to cull the best from the past and never to ignore it,' said Captain Cheerall at another lecture. 'If our fathers frequently blundered through, they did so heroically. No army is blessed with such high traditions, such records of chivalry and glory, as ours; yet, like all armies, it has frequently failed. We do not claim to have been invincible. But

we have a right to know, and be proud of, the battle honours on our flags.

'This you may think is a new line of thought for me, the arch-priest of the present and the future. Well, my reason for reminding you is this: you are of the new faith, the new school, the New Army. Your success has been wonderful, and in another lecture I have paid tribute to your genius, courage, and patriotism. Now I want to remind you, not of past follies, but of past glories. The small-minded person is very apt to remind us of our failures in America during the War of Independence, our awful blunders in the Crimea, our shameful disorganisation in the early part of the South African War. Such accusations are true. But if you study these failures, get to know *why* we failed and *where* we might have scored, and thus increase your professional knowledge. Never be afraid to admit our errors, but take good care *never* to repeat them. This is a maxim you must ever bear in mind. Even in this war—at Loos, Neuve Chapelle, Cambrai, Gaza—there are instances where the human machine went wrong, instances which afford you food for serious thought and reflection.

'But what I really want to concentrate on to-day is the spirit of the British Army—that unconquerable soul which lightens a disaster, sustains us in a reverse, and proclaims to all the world that we Britishers never know when we are beaten. That, gentlemen, is the most priceless asset of our army. To understand this spirit you must look at our history. You must dip into the annals of India, Egypt, Africa, the story of the Peninsular War, or of Waterloo. In these tomes are the deeds of your fathers. Our army never fights better than when it struggles for a moral cause. We conquered Napoleon in the flower of his strength, and in our hour of national weakness, because truth, honour, and right were on our side.

'I do not say we have always been crusaders. There are wars in which we have played an Imperial game. Yet, after deep reflection, I am convinced some Power or Powers must be predominant in this world, and this leads me to believe that a Power which is based on liberty, equality, and fraternity is the Power entitled to impress its own culture on the world. We have always been civilising, always pioneering, always trying to leave the world a little cleaner, a little better, than we found it. This work has been supported and made possible by the splendour of British arms.

'What you must take from the past is the spirit of your fathers, the simple faith, the sense of duty, the code of honour, and the love of country which have been shown by the best of our men in all our wars. And I do believe no man is cultured or efficient unless he has a knowledge of history. This gives you the reason why. Such a study prevents gross materialism from entering your soul. It takes self above the battle, and enables you to realise that beyond the trials, the sorrows, and the horrors of war there is a god-like spirit which is clean, noble, and must, therefore, be triumphant. I am not sanctifying war, for I loathe it; but I am sanctifying the moral force which is behind us, for example, in this war. There never was a cleaner crusade.

'Whatever regiment you go to, you must first read its records, learn its battle honours, get to know its heroes, study all its peculiar traditions, and generally imbibe that *something* which has made it wonderful. There you are on sure ground. You can fascinate your men with its stories of valour. You can thrill them with its pride. You can cheer them with its humour. And you can make them love you by displaying an intense devotion to all things pertaining to your regiment. You will not do this in a day. But you can do it in a few months. And *yours* shall be the glory.

'Some one has said that the path of duty is where honour lies. Our military histories will corroborate that. White in Ladysmith, Gordon in Khartûm, and Townshend in Kut are good examples of patient courage and unselfish devotion. The death of Captain Oates of the Dragoon Guards is a fine story, if not actually military. This British officer and gentleman, when stricken with disease, walked out into the Antarctic snow to die, rather than burden his companions and bring them to death and disaster. There are thousands of anecdotes of this order. When you read them, your spines will thrill at the valour of your fathers.

'And I should like you to study very closely the spirit of friendship between the British officer and the private soldier. This is a wonderful story. It shows we have discipline, and yet we have none. In other words, it illustrates that we have got things done because the men liked their officers, and not because "they had to." You have to discover that secret. Yet it is easy to find. Frankness, courtesy, love, and courage are the basic elements of the plan. The gentle patience, the benevolent rule, and the paternal anxiety of our fathers were marvellous things. They made the British Tommy the most faithful, the most willing, the finest soldier in the world. He has no equal. He will never let you down. But you cannot get the best out of him unless you model your personal conduct on the lives of Kitchener, Roberts, Maude, or Wauchope. These four men are the pictures of simple British gentlemen, with Christian instincts, a plain sense of duty, unalterable devotion to their country, and a *magnificent* belief in their fellow-men.

'Again, I do want you to feel that a British officer is no vain person, put up for the admiration or the subjugation of the mob. Do not be a sabre-rattler. Let your demeanour to the civilian crowd be one of chivalry. If we are democratic in our politics, all of us, even the private soldiers, are aristocrats in temperament. We loathe a bounder; we hate a prig, scorn a sneak, and curse a knowing fool. Carry the

white flower of a blameless life, and champion all things that make for the propagation of truth, civilisation, and honour.

'History, I say, will give you much. It will prove that there is a wonderful fire and force in our race. Our island story is very well summed up by Kipling when he says:

'What should they know of England,
Who only England know?

'When you have travelled the Seven Seas; when you have walked in the footsteps of frontiersmen, seen the Valhalla of heroes and the sleeping-place of martyrs, watched tribes and nations of all creeds and colours saluting the British officer and the British flag, it is then you feel:

'There is a voice divine,
And a mission that is high.

'Gentlemen, here is the proof of our liberty and wisdom. At Gallipoli are the graves of free Colonists with no ties to this country except the ties of blood. Their country is a Labour country. Imperialism is banned. Yet when Germany threw the gauntlet these freemen came forth to help the Old Land. They died like Trojans. They died for LOVE. They died that we might live. And their brothers to-day are dying in France. Side by side are those wonderful Canadians, glorious Newfoundlanders, gallant Africans, brave Indians—indeed, all nations under the British flag. They have not rendered mere lip-service. They have given the flower of their land that this Old Country, the mother of Democracy, the breeder of nations, the fount of tolerance, shall keep her lamps burning brightly and repel the hordes who would destroy the Crucifix and deify the sword. You can understand this devotion only by a study of the past.

'When you have mastered military history, you will quickly grasp the value of *esprit de corps*. You will know *why* the Guards would scorn to be called Highlanders, and *why* the Highlanders would shoot you if you put them into the Guards; *why* the K.R.R.'s want to beat the Rifle Brigade, and *why* the Rifle Brigade believe they are better than the K.R.R.'s; *why* Dragoons think themselves superior to Hussars, and *why* Hussars would sicken if you named them Dragoons; *why* the R.H.A. believe that the R.F.A. are not fit to lick their boots, and *vice versâ*. Unimportant as these things may seem to the uninitiated, they are really the basis of good work and true fellowship. This spirit is the same as the spirit of the public schools. You will not find this spirit in Germany. Force is the gospel of Germany, even in school and in sport. *Force never made a gentleman or a great nation.* Let me tell you a story. A broad-minded German was travelling past the playing-fields of Eton before the war. He saw the boys playing Rugger, Soccer, &c., and immediately ordered his car to stop. He sat for quite a long time looking at the clean, bonny British boys playing their games. Then he jumped up, took off his hat, and shouted, "Ah, mine friends, I would lub to be one Breetish boy!"

'That is a very great tribute from an enemy. To you we hand the guardianship of that spirit. You must believe that to "Play up, and play the game," is the noblest thing in life. You must live not for self, but for country. Your wealth, your gifts, your pleasures, even your loved ones, must be surrendered at the call of duty. Duty is the keystone of patriotism. And patriotism has made us what we are. The defects of this system are outweighed by its virtues. "The word of an Englishman" is all they ask of a Britisher in the Argentine. *But from a Hun they demand an agreement, stamped, sealed, dated, and witnessed.* What finer tribute can you have to the spirit of our race?

'An army, gentlemen, without a soul is a vile and cruel instrument. It will commit excesses. It will rape, plunder, and demoralise. It will stink in history like the armies of Attila, Cortes, and the Kaiser. We must avoid that. We cannot do so unless you leave this school with a full knowledge of history, an appreciation of *esprit de corps*, a love of the truth, and an adherence to the principles of justice.

'Gentlemen, words fail me—but I feel that I have shown you the soul of the British Army. Guard it! Cherish it! Fight for it! And when this bloody war is over, the world will take you into its arms, and God will proclaim, "Well done, thou good and faithful servant."'

A strange silence fell over the room as the lecturer finished. The spell had not yet passed. Men had been transported from the sordid to the higher things. But when the captain lifted his stick and gloves to go, we burst into a wild hurrah.

. . . . . .

That night Tosher, whom we dubbed 'The Materialist,' slipped out of the hut about nine-thirty. He crossed the dark parade-ground, and made for the officers' quarters. On arriving at Captain Cheerall's domicile, he knocked at the door.

'Come in.'

'Say, cap., I 'd like to swot up some of that history.'

'I see! What can I do for you?'

'Well, I guess you 'd better lend me a book to get on with.'

'Certainly. Here you are. Anything to oblige a good Canadian.'

'Thanks, cap. And, I say'——

'What?'

'You were real good on that stunt to-day. Good-night, sir.'

'Good-night, Johnson.'

When Tosher got to the hut, he looked at the book. It was entitled *Deeds that Won the Empire.*

(*Continued on page 507.*)

THE MONTH: SCIENCE AND ARTS.

A NEW TYPE OF GRAMOPHONE.

SINCE the invention of the gramophone no considerable modification has taken place in the design of talking-machines. We still have as the source of sound the mica disc vibrated by the needle, while the horn merely amplifies the effect. Recently, however, a different type of sound-producer has been invented, consisting of a parchment disc in the form of a shallow cone. Owing to the large diameter of the sound-disc, no horn is required to magnify the results. The parchment disc, which is stretched upon an aluminium ring, occupies a position at one side of the revolving table, and has an arm projecting from the centre. As seen in position, it bears a strong resemblance to a mushroom laid on its side, the end of the stalk carrying the needle. The whole arrangement is supported on swivelling trunnions at the root of the stalk. The needle, which may be of steel or fibre, bears on the record as usual, and the vibrations are transmitted by a lever to a rod which passes through the 'stalk' to the apex of the parchment cone. Pleasing results are said to be obtained with this new instrument from all types of records.

THE MICRO-TELESCOPE.

Few persons realise that a telescope is composed partly of a microscope, a distant view or an astronomical object being presented by the lens at the big end of the telescope, and magnified by the eye-piece, which is really a miniature microscope. Indeed, the eye-piece in a big instrument may have a magnifying-power equal to that of the most powerful microscope. Until recently, however, a telescope of even very moderate power could not be used on objects that were less than, say, fifty yards away. It is true that some field-glasses will show clearly a picture at the far end of a small room, but their magnifying-power is very low. Another point to be remembered, when considering the instrument that forms the subject of this note, is that any power can be used on any telescope; that is to say, one could apply an eye-piece which magnified an object five hundred times to an ordinary telescope, the only drawback being the dimness of the view owing to the lack of light, and the want of definition owing to the character of the object-glass. Lastly, every high-powered telescope is of unwieldly length, due to the long focus needed for the big lens; moreover, this feature involves a very small field of view. These drawbacks have been overcome in the 'Davon' Patent Micro-Telescope, in which a special object-glass with a short focus gives a big field and brilliant illumination, so that objects may be examined at any distance to within three feet, the degree of magnification ranging to sixty diameters. With an object-glass of still shorter focus uneven areas can be viewed at a distance of from one to three feet, the degree of magnification ranging from thirty to one hundred and fifty diameters. The magnifying is done by an ordinary microscope, which, thus used, forms the eye-piece of the object-glass. In fact, the latter is made to fit the standard microscope without any alteration. Such an instrument has a great variety of uses. For instance, the habits of bees, ants, and other insects can be studied from distances of from four to twenty feet without disturbing them; while mineralogical specimens, fractures of metals, or textile fabrics can be illuminated and highly magnified, the whole surface within the field, though irregular, being in focus. This is a most important feature, as under a plain magnifying-glass or an ordinary microscope only parts can be focused at one time, the remainder being blurred. The application of these principles is carried still further in the 'Davon' Super-Microscope, with which high magnifications can be obtained. The ordinary microscope still forms the eye-piece, but instead of the telescopic object-glass attachment, a microscopic objective is fitted with a collecting lens, so that the power of one microscope is employed upon another. As in the micro-telescope, the depth of focus is considerable, and as the object-glass does not need to be close up to the specimen under examination, opaque objects can be illuminated and their surfaces studied, whereas only transparent specimens can be seen under high powers in the ordinary microscope (unless a vertical illuminator is used, as is done in examining metals). Finally, photographs can be taken of everything as shown by the micro-telescope or the super-microscope. The former is also made without the microscope-stand for field use, and, owing to the principles upon which it is constructed, it gives a wide field of view at all powers, while being remarkably compact when compared with other instruments of similar power. Although this field-glass is only twelve and three-quarter inches long, a magnification of forty-five diameters is obtained. Many of these micro-telescopes were supplied to officers in the army and the navy during the war for use in observation posts, kite balloons, and the like. The micro-telescope is likewise made in binocular form, and the result is greatly increased field illumination and stereoscopic effect.

A GUN RANGE OF ONE HUNDRED AND TWENTY-ONE MILES.

Although in actual achievement in the matter of long-range bombardment the Germans outdistanced the Allies with the guns that threw

shells into Paris from a distance of seventy-five miles, it is generally admitted by artillery officers that even greater ranges could be obtained if the results were likely to justify the cost. The problem is simply one of obtaining a high enough initial velocity for a projectile of adequate weight. In order to compass the first end it is necessary to have a slow-burning powder and an enormous length of barrel, so that the pressure may act on the projectile for a comparatively long distance. Weight can be obtained only by adopting a suitable diameter of shell, as there is a limit to the length of the shell which is practicable. According to the *Scientific American*, a gun has been worked out by the United States Ordnance Department that could hurl a shell for just over one hundred and twenty-one miles. This weapon would have a bore of ten inches and a length of two hundred and twenty-five feet, while its weight would be three hundred and twenty-five tons. One of the chief difficulties with so long a barrel would be to prevent the end drooping with its own weight, and this drawback was to be overcome by a deep lattice girder along the under-side. This method of construction renders impossible the use of the customary trunnions for supporting the gun. As a substitute for these, the two sides of the girder at the breech end are curved to form an arc of a circle about the centre of gravity. The gun, therefore, exactly balances on these curves at any elevation. Teeth are cut in the curves, and these engage with similar teeth in flat tracks upon which the gun rests. This arrangement is often applied to raise the portions of bridges which open, the Tower Bridge in London being a well-known example. The gun would be elevated by means of a huge hydraulic cylinder with a telescopic plunger working on trunnions underneath the barrel, and pivoted to it at a point nearer to the breech end than to the muzzle end. In order to be loaded, the gun must be lowered into a horizontal position, with the breech end opposite the loading-stage. The mounting would be carried on rollers, and arrangements were worked out to take the recoil, which, of course, would occur with enormous force. It was estimated that a charge of slow-burning powder weighing fourteen hundred and forty pounds would maintain the pressure behind the projectile throughout the two hundred and twenty-five feet of the length of the barrel, and give the shell a velocity at the muzzle of eight thousand five hundred feet (more than one and a half miles) a second. Moreover, this prodigious speed could be obtained without putting any undue strain on the breech end of the gun, the pressure being only twenty tons per square inch against eighteen tons for an Elswick ten-inch gun. To enable the shell to pass quickly into the upper and more rarefied regions of the air, where less resistance would be encountered, the best elevation was considered to be fifty-five degrees. A shell, weighing four hundred pounds, was designed, with a long, tapered, false head, so as to give the least possible resistance to the air. When fired from the gun, the shell would soar to a maximum height of forty-five miles, and would come to earth again at a spot about one hundred and twenty-one miles distant from its starting-point.

SOAP SUBSTITUTES IN GERMANY.

During the war many samples of German food-stuffs and other commodities were investigated with a view to gauging the shortage of materials arising from our blockade and other causes. Apart from the scarcity of food, the comfort of German homes was seriously affected by the miserable substitutes for soap with which housewives had to content themselves. Most of this so-called soap was largely composed of clay, sodium silicate, or sodium carbonate, which gave bulk and enabled more water to be taken up, but did not properly take the place of soap, although having some action in removing dirt. One of the worst samples consisted chiefly of clay held together by a little soap. Most of the soaps tested were dirty, and their character suggested that they were made from refuse and recovered grease not properly purified. One sample contained, in addition to the clay, gritty matter, which appeared to have been added to give a scouring effect. In a final report the investigators mention a sample composed almost entirely of clay, such as pipeclay, with a very small proportion of soap, probably as a binding agent. In general the substitutes examined are said in no way to resemble soap, as they clean mechanically, the fine clay *absorbing* grease from the skin, and with it some of the dirt, instead of emulsifying the grease, as genuine soap does. The report concludes with the dictum that 'if these clay blocks are actually in use as toilet soaps, it certainly points to there being a great dearth of fats in Germany. No real substitutes were found, nor any indication of emergency methods and processes, except adulteration.'

INCREASED PROTECTION FROM RUST.

The complete protection of iron from rusting has remained practically an unsolved problem ever since this metal was first discovered. It is true that various coatings, such as zinc, nickel, and lead, preserve iron and steel articles from corrosion for considerable periods, but sooner or later rust-spots appear and spread rapidly. Chrome steel, of which rustless knives are made, appears to be absolutely immune from corrosion, even when exposed to the action of salt water and vinegar; but this solution of the rusting problem is too costly for general use. In a German journal, *Zeitschrift für Strassenbahnen*, Professor Barff describes a process for protecting iron and steel which is said to be more effective

than any other. The part or article to be protected is maintained at a high temperature in a chamber filled with superheated steam. This results in the formation of a coating of black oxide of iron, upon which rust does not form, although the metal be continuously exposed to the weather. The thickness of the coating depends upon the temperature of the steaming-chamber and the length of time the treatment is maintained. Exposure to steam at a temperature of five hundred degrees Fahrenheit for five hours produces a rustless surface that will resist rubbing with emery-cloth for a considerable time. A temperature of twelve hundred degrees Fahrenheit for six or seven hours forms a coating that cannot be filed through. One advantage is that rust will not form under the protective coating, so that, if the black oxide is worn off in places, corrosion will not spread beyond the exposed areas. Pieces of iron protected by this process have been left out for six weeks in rainy weather without showing a sign of rust. It is thought that the new process will be applicable to bridges and other steel structures, the protection of which by means of painting costs large sums of money.

ENORMOUS COAL-HANDLING PLANT.

In railway matters, at least so far as mere size is concerned, the United States easily lead the world, American locomotives, goods-wagons, and passenger-coaches being not infrequently colossal as compared with the corresponding rolling stock to be seen on European railways. This being the case, one would expect to find their railway appliances for handling coal on a similar scale. In this expectation few will be disappointed after reading of the apparatus for tipping out the contents of coal-trucks recently installed at Hampton Roads by the Virginian Railway. This appliance, known in America as a 'car-dumper,' is said to be the largest in the world, which may easily be true in view of the fact that it tips over two trucks at a time, each containing sixty tons of coal. 'Car-dumpers' have been used in this country for many years, but their capacity is limited to single trucks holding ten tons, and these are tipped endwise. The Virginian variety consists of an L-shaped trough or cradle containing a platform with rails, on to which the trucks are run after being pushed up an incline, whereby the vertical lift of the dumper is reduced. The L-shaped trough is tipped over sideways; consequently the weight of the trucks and the platform is taken by the vertical side during the operation. To enable trucks of varying widths actually to lie on the side of the trough, the platform is fitted with wheels which allow of transverse movement. The trucks are turned nearly upside-down, so that all the coal resting on the sides is tipped out. It is necessary, therefore, that they, with the platform, should be kept from falling away. This is done by four inverted L-shaped clamps for each truck, which close down until the horizontal leg of the L lies across the top of the truck. Wire ropes pass across grooves in the upper sides of these horizontal legs, and are hauled tight by counterweights during the tipping operation. As the trucks are tipped, the wire ropes slip into the grooves of the clamps. The lifting and overturning of the L-shaped cradle is accomplished by means of wire hoisting-ropes, says the *Scientific American*. As the trough or cradle is lifted it encounters a pivot at each end when it has reached the correct height, and the pull of the ropes is converted into an overturning movement round these pivots. It is interesting to note that the American plan is to 'pour' out the coal from trucks with fixed sides all round, and that is why they must be turned nearly upside-down to empty them. British trucks have doors at the ends, and have only to be tipped sufficiently for the coal to run off the floor. The giant dumper is by no means the only astonishing feature of the coal-handling plant at Hampton Roads, for the equipment includes a loading-pier, of which the deck is seventy feet above the water. Coal is carried to this pier in trucks which are said to be the largest in existence, holding, as they do, no fewer than one hundred and twenty tons each. These are loaded by a dumper, and are either hauled up a long incline to the deck of the pier by a cable, or hoisted vertically by an enormous lift. The weight of the platform with a loaded truck is so counterbalanced that about the same power is taken to lower the lift as to raise it. This arrangement demands only half the power that would be required if merely the weight of the lift platform was balanced. Moreover, the power consumption is uniform throughout the round trip (up and down), which is more economical than using twice the power for half the time.

AN IMPROVED MACHINE FOR PRODUCING TYPEWRITTEN CIRCULARS.

Most of us receive circular letters from time to time that purport to be genuine typewritten productions written exclusively to ourselves. The nature of such epistles is generally made apparent by slight differences in the appearance of the body of the letter and of the name and address of the recipient, which, of course, have to be filled in after the body of the letter has been duplicated. Not infrequently, if both sexes have to be addressed, the 'Sir' or 'Madam' is not quite in line with the 'Dear.' These drawbacks have been overcome in a machine recently invented by Mr E. E. Strawn, of Des Moines, Iowa, the salient features of which include the following: (1) the printing of the whole letter at the same time in a form which exactly resembles typewriting; (2) the reproduction of the letter-head and the signature, the former

being in two colours if desired, while the latter may be in any colour; (3) the cutting off from a roll of paper of each letter as it is printed. These operations are carried out at the rate of five thousand letters an hour. Obviously, special arrangements are needed to avoid the setting up of type for the names and addresses, and so these are embossed on small zinc plates, which are fed to the machine in alphabetical order. The printing is done by pressing the paper down on to the type by a roller with an inked ribbon between the two, so that the process is the same as typing, and naturally gives the same result. As the paper moves forward for the next letter the heading and the signature are printed from electrotype plates. By double printing, which is provided for, part of the letter-head may be in one colour, and the remainder in another. The machine may also be used as an ordinary printing-press by rearrangement of the mechanism. In this case the paper passes through the machine continuously instead of pausing for the ribbon typing, and bill-heads or other types of leaflets can be printed at a speed up to fifty thousand an hour. Again, with a very simple attachment, says the *Scientific American*, the machine may be applied to the production of envelopes complete in every respect except for one fold of the flap, which has to be made by hand. The envelopes are creased and gummed ready for the fold, and, by means of the name-plates already mentioned, are addressed at the same time. Even yet the list of this machine's capabilities is incomplete, as it is fitted with pens for ruling in either direction, an operation which can be performed at the same time that the headings are printed.

A NOVEL FORM OF DOUBLE SAUCEPAN.

During the last few years increasing attention has been rightly paid to the invention of new domestic appliances and the improvement of those already in use. Among other household aids that have recently been placed on the market is a double saucepan which presents several novel features. The outer portion is made of stout tin-plate, and is provided with a beaded rim. Resting upon the rim, and separated from the outer pan by a space of about three-quarters of an inch all round, is a cage or frame with three legs connected to a perforated disc. This frame carries an inner pan or container, which fits easily and is furnished with a handle for lifting it out. Being made of glazed earthenware, the container is ideal for cooking purposes and is easily cleaned. It is exceedingly durable, and in case of accident a new one can be obtained at a reasonable cost. This inner container has also the advantage that when the cooking is completed it can be lifted out, and placed direct upon the table, with a table-napkin wrapped round it to keep the contents hot. During the process of cooking the cook can remove the lid at any time, observe the height of the water in the outer pan, and add to it, if necessary, without interrupting the culinary operation. With ordinary care, the food in the container will neither boil over nor burn, nor will it stick to the pan, although left untended for a considerable time. After use the various parts of the saucepan can be readily dried, thus preventing corrosion of the outer pan, and adding to its life. The essential part of this helpful domestic utensil, namely, the container, may be had from the manufacturer in three sizes, of one pint, two pints, and three pints capacity, and as the outer pans, the cages, and the containers can be purchased separately, any part of the apparatus coming to grief can be easily renewed, while the housewife who already possesses a saucepan of suitable size can readily obtain a cage and a container to fit.

To Correspondents who wish fuller information regarding new inventions, publications, &c. mentioned here, addresses will be furnished, when possible, provided a stamped and addressed envelope or post-card be sent to the Editor, 339 High Street, Edinburgh.

THE ATTEMPT ON LONE PINE RANCH.

By E. R. PUNSHON.

I.

OF the five of them, Cyril Rawson was the youngest—and the toughest. He was an Eton and Trinity man, and when one of the public school and university caste does go wrong—a comparatively rare occurrence—he generally goes very wrong indeed. By black pre-eminence, Rawson was the leader of the gang.

The others included the Scotsman, Johnny M'Rae, son of a God-fearing 'Wee Free' Kirk minister in the Highlands, who still, poor man! prayed daily that his boy might yet return to him, little dreaming that the granting of his prayer would have been the most cruel blow his God could have dealt him. For exactly fourteen years from the month of August 1900 had that prayer gone up, and it would continue to do so while the minister lived, though Johnny M'Rae loved to tell himself he must long since have been forgotten.

Then there was the cockney, Alf Dunning, who, when he was drunk, as frequently happened, was wont to lament even to tears that he had never had a chance—which indeed was true enough, for he had succeeded in dodging the

police till he was too old for Borstal, which might have made a man of him. He was a connoisseur in jails, and could compare them all, in England, Canada, and the States, with nice appreciation of their respective merits. And the quintet was made up by an English South-Country agricultural labourer, named Billingshurst, who was probably the one amongst them all of the most decent instincts—he had been driven by intolerable wrong into the crime of arson for which he had served the long term of penal servitude that had degraded him to the level of the brute he was; and by little Will Wilkins from Bristol, of whom the others, even Rawson himself, were a trifle afraid, so glum and silent was he, so given to fits of frantic and unreasoning rage.

It was at the foot of San José cliff, hard by a long-deserted hut some old-time pioneer or prospector had built there and sojourned in for a time, that these five met; and that they were all five Britishers was a coincidence none among them noticed, for indeed they had long since shaken themselves free from all ties of kin or upbringing or nationality. When they had hobbled their horses and turned them loose on a little patch of grass near by, they grouped themselves round the fire Dunning had started, and ate their supper of bacon and beans, bannock and coffee. Fortunately—or unfortunately—none of them had any whisky. Had they started drinking, they would probably have started quarrelling too, and the enterprise they contemplated have ended then and there in a free fight.

As it was, they all kept sober and comparatively amiable, and when they had finished their meal Rawson kicked the embers of the fire together, so that a flame leaped up and threw into strong relief their rough and weather-beaten, scowling features, glinted on the weapons in their belts and by their sides, and cast strange moving shadows on the rugged background of the rocks behind.

'Now, boys,' said Rawson, 'I suppose you're all game to see this thing through. If any of you don't want, he had better quit while there's time. It'll be too late afterwards.'

No one answered, and Rawson continued after a moment's pause: 'That goes, then. To-night the only man on the place is Colonel Veale himself, and seeing he is all of sixty-five, and is just out of bed after a touch of fever, I don't reckon he'll give much trouble.'

'Suppose he tries to turn awkward?' asked Dunning.

'Suppose he does, what then?' snarled Rawson. 'Sha'n't we know how to handle him? This is no Sunday-school picnic we are starting out on.'

'That's all right,' retorted Dunning. 'I only wanted to know.'

'I don't believe in taking risks,' said Wilkins suddenly. 'This here colonel's a kind of a big-bug, I reckon, and just the sort to raise Cain if he gets the chance.'

'Who says he'll get the chance?' demanded Rawson darkly. 'Do you think we want you to tell us how to look after ourselves?'

'So long as we understand each other,' answered Wilkins, 'it's all right. But I was as near as may be strung up once, only for letting go a fellow I ought to have plugged when I had the chance.'

'Hasn't this colonel a daughter?' asked M'Rae. 'Didn't I hear something in town'——

'I believe there's a girl of some sort,' answered Rawson; 'but I don't know—and, anyway, that's her trouble, not ours.'

'I didn't know there was womenfolk,' said Wilkins slowly. 'I hate having truck with womenfolk.'

'Oh—a woman—eh?' muttered Billingshurst, the first time almost he had spoken since they met.

'Any one who don't like it can quit,' said Rawson; 'quit right now.'

'Speaking for meself,' said Dunning musingly, 'I always was a man for the ladies.'

'Never mind the girl,' interrupted M'Rae harshly. 'She doesn't count. What matters is the cash. Are you dead-sure it's there, Cy Rawson?'

'Dead-sure,' answered Rawson. 'It's in the safe in the colonel's bedroom. We'll make him give us the key. If we can't get it, we must burst the thing open somehow, that's all.'

'You won't get the key from him,' said M'Rae. 'I know these old British Army men, hard as nails and proud as hell.'

'We'll see about that,' answered Rawson with a sneer. 'There's ways and means. There's one thing, boys, I want you to remember.'

'What?' asked Wilkins.

'No drinking till the job's done and the cash shared up. There's a whole lot of whisky on the ranch you can have as much of as you like afterwards. But not a drop till the cash is shared.'

'That's sense,' said M'Rae—'horse-sense.—You mind, boys.'

'You'll have to watch Scotty,' said Dunning with a grin.

Wilkins broke into a splutter of oaths. 'Whisky, a woman, money,' he said; 'it's all there, ain't it?'

'The woman'—— began Billingshurst, and paused and once more became silent.

'First thing,' observed M'Rae, 'is to fix up the old colonel.'

'That's so,' agreed Rawson; 'that's the talk. With him fixed up, it'll be all dead-easy; and as for the girl, she must look after herself. We can't let a chance like this go because of a fool of a girl being where she ain't wanted.'

'Besides'—— said Wilkins, and paused.

Dunning looked across at him and grinned. 'He thinks she'll take a fancy to him,' he said; and Wilkins grinned back through the dancing, flickering firelight.

'More like to me than you,' he said, with a hand on the butt of his pistol.

'Quit!' commanded Rawson, glaring at them both. 'The colonel first, then the cash. When that is shared up, every man for himself; till then, every man to do as he's told.'

'Let's have one thing plain,' said M'Rae. 'This here colonel's old, but he's tough, and he's a sure dandy shot. If he gets his gun loose and starts first, then this job won't turn out the dead-easy cinch it looks. I heard that last fall, with his big automatic, he put ten shots in an ace of spades at forty yards in ten seconds.'

'Some shooting,' said Rawson thoughtfully. 'Yes, if the old man cuts loose, things may turn out unhealthy. Well, boys, what do you say? My word's shoot at sight.'

A low, evil murmur of assent answered him, and for a little longer they lay and smoked and muttered to each other of the good time they would have when they had possession of Colonel Veale's cash, which he was so rash as to keep in his possession on this remote and lonely ranch.

II.

'Time to get a move on, boys,' said Rawson, getting to his feet. 'We had best be off.'

The moon was up now. They mounted, and in single file, a sinister and threatening procession, rode from the heavy shadows where the ruined hut hid beneath the shelter of the tall cliff out into the plain, where the moonshine lay palely clear.

Half-an-hour's brisk riding brought them to the borders of the ranch, and when they came to a wire fence, they were careful to close behind them the gate through which they passed, so that none of the cattle of the man they had come to rob and murder should stray and get lost or do damage. Another gate they passed through they closed behind them with the same instinctive care, and then there rose before them in the moonlight the lonely ranch which Colonel Veale had called after the one tall pine-tree that grew near.

The outbuildings lay all dark and silent, but in the ranch a light still burned. And evidently the sound their horses' hoofs made in the quiet night had been heard within, for there was movement perceptible, and the house door swung open at once.

Every man's pistol was ready, and had it been the old colonel who stood there, a shower of bullets would have smitten him to death at his own front-door before he had realised his doom. But it was a girl who came in view—a girl, tall and slim, young and pretty, peering out eagerly into the moonlit night.

'Who is it?' she asked in a clear, young, eager voice; and then, in tones a little quicker, with a touch of excitement in them, she called out, 'Oh father! Come here, father. I do believe you were right after all.'

A tall old man, still straight as the great pine his ranch was named from, his white hair in the moonlight like an aureole about his head, came forward quickly. 'Gentlemen,' he said, 'I'm very glad to see you—very glad indeed. When I heard you were camping by San José cliff, I hoped perhaps you were coming here. I hoped you were.'

'Hoped—hoped, did you?' muttered Rawson. 'Hoped, eh?'

'Mr Rawson, isn't it?' asked the colonel. 'I thought so. And Mr M'Rae—ah, no Scot's likely to hang back. I have seen the Highland regiments fight—yes, and the Lowland men too. I see there are five of you. Oh, the lads are gathering from all the world over.'

'Father, perhaps they have come a long way; perhaps they are tired,' hinted the girl.

'Yes, yes, of course,' said the colonel. 'Gentlemen, will you put your horses up? That first building's the stable. You will find all you want. Then perhaps you'll be glad of some supper. There's plenty ready, for, as I say, I hoped—I hoped you were meaning to visit me. When I heard where you were camping, I said, "Those boys are coming here. We must be ready for them."'

'Ready?' muttered M'Rae. 'My God!'

'See here'—— began Rawson, making an effort to control a situation he felt he failed to understand.

'No, no,' interrupted Colonel Veale; 'put the horses up first, and then we'll have a talk. Five of you, eh?' His voice rang out loud and clear, with a strange thrill of pride and exultation. 'All the world over,' he said, 'the British are going home again—back to the Old Country again. Germany never thought of that.'

'Germany!' repeated Rawson, and his voice, too, was a little high, and shook with a new and strange excitement. 'Germany!' he said again, and paused.

'And I should like to tell you boys right now,' added the old colonel, 'how proud I am, and what a privilege I think it, to be able to help you back to the Old Country now she has need of every man she ever bred. When I said I would give any man willing to go home to enlist every help I could—pay his fare or anything else I could—well, I hoped for a good response. I've got it. The Old Country won't be deserted in her need. And it is a need. I know Germany. She is strong, trained, disciplined, ready. It'll be a long war and a bitter, but the Old Land will win through in the end—the Old Land that breeds men still.'

'War!' muttered Rawson. 'War!... Excuse me.... We've seen no papers; we've heard

some talk, that's all. . . . There's war between Britain and Germany?'

'Since Tuesday last,' answered Colonel Veale. 'They say the Germans are already planning to invade England, but I think no German soldier will ever march through British towns.'

Rawson turned to his companions. 'Boys,' he said, 'we'll put our horses up.'

In silence the five of them trooped down to the stables; in silence they fed and watered their horses; and when they had finished, Rawson called his four associates round him. 'Boys,' he said, 'what are we going to do about it?'

'War!' answered M'Rae slowly. 'War! . . . Well, that's—war.'

'Germany and England,' said Dunning; 'England and Germany. There you are, you see.'

'A hell of a fight!' Wilkins said. 'Lord Almighty, a hell of a fight!'

And Billingshurst, the last of the five, looked at the clear, shining moon above, and said not a word, but remembered very clearly the little village where he was born, and the church-bells on a Sunday morning in the summer ringing out across the quiet and drowsy fields, and the people walking there in their best attire.

A memory stirred oddly, too, in Rawson's mind—a memory which he had done his best many times to kill, which he had often drunk himself stupid to forget.

'*Floreat Etona*,' he murmured; and then very quickly, bitterly ashamed, and hoping intensely that none had noticed these words that had escaped him so unexpectedly, he said aloud, for the second time, 'Well, boys, what are we going to do about it?'

'The Dutchies blow a lot about their army,' said M'Rae thoughtfully. 'I wouldn't mind seeing what they can do if I had a bunch of fellows from the Highlands with me.'

'The Germans,' said Dunning, with a judicial air, 'has their points which I never should deny, but taking 'em all in all, I never was stuck on 'em—never.'

'Bit of a spree,' Wilkins suggested—'bit of a spree to be in a show like this; quite respectable and lawful, and the police to cheer you on, so to say.'

'I'm going home,' said Billingshurst. 'If a man can ride a bit and shoot a bit, they won't ask now if he's ever been in jail.'

'No,' agreed Rawson; 'it's the chance of a lifetime to die good and clean and decent, after all.'

'Scotland for ever!' cried M'Rae. 'God forgive me; I never thought to say that again.'

'Shouldn't like it one little bit,' said Dunning, 'if the Germans marched through the Boro'. Dunno why; but it's a fact, I shouldn't.'

'Bristol men treated me dirty,' said Wilkins, 'and I'd burn the old place down as soon as not if I got the chance. But Dutchmen—that's another thing.'

'Lord, you talk,' exclaimed Billingshurst impatiently; 'talk and talk!'

'Then that goes, boys,' said Rawson. 'We're for it.'

At the head of his companions he went back to the ranch, where, in a blaze of yellow lamplight, the old white-haired colonel was waiting, by his side his daughter, holding a tray on which six glasses stood.

'Gentlemen,' the old man said, taking one glass himself, 'shall we drink—to King and Country?'

'To King and Country,' said Rawson, and took a glass and emptied it.

The others did likewise, and when all had drunk, Rawson lifted his glass high, tilted it to show not a drop remained within, then dashed it down on the ground so that it shivered into fragments. 'That's the last whisky or anything of the sort,' he said, 'that I will touch till this job's done.'

And M'Rae and Dunning and Wilkins and Billingshurst answered with a low, deep murmur of assent.

THE MESSAGE.

(RAINY SEASON LONGINGS—FOR N. G. E.)

That my heart, like the wind, were empower'd to find
The summer, the sun, and the swallow!
Ever northward it blows to the land of the rose—
Dear England—and bids me to follow.
'Follow on! follow on! till the daylight be gone;
Cool night brings the scent of the heather.
Hear the somnolent bees; list the murmurous trees—
'Tis summer! and finest of weather!

'Breathe the fragrance of June; English hearts are in tune;
Vagrant elves lightly flit through the sedges;
And the spirit of peace has imparted release
To health from a hundred green hedges.'
Southern wind! southern wind! let my joy be to find
The zest of thy sensuous motion;
Let me follow thy lead till my exile is freed
From the bounds of this severing ocean.

Happy wind! day by day 'tis your fortune to play
Through lanes that are sunlit or shady.
Speed swift by our ships, and find out the lips
Of my lady, my own little lady.
Shape the music of birds to these three earnest words,
As you playfully frolic above her;
Let your message be this (and its pledge be a kiss),
'I love her! I love her! I love her!'

J. M. STUART-YOUNG.

**** TO CONTRIBUTORS.

1*st*. All communications should be addressed to 'The Editor, *Chambers's Journal*, 339 High Street, Edinburgh.'

2*nd*. For its return in case of ineligibility, postage-stamps should accompany every manuscript.

3*rd*. To secure their safe return if ineligible, ALL MANUSCRIPTS, whether accompanied by a letter of advice or otherwise, *should have the writer's Name and Address written upon them* IN FULL.

4*th*. Poetical contributions should invariably be accompanied by a stamped and directed envelope.

THE MAN WHO LOVED LONDON.

By J. S. FLETCHER.

PART I.

THE First Commissioner of Works (the Right Honourable E. J. Jenkinson-Pelham, M.P.), while not precisely the hardest-worked member of the Cabinet to which he had had the honour of belonging for the space of three years, was one of those men who are always glad when Friday comes. As a matter of pure fact, so were most of his colleagues. They were all more or less week-enders. The Prime Minister retired to his little farm in Hogshire, and looked at his prize pigs. The Chancellor of the Exchequer arrayed himself in loud tweeds, and went to play golf. The Secretary for Home Affairs retreated to a country estate, and caught butterflies; when there were no butterflies to catch, he turned over his priceless collection of coins, and hugged himself when he came to one which he believed to be unique. The Lord Privy Seal spent Saturday in haunting the London bookstalls, and Sunday in inspecting the ancient rubbish he had picked up. Some Ministers went to country houses, where they ate, drank, and slept, or made love to the prettiest lady of the house-party; some marched solemnly by the sea, drawing in stores of ozone which should furnish them with air for the coming week of late hours and bad atmosphere. As for Mr Jenkinson-Pelham, he went fishing.

In these days of cheap newspapers, privacy for public men is a thing of extreme rarity. The man who wants to interview you comes in with your early cup of tea; the young gentlemen who take photographs for the illustrated press have no objection to fixing their cameras upon you as you disrobe for your bath or open your mouth for your first forkful of eggs and bacon. You cannot walk a yard along Whitehall without being button-holed or snapshotted; and if, during his week-end in the country, a Cabinet Minister obliges by reading the lessons in church, there is sure to be some infernal press-man at hand who subsequently remarks on the reader's inability to pronounce Hebrew proper names.

Mr Jenkinson-Pelham, however, was a cute and clever man. He took good care that no one, not even his valet, knew where he went for his week-ends. According to the *Morning Post*, he left town for the country—the supposition being that he was either at his own seat, or at the Duke of A——'s or the Countess of B——'s. The truth of the case was that in the shades of evening Mr Jenkinson-Pelham, unobtrusively clad in an old tweed suit and carrying his own bag, went quietly to the railway-station and betook himself to a certain rustic inn, deep in the heart of the country, close by which was a delightful stretch of brown water, wherein, for the next two days, he cast his flies, thanking his stars for peace and quietness.

The certain rustic inn was called 'The Dish of Trouts,' and Mr Jenkinson-Pelham had discovered it by accident. It was seven miles from the nearest railway. It was an old—a very old—house. It had a thatched roof and diamond-paned windows, and it was set in an old-world garden, full, at the proper time, of hollyhocks, and thyme, and big, thoroughly English, red roses, and vast clumps of rhubarb and orderly rows of potatoes. The fragrance of flowers and herbs hung all over that house, and the sheets were lavender-scented. There was excellent mutton to be had, and home-fed ham, new-laid eggs, and milk from several respectable cows. If you desired company, there was an old-fashioned landlord and his buxom wife and pretty daughter; you could also sit amongst the rustics in the bar-parlour o' nights, and hear the affairs of the country discussed and settled with more acumen and promptitude than Mr Jenkinson-Pelham was accustomed to in Downing Street. In short, 'The Dish of Trouts' was an ideal place, and Mr Jenkinson-Pelham kept the knowledge of it to himself. He was known there as Mr Jenks, an elderly London gentleman, affable, peaceful, friendly, who was old-fashioned in his tastes and generous in his ways, and at certain times of the year was as much a fixture as the seventeenth-century signboard on the ivy-covered porch.

Upon a certain fine morning—Saturday, of course—Mr Jenkinson-Pelham sat by the side of his favourite patch of water, rod in hand. He was supremely happy. He wore a comfortable old suit; his head was easy in an old Panamá hat; he had a beloved old briar pipe between his lips. There was his little packet of sandwiches, there his pocket-flask of weak

 [*All Rights Reserved.*]

whisky-and-water, there a volume of very light and amusing essays. All around him was the pleasant mingling of sunshine and shadow, the hum of bees and insects, the plaintive bleating of sheep, the gentle lowing of cattle. What more could man desire in the way of peace and calm retreat? He would pass all the fair morning in this way; at two o'clock he would return to 'The Dish of Trouts' for his early dinner—roast-lamb, garden peas, new potatoes, cherry-tart, oceans of thick cream. That was the sort of dinner Mr Jenkinson-Pelham liked; he summed it up in one word—scrumptious! He was not quite sure where he had got that word, but it expressed exactly what he meant and felt. And, his pipe having gone out just then, he laid it aside for a moment and hummed a stave or two of an old song which he had learned by heart from *The Complete Angler*.

It was as he chanted this ditty that a shadow fell over Mr Jenkinson-Pelham—fell in more ways than one. He was so absorbed, and the grass on which he sat was so thick, that he did not hear the approach of a person who suddenly accosted him—not by his rustic name of Jenks, but by his proper patronymic.

He almost dropped his rod as he looked up—to find an oldish, rather uncommon-looking gentleman standing between him and the sun, gazing at him with a benign, yet decidedly wistful, expression. Mr Jenkinson-Pelham was a sharp and shrewd observer, and he took in the details of this interrupter of his privacy at a glance—a tall, gray-bearded, blue-spectacled old fellow, with the pallor of the student and the student's stoop; dressed in good, but very old-fashioned, garments; topped with an ancient wide-brimmed hat; and armed with an unusually large umbrella. He was the sort of man whom you would expect to find poring over old book-stalls or nosing round the remains of some ecclesiastical ruin, and Mr Jenkinson-Pelham labelled him in that way at once. Still, there was the disconcerting fact that he had mentioned him, Jenkinson-Pelham, by name. What was more, he repeated it.

'Mr Jenkinson-Pelham, I believe?' he said in a rather quavering voice. 'The Right Honourable Mr Jenkinson-Pelham, First Commissioner of Works, *with* a seat in the Cabinet. I—er'——

'Well, sir,' demanded Mr Jenkinson-Pelham, with considerable asperity, 'what do you want? And do me this favour, if you please—to omit any further reference to my name and office. I am here in an absolutely private capacity, and I—in fact, I very much dislike to be intruded upon. What can I do for you?'

'I crave your pardon, Mr—sir,' replied the old gentleman. 'The truth is, I am a person greatly interested in antiquities, and I am now on my way to inspect an old Jacobean mansion which is situate about a mile away. From the meadow-path yonder I saw you, and as you are quite well known to me by sight—I reside near you, in Kensington, as a matter of fact—and as I have long desired to have speech with you, I ventured to cross the intervening space and accost you. Do not fear, sir, that I shall not respect your privacy. I shall not even mention you at the inn where I propose to refresh myself later on.'

'Much obliged to you,' said Mr Jenkinson-Pelham, greatly mollified and relieved. 'Very good of you, I'm sure. Well, now, what can I do for you? Will you have a cigar?'

'Thank you—I never use tobacco,' said the stranger. 'Not that I object to others using it—pray relight your pipe. Yes,' he continued, as he seated himself on the trunk of a fallen tree, and laid his big umbrella across his knees, 'I am glad of the opportunity of having a little conversation with one who occupies your highly important position. Sir, I am the Man who Loves London! You have doubtless read many letters of mine in the public journals?'

Mr Jenkinson-Pelham turned a quizzical eye on his companion, whom he had already set down as a harmless crank of some sort or other. 'Ah!' he said. 'I see. You're the man who sometimes writes letters about London's uglinesses, eh? Oh yes—just so!'

'Sir,' replied the other, 'I am, as I say, the Man who Loves London. I am not *a* man who loves London, but *the* man who loves London; for there are no other men who love London as I do. That is why I wish to see London swept clean of all the hideous, vile, abominable atrocities which disfigure her! London, sir, would be the most beautiful city in Europe if she were purged of certain eyesores!'

'Such as what?' asked Mr Jenkinson-Pelham, leisurely relighting his briar.

'The railway bridge at Charing Cross,' promptly replied his companion. 'Sir, that bridge is an offence! It is enough to bring down on us the thunders of the gods!'

'Not my job,' said Mr Jenkinson-Pelham calmly. 'Um!—I think you once referred to my powers in one of your—er—very interesting letters to the papers. But, you know, my powers are limited. Public buildings, palaces, and parks—that's my job. Can't touch private property, don't you know.'

'You might make a very good beginning with the parks,' said the old gentleman meditatively. 'Sir, to any one of an artistic turn of mind, our London parks and public places, squares and gardens, are revolting!'

'Ay? And in what way, now?' asked Mr Jenkinson-Pelham.

'The statuary, sir—the so-called statues to our public men,' replied the reformer. 'Not only that, but all our outdoor attempts at art. Sir, have you ever set eyes on that truly awful thing known as the Albert Memorial?'

Mr Jenkinson-Pelham sniffed and rubbed his chin. 'The Albert Memorial is certainly a bit —trying,' he said thoughtfully. 'Yes, I admit that. Yes, I suppose it is awfully vulgar. What else, now?'

'The statuary in Westminster Abbey should be taken out, broken up, and used—in any useful direction,' said the other. 'All the similar things in St Paul's Cathedral should be similarly treated. The Crimean Memorial ought to be blown up, and the Achilles Statue should be ground to powder. As for the Surrey side of the river, the entire frontage from Lambeth to Deptford should be completely swept away—by dynamite if necessary.'

'Drastic changes!' murmured Mr Jenkinson-Pelham. 'All that requires time.'

'But you might make some small beginnings,' urged his companion, with almost trembling eagerness. 'It is in your power, you know. Public buildings, palaces, and parks—you have full control over these. Sir, why not signalise your term of office by doing something to rid our beautiful capital of these offensive and painful eyesores? It would beseem you. Besides, think what a benefactor you would be!'

'They'd only put up one of those horrible statues to me, you know,' answered Mr Jenkinson-Pelham. 'Or perhaps a medallion—they're bad too. However, what would you do first, if you were in my place?'

The man who loved London nursed his big umbrella and looked skyward through his blue spectacles. He was plainly in deep thought, and the First Commissioner did nothing to interrupt him.

'Well,' he said at last, 'I am not quite sure. Of course, whatever is done must be done with violence.'

'Violence!' exclaimed Mr Jenkinson-Pelham. 'Why violence?'

'As an object-lesson,' replied the reformer gravely. 'To show the people that never again must bad architecture, false taste, meretricious art, be permitted to obtain in our marvellous metropolis. Certainly, there must be violence. I would suggest the use of some of the more modern explosives, carefully choosing those that make the most noise.'

'Well—and what would you select as the first object of your wrath?' asked Mr Jenkinson-Pelham.

'It is difficult to decide,' answered the old gentleman, gently dandling his umbrella. 'But I think I should begin with either Buckingham Palace or the Bank of England. Perhaps the Bank. It is, of course, utterly stupid that such a poor, obscure, featureless place should house our main stores of wealth. Still, Buckingham Palace is so very hideous that'——

'I say,' interrupted Mr Jenkinson-Pelham, 'how would it do to blow up a few of the slums? East End—Borough—Lisson Grove—Lambeth—Notting Hill—eh? Some pretty decent eyesores round all those quarters, aren't there?'

But the reformer shook his head, and his eyes —from what Mr Jenkinson-Pelham could see of them behind the goggles—became dreamy. 'No —no!' he said softly. 'Oh no, sir—not the slums! Certainly not! The slums are very far from being ugly or inartistic. I know the slums very well. I am quite familiar with all the districts you have mentioned. I paint a little, in water-colour, and you would be astonished to find what truly wonderful colour-schemes and effects you can find in the slums. In fact, a slum street is a delight to the eye. The variety one gets—especially on washing-days—the blues, reds, yellows—delightful! No, no; the slums must be left to the artist. Besides, one finds raggedness and semi-nudity in the slums—most important adjuncts to a picture. No—I cannot have the slums interfered with.'

'All right,' said Mr Jenkinson-Pelham good-humouredly; 'we'll leave 'em alone. But I'm afraid I can't promise about Buckingham Palace. You see, we have just had a new face put on it, and I should like to see what artistic effect the weather has on the stone. And as to the Bank, I'm afraid it would be difficult to find accommodation for the money'——

'Well, well!' broke in the other, a little testily; 'there are other places. There is St Paul's Cathedral. Nothing could be uglier. I know several quite intelligent people who believe it to be a warehouse. Foreigners invariably take it for a bourse. It must be blown up, and something Gothic put in its place. You might well begin on St Paul's, because I am told that in any case it is bound to fall down within the next few years.'

'Well, that would satisfy you, wouldn't it?' asked Mr Jenkinson-Pelham.

'Not at all!' replied the reformer, with emphasis. 'My object is to see an example made and justice done. You will do it, will you not?' he continued, rising and waving his umbrella. 'Begin—begin! Even if you began in a small way, by pulling down and pulverising all the statues in Parliament Square, it would show that you mean well. But, sir, if you do not'——

'Yes?' said the First Commissioner composedly. 'What then?'

The reformer shouldered his umbrella and began to stalk away. 'In that case,' he replied over his shoulder—'in that case, somebody will do it for you. Unexpectedly! And violently!'

Therewith he marched off in the direction of the ancient Jacobean mansion, and Mr Jenkinson-Pelham cocked an amused eye at his back.

'Rum old bird!' he murmured as he picked up his sandwich-case. 'Mad, of course—mad as a March hare!'

(*Continued on page 505.*)

ON A RIVER OF THE FAR NORTH.

By G. LINDESAY.

I.

ON a beautiful June morning, two days out from the Humber, we got our first glimpse of the coast of Norway in the shape of a range of rugged mountain-tops. Gray mist effectually concealed their bases, and swept in filmy wreaths along their storm-worn sides. Ere long we were in among the outer skerries—haunt of the eider duck and of the seal, and soon the waters of the North Sea glittered in the light of the rising sun and rippled beneath the breeze.

At Molde some of our party, bound for the Rauma, took their departure; others, again, landed at Christiansund and Aalesund; and in the course of time the rest of us were beneath the hospitable roof of the Britannia Hotel at Trondhjem. The North Cape boat was not due to sail until late the following night, so I elected to try for a 'fush' at the Leerfos, about an hour's drive from the town *en carriole*. The roads were in very bad condition, and the Nid was in spate; but fortune smiled, and with the assistance of a big Silver Phantom, mounted on treble gut, I managed to secure, from an extremely leaky cockle-shell of a boat, a twenty-two and a twenty-four pounder, both with sea-lice on their silvery flanks.

Not until after midnight did our ship, which lay out in the fjord, get away from the swarm of boats that surrounded her; and some twelve hours later we were steaming up the Namsen Fjord, the colour of whose waters for many miles out towards the sea bore witness to the fact that the classic river which discharged into it was in heavy snow-flood. It was pretty evident that those of our fellow-passengers who left us to fish the Namsen and the Björa would have some time to wait before they got their first 'Lax.'

All up the coast there were signs of a late spring. In many places snow lay close down to the water's edge, and the splendid group of mountains—'The Seven Sisters'—which guards the entrance to the Vefsen Fjord presented a very wintry appearance. The fear that they would be too late for the first run of fish, which had been entertained by the Fusta and Vefsen men, was dispelled. Bodö, on the Arctic Circle, looked dreary and cheerless; but soon the sun shone forth, and throughout the passage northwards to Tromsö the weather was propitious. Far out at sea the peaks of Lofoden and Vesteraalen, flecked and sheeted with snow, stood up clear against a sky of cloudless blue.

On the coast of the Tromsö Amt a river called the Reisen discharges. In order to reach some of the casts the enterprising angler has to be let down precipices with ropes, and the valley, which is a very wild one, has the reputation of being one of the worst in all Scandinavia for gnats. As illustrating this, the story is told that on one occasion the Amtmand of Finmarken was conversing with a friend in Tromsö on the joys of life in Reisendal. Remarked the Amtmand, 'I was there bear-hunting three years ago, and the air was so densely filled with midges that I was able to trace my initials among them.' 'And there they still remain,' replied his friend. 'I have just come from the place, and saw them!' For this paradise two of our passengers, enthusiastic youths, were bound, and they were subjected to an immense amount of chaff. The best of the many fanciful sketches produced as appropriate to the occasion was one of an angler, attired in 'the garb of Old Gaul,' and provided with all the paraphernalia of his craft, being let down a tremendous wall of rock, while from far and near the bloodthirsty gnats were hastening to the banquet!

At Hammerfest there is a little loch which supplies that odoriferous town with water. It was full of blocks of ice, but I managed to catch a few char in it with the fly while our steamer was discharging cargo.

Dreariest of all Norwegian fjords is the Porsanger, the first great inlet to the east of North Cape. The island of Tamsö, near its mouth, which is the breeding-place for vast numbers of sea-fowl, and from which large quantities of the valuable eider-down are obtained, was sheeted almost completely over with the white bloom of the cloudberry; but its bird inhabitants, being occupied for the most part with domestic matters, were not so much in evidence. It was otherwise at Svaerholt Klubben, the famous 'Fugle Berg' which faces the Arctic Sea between the Porsanger and Laxe Fjords. There the air was alive with kittiwakes, while thousands upon thousands of these pretty little gulls sat on the ledges of the great cliff. At Gamvik, a fishing-hamlet on the north coast of Finmarken, we were transferred from the mail-boat to a steamer called the *Fram*, a wretched little craft. There were no signs of steam being got up, the captain and his engineer being both engaged in sleeping off the effects of a recent debauch; the machinery was tied together with pieces of string; and we were informed that the boat was always wrecked at least once a year. 'A hair of the dog,' however, in the shape of a strong dose of undiluted Scotch whisky applied to the skipper as soon as he emerged from his bunk, had the desired effect, and soon the old tub was rolling and tumbling down the Tana Fjord before a fresh northerly breeze. Every

now and again the sun was overshadowed by a cloud, from which snow or hail fell, and the thermometer sank to within a few degrees of freezing-point. The state of the tide was fortunately such that we were enabled to steam across the vast sandbanks at the head of the fjord, and to land at the little islet of Guldholmen, which lies in the mouth of the river. Here is the local merchant's store; here arrangements must be made for the journey up-country—by boat in summer, with reindeer in winter; and hither from the inland wastes come the Lapps to buy their stores and sell their skins and timber.

After a good deal of bargaining, four long canoes, with their crews of two Lapps each, were arranged for, and next morning we started off up-stream in good time.

II.

The Tana is undoubtedly the finest salmon-river discharging on the Norwegian coast. Including its tributaries, it is accessible to the migratory Salmonidæ for at least four hundred miles. It possesses a practically unlimited extent of spawning-ground, and many long reaches of water admirably adapted for angling purposes. But the Lapps net and spear it very severely, and comparatively few of the thousands of salmon which annually ascend it ever return to the sea.

The lower reaches of this great river are very monotonous. The low hills lie at a considerable distance from the banks, and between the latter, upon which only a few scrubby birches grow, the broad stream flows slowly and evenly for many miles.

After twelve hours' poling, during which we passed only one rapid (at Seida, where the road from Nyborg, on the Varanger Fjord, comes in), we reached Polmak, a small hamlet prettily situated among coppices of birch and juniper on the right bank of the river, and here we spent the night at the house of the Norwegian forest-master. Within two hours of resuming our journey next day, we came in sight of the rapids below the Storfos. Acres of ice, from fifteen to twenty feet thick, extended along the shores, and, the ice being gradually eaten away from below by the action of the stream, the upper parts of these frozen walls constituted a real danger to our heavily laden canoes, which, in order to avoid the tremendous current farther out, had to pass close alongside them.

A bitterly cold wind whistled through the pass, in which the Tana, compressed between lofty birch-clad hills, forms the series of rapids known as the Storfos, and snow continued to fall at frequent intervals. For a distance of nearly a mile everything had to be carried, and then the empty boats had to be poled and dragged up—a very hard task—to where a fresh start could be made. Near this point the line of demarcation comes in from the south-east, and above it the river forms the frontier between Russia and Norway for a considerable distance.

The first run of salmon on the Tana consists mainly of fish which average from twenty-six to twenty-eight pounds, and it would seem that they do not halt in their upward progress, as might be expected in view of the long journey, until they reach Ule Savo, a magnificent pool about ten miles above the Storfos. From this point upwards—varying, of course, in degree of excellence—the pools succeed one another, with (except in one instance) but short intervals between, for a distance of fifty miles, and, speaking generally, it may be said that after the 15th of June all contain fresh-run salmon.

The formation of the country is such that until the bulk of the first heavy snow-flood has run off, the Norwegian tributaries discharge only 'snow-broth,' a liquid which salmon do not appreciate; while the water from the Russian affluents, having been well silted in its passage through extensive moorlands, is moss-coloured, but clear, and comparatively warm. For miles down the centre of the main river the line between the two types of water can be plainly traced; and it is useless to fish on the western or Norwegian side of it.

About half-a-mile above Ule Savo the Vietsjok enters on the Russian side. The pool at its mouth—Vietsjok Savo—is a very uncertain quantity; sometimes, even when in seemingly good order, it will yield nothing; sometimes it will contribute four or five heavy fish to the day's bag. Between it and the effluent rapid there is a broad, streamy piece of water some three hundred yards in length, which by reason of its comparative shallowness is of no use under ordinary conditions. Here one evening in mid-June, when the river was in heavy spate, I chanced upon a shoal of salmon disporting themselves in the clear, brown water from the Vietsjok; and here, between six P.M. and one o'clock, I hooked and played thirty-seven of them. As soon as one was secured or lost, another was hooked. A better piece of sport with the rod could hardly be imagined. In gaffing a twenty-eight pounder one of the Lapps missed his footing and got half-drowned, to the infinite joy, apparently, of his companion! Similarly situated as regards another Russian affluent is the Utsjok Gnoika, a grand pool about five miles farther up, immediately below the mouth of the Utsjok River. This is one of the best and most certain casts on the Tana, and the Russian 'Krono Foged,' whose solitary house stands near by, told me that one day he caught a thirty, a forty, and a fifty pounder in it.

To recur, however. On the morrow of our arrival at the cottage (built at the instance of two good old Scottish anglers) on the banks of Ule Savo, I killed a forty-pounder and six other fish, all over twenty-five pounds; but

the weather set in cold and stormy, and next day it blew a whole gale from the north, with blinding snow. So much stronger than the current was the wind, and so heavy was the 'sea' it kicked up, that there was no working the canoe with any degree of safety on the exposed surface of Ule Savo. On the 18th of June everything was white, and when I was fishing Galgo Gnoika and Biavra Savo, the two next pools below, some thirty or forty reindeer were feeding on the banks. They had been driven down from the hills by the weather. On the 20th, however, the wind veered round to the south-west; the sun made its appearance, and so—*mirabile dictu!*—did the gnats—in thousands. The short Lapland summer had at last commenced.

III.

As on the Namsen and other classic streams, the spoon is the best lure for salmon on the Tana until the water has fined down very considerably; after that the fly is preferable. One of the 'confections' which proved very attractive was composed as to its body of black floss silk, ribbed with silver tinsel and black hackle; whilst its wing, besides fibres of Spanish bustard and Himalayan pheasant, consisted of six long golden crests, four jungle cocks, and four 'tippets'—a lovely insect! With one of these I had quite a performance in Ule Savo one day. On hooking a fish in this pool it was the custom to run the boat up on to the rocks near the head on the Norwegian side, the two Lapps following me while I played it. On the occasion in question a heavy salmon took me so far down-stream, with a long line out, that it was evident he meant to continue in the same direction indefinitely, and leave the pool, a proceeding contrary to all precedent. To follow along the shore was impossible, and there was not time to fetch our canoe from where we had left it; but a spare one lay at the landing-place below the hut, and into this, which we reached only just in time, we all three tumbled, the last Lapp giving a vigorous kick that sent it out well clear of the rocks. The next minute we were descending the long rapid to Galgo Gnoika at a great pace in the train of the fish, which, inasmuch as it weighed between thirty and forty pounds, and was hooked close to the tail, gave a deal of trouble before being secured. In this same pool on another day, after playing a fish for quite ten minutes, I lost it; but within a quarter of an hour it rose again at another fly at exactly the same spot, a submerged boulder, and I killed it. The fresh cut made in the mouth by the first hook was plainly visible.

Some thirty miles above Ule Savo, the Levjok River, descending from the wastes Rasta Gaiser, joins the Tana; and here stands another log-hut built by British anglers. The pools are as good as those farther down so long as there is plenty of water, but they get out of order sooner. In this part of the main river there are quantities of grayling. One evening in three hours I caught close on a hundred pounds weight of these fish, and a grilse, with trout-flies.

A couple of miles below the mouth of the Levjok a series of rapids nearly five miles in length, in which there are no salmon-casts, commences; it terminates in a very deep, rocky pool called Sjumpo. Salmon on their way to the upper waters rest here for a space, and as there are many fine pools immediately below, this is a good neighbourhood in which to camp out for a few days. A good deal of excitement attaches to the descent of the rapids aforesaid, as the channel is full of rocks, and everything depends on the skill of the Lapps. When the calm haven of Sjumpo is reached, the canoe generally contains rather more water than is consistent with comfort.

Every now and again we 'interviewed' exceptionally heavy salmon, but we were never fortunate enough to land anything over forty pounds. One day, for instance, when resting on the banks of a very long pool just above Utsjok, called Aite Gnoika Savo, I saw a huge tail show above the surface three or four times, and I prepared for an attempt on its owner's life by attaching treble gut to a beautiful new Snow Fly, which I had 'busked' the day before. At this, on its being nicely proffered, he came, and at once celebrated the occasion by taking one hundred and eighty yards off the reel with one grand rush. After he had been on for the better part of an hour, I began to entertain hopes of bringing him within reach of the gaff; but it was not to be, and finally this huge salmon broke away with the fly.

By the beginning of August the river had run very low, and at dawn on the 8th we bade farewell to the lonely little hut where we had had such a good time. The total bag was just over five thousand pounds to our two rods; the salmon averaged twenty-one pounds, and the grilse five pounds apiece.

IV.

The best season on the Tana of which I have definite record was that of 1867, when, in twenty-six days' fishing, one rod killed two hundred and eight salmon weighing three thousand seven hundred and sixty-four pounds, the best day being 5th August, when this lucky sportsman landed twenty-two fish weighing four hundred and thirty-eight pounds.

In this connection it may be recalled that the late Duke of Roxburgh, who for so many years rented the Alten, killed on that river in one day thirty salmon weighing five hundred and thirty-seven pounds, the largest a forty-six pounder; and that in two days the same good sportsman landed seven hundred and

fifty-five pounds to his own rod. On another occasion, on the same river, Mr Brittle captured thirty-three salmon, weighing five hundred and eighteen pounds, in a day; and in 1847 an angler landed two thousand five hundred pounds in a fortnight.

Seals are said to have been seen as far up as Assabagti on one of the main branches of the Tana, one hundred and eighty miles from the sea, and large numbers of these creatures frequent the lower reaches. Here they used to be destroyed wholesale, and in rather a curious way. In autumn, when the river was low and it was known that many seals had passed up, the channel, at a point above tidal influence, was barred from bank to bank with double salmon-nets in such a way that the seals could not pass round, over, or under them. In mid-stream there was formed either a square enclosure into which the seals were driven, or a narrow, wedge-shaped opening, which led to a large bag made of quadruple salmon-netting. Here two boats were stationed with a couple of Lapps in each, to despatch the seals when they showed their heads above water; whilst the other participators in the hunt drove the animals down towards the barrier by means of a salmon-net extending completely across the river. In this manner one hundred and twenty seals were captured on one occasion.

On the sandbanks at the head of the fjord war was waged on these enemies of the salmon in another way. At low-water a long timber log was buried in a sandbank to which at high-tide the seals were in the habit of repairing, and to this log were attached a number of sharp hooks about a foot long, each with its point towards the river. In the log were four holes, through each of which a stake was driven several feet into the sand, while both ends were fastened with ropes to strong pegs placed farther up on the bank; and all was buried so effectually that neither rope nor stakes were visible. These preparations having been completed, watch was kept in order to observe exactly when, after the seals had gone up with the rising tide, the water in falling again stood at such a height that the points of the hooks were about two or three inches below the surface. The attacking party then quietly approached the seals assembled on the sandbank. A shot was fired, at which, of course, the seals floundered into the water, and as they made for the sea were caught on the hooks. They were then despatched with clubs, a process, however, which had to be carried out quickly, as, if many seals were transfixed at the same time, they were apt to tear the log away in their struggles, and carry it off with them.

This method of capture has now been done away with. The seals are still to be seen in great numbers on the sandbanks; but although they do as much injury as ever to the salmon, they are not so much sought after.

THE SEARCHERS.

By JOHN FOSTER, Author of *The Bright Eyes of Danger*, &c.

CHAPTER XXX.

THE house was the Bynack Shieling, a remote little outpost in the Forest of Mar. As there were thin, clammy vapours hanging like wisps of smoke over the cooling earth, we decided to call a halt there, rather than bivouac under the sky up the Pass; but when we arrived at the Shieling we found that the windows were shuttered and the doors locked. No answer came to our knocking, and there was an ominous absence of smoke from the chimneys. But there is an unwritten law among the hill-folk. Hospitable as Arabs, they turn no wanderer from their doors. If one of them is from home and his house barred, his friends who chance that way know where they may rest and shelter in his absence. With a confidence which suggested that he had been there before, Malcolm led us to a bothy at the back of the Shieling—disused, bare of furniture, but clean—and took possession of it as a matter of course. He vanished for a few minutes, to reappear—old compaigner!—with armfuls of hay from the stable and peats from the stack. The rücksacks produced sandwiches and thermos flasks; the hay was eider-down; peats were quickly blazing in the great fireplace; blue haze of tobacco rose to the rafters. But we had little time to spare for talk or tobacco, and, having left Malcolm on sentry-go, soon were stretched luxuriously on the hay, boots off, with our feet to the fire—the drowsy gabble of the Bynack Burn near the house the only sound in the night.

About ten o'clock, when Malcolm roused us, I was thankful to see moonlight flooding the little room, for the passage of the Larig in the dark is a venture with more than a spice of danger. The moon was riding clear, and the June dawn in these latitudes would greet us early. To make the most of the light, without delay we started off at a good pace through the young heather beyond the Shieling, and after the meeting of the Bynack and the Geldie Burns, having skirted the base of Carn Geldie, we entered the Glen on the threshold of the Cairngorms, where the Dee, escaped from its mountain cradle, was trying its young strength in sudden, coltish scampers round obstructing boulders. It was easily crossed on stepping-stones, and soon we struck the hill-track and faced the climb up the wild Glen.

Malcolm, who knew every inch of the way, walked in front. Now and then he would throw us a warning or a direction over his shoulder, for, though the night was moonlit, mists were marshalling on the heights, and the Glen was full of shadows. Between the dark and the danger of a twisted ankle when tramping over multitudinous stones or jumping burns, in the quaint speech of our guide, we 'cam' nae speed;' but we climbed doggedly on, passing Beinn Bhrotain and the great gap of Glen Geusachan, until we were eighteen hundred feet up, amidst an unearthly silence, near the grim peak named 'The Devil's Point.'

Great mountains now loomed up, tier upon tier, on every side, far as the eye could reach, the moonlight lending their misty masses a strange and spectral glamour. There was beauty and terror in the Pass as I beheld it that night—beauty in the moonbeams etherealising the stark masses of the mountains; terror when the icy brilliance of the night, suddenly tarnished by passing clouds, dissolved into a leaguer of inky shadows. The wild dark setting suggested Walpurgis Night on the Brocken.

The Forbidding Pass earned its name. To me the mists seemed to be weaving and unweaving sombre alleys and hiding-places where evil, secret things and unspeakable creatures of eld could hide and linger. I peopled the recesses with a thousand lurking presences and things unutterable, deadly legacies of ancient peoples and their unholy primordial rites; and these fantasies were aided by a Voice, the strange, steady, tireless harping of the wind, that is rarely still in the high places of the Cairngorms, now like a long sigh through swaying pines, now like the wash of seas on distant shingle; now pretending to die down, now rising again in a derisive halloo through the funnels of the ravines; never at rest.

Over three miles still lay between us and the Chanter Corrie. Terraces of moraine, granite boulders, acres of huge stones barred the way; and, to add to these grinding discomforts, a treacherous darkening of the moon brought us to a standstill. When the cloud lifted, the going was intolerably slow in the half-light, but at last we came upon a stalker's shelter-hut—the Corrour bothy—one of the loneliest roofs in Britain. Malcolm knocked, and the inmate rose and offered us hospitality. It was given with fine natural courtesy, and he was plainly disappointed when I told him that we only wished to rest for a little. Too well-mannered to ask any questions, he kept his birthright of tact, but on his face was written that the ways of wandering townsfolk who preferred darkness to daylight were beyond comprehension. The good fellow lit his lamp, got out the kettle, and wanted to kindle the peats. It almost required force to restrain him; and when he compromised on the offer by producing excellent oatcakes and mutton-ham, he did so with such obvious goodwill that it would have been impolite to refuse.

It was still dark, but a faint, scarcely perceptible brightness was stealing into the east when we set out again. The next two miles, in face of a stinging wind, were the most trying part of the Pass, but the first streak of day was now touching the sky-line, we were nearing our journey's end, and, much to our relief, the wind gradually died down. In this respite the swirling mists steadied and began to mass together. Now and again, between their uncanny, silent movements, we caught glimpses of great rock bastions, sombre and forbidding, a hint of the gaunt wilderness awaiting us. In a few minutes the mists sagged down, hanging heavy and motionless, dislimning everything over a hundred feet above us. I had visions of delay and dislocation of our plans, for Malcolm, who was making the pace a cracking one over the interminable stones, had outdistanced us; but a shout from him hurried us forward, and we came upon him waiting beside one of the stone men—all thanks to the thoughtful hands that set them up—which mark the track over two thousand feet up in the dark saddle of the Larig.

Here we turned from the Pass and struck into the gray wilds on our left. The mist clothed the hills almost to their base, but we followed the thread of a burn, and at last found ourselves near a huge granite spur called, in the Gaelic, *An Rùdan* ('The Knuckle'), one of the ends of the horseshoe entrance to the Chanter Corrie. There was just the chance of our quarry having arrived before us, but, the mist favouring us, under its cloak we went forward cautiously and silently into the Corrie until we found a boulder high up on a slope, from which we could command observation. From its cover, unseen, we could spy all avenues, except one behind us, which, however, was guarded by steep and difficult ramparts of rock. It was improbable that any one would use so circuitous and dangerous a way of approach.

The pallor in the east was slowly spreading as we got behind the shelter of the boulder, but daylight, delayed by the mists, was barely on the threshold, and in the dimness spying was impossible. We could not make anything out with certainty beyond a hundred yards.

'So far, so good!' said Tony, as he discarded his rücksack. 'By this time all our men are posted, and it's a hundred to one that "The Searcher" hasn't tackled the Larig alone in the dark. If he intends to come to-day (and I think he will), he is probably lying low in Glenmore or in Rothiemurchus Forest until daylight. Lord send us a clear morning!'

We tossed for the post of watcher for the first half-hour. It fell to me. My companions made themselves as comfortable as possible on the ground behind the boulder, with their rücksacks as pillows and their revolvers beside them, and were soon asleep.

Peering over the boulder, I watched the coming of the dawn in a silence fretted only by the whisper of a light air searching the Corrie, the muffled voices of unseen waters, and once the lonely scream of an eagle, harsh and pitiless.

A vast curtain of mist confronted me, moving so slowly that at first the eye hardly marked its movement. It swung gently in a light wind, and above its thousand feet, by a strange caprice of the air-currents, the high tops of the mountains were revealed like unearthly islets in an unearthly sea. Slowly the sky paled. The stars waned and melted. On the ridge of one of the islets in the skyland a tiny orange spark glowed for a moment, grew to a hand's-breadth, and crept steadily along until the ridge was edged by a trenchant hieroglyph of fire. As I watched, the streak of colour lengthened, the selvage of the mist wavered, and its swinging curtain lost something of its density. I had turned for a moment or two towards my sleeping companions, and when I looked up again a spear-head of granite was thrust through a hugh rent in the mist. But another moment and the dark arras was riven apart, the Corrie unveiled.

You are to picture the great *cul-de-sac* in the wilds, its steep ramparts scarred by the tempests of ages, seamed by innumerable channels, now dry in a brief spell of summer heat, but throughout most of the year filling the Corrie with the steady call of hoarse and menacing voices. Summer and winter, gloom holds the place in thrall. The streamers of mist which linger out of the wind are powerless to soften its inhuman contour. The stream creeps almost furtively out of it. Green blade never relieves its dark panoply; no path invites pursuit, for the Corrie leads nowhere except to the scowling face of a precipice which rises, stark and unscalable, a sheer thousand feet; high up on its forehead is an arrow-head of white, in strange contrast to its black matrix, for the lonely place is avoided even by the sun, and all the year round snow finds sanctuary in the cold heart of Coire an t-Òranaiche.

I awoke the two sleepers, a sense of isolation having suddenly encompassed me. It was as though an invisible gate had been noiselessly closed, shutting us off from the kindly world of men.

The hill-country around The Bield in Glen Ciuin is humanised by many things: peat-reek rising from the shielings, the solace of woods, specks of sheep in the distance, and the green of cultivated land. But man has never touched the untamed and untamable heights around the Corrie. No trace of his handiwork shows on its scarred fronts. The effect of the scene disclosed was as though we had been suddenly awakened in some secret land, grim, elemental, yet invested with a strange and savage dignity. I hate the place, but I own its magnetism. It recalls the sense of cruel strength in presentments of pagan gods and great emperors of old, something derived from the dim past, the unnumbered ages which its brute static masses had watched and defied and outlasted.

In the centre of the hollow was a rock-pillar about fifty feet high, its detachment from the disordered masses of detritus sprawling round its base suggesting something more than loneliness, almost, to my fancy, ostracism. Probably the pillar's shape (not unlike the chanter of the bagpipe) suggested the Corrie's name, but the hillmen, over the peat-fires o' nights; whisper that the wind, when in a certain quarter, wails as though the Devil himself played his chanter there. The fantasy fits the place. To this day I 'grue' at the thought of it—a spot apart, accursed-looking, inimical to life.

MORE ABOUT THE MAGIC OF GOLD.

By James Beattie.

IN a previous number of *Chambers's Journal* (October 1917) I gave an account of how, having emigrated to southern New Zealand as a shepherd, I became a gold-digger, and I endeavoured to show the change wrought in the country by the magic of gold discoveries.

When I left the Otago goldfields through a sharp attack of what, for want of a better name, was called 'colonial fever,' I little thought to resume the roving life of the digger, with its come-easy, go-easy philosophy, its moving adventures by flood and field, its up-and-down fortunes, and its hardships and vicissitudes. But then I had not correctly gauged—in fact, I may say I had not even remotely guessed—the power of the microbe that had got into my blood. However, I soon made the discovery that when men have once been smitten with gold-fever, they are always liable to a relapse. So it was with me.

A great rush set in to the west coast of the South Island of New Zealand in the year 1864, and I succumbed again to the call of the goldfields. The call was loud and insistent, and I packed my swag in the usual fever of anticipation, and looked round for a mate. Go I must; but how? There was the choice of two ways—overland or by sea. Between Otago and Westland nature had imposed a gigantic barrier—the backbone of the island, the Southern Alps—grim, forbidding, their steep crests covered with a perpetual mantle of white. Away at their northern end, at the northernmost confines of the province of Canterbury, two or three mountain-passes led over into the wilds of West-

land; but these passes were difficult to trace, and proceeded through a rough, uninhabited, and foodless country. No! these precipitous, inhospitable paths might do for large and well-organised parties, but they were not for the humble digger and his mate.

We went round by sea, and it was a great experience. We were on a small coastal steamer called the *Gothenburg*, crowded with excited miners off for the rush. So many were crammed on board that there was not room on deck for all the passengers, and quite a number had to stay below during the two days of the voyage. Of course, with such a crowd aboard meals could not be properly served, and it was 'every man for himsel', and de'il tak' the hindmost.' The food for those below was thrown down amongst them, and the resultant scramble was more reminiscent of a wild-beast show than a Christian community partaking of victuals. However, all things come to an end, and our uncomfortable 'floating home' came abreast of the Hokitika River, and we were lightered ashore in relays, getting a solid drenching when crossing the bar, a sort of premonitory baptismal introduction to that wet and rainy region.

If the harbour was primitive, the town was equally (if not more) so. The bush had been hacked down, and some wooden buildings of a rough-and-ready architecture occupied—it can scarcely be said that they adorned—the business part of the town; the rest of the place consisted of the familiar canvas. The beach in the vicinity of the town was strewn with small coasting-vessels that had failed to make the river and had run ashore. The seashore was a novel sight to me, and I gazed at it in amazement and delight. For twenty miles north and south of Hokitika harbour is a bar of hard sand, and the great rollers of the Pacific Ocean, like the giant plough-furrows of some Titan, rise and roll in with endless regularity, in practically straight lines, as far as the eye can see. Along the shore at low-tide were parties of miners washing the last deposit of sand cast up by the sea. Every tide brought in a fresh deposit of sand, through which ran particles of very fine gold. Although this 'beach-combing' was not so remunerative as were land claims, it yet afforded easily earned and very reasonable returns.

With thousands of men rushing in from other parts of New Zealand and from Australia, Hokitika was a bustling place in those early days of 1865. Dozens of public-houses (or grog-shanties, to be more accurate) made their appearance, and one street in the town boasted of seventy-two drinking-shops alone. Banking-companies in the more settled centres sent agents to buy the gold, and opened branches which conducted business in a rough-and-ready pioneer manner that would have made the hair of a prim British banker stand on end with horror. The storekeepers were as busy as bees garnering the golden harvest, and packers (that is, the men who owned and drove pack-horses) did a roaring business transporting diggers' utensils, goods, and food from the town along the rough bush-tracks to the widely distributed camps. Everywhere was hurry and scurry, hustle and bustle—a madding crowd, truly—and excitement was always kept at fever-heat by fresh arrivals pouring in, and by the constant rumours flying from mouth to mouth of fabulous El Dorados just discovered or just about to be discovered. Newspapers were worth their weight in gold, so to speak, and Australians were known to give five shillings for a copy of one of their beloved journals published and sold in Melbourne for a copper or two.

A description of the goldfield may not be amiss. A densely wooded country, with a moist climate and plenty of creeks and rivers—in many cases tumultuous watercourses which swept away unfortunate diggers. These, I have sometimes thought, were the men who in after-years were advertised for by relatives in the 'Missing' columns of the newspapers—'So-and-so; last heard of at the Westland diggings.' The goldfield was approximately sixty miles long and from ten to thirty broad. Along the seashore the land keeps low and comparatively level, rising inland into terraces and ridges as it approaches the lofty mountain background. The bush at the seacoast and inland was very dense and luxuriant, there being some fine timber in it, principally red and white pine up to one hundred feet in height; but near the mountains the bush generally degenerated into scrub. The lush growth of the underbush and the abundant rainfall for centuries had covered the whole area with a leaf-mould of springy texture about twelve inches deep. A little way under the soil a uniform cement formation of gravel prevented water from oozing away; in fact, it kept the surface like a sponge. Once that hard crust was broken, however, the surface moisture drained away readily, as there was a gravelly soil underneath. This was a new description of goldfield after Otago's steep ravines and woodless mountains, and it took some time for me to adapt myself to the new conditions.

Eventually, after I had had a narrow escape from death by a falling boulder at Jones Creek, we got a good claim at Totara Flat, of a singular formation. About one foot from the surface we struck gravel, and we were no more troubled with water. At some thirty feet deep we struck a layer of about four feet of gold-bearing strata, which we had to drive out. Timber was good and plentiful, and we had no difficulty in timbering the drive, after which we proceeded to wind the 'wash-dirt' up to the surface, where it was washed, and yielded us fairly rich returns.

The gold, when extracted from the gravel, was of a nice colour, and resembled sequins in shape. We worked out the thirty-foot level, and then sank our shaft approximately forty feet

farther before we came on another layer of golden gravel, similar to that at the former level, but even richer. It was naturally more costly to extract, but it paid well for our arduous labour. This layer, like the former one, ran over our entire claim, and after getting it out we again sank until we found the rock-bottom at one hundred and ten feet from the surface, with a richer deposit of wash-dirt than ever. But, alas! below seventy feet we were beneath the level of the sea, and it was impossible to keep the water down without expensive machinery beyond our means.

Misfortunes seldom come singly, even on the goldfields. We had been so intent on luring the gold out of the ground that we had paid no attention to the miasmatic location of our tent, and I was stricken down with 'swamp fever' and ague. A devoted mate doctored me with pain-killer, nursed me back from the portals of death, and had me carried many miles into the primitive hospital then started at Hokitika. It was full, so a kindly couple took me in and tended me. I am pleased to say that the mate who acted as a good Samaritan to me bought a farm in Westland with his goldfield earnings, and is now a prosperous farmer there.

I went to Nelson (the 'Sleepy Hollow' of New Zealand), and its beautiful climate soon brought back health and vigour, and also, strange to relate, the craving for the excitement of gold-seeking. I was preparing to go to a small goldfield near Blenheim, when a Nelson capitalist advertised for a manager for a sheep-station, and I applied for and got the situation. This ended my gold dreams for the time. Shortly afterwards I learned how fortunate it was for me that I had not gone on the Nelson-Blenheim track, as the Burgess, Kelly, Sullivan, and Levi combination of bushrangers had 'stuck up' and murdered several people at that time. Three of this notorious gang paid the penalty of their crimes with their lives, but Sullivan turned queen's evidence and got off.

The magic of gold worked as great a transformation in the case of Westland as it did in that of Otago. Gold is still found on the west coast, but in sadly diminished quantities. Altogether that small area has yielded thirty million pounds' worth of virgin gold, and this has brought the district prominently before the rest of the country. Prior to the discovery of the yellow metal Westland lay lonely, neglected, out of the way, and unknown to all save a few hardy pioneers who had ventured into one or two localities. The search for the precious metal carried intrepid explorers and prospectors through treacherous rivers and almost impenetrable bush, down precipitous cliffs, and over wild mountains, into all the nooks and crannies from one end of the coastal strip to the other.

Some of the diggers settled down in fertile valleys, and when the alluvial diggings were exhausted they carved farms for themselves out of the wilderness. Sawmills came into these wilds, and a considerable trade in sawn timber has since resulted, the white pine having proved to be well adapted for boxes in which to carry our butter home to the Old Country. Greatest of all the monetary results of the opening up of Westland through gold has been the discovery of immense deposits of first-class coal. The coal is the best found in New Zealand, and the State owns large collieries there now. The towns of Greymouth and Westport owe their existence and prosperity to these seemingly unlimited seams of excellent coal. All these things might have come eventually as settlement increased, but the magic of gold has much accelerated their development. It is open to discussion that much of the west coast might still have been *terra incognita* but for the diggers of the 'sixties.

The great drawback is the lack of good harbours, all having bars and being exposed to the powerful swell of the mighty Pacific. This deters all shipping from going there except for very good reasons. This drawback will soon be considerably diminished, as a railway tunnel has been driven under the Southern Alps (a five-and-a-half mile tunnel, the longest in the southern hemisphere), which will give the west coasters direct access to the east coast, where are good harbours and good markets. Then will be seen the full fruition of the seed of progress planted by the diggers on Westland soil, and yet another illustration will be afforded of how the magic of gold has assisted in developing this portion of the land we so love to call the Britain of the South.

THE COURTING OF SUZETTE.

By Ashmore Russan.

I.

CORPORAL SHILLITOE had driven the great Italia through La Lisière on numerous occasions, but had never before seen the children. He could not stop, of course, for General Ridgeton—otherwise the 'Rigid Un,' or the 'Black Tiger,' as the *N*th Division more or less affectionately called him—was in the tonneau. One glance, indeed, was all the corporal could give them, as just there the street was very little wider than the car, and the roadway was in a terrible condition owing to the too frequent passage of heavy British motor-lorries. Besides, La Lisière was about the twistiest town in all France, 'Eyes front and skinned' being the

order of the day for motor-drivers passing through it.

But that one casual look (which, however, took in the children's rosy cheeks, curly, yellow hair, and bonny bare legs and feet, as hand-in-hand they stood on the narrow pavement outside an *estaminet*) instantly summoned up a never-to-be-forgotten picture that dimmed the corporal's eyes and set his heart beating fast and confusedly. It was of a little orchard at home in Surrey—an orchard with many apple-trees, at the time just huge pinky-white bouquets, and tall pear-trees so laden with snowy blossom that the leaves were scarcely visible. Beneath, springing from the greenest grass that ever grew, late yellow daffodils jostled golden-eyed narcissi; and under the trees, amongst the flowers, gambolled two other yellow-haired, barefooted children—his own motherless Sammy and Lou. So had he last seen them, and that was the picture the youngsters at La Lisière had conjured up before his mind's eye. 'They're their very livin' images,' he told himself as he crouched low over the steering-wheel, peering under the brim of his tin hat with his misty eyes. 'I'll look out for them two when I come back—if ever I do.'

Having seen a great deal of the war, Corporal Samuel Shillitoe of the A.S.C.M.T., then acting as chauffeur for the divisional general, could have rattled off a pretty long list of M.T. drivers who had gone to the front never to return; but his luck happened to be in, for he was sent back to the base beyond La Lisière the same day, the great car empty, except for himself. His orders being to remain at the base until wanted, he threaded slowly the tortuous ways of the little town, keeping a keen look-out for some place where he could pull up and leave the cumbrous machine, a proceeding impossible in the narrow streets. Directed to a tiny square, he stopped the engine and hastened to the *estaminet* near which he had seen the children.

The place was full of English soldiers drinking thin beer, supplied by a handsome young woman with fluffy, fair hair and laughing blue eyes, at whom Corporal Shillitoe gazed steadily and appreciatively for a space; indeed, he stared at her very hard, for her hair was of the same rather unusual colour as the children's. 'Kids' mother, or aunt, for a pound o' nuts!' he reflected, nodding to himself with great satisfaction. 'Here goes,' and he gave an order. 'Doo beair, sivvo play,' he said boldly, for, like most British soldiers who had been a long time in France, he had picked up a lingo that sounded something like French sometimes, and, strange to say, was frequently understood.

The fair lady of the *estaminet* smiled, for Corporal Shillitoe was rather a handsome fellow and very smart, as befitted the chauffeur of a general of division. 'Een 'arf a teek—'arf a mo',' she answered roguishly.

'Ho—ho!' exclaimed the corporal; 'so you can speak English? That'll save an awful lot o' trouble. Where's the kids?'

But the fluffy dame's English had limitations. Such phrases as ''Arf a mo',' 'Stow that,' or 'That's the stuff to give 'em,' she knew the meaning of, if she did not exactly comprehend how it was arrived at; but 'Where's the kids?' she had never heard before. Aware, however, that a question had been asked, she answered politely, '*Pardon, monsieur?*' For ten seconds or so Corporal Shillitoe racked his brains in search of an explanatory French phrase, but not finding one, addressed the soldiers generally: 'Is there any fellow here who knows the lingo for two yellow-haired kiddies, or where they're to be found?' he asked.

'You don't want to know much French to find *them*, corp.,' said a sergeant with the Mons ribbon on his tunic. 'The only yellow-haired kids in this town that I know of are Suzette's, and here's Suzette herself.' He turned to the still smiling Frenchwoman and asked, 'Le'p'tees ongfongs?'

'*Ô!—oui—certainement!*' she cried, and disappeared into an inner room, returning in a moment with a fair-haired child on each arm.

'Dashed if I didn't think so the minute I set eyes on her!' remarked Corporal Shillitoe. 'Saw the kids this morning as I drove the Black Tiger through. I've got a couple at home the very images of 'em—boy an' girl, just the same size. Haven't seen 'em'—his voice broke slightly—'for more'n two years.—Donny moy, madame; just let me hold 'em an' feel 'em—just a minute?' And he stretched out his arms.

She understood the action, if not the request, and gave them to him one at a time. They were not in the least shy. 'Jean,' she said, as he took the boy, who was seven, and 'Petite Suzette,' as she gave him the girl, who had seen five summers. Very like his own Sammy and Lou they were, as he had last seen them playing in the orchard, and tears trickled down the corporal's face as he cuddled them to him. None of the soldiers laughed; not one smiled even.

'They've got no father,' said the sergeant gravely. 'He went West at Verdun.'

'Mine have got no mother,' rejoined the corporal. 'Their granny's lookin' after 'em.'

'Suzette's a widow,' the sergeant went on, and there was a twinkle in his left eye. 'And you can take it from me, corp., as there's no end of our chaps would give all their back-pay to be a second father to them kids; but Suzette isn't taking any. Still, you might try your luck. I'm a married man myself, or—— That's about how it stands, isn't it, Suzette?'

'I—not—know—vat you speak,' she answered, blushing, as she relieved Corporal Shillitoe of the children, he having kissed both of them a dozen times and given each a franc. Then, his arms being free, he wrote on a page of his pocket-book, tore out the leaf, and gave it to her. 'I am coming again soon, if I don't get killed,' it

read, and was signed, 'Corporal Samuel Shillitoe, Chauffeur for General Ridgeton.' Then, forgetting all about the beer he had ordered, and with a 'So long, you chaps,' he left the *estaminet*, and presently drove the great car off to the base, which was only about two miles beyond La Lisière.

II.

That is how the acquaintance began, and as the general's car had really been sent back because it was much too big to navigate the trench-scored country then held by the division, Corporal Shillitoe had plenty of leisure to continue it and improve upon it. Sometimes on foot, sometimes in the car, he visited the *estaminet* almost daily. He had ascertained that Suzette, otherwise Madame Cordonnière, was the trusted *fille de café*, and not the *maîtresse*, and that she had an hour off every afternoon, which she devoted to her children. South of La Lisière there still remained a quiet road or two not congested with war traffic, and there the corporal took little Jean and tiny Suzette for rides, which were great fun, and did him as much good as 'le'p'tees ongfongs,' for his home-sickness departed. The little ones—their mother's own, and full of mischief, especially Jean, who was a terror—called him Sam-mee, which singled him out from the other British soldiers they knew, all of whom were Tom-mees to them. And one day, by dint of signs and gestures, he persuaded Suzette to accompany her children, when he had the surprise of his life. A Parisienne, and a *modiste* before she married Jean Cordonnière, she knew how to dress with effect. 'Looks like a duchess,' the proud corporal told himself as she sat beside him in the car. And so Corporal Shillitoe lost his heart completely, the result being that the general's great Italia was to be found in the small square near the *estaminet* at almost any hour of the day thereafter.

He loved her, and he wanted to marry her; but how was he to tell her so? Of course, like other British soldiers serving in France, he was acquainted with a number of sentences signifying admiration and love, but he was afraid to make use of any of those he knew, for fear that they might not be quite nice; so, out of delicacy, and being thoroughly in earnest, he decided to make the attempt in eked-out English, and trust to his luck. When he carried out his intention—which, by the way, was not during Suzette'e first or second joy-ride in the big Italia—he went straight to the point. She was seated beside him, the children being in the tonneau, when he opened the throttle, so to say: 'I have got a good home and a house—bong maisong—in England—*Angleterre*,' he said, very slowly and distinctly. 'I should be a very happy Johnny if you would marry me. Will you, Suzette?'

She caught at the word marry. '*Ô, non, non!*' she cried. '*Il est mort, mon pauvre mari* —vat you say—dead.'

Corporal Shillitoe did not understand that Suzette thought he was asking about her husband, and had told him that poor Jean was dead—as he already knew. On the contrary, he jumped to the conclusion that her words meant she could never marry him because her heart was dead, and for the rest of the ride he was very silent, thinking. He would try again, certainly, but he would make sure next time by putting the question by proxy, if he could come across the 'Old Contemptible' sergeant who had so quickly found the children for him. In this he was fortunate, for he met him the same evening in the *estaminet*. Nothing loath, the sergeant essayed the task with a grin.

'*Madame Cordonnière—ma chérie*—Suzette,' he began, with an impressive wave of the hand, '*voilà le bon garçon—très bon homme*, and no error! Well, he—*il*—wants—*manque—vous lui épouser. Que dire?*'

A good effort, no doubt, but Suzette did not say anything, although it was plain that she understood, since she blushed like a peony and ran away laughing. Corporal Shillitoe, who had never heard of what happened to Miles Standish, Captain of Plymouth, in like circumstance, looked disappointed and felt aggrieved; but what could he have expected when proposals by proxy even as a royal privilege have fallen out of fashion these many years?

'Didn't seem to work, old man,' he remarked to his grinning interpreter.

'That's all you know about it,' returned the veteran confidently. 'You wait. Billy Clarke —he's a second-lieutenant now—asked her once. She boxed his ears—a regular right-and-lefter! She didn't box my ears, nor yours, corp. You wait. She put the red flag up all right. To-morrow she'll waggle a white un an' whisper "*Kamerad*" in your ear. You'll see.'

III.

But Corporal Shillitoe did not see a sign of surrender when he called the very next day to take the children for a ride; indeed, he scarcely had a glimpse of Suzette, for either she was desperately busy in the kitchen, or she pretended to be, a state of affairs that continued for a whole week, when the unexpected happened, as it usually does; otherwise it would neither be unexpected nor a happening.

'The general wants his car just as quickly as you can run it up,' a base orderly in charge of the telephones told him one morning. 'Better look slippy. There's something doing. Fritz on the rampage, they say.'

Within five minutes Corporal Shillitoe and the big Italia were off. The uproar away at the front was louder than it had been for some weeks, and the increased bustle in La Lisière indicated an attack somewhere, but of course it was quite impossible for the corporal to run through the town without calling at the *estaminet* to say *au*

revoir to Suzette, whether busy in the *cuisine* or not. As usual, he left the car in the square near by. No sooner had he gone than Suzette's fair-haired monkeys turned a corner and stopped. They knew the car, naturally, and had come to look upon it in some sort as a monster toy of their own.

'We will get in,' said the bold Jean. 'We will lie down so that Sam-mee shall not see us. Then we will frighten him. Oh yes, we shall make him jump. Come on, Suzette!' He opened the door of the last compartment, which was full of rugs, lifted his sister in, and hid himself and her in the rugs. The corporal came back quickly, as Suzette was absent searching for 'le'p'tees ongfongs,' who had strayed, he was told. He cranked up the engine and jumped to the driver's seat. The great car gave a monstrous snort and was off, not exactly like a flash, but as fast as he dared drive it through La Lisière. Out into the country he dashed, and the nearer he drew to headquarters the louder and more continuous the firing became. He could see the Hun shells bursting on the ridge whither he was bound. Presently he began to meet ambulances—a string of them. 'What's up?' he shouted to a driver. 'Attack in force!' was the reply. Then shells began to burst on the road in front. A lorry going up was hit close to him, and overturned into the ditch. At top speed, which was sixty miles an hour, he pressed on, for the Black Tiger was not a patient man. Finally he ran off the road upon a grassy slope, and pulled up at the headquarters hut.

A dark-featured, black-moustached officer, followed by his staff, rode up at once. 'You've been a deuce of a long time on the road!' he roared. 'And now you've come, the confounded car's a mile too big for the job. But we'll have to make the best of it, I suppose!' And he sprang from his horse. 'Jump in, Talbot.—Murdoch! We've no time to waste!' Next moment he was in the car, the end compartment.—'The devil! Here, you, corporal; what's this? What the dickens d'ye mean?'

This was a pair of yellow-haired children, crouched in the bottom of the car, terrified and sobbing. 'Sam-mee! Sam-mee!' wailed Jean, no longer bold.

Corporal Shillitoe came with a jump, looked, and gasped. 'Oh, my God!' he cried. 'The kids!'

'Whose kids?' thundered the Black Tiger furiously.

'Suzette's,' faltered the corporal. 'I didn't know, sir—hadn't no idea!'

'Suzette's!' echoed the Black Tiger, and a humorous look came into his eyes. He hummed a line of a song he had heard—in a theatre—before the war: '"I am the husband of Suzette—of Suzette—of Suzette! I am the"—— Hallo!' as another much lighter car ran up snorting. 'This will suit me better. Take Suzette's children out of here!—Damn!' as a whiz-bang exploded within fifty yards. 'Take them out of this, I say! We're falling back, man! La Lisière will be under shell-fire to-morrow if we fail to hold them.—Blake, I want your car!—Off you go, corporal! Take—them—away!'

Corporal Shillitoe needed no further bidding. Swiftly he moved the children forward in the tonneau, wrapped them up again in the rugs, laid them on the bottom of the car, sprang to the wheel, made a quick turn, and was away, this time really like a flash. It was a fearful journey. Scores of shells were falling on the road now, and the corporal was terribly afraid—not on his own account. He dared not look back, but he remembered what Suzette had said one day when Jean had cut his finger: '*Courage, mon petit!*' and his voice punctuated the explosions: '*Courage, mon petit!* Sammy's here!—*Courage!* Sammy's here!' And so they ran into La Lisière.

This time, and for the first time, he stopped the car at the *estaminet*—would have halted there if in so doing he had held up the field-marshal himself—stopped the car, sprang out, picked up the bundle of children, rugs and all, and carried them within. They had stopped crying. Suzette, her eyes red and swollen with weeping, rushed to meet them, excited, voluble. Round the three she flung her arms, kissing them impartially, crying and laughing by turns.

Corporal Shillitoe had travelled fast, but the news had arrived at greater speed, for a telephonist had witnessed the discovery of Suzette's children at headquarters, and had sent full particulars, so the corporal had little to explain. He was a hero. Suzette's hero. He had brought 'le'p'tees ongfongs' safely out of a terrible battle, and his reward must not be withheld. And so Jean the bold and little Suzette play happily now with Sammy and Lou in a Surrey orchard, where shells and bombs never fall, and never have fallen.

SOME CURIOUS CORNERS OF THE 'KINGDOM' OF FIFE.

By W. T. LINSKILL, President, St Andrews Antiquarian Society.

APART from St Andrews, the cradle of Christianity in Fife, there is much to attract (both from the antiquarian and from the religious point of view) in the 'Kingdom's' beautiful, old-world villages, such as Crail, St Monans, Anstruther, Kilrenny, to name but a few of the gems clustered in the 'East Neuk.' Old ruined buildings, all over the county, take one very far back in the history of Scotland.

St Monans Church, *once* beautiful and ornate,

rises beside the lovely Firth of Forth. There is a tradition that the perpetual lamp burning before the Holy Sacrament served for two purposes in St Monans—namely, as a mark of reverence for our Lord's presence, and as a light to guide the pious fishermen of those bygone days safely into harbour.

Old Abercrombie Church has an interesting legend attached to it. Dedicated to St Mary and St Margaret, it appears to have been a parish church as far back as 1174. It is beautifully situated in romantic surroundings, but has long been a ruin. In the twelfth century, on the death of Sir Humphrey Abercrombie, failing male issue, the estate fell into the possession of two lovely sisters, Mary and Margaret, only daughters of the baronet, and apparently they built the church, and dedicated it to their patron saints. Both fell in love with their handsome cousin, Philip de Candela. He chose the soft-eyed Margaret, and they were married by the hermit, St Monan of Pittenweem. Naturally, the sisters quarrelled, and vowed never to meet again. Candela was killed fighting in King David's army; Margaret became insane, and was taken back and forgiven by Mary. After their reconciliation Margaret recovered her reason. One day the beautiful sisters were attending mass in Abercrombie Church, when a strange thing happened. As the two knelt before the altar to ratify their reconciliation a fearful thunderstorm came on, and when Bishop Arnold of St Andrews bent to give them his benediction, the sacred edifice was filled with a blaze of lightning and the roar of thunder shook the walls. The sisters remained kneeling and silent. The bishop tried to raise the penitents, but they neither moved nor spoke. Awe fell on all present, for death was there. Mary and Margaret, forgiving and forgiven, had passed away before the altar. And, as M. F. Conolly says in his *Fifiana*, 'doubtless angels and redeemed spirits had heralded them to the mansions of the blessed.'

Now for my favourite village, Kilrenny. The old church was dedicated to St Iræneus, Bishop of Lyons, locally called St Renny. Of this old church only the tower and the spire now remain. At the end of the modern building is the Beaton Vault. In former days, no doubt, this vault was beneath the apse, or chancel, of the early building. Cardinal Beaton is believed by many to lie within that vault. After the tragedy at St Andrews, it is said that the cardinal's body lay in salt for nine months in one of the castle dungeons, after which it was taken to Blackfriars Monastery in South Street. Conolly, in his *Biographical Dictionary of Eminent Men in Fife*, says that 'at the time of the cardinal's death John Bethune of Balfour, Markinch, Fife, his cousin, was keeper of the castle of St Andrews, and under his directions the body of the cardinal was conveyed to Kilrenny and buried in the family vault.' This ancient monument stands in Kilrenny churchyard, at the east gable of the church, with the arms of Bethune of Balfour finely sculptured thereon: 'Thus perished in the fifty-second year of his age, and seventh of his primacy, an eminent man of Fife, an illustrious Scotsman.' It would be a matter of great historical interest reverently to examine the vault and ascertain if the coffin of the murdered prelate lies within it, as there has been much discussion on the point.

Dairsie Church is another interesting building. It was erected by Archbishop Spottiswoode (died 1639), who was buried with great ceremony in Westminster Abbey, four hundred candle-bearers being present, and many prelates.

Ceres is a 'real bonny' village, and the dancing-tune of 'Ceres Green' is a great favourite at St Andrews Lammas Fair when the lads and lasses disport themselves in Church Square. Formerly, in a sort of outhouse (which may once have been a Mortuary Chapel) in the kirkyard, lay exposed to view the coffins of the brave John, twentieth Earl of Crawford and Lindsay, and his young wife, with the earl's heart in a casket between the two. On the coffins and the casket—I have a picture of them—was the family coat of arms. I am thankful to hear that all have now been decently buried. The earl, who had a distinguished military career on the Continent, died of wounds in 1749, aged forty-seven. His coffin, his wife's, and the heart-casket were covered with red silk plush. The humble building in which they lay so long appears to be a wing or a side-chapel of some earlier ecclesiastical building, probably the pre-Reformation church. Why they lay so long above-ground in this little building I know not. There may have been some quarrel or misunderstanding, or, as in many other cases, the earl may have objected to be put below the ground. I have heard of numerous curious places where people have ordered their coffins to be deposited after their death. One man was placed on the roof of his house, and another left instructions that his coffin be deposited in his summer-house and a high wall built round it. The Haunted Tower, St Andrews, offers an example of coffins being placed in a built-up chamber—not below-ground.

As for the casket, years ago heart-burials were very common. Devorgilla had the heart of her husband, John de Baliol (died 1269), buried in New Abbey, which she erected by the Solway, near Dumfries. (Hence its name, 'Sweetheart Abbey.') Their son's successful rival, Robert the Bruce, ordered his heart, after his death, to be taken in a handsome casket to the Holy Land. It was being carried to Jerusalem by Douglas when he was attacked *en route* in Spain and slain by the Moors. The casket and the heart were afterwards discovered by his friends, brought to Scotland, and interred in Melrose Abbey,

where they now lie. (The king's body was buried in Dunfermline.)

I try not to get too enthusiastic about things and places, but I must admit I am passionately fond of Crail, perhaps because I have always gone there under favourable auspices. Every year old Tom Morris and I used to have a round on the beautiful links at Balcomie, and I sha'n't forget in a hurry the occasion when I journeyed to Crail with a priest, a minister, and a workman to explore the Caiplie Caves. Much has been written about Crail, and I commend to my readers' notice that excellent novel entitled *May* by Mrs Oliphant. Crail existed long before the eleventh century, and its Provost holds by royal charter the title of Vice-Admiral of the Forth. It was made a royal burgh by Malcolm Canmore, the husband of St Margaret; and their son David I. built a castle there at the top of Nethergate Brae, which for long was a royal residence. William the Lion granted a charter to good old Crail, which he sealed. Robert the Bruce likewise granted a charter in 1306; another followed, signed by Robert II.; and in 1553 Mary Queen of Scots signed the last charter, granting to Crail many liberties.

On Sunday a free market used to be held regularly at Crail, and people flocked to see it from all parts of the East Neuk and elsewhere. Merchants, venders, purchasers, thronged the usually quiet streets, and we learn that the St Andrews and other roads were crowded with merry folks hastening to the fair. This free market continued until the Reformation gradually suppressed it, but it died slowly and reluctantly.

It was from old Balcomie Castle, at Crail, that Mary of Guise, the queen-mother, after her voyage from France, came to St Andrews to marry James V., 'the gude-man of Ballingeich,' at our noble cathedral, then standing in all its majestic splendour.

In Conolly's *Fifiana* is an excellent account of the venerable church of Crail (1310), and of its ornaments, books, and vestments, which in the ancient days of the faith must have been very handsome.

Leuchars old church (1244) is a splendid specimen of Norman architecture, at one end. The west part is modern.

Alloway has its Burns's Cottage, and Perth its Fair Maid's House; but Fife, too, has its humble homes of literary and historic interest.

Kate Dalrymple's cottage on the Cameron Burn, close to the St Andrews water-reservoir, is but a ruin. Her wraith is stated to hover in the vicinity. The tune of 'Kate Dalrymple' always brings to my mind my very old friend, the Scots comedian, R. S. Pillans, and his famous song of 'Auld Reekie,' set to that air.

Maggie Lauder's house at Anstruther reminds one of the grand old song in her praise. Rab the Ranter, who appears in that song, was no less a personage than King James V., who was always going about in various disguises, and on that occasion assumed the character of a piper. No doubt he went to Anstruther either from his palace at Inchmurtach or from St Andrews. When at Anstruther do not forget to visit the old house where the 'Beggar's Benison' sprees were held and attended by the *élite* of Fife.

Nestling under the shadow of Balcarres Craig lie a few bonny cottages, on the old road to Elie. One of them is said to be the dwelling of Auld Robin Gray. It was the young daughter of the fifth Earl of Balcarres, Lady Anne Lindsay (afterwards Lady Anne Barnard), who wrote, at Balcarres, the beautiful and well-known ballad of that name.

At Largo we find the birthplace of Alexander Selkirk, or Selcraig, the original of Robinson Crusoe. A St Andrews councillor tells me that Selkirk was an ancestor of his. In the Crusoe Inn are the flint-lock gun, the chest, and the drinking-cup that Selkirk, *alias* Crusoe, had with him on the island of Juan Fernandez. When he returned home to Largo after his long solitude, he naturally shunned society for a while. I suppose he got 'jumpy,' and so went and took up his residence in a lonely hut in lovely Keils Den. He married, I believe, one Sophia Bruce; and they lie peacefully at rest together in Largo Kirkyard.

There are many historic old houses and cottages round about St Andrews and elsewhere in Fife that remain forgotten and neglected. More 's the pity! Things above-ground should not sink into oblivion; things below-ground *must* be brought to the surface if possible.

Wonderful county, Fife, for coals, auld castles and houses, churches, caves, underground passages, and golf-courses!

THE NIGHTINGALE.

MAGICIAN of the slender throat,
Whose whispered song on softest note
Has oft my inmost being stirred,
What spell is thine, oh plaintive bird?

When in a haze of dusky gold
Day creeps away, her story told,
And in a silence tense, elate,
The heavens enthralled and breathless wait,

A silver song, unearthly, breaks
The silence, and the sleeper wakes
To wonder at the silken thread
Of sound, and dream of love, long dead.

Each poignant note, with plaintive sob,
Vibrates upon the air, to throb
Within my soul: a song that sears
My heart with pain too sad for tears.

THE PROVERBS OF SCOTTISH HISTORY.

By CHARLES MENMUIR, M.A.

THE history of Scotland is phenomenally rich in examples of proverbs and proverbial sayings inextricably entwined with noteworthy events and great personages. Indeed, it is doubtful if the annals of any other country can yield a list of proverbs comparable to that which may be compiled from the stormy story of the Scottish nation. Sufficient attention has not, as a rule, been given to this bypath in Scottish history, but the significance of such sayings, as they gleam amid the somewhat drab warp and woof of affairs, is none the less obvious.

Sometimes they give the gist of a notable incident, or, it may be, say the last word upon a period, far-reaching in its influence upon future generations; now and again they cast a valuable side-light on the inner meaning of deeds which might otherwise be easily misconstrued by the modern mind. At other times they are more purely personal, and depict for us with graphic and unerring touch the character or the idiosyncrasies of one or other of the chief actors who held the stage at certain thrilling moments. Some of them, also, are characteristic in the manner in which they hit off national virtues or failings; and there are few—if any—that are not racy of the soil from which they have sprung. It may be said of them, as a whole, that they are in very truth supreme instances of the apt use of the just word or phrase upon which our French friends lay such great stress, and in the employment of which they easily lead the world. It may not be altogether out of place to suggest that 'the auld alliance' between Scotland and France may have had a considerable influence in fostering this native readiness north of the Tweed to connect the memorable deed or individual with an equally memorable and fitting phrase or sentence.

Unfortunately there is much matter for regret in the circumstance that so many of these 'jewels five words long' have lost their hold in the common speech of the people, and are familiar now only to the student or the reader who has given days and nights to the chronicles of Scotland. The restoration of such bywords to their former vitality is now almost past praying for; but their historic value, considered even from the modest point of view of their aid to memory alone, makes one desire that their passing into oblivion should at least be retarded as long as possible.

In setting forth here notable illustrations of this proverbial usage, which is so marked a feature in Scottish historical records, it is not the writer's aim to give anything approaching a complete list of these sayings. Readers who may be disappointed at the omission of examples which they personally consider peculiarly happy will, it is hoped, forgive all shortcomings in this respect, and not too severely blame the scribe for any apparent wilfulness of selection. Several reasons are at hand to account for the absence of a goodly number of suitable instances that might have been given to back up the contention advanced in the opening sentence of this paper. Limitation of space might be pleaded. Many illustrations were intentionally put aside because they appeared more local than national in their usage, although certain local proverbs are amongst the best of their kind, and in some ways have a far wider application than their mere wording would imply. The temptation to include these was well-nigh irresistible, and one at least may be admitted here as typical of quite a number of others of a similar character. 'Ne'er misca' a Gordon in the raws o' Stra'bogie' is redolent of the old clannishness which was a fruitful source both of weakness and of strength throughout the turbulent pages of the history of the Highlands of Scotland. The saying, indeed, voices the universal feeling that it is always the safest course not to speak ill of a man among his friends.

No reader of Scottish history can have failed to be struck with the almost fiercely dramatic element that throbs in so many of the chief events. The native of a country whose history has run in more pleasant places may sneer at a rudeness which often borders on savagery, and feel dislike for the frequent display of passions all too primitive for the more conventional taste; but he cannot deny the splendid and hardy vigour of Scotland's story, and he cannot refuse to recognise the indomitable spirit that explains, if it does not always excuse, the grim doings of a bygone age. It is this feature in Scottish history which lends itself so readily to the laconic emphasis of so many of our historical proverbs and sayings.

 [All Rights Reserved.]

When the Scottish nobles were sick to death of the régime of Robert Cochrane, the favourite of James III., they determined on ending or mending matters. In one of their discussions Lord Gray recalled the well-known fable of the mice who hit upon the plan of putting a warning bell round the neck of their enemy, the cat. 'Wha daur bell the cat?' he bluntly asked the company. Archibald Douglas, the powerful Earl of Angus, accepted the challenge; arrested Cochrane and other minions of the king, and hanged them over Lauder Bridge. Since that far-off day (1482) Angus has been known as Archibald 'Bell the Cat,' and Lord Gray's question is still a common one on the lips of a Scotsman desirous of knowing who will face some risky or disagreeable task.

A less familiar allusion traces its origin back to Bruce. This is the saying, 'Ye 'll hae made anither Lord Soulis mistake.' When complaints were made to the king about this nobleman, Bruce incautiously told the aggrieved parties to boil the offender if they pleased. They took the king at his word, and 'to mak siccar' they first of all rolled Soulis in a sheet of lead. The phrase was once in common use when rash advice was given to anybody who might be only too ready to carry it into effect, but it is now obsolete. Sir Walter Scott, who saved many sayings of a like nature from total oblivion, embalmed it in *Guy Mannering*.

Another saying which dates from the same period in our history is that alluding to the betrayal of Sir William Wallace (1305). Such was the horror of the people at Sir John de Menteith's act that it was usual for many centuries in Scotland, when handing a bannock to a Menteith, to give it the wrong side uppermost. The proverbial phrase was: 'The wrang side o' the bannock to a Menteith.'

The French guillotine had an ancestor in the 'Maiden' of Scotland, a word which still retains this special meaning in the sentence: 'He that invented the maiden first handselled it.' This machine for executing criminals is said to have been introduced into Scotland by James Douglas, Earl of Morton. This nobleman, who was regent of the kingdom during part of Queen Mary's reign, was himself beheaded by the 'Maiden,' which is now preserved in the Antiquarian Museum in Edinburgh.

The still familiar proverb, 'Better bairns greet than bearded men,' is generally supposed to have been addressed by Knox to Queen Mary on one memorable occasion after he had moved her to tears by his strong condemnation of her religious views. The tutor of Glamis is sometimes credited with using the same proverb to King James VI. when he burst into tears on finding himself a prisoner after the Raid of Ruthven (1582). Knox's name is also connected with an equally well-known saying, applied to him by the Earl of Morton just mentioned. This was the fine and striking eulogium which the earl, when regent, delivered over the grave of Knox: 'There lies one who, neither feared nor flattered flesh.' This is the actual version as it is recorded in Melville's Diary, but the more frequent and later wording of it runs: 'There lies one who never feared the face of man.'

'Out in the '45' is another of these old expressions still significant to most Scotsmen, but 'The mair mischief, the better sport,' which dates from the same time, may be less familiar. Its historical application is to Lord Lovat, who was deeply implicated in the last Jacobite Rebellion. On the day of his execution the guards, on entering his cell, told him that the platform erected to give the public a good view of the procession to Tower Hill had collapsed. Lovat's grim comment was, 'Weel, weel, the mair mischief, the better sport.'

The administration of justice in Scotland was frequently very partial in early times, and there are at least two proverbial sayings which bear this statement out. When the iron hand of Cromwell was felt throughout the British Isles, he sent English judges to Edinburgh to try cases. A Scottish judge of the old school expressed his opinion of the new-comers in these words: 'Deil mean them for justice, a wheen kithless loons.' For long afterwards this sentence, shortened to 'Deil mean them,' was current in common talk. As the old Scots judge uttered it, however, it shows clearly enough how the native judges had been accustomed to favour their relatives and friends. (This partiality, as a matter of fact, flourished down to the Union in 1707; and Scott, in his *Bride of Lammermoor*, makes use of a kindred saying in reference to the existence of this state of affairs: 'Show me the man and I 'll show you the law.')

'Jeddart justice,' meaning first hang a man and then try him, has survived down to the present day, and may still be heard in use when occasion arises. It is held by some to have originated in 1574, when the Regent Morton visited Jedburgh and executed with scant ceremony a large number of his political opponents. Another explanation of its origin that is sometimes given may be stated here because of its sardonic humour. The trial of a number of persons was in progress, and the jury were divided as to their verdict. A juryman, who had not been missed while the discussion was going on, was noticed to be sound asleep in a corner. The others promptly awoke him, and when they demanded his opinion, it was hurled at them in the words, 'Hang them a'.'

Scotland, however, did not have a complete monopoly in this rough-and-ready method of dealing out justice, for it may be noted that Lydford, in Devonshire, could claim, on the strength of its couplet,

> First hang and draw,
> Then hear the case by Lydford law,

to be no unworthy rival of the ancient burgh of Jedburgh.

Another phrase dealing with the same grim question of hanging is the simile, "As high as Gilderoy,' which may still be heard in use, amongst older folks at all events. Gilderoy was a notorious Aberdeen freebooter in his day, and, along with his band of outlaws, was eventually hanged in Edinburgh about the beginning of the seventeenth century. To mark his position as leader, he received the somewhat dubious distinction of being hanged on a higher gallows than the others.

When Cardinal Beaton was murdered, his body was preserved in salt by the conspirators during the time they held St Andrews Castle against the forces of the Government. A rhyme, for long familiar, in Fifeshire especially, referred to this incident. It ran as follows:

Marry, maidens! marry, maidens! marry, maidens, now!
For stickit is your Cardinal, and sautit like a sow.

The insinuation as to the Cardinal's private life which is contained in this couplet was generally accepted as doing but scant justice to the many gallant affairs which Beaton apparently found leisure to indulge in, even amid the affairs of State, in the handling of which he was so great a master, as is now acknowledged by our most recent authorities upon Scottish history.

Space forbids our dwelling at length on a long array of such sayings, although in themselves they are well worth more than a passing glance. Amongst them may be mentioned 'Falkland manners" (the old courtly manners associated with Falkland Palace); 'An Admirable Crichton;' 'A regular Pate Stewart" (an evil taskmaster); 'Every man for his ain hand, as Henry Wynd fought;' 'Earl Percy sees my fall!' (often applied to cases where an old rival is witness of his opponent's discomfiture); "Comes Liddesdale's peace when Armstrongs cease;' 'Another for Hector;' and 'Ding doon the nests and the rooks will flee awa',' the very expressive proverb which describes so aptly the fury of the Reformers in their destruction of the architectural splendours of the Roman Catholic Church.

Many of the above occur in one or other of Scott's masterpieces, and to give anything like an adequate idea of his use of such illustrative phrases would require an article in itself. In *The Black Dwarf* he preserves for us the old adage, 'All evil comes out o' thereaway,' which was generally on the lips of Borderers whose lives were passed in continual and imminent danger from their neighbours beyond the Cheviots.

In *The Fortunes of Nigel* will be found the dictum attributed to the fourth Earl of Douglas, nicknamed 'Tineman' (that is, 'the loser'), because of his many lost battles, who was wounded and made prisoner at the battle of Shrewsbury (1403): 'He sits fu' close that has riven breeks.' If the 'Tineman' did really make the remark in such circumstances as he found himself at the close of the fight, it certainly shows that he was something of a philosopher as well as a doughty fighter.

Scott's favourite amongst all these old sayings was the beautifully worded sentiment, 'It were better to hear the lark sing than the mouse cheep,' and he employed it more than once to express the superiority of a free, open-air life over that of a city. It will be found so applied in *The Fair Maid of Perth*. Originally it was attributed to the Douglases, but many another Border chief adopted it to asseverate belief in the truth of Bruce's opinion that the woods and the hills of their country were their safest bulwarks, instead of fortified places, which the English were more accustomed to assaulting or defending.

In acknowledging our debt to Scott for the preservation of many of these, it may be permitted to quote another which he employs with great effect in *The Heart of Midlothian*. There he pawkily informs us, 'Naebody's nails can reach the length of Lunnon.' This was a proverb that was much in use in the years after the Union in 1707, and it recorded, somewhat regretfully, the fact that the bribery which had previously been influential in Edinburgh could not afterwards be employed with the same results in distant London.

Quite a considerable number of these proverbial sayings refer particularly to our turbulent Border history. 'To tak' Hector's cloak' may be cited here as a good example. Its origin can be traced to the flight into Scotland of Thomas Percy, Earl of Northumberland, after his ill-fated share in the 'Rebellion of the North' in 1569. In the course of his wanderings he sought refuge with Hector Armstrong, who basely handed him over to the Regent of Scotland. The fate of the betrayer is said to have been such as he merited. As an old writer puts it, 'This Hector, from being a rich man, fell poor of a sudden, and was so hated generally that he never durst go abroad.'

'The Douglas larder,' an expression employed to indicate a reckless waste of provisions, is said to have originated in the action of Douglas when he recaptured his castle from the English in Bruce's time. When he had again become master of it, he deliberately destroyed all the liquors and provisions stored there, so that they might not benefit the enemy if again successful in attacking the castle.

'Macfarlane's Lantern,' a well-known Border synonym for the moon, is eloquent in its hint as to the ways and means the early Borderers adopted in earning a livelihood. The Macfarlanes may have been more than usually notorious in these night raids, but the other clans followed their example readily enough.

It is interesting to recall that the Scotts of Harden, from whom Sir Walter was proud to trace his descent, had as their family motto, '*Cornua reparabit Phœbe.*' This, along with their coat of arms, which was a crescent moon, proves conclusively that they considered they had as good a right as any to share in the benefits of 'Macfarlane's Lantern.'

Not one of the phrases scattered throughout this paper stirs the blood or warms the heart of a Scotsman as that which has come to be regarded as the most characteristic of all. I had the privilege of hearing it used with telling effect not long after the war burst upon us. The occasion was a great recruiting rally in the City Hall of Glasgow; the speaker was Sir Samuel Chisholm, the city's 'grand old man,' one of the most picturesque personalities of the West of Scotland, and a perfervid Scot withal. As he closed a ringing speech with the trumpet-call, 'Scotland for ever!' the audience rose to him in a wave of enthusiasm which proved that a Scottish heart 'aye warms to the tartan.'

THE SEARCHERS.

CHAPTER XXXI.

THE sun took no gallant stride into his own that morning; the opening of his blood-shot eye was more like daybreak in mid-December than in June.

Burning fringes of clouds, lance-heads of fitful flame piercing the smoking mists round the high tops, strange warring splashes of black and crimson, all wrought an effect of a huge chromatic error in the sky. There was something sinister and minatory in it, the suggestion of an unseen, watchful Evil, the eternal struggle behind the veil between the Powers of light and darkness. But the sun steadily gained strength, the cloud-battalions retreated stubbornly, fighting every yard, until at last they wavered and broke. Triumphant Day drew a deep breath as the light streamed down to the valleys.

Where we lay we commanded the view of the Corrie's entrance, sentinelled on our right by The Knuckle, on our left by a slope leading up to a steep granite escalade, well named in the Gaelic *Faradh 'ghobhar* ('The Goats' Ladder'), and beyond it a section of the Pass, its background the red mass of Ben Muich Dhui, in strange contrast to the black, stern precipices of Braeriach behind us.

Once or twice a curious sound like a far-off salmon-reel—the *chirr-r* of the ptarmigan—reached us, but we knew it came from Duncan. It was a prearranged signal, to tell us that our men were all posted and ready. Duncan and Finlay were in a hollow over the ridge on the crest of The Knuckle, Rob Macbain four or five hundred yards higher up on their right, while Matheson and Angus, half a mile away on our left, watched the Pass to the north.

Spying was now possible, and almost at once I saw something stirring in the waste below Ben Muich Dhui. It proved to be a herd of deer, moving quickly. In a minute or two they stopped and turned head to wind. Plainly, something had alarmed them, for they bunched together restlessly, while a big stag—the leader of the herd—kept a wary look-out above them. Suddenly the sentinel wheeled round and trotted down to the main body, when they all went off at a great pace, and swinging abruptly to the east, disappeared over a ridge. Eagerly we spied for signs of the cause of their manifest disquiet, but the mountain-side was empty.

'If there's any one there, he is taking cover or coming down one of the corries,' said Keene-Leslie, his eye glued to his glass. Presently a couple of brace of ptarmigan shot across the Pass in quick succession. Ten minutes passed while our glasses ranged the distances. Happening to look at Macbain's hiding-place, I caught sight of the crook of his staff showing cautiously above the rock where he was posted—a signal that he had something to communicate. I told Tony, and with our glasses we picked out Macbain behind the rock. He pointed towards the base of Ben Muich Dhui. We had not looked for an approach from that quarter, but Macbain was high up, and had keen stalker's eyes. After a few seconds' spying I caught my breath, for my glass revealed, beyond doubt, the figure of a man moving along the lip of a gully between the Ben and the Pass. Against the dark background of the rock-face, he was difficult to follow, but when he came to a scree strewn with lighter-coloured granite he leaped into clearer focus—a tall man picking his way leisurely among the boulders. He halted for a moment, looked about him, and began to clamber down the gully until we lost sight of him.

'Didn't expect to see anybody from that quarter, Neil. A wandering tourist, maybe,' was Tony's comment. 'We 'll soon find out, for he is probably heading this way.'

We had not to wait long, for the solitary man suddenly reappeared, and again halted. I got him in a good light, and could see him looking around him deliberately once more, as if taking his bearings. He was too far away for me to seize any details, but soon he started again, and a light-gray patch threw him into sharp relief. He showed for an instant or two only, but long enough for me to make out a tall figure. Tingling with excitement—for I was

certain that I had seen him before—I steadied the glass and followed his progress. The man came straight on, with no attempt at concealment. Soon he stepped into a clear pool of the young sunlight, and in an instant I recognised my jailer of No. 9 Duff Avenue, the leader of the gang who had kidnapped me in London!

'Our man, Tony,' I whispered with grim elation. '"The Searcher"! Guidotti!'

Keene-Leslie watched him through his glasses, and made no reply for a long time. At last he turned to me. 'This is interesting, Neil. But I'm puzzled.'

'Puzzled?'

'Yes. I confess I looked for somebody else, some one bearing no resemblance to the amiable Guidotti. . . . He may have an accomplice. I wonder! . . . He seems profoundly interested in mountain scenery. He is using a field-glass.'

Sure enough, Guidotti was spying, and with care and deliberation. Well out of sight round the corner of the boulder, we watched his every movement.

Suddenly he dropped to the ground, instantly to resume his spying, keeping his glass steadily on the Pass to the north.

We turned our glasses to the foot of The Goats' Ladder, and almost at the same instant picked up a dark speck out of colour with its granite-strewn base—a deer, or perhaps a mere trick of the eye, I thought, until the speck moved. It was a man, and, unlike the first-comer, this one was covering the ground quickly. He never halted for a breathing-space, but rounded the foot of the Ladder, and came steadily on towards us. After a long look, Keene-Leslie lowered his glass.

'At the rate he is going,' said he, 'the new-comer will be here in a quarter of an hour, and friend Guidotti, who is watching him, will probably join him. Have your revolver ready.'

The man never slackened his steady rate of progress, the hidden watcher covering him all the time with his glass, while we spied them both. Ever onwards he pressed, with hardly a glance to right or left. Guidotti now commenced to follow him stealthily, crouching behind boulder after boulder. On came the new-comer, manifestly unconscious of the eyes watching him in the lonely wilderness. Whoever he was, this was no hill-climber out for pleasure, but a man plainly in a hurry, and making for a definite objective. Leaden minutes crawled by before the range shortened sufficiently for me to get a good look at him. I lowered the glass, astonished but relieved, and looked at Tony. The man was Dr Hall!

'He is looking for us. Something must have happened. Shall we hail him?' I whispered.

'All in good time,' said Tony, his eyes glued on the two men. 'Look! He is coming towards us.'

I took up the binocular again. The doctor was now breasting the slope towards the Chanter. Fifty yards from the rock-pillar he halted, his eye searching the empty-looking solitude. What he did not see was the figure behind him, crouched, stealthy as a panther, slipping, a foot at a time, from boulder to boulder, with so uncanny a skill that, had I not known, I should have been unable to distinguish it from the rocks. The shoulders never showed, but every now and then an inch or two of its head or the white of its watching eye told me that it was coming nearer, and I knew, with a strange certainty, that the two men were enemies.

The doctor reached the Chanter, where he halted, and stood leaning a shoulder against it, resting. The pillar was now between him and the watcher, who instantly seized his opportunity. Swiftly and surely he picked his way to within thirty yards of his quarry, who, all unconscious of the hidden presence, was still standing beside the pillar. Then Guidotti rose to his full height, and stood motionless as a statue. My heart was drumming. Another moment and I should have shouted a warning to the doctor, but at that instant he swung round and the two men's eyes met. The doctor reeled back, holding a hand in front of his face as if to shut out a repellent vision. Not a word passed. Guidotti held himself erect, his arms folded, a scornful and Mephistophelian domination in his eye. The doctor was swaying slightly, a steadying hand outstretched to the rock, his face gray and shrunken. With a dawning sense of horror, I saw that he had a beaten look.

My racing thoughts were checked by a quick movement from Guidotti. Instantly the other threw up his hands and held them above his head, his eyes fixed on the gleam of a revolver in his enemy's hand. The echo of a laugh floated up to us. While one might have counted ten neither of them moved. . . . Then the covered man walked forward towards the tall figure, and halted in front of him. Guidotti, revolver still levelled, deliberately searched his captive. I saw him take something from him, and in the stillness we caught, for the first time, the sound of their voices. They were too far off for us to make out the tenor or even a single phrase of what passed between them, and there was little in the strict sense of conversation, for the tall man dominated, his voice level but insistent, the doctor speaking at rare intervals.

'I would give a good deal to hear what courtesies are passing,' whispered Tony.

Suddenly a word thrown at the other by Guidotti rang out twice, clearly and distinctly. The word was '*Traditore!*' and in a second, like a flash of lightning at black midnight, the truth blazed on me. I *knew*, and the revelation sent a current of ice through my blood. Stabbed into my brain in that instant, I knew that 'The Searcher' at The Bield was none other than the

man who called himself Dr Hall, and at the sight of the smooth villain a masterful wave of wrath almost lifted me to my feet. But Tony's cool and steady hand gripped my wrist, and there was a triumphant spark in his eye as he bent forward and whispered, 'Now you know, Neil! But—steady! And fire if either attempts to bolt or resist after I challenge them. See! They are moving. They can't escape. Our men will get them on the flanks, but when they discover this—look out for trouble.'

Guidotti, revolver in hand, was walking behind 'The Searcher.' They had reached a point about half-way between the Chanter and The Knuckle, when the man in front stopped and pointed to The Goats' Ladder. Guidotti gave a gesture of assent, and the two turned towards The Ladder, and having gained the level ground by the burn, crossed it by some stepping-stones.

Their détour brought them near where we lay, and now and then a word, borne on a light wind, reached us.

(*Continued on page 519.*)

HOW HONEY-BEES DEPOSE ROYALTY.

By Canning Williams.

WHAT can be said of the intelligence of insects which murder their mother—her upon whom the prosperity, if not the very life, of the home depends—and then, immediately after committing the crime, run about in a state of panic and despair, bemoaning their self-inflicted loss? Most people would reply that creatures which acted in so insane a manner could not possess intelligence at all, and some might be disinclined to believe that insects could be guilty of such extraordinary behaviour. It sounds altogether too human in its utter foolishness to be true. And yet that wise little bundle of nerves and animation, the honey-bee, is addicted to these strange acts of frenzy when her domestic arrangements are rudely upset. Perhaps it is a form of hysteria, for, as every one knows, creatures of a delicate and high-strung nervous organisation are liable to singular aberrations.

The death of the queen, or mother, is brought about by suffocation, assisted possibly by starvation. A knot of bees, about the size of a walnut, surrounds Her Majesty, and literally hugs her to death. The procedure is known among bee-keepers as 'balling' the queen. It would seem to the lay mind to be an easy and expeditious thing for a single bee to be appointed executioner, and for her to compass the death of the head of the hive by a sting-thrust or two and a particle of poison; but, for some reason best known to themselves, the bees—such thrifty economists in so many other directions—do not adopt this speedy and business-like method. It is as though no individual bee had the moral (or immoral) courage to be the sole assassin, even under orders, or to bear the onus of the crime, and so two or three score of arch-traitors—the Bolshevists of the colony—associate in the deed. At any rate, that great student of bees, Maeterlinck, takes this view. He attributes the balling of the queen to a law which 'invests her person with a sort of inviolability,' and prohibits the direct assault of any one bee. 'No bee, it would seem,' he says, 'dare take on itself the horror of direct and bloody regicide. Whenever, therefore, the good order and the prosperity of the republic appear to demand that a queen shall die, they endeavour to give her death some semblance of natural disease, and by infinite subdivision of the crime to render it almost anonymous. . . . They will thus form a sort of living prison, wherein the captive is unable to move; and in this prison they will keep her for twenty-four hours, if need be, till the victim die of suffocation and hunger.'

The act committed, a strange agitation takes possession of the bees. All work stops. The nectar may entice ever so seductively, but it is ignored. Their grief is so great that it even overpowers their greed. They rush about the combs and the floor; they explore the entrance-porch and the alighting-board; they run up and down the front and the sides of the hive; in short, they search for their mother in every likely and unlikely place, and all the time her lifeless body lies in the citadel, soon to be cast as rubbish to the void. The commotion gradually subsides, and at the end of two or three days all signs of agitation have disappeared. But the colony, without its queen-mother, is in a stricken, hopeless condition. The erstwhile industrious workers are disposed to linger and idle round the cabin door, and a general air of listlessness and indifference pervades the once busy place.

If there are in the hive eggs, or grubs (larvæ) not more than three days old, the bees set to work to construct royal cells (in shape something like an acorn), and to rear a few queens; but before a queen is reared, fertilised, and laying, a month or more may pass away, and in that time the colony rapidly dwindles in population, and may become so weak as to necessitate its being united with another hive. Time can, of course, be saved by introducing to the stock a fertile queen. Experienced bee-keepers take care to have, in miniature or 'nucleus' hives, a few young laying queens on hand in readiness for emergencies of this kind; and those who are not so provided are usually able to purchase

queens from dealers during the summer and autumn months.

The introduction of a new queen to a queenless stock is a "ticklish" business, and even experts sometimes fail in the attempt. If the greatest care is not taken, the experiment may result in disaster—in a repetition of the fatal 'balling' procedure. The longer a hive is without a queen, the more difficult it is to introduce one successfully. It is not easy to square this fact with the reputed intelligence of the bee, but so it is.

Let us imagine that the bereaved apiarist, in return for, say, ten shillings, has received a young fertile queen by post. She has arrived in a small wooden cage consisting of three apartments connected with each other by small tunnels or openings. The queen and about a dozen attendants to feed her and keep her warm are in possession of two of the apartments, while the third is filled with food, consisting of a paste or candy made of icing-sugar and honey. The bees are confined by means of a piece of wire gauze tacked on to the box. At the end of the cage there is a small hole which gives access to the food from the outside. The bee-keeper goes to the hive into which he intends to introduce the new arrival, and carefully cuts out all the queen-cells which the bees have formed, for a colony is always less inclined to accept an alien sovereign if it has commenced to rear queens of its own. He then places the cage, gauze side downwards, immediately over the space between the two middle combs, covers up warmly, and, if he is wise, leaves things severely alone for a week. The bees at once become aware of the presence of the strangers by their odour, and a fiercely hostile attitude is taken up towards them. Infuriated but vain attempts are made to attack the new-comers, who, in their narrow prison, and in the midst of hundreds of bees clamouring for their lives, must experience anything but a happy time. If a prisoner should chance to poke her leg through one of the openings in the gauze, it is immediately seized in the strong mandibles of one of the storming-party, and a tug-of-war ensues, which sometimes results in the limb being forcibly torn away. Queens have been known to lose a limb in this way, but they seem to manage as well on five legs as on six.

While this has been going on, a few bees have discovered the way to the candy, and are busily engaged, one at a time (for the passage is too small to accommodate more than one), in consuming it and, all unknown to themselves, preparing a way of escape for the queen and her retinue. After a dozen hours or so have passed, hostilities moderate, the bees in the cage begin to lose their own odour and to acquire that of the denizens of the hive, and before long a feeling of cool indifference takes the place of the former hot enmity. This in turn is followed by a sentiment of distinct friendliness, some of the younger and more amiable bees even going the length of offering food to Her Majesty, and she, nothing loth to exchange candy for honey, accepts the gift with, doubtless, becoming grace. Still the excavators are proceeding steadily with their tunnelling, and at the end of about thirty-six hours from the time the cage was placed in position a clear passage has been made, and the queen and her attendants find their way along the corridor, and enter the hive proper. This is a critical time. A few crusty old spinsters (the older a bee becomes, the more waspish it grows) are disposed to show Her Majesty the cold shoulder, even if they are not so rude as to commit acts of open violence; but if the queen behaves herself with dignity and quietness, not arousing opposition by excitable behaviour, or inviting attack by manifesting cowardice, the chances are that she will be accepted, and will soon enjoy all the rights and privileges of her position.

Now, it is natural that the bee-keeper, especially if he is a beginner, should be anxious to find out whether or not the new queen has been received in a friendly spirit; and if he allows his curiosity to get the better of his judgment, he will probably open out the hive and 'have a look.' He lifts out frame after frame of comb, and searches with a quick eye among the dense population for the long body of the mother-bee. Ah, there she is! What a beauty! But he notices that she is being harried about the comb, and that one or two bees are biting her wings and trying to get on her back. He is alarmed, and, with visions of 'balling' in his mind, he hurriedly returns the comb, and puts on the 'quilts' and the roof. But the mischief has been done. Even now, as the bee-keeper, with knitted brow, is regretting his untimely interference, the bees are at their deadly work; the ball is growing in size, and the queen is being locked in a remorseless embrace, and in that fatal grip she will be held until life departs.

I have had personal experience of the balling of queens. A year or two ago I purchased from a breeder in Italy a native queen, which duly arrived by post in good condition. The cage was placed over the queenless stock in the manner already described, and seven days later an examination was made. The bees had eaten away the candy, and were passing in and out of the cage; but the queen was still in confinement, the passage probably being too narrow for her to pass through. I therefore removed the wire gauze, and returned the cage, with its inmate, to its former position. An hour or two later I was sitting near the bees, enjoying the soothing effect of their humming, when I saw a young virgin queen come out of the hive next to the one where I had introduced the Italian, and, after a short flight, enter the Italian queen's hive in mistake for her own. I knew what would

happen if the two queens met—there would be a duel to the death; so I sprang up, and, without bothering about smoke or veil, immediately opened out the hive with the intention of catching the interloper. On removing one of the combs, I saw thereon a tell-tale bunch of bees, and, on parting them with my finger, exposed the bright-yellow body of the Italian queen. They were in the act of balling her, and had probably been subjecting her to their murderous attentions from the moment I had replaced the cage. I seized her by the wings—in my excitement taking no heed of the stings inflicted upon me by some of the malefactors—and placed her in a matchbox. I then found the princess, and returned that wandering maiden to her rightful quarters. Next I filled an egg-cup with honey, immersed the Italian queen completely in it, and poured honey and queen into the hive. The bees at once began to 'clean' Her Majesty, and by the time the process was finished they had abandoned their grim purpose. Possibly they thought that so 'sweet' a queen should be spared. If it had not been for my having seen the princess enter the wrong hive, the Italian would probably have succumbed to suffocation. I say 'probably,' because it sometimes happens that the bees do not carry out their plan to the bitter end, especially if, as in the case mentioned, the queen has been caged for several days, and so has acquired the family smell.

It is not an easy thing to disperse a ball of bees and rescue the queen uninjured. If smoke is used, the already irritated creatures are made more angry, when, forgetting their strange etiquette to royalty, those nearest to the captive are apt to use their stings with quick and deadly effect. A good plan is to insert a piece of thin card under the ball, raise it gently, and drop the bees into a basin of tepid water. The murderous design will at once be abandoned, and the queen may be rescued none the worse for her bath. Another method is to carry a small oil-can with a spring bottom (such as is used for oiling sewing-machines), filled with thin syrup. A ball of bees, on being discovered, should be well saturated with syrup, and the hive closed. The bees will then break up the party, and give attention to their own and the queen's toilets, and in this peaceful occupation soothe their savage breasts.

Bees are specially prone to attack the queen if their domicile is disturbed just as she is settling down in the spring to her business of egg-laying. At such times they strongly object to a rude interference with their domestic arrangements, deeply resent their nurseries and storehouses being peeped and pried into, and are greatly disposed to wreak their mad vengeance upon the poor innocent queen. A bee-keeper 'manipulates' at this season at his peril. More queens are balled in the spring than at any other period of the year, and it is just at this time that queens can least be spared. Let me give another personal experience. On the 22nd of April 1916—a warm day—I transferred a stock of bees from the hive in which they had passed the winter, and which badly required spring cleaning, to a new hive, dry, comfortable, and in every way a most desirable residence. I did it with as little disturbance as possible, for I knew it was an operation not unattended with risk. Two days later I was brushing up some dead bees near the hive, when I saw—could ingratitude go further?—the lifeless body of the queen. I picked it up, more in sorrow than in anger, and proceeded to examine the hive. Yes, there was no mistake about it; the queen had been killed as the result of my moving the bees to more salubrious quarters, and the absurd insects had already taken steps to repair their loss by constructing queen-cells. Queens were not to be had for love or money at that time of year; so, in order to keep the colony going, I helped it occasionally with a comb of young brood from other hives. It was the 26th of May before the new queen was laying, and thus five valuable weeks had been lost, all as the result of my having done the 'flitting' too soon. Had I waited a few weeks, and moved the household on a bright, warm day when honey was coming in freely and brood-rearing had been well established, there would have been no such calamitous sequel.

Bees depose their sovereigns in other ways than by balling. The honey-bee itself is a short-lived creature—in the height of the summer it works itself to death in about six or eight weeks—but the natural life of a queen extends to several years. She is at her best, however, in the second summer, and bee-keepers who are abreast of modern practice rarely keep their queens after the second season. If left to themselves, the bees will supersede a queen as soon as she shows marked signs of failing fecundity. The edict goes forth, in the strange, mysterious way of the hive, that the queen, from whose teeming flanks hundreds of thousands of eggs have fallen, is to die. A few royal cells are formed, and in due time the first princess emerges from her cradle. She at once begins to kill her hapless sisters—a tragic piece of work in which she is assisted by the workers; but, until her strength shall have increased somewhat, she avoids a direct meeting with the reigning monarch. A few days pass, and then, not only ready but eager for the fray, the now strong and active princess challenges her mother to mortal combat. The old bee is aweary; she is worn out with almost unceasing egg-laying; her body has lost its youthful agility. Though at the sight of her rival a little of the old martial spirit rises in her, and she for a time wards off the furious onslaughts of her antagonist, she fights a hopeless battle, a forlorn hope, and presently, paralysed by a deep thrust from her adversary's

keen scimitar, she ceases the unequal conflict, drags her heavy limbs across the combs which formerly she traversed so proudly, and which her life's labour has peopled so often, and presently falls dead to the floor of the hive. Then the undertakers set to work, and the body is cast out into the outer light. Thus in the world of the honey-bees, as in that of men, the grim spectre of Tragedy lurks behind the throne!

THE MAN WHO LOVED LONDON.

PART II.

BY Monday morning, when he returned to town, the First Commissioner of Works had forgotten all about the man who loved London, and as he was almost immediately plunged into a violent controversy with a Metropolitan member of Parliament who complained that buttercups and daisies were beginning to grow scarce in Hyde Park, and blamed the Board of Works for shameful neglect, the subject of ugliness faded from his mind. In fact, it never occurred to him again until the beginning of the following winter, when his official senses suddenly received a violent shock. He was sitting in his private room at the Works and Public Buildings Department at Storey's Gate, when there entered to him an important personage, the Assistant-Bailiff of the Royal Parks, upon whose face were written the tidings of a catastrophe.

'I have a most serious matter to report,' announced this gentleman. 'During the night some evilly-disposed person or persons have knocked off the head of the statue of Queen Victoria which stands between Kensington Palace and the Round Pond. Certainly,' continued the speaker, 'it was not an object of any great pretension to distinction in art, but what is really of importance is the principle of the thing! It would seem to have been the work of some vandal'——

'You're quite sure it wasn't a high wind?' asked Mr Jenkinson-Pelham with anxiety.

'There was no wind at all last night,' answered the Assistant-Bailiff. 'And the deed was done with a large sledge-hammer. In fact, the sledge-hammer is downstairs in a taxi-cab.'

Mr Jenkinson-Pelham meditated, considered, and picked up a large sheaf of documents which he always kept at hand in order to frighten callers with. He waved the sheaf at this caller. 'Let every proper inquiry be made at once,' he said. 'As you see, I am much engaged.'

The Assistant-Bailiff went away, and Mr Jenkinson-Pelham put his sheaf aside and picked up the *Times*. Even then he did not connect this outrage with the old gentleman of the blue spectacles. But presently a messenger entered with a telegram, over which the First Commissioner bent with wonder. As soon as he was alone he muttered the wording: '"I warned you of what would result from your inaction. Now take heed and follow up the good work. Otherwise it will be continued by the Man who Loves London."'

Mr Jenkinson-Pelham sat upright in his chair and gasped for breath. His memory immediately recalled the beautiful May morning, in the neighbourhood of 'The Dish of Trouts,' the grave accents of the old crank, and his preposterous notions.

'So the old—old reprobate really meant it!' he soliloquised. 'And he's begun! What an awful business! Who knows what he may not do? Let me see, now—didn't he say he lived somewhere near me? I wonder if I could have him found, and locked up as a madman. Of course, he's a raving lunatic!'

Later in the day, when he had lunched at his club, the First Commissioner of Works went over to New Scotland Yard and had a little chat with a high official. Thence onward several remarkably acute detectives sought the Kensington district for a benevolent old gentleman who wore blue spectacles and carried a large cotton umbrella, and was likely to be found in the neighbourhood of any modern specimen of the sculptor's art. Their various searches proved quite empty of result, and at the end of a week another disturbed-looking official came into Mr Jenkinson-Pelham's private room.

'The statue (by Scraper, R.A.) of the late Field-Marshal MacGrowther, in Waterloo Place, has been shamefully maltreated during the night,' he announced. 'The plumes of the cocked hat have been broken off, the nose chipped away, and one leg is gone from the knee downwards. It was the leg on which the Order of the Garter was displayed. A sledge-hammer was lying at the foot of the injured monument. It is downstairs in a taxi-cab.'

Mr Jenkinson-Pelham got rid of this informant in his usual fashion. But when he had gone, he did not pick up the *Times*. Instead, he cowered in his comfortably padded chair, waiting for what he knew would be sure to come—another telegram. Within half-an-hour it came, and he opened it with trembling fingers, and read it with starting eyes: 'This is nothing to what will happen. You had better begin your work at once. Otherwise it will be

done for you, most drastically, by the Man who Loves London.'

This message acted on Mr Jenkinson-Pelham like a cold douche. He rose, assumed his fur-collared overcoat, went away to New Scotland Yard, and a little later drove with a detective to a suburban post-office, at which the telegram had been handed in at precisely 10.53 that morning. He and the detective took a spectacled lady who was in charge mysteriously aside, and held the telegram in front of her nose.

'Can you tell us,' asked the detective, 'who sent this wire from your office this morning? I mean, can you describe the sender?'

The spectacled lady immediately found speech. 'Certainly,' she answered. 'I remember the gentleman very well—an elderly man, attired in a blue-serge suit.'

'Bearded, and wearing blue spectacles,' demanded Mr Jenkinson-Pelham eagerly; 'and carrying a large—a very large—umbrella?'

'Not at all!' replied the lady. 'He was clean-shaven, except for a gray moustache; he wore a monocle on his right eye; and he carried a very handsome Malacca walking-cane.'

'I see it—I see it!' exclaimed Mr Jenkinson-Pelham. 'The miscreant has shaved himself! At any rate,' he added anxiously, 'he looked like an antiquary?'

'On the contrary,' said the spectacled lady, 'he looked like a half-pay colonel.'

Mr Jenkinson-Pelham and the detective went outside to their taxi-cab. The detective, once they were inside it, tapped the side of his nose. 'I see what it is, sir,' he said confidentially. 'There's more than one of 'em in at this job. It's a gang! Of course, this address that he filled up in there at the back of the telegram-form is "all my eye." There ain't no such hotel in all London as the Hotel Musidora, Strand. That's a fake. The next thing, sir, you'll have a letter demanding money.'

But the next thing—of importance—occurred a week later. The First Commissioner of Works, entering his department at his usual hour one morning, was met by his secretary, who was evidently brimful of news. It was with a visible effort of self-denial that he bottled it up.

'There's the treasurer of St Paul's Cathedral and a City police-inspector waiting to see you,' he announced. 'They've been here twenty minutes. Shall I bring them in?'

Mr Jenkinson-Pelham sank into his chair and waved a hand. It was with a sinking heart that he looked up at his two visitors. They advanced upon him, eyes fixed and heads erect. The treasurer of St Paul's, a severe, ascetic-looking clergyman, wore a vinegary aspect; the City police-inspector appeared to be nerving himself to a stern effort.

'What—what is it?' gasped Mr Jenkinson-Pelham. 'Not'——

'Mr First Commissioner of Works,' said the treasurer, gravely resting the tips of his black-gloved fingers on the outer edge of the official desk and leaning forward towards its occupant, 'I have waited upon you, in company with this officer of the City police, to acquaint you with a grave outrage. During the night which has just passed, the statue of her late sacred Majesty, Queen Anne, which stood in our churchyard, was blown to fragments!'

'Blown!" exclaimed Mr Jenkinson-Pelham. 'Do you say blown?'

'With such force that one fragment penetrated the window of a tea-shop half-way down Ludgate Hill,' answered the treasurer, 'destroying various matters of confectionery, left in the window from yesterday, and a large brass urn.'

'That fragment, sir,' remarked the police-inspector, 'I picked up with my own hands. It was still warm.'

The three men looked at each other.

'You have no clue?' at length asked Mr Jenkinson-Pelham.

'None, sir!' answered the police-inspector. 'Not the least! The bomb, or infernal-machine, appears to have been placed within the railings which surrounded the statue. The explosion took place at three minutes past six o'clock. A great many windows in the surrounding shops and warehouses are broken. One early bus horse received a wound in the chest. A donkey, driven by a man from Whitechapel, had a piece cut clean out of its left ear. Several people were knocked down. One of my men, on point-duty at Ludgate Circus, was so affected—nervously—that he has passed out of one fainting-fit into another ever since. As for the statue itself, sir, it appears to have been reduced to powder.'

Mr Jenkinson-Pelham put the tips of his fingers together and his head on one side. He glanced furtively at the ecclesiastic.

'So far as my memory serves me,' he observed, 'that particular statue was a remarkably ugly and inartistic piece of work. I believe remarks to that effect have been made from time to time. I have a dim idea that I have heard the statue jeered at—ridiculed. I'——

'Mr First Commissioner of Works,' said the treasurer, in tones of measured severity, 'that is not the point. I am not a judge of art, and I dare say that the statue in question was sufficiently hideous. The point is—if these outrages continue, what about the safety of our national Cathedral? When an outrage of this sort is committed on our very doorstep, what, I ask, is likely to happen next? The miscreant will—may, at any rate—endeavour to blow up the Cathedral itself!'

'I apprehend your meaning,' said Mr Jenkinson-Pelham. 'Yes—this is really becoming a

serious matter. I shall have to mention it—delicately, you know—to the Prime Minister. You are quite sure it was a bomb?'

'Perhaps, sir, you would like to inspect the fragment which flew into the tea-shop?' suggested the City police-inspector. 'It is downstairs in a taxi-cab.'

Mr Jenkinson-Pelham produced his magic sheaf of official documents and became very busy. But when the visitors had left him, he nerved himself to receive the inevitable telegram. It did not arrive on this occasion until the middle of the afternoon, and he noted at once that it had been despatched from Calais: 'On my way to secure a most valuable and effective new explosive. You wait until I return. Then you will see what can be done by the Man who Loves London.'

Mr Jenkinson-Pelham now felt that this was one of those jobs which no man can be expected to tackle single-handed, and he made a clean breast of everything to his colleagues of the Cabinet. But there was just then a most important Bill under discussion, on a subject of vital interest to the nation, concerning the cruelty of asking broody hens to sit on artificial eggs until a proper supply of real eggs could be supplied to them, and the Cabinet brains were so engrossed in considering its numerous clauses that the First Commissioner of Works received scant attention, and was left to do what he could. Mr Jenkinson-Pelham did what he could—he had the ports watched, and circulated various descriptions of the old gentleman. But nothing happened. Several weeks passed, and he began to cherish a hope that the man whose love of London assumed such uncomfortable forms had either been incarcerated as a maniac on the Continent, or had suddenly come to his senses.

February came, and with it the opening of a new session of Parliament. The Bill for treating Sitting Hens with Proper Humanity was in Committee, and the House of Commons was crowded. On the most eventful night of this historic debate, the Prime Minister was in the midst of a glowing peroration, which was rapidly drawing tears from the eyes of his audience, when an infernal roar and the shock of a terrible explosion threw him half-way across the table, extinguished all the lights, and whisked the Speaker's wig off his head. There were loud cries, and there was terrible confusion, and Mr Jenkinson-Pelham does not know to this day how he found his way to the open air. But there he was at last in the half-light of Palace Yard, clutching at various arms, and hearing great shoutings on every side of him.

'It's Charing Cross Railway Bridge! Charing Cross Railway Bridge has been blown up! Charing Cross Railway Bridge! Blown to atoms!'

It might have been about two hours later that Mr Jenkinson-Pelham was taken by a detective to look at a body which the river-police had found placidly floating on the Thames—the body of an elderly gentleman whose right hand still grasped a slow-match. The detective looked at it, and then at the First Commissioner of Works.

'That him, sir?' he asked.

Mr Jenkinson-Pelham heaved a mighty sigh, and threw his grammar away. 'That's him!' he said. 'Thank Heaven!—at least, I mean I'm awfully sorry, but—oh yes, that's him!'

He went away then, and sought the chairman of the railway company whose property had just been scattered in fragments all over Lambeth and Westminster. The chairman's jaw dropped when he saw Mr Jenkinson-Pelham's eye.

'Look here!' said Mr Jenkinson-Pelham in tense, staccato accents. 'A word with you! Do you intend, sir, to rebuild that infernal railway bridge of yours? You do—naturally. Then let me tell you, sir, that before you do so you'll call in a committee of the best artists we've got, and you'll rebuild that bridge in strict accordance with their designs and wishes, and you'll make it, sir, a thing of Beauty—Beauty, do you hear? Damn its usefulness! That bridge, sir, has got to be the first stone of a new and lovely London! Mark me!'

Then Mr Jenkinson-Pelham shook his fist and departed. The chairman, pulling himself together, went home and told his wife that one result of the explosion was that the much-respected First Commissioner of Works had gone quite mad.

THE END.

JOHN BROWN.

CHAPTER XXII.—THE SPIRIT OF GOD.

THE extraordinary thing in our hut was that the quietest and most decent member of our little society was, in reality, the most powerful. This was Billy Greens, generally known as 'The Padre.' In controversy Ginger or Tosher could simply bowl him out, but there was a sweetness and a kindness about him that made him a very dear pal. He was always so broad, ever willing to understand us, but quietly and effectively he was pitting his moral weight against our immoral and careless code. Billy had no physical strength to speak of. It was really a shame to see him in khaki, for temperamentally he was unfitted for the awful strain.

But he was there of his own choosing. As he always said, 'It is a holy war.' This gave him a great standing. He was fighting for a moral cause, and we did think him a cut above the ordinary parson.

Billy Greens was a 'white man.'

His strength lay in his private conduct, which was above suspicion. A fair sportsman, in a 'rag' he took his punishment. We never heard him speaking about 'the Cross' or 'salvation,' but in his own charming way he would lug one or more of us out for a walk, and land us in the Y.M.C.A., where he regaled us with refreshments and kept us to hear the entertainments. And the most amusing thing was that he and Ginger (the so-called Rationalist) were the best of pals. Ginger, however, was no Rationalist; he was just an argumentative beggar, so brilliant that he could flatten every one of us out. At all hours of the day and the night Billy and Ginger were going it, but it was quite evident that the padre was coming out top-dog, and taking the sting out of Ginger's oratory. As a matter of fact, after they had lived three months together, Ginger ceased to batter the Church, and often helped his clerical chum to get up concerts for the Y.M.C.A.

The padre was making good.

Even old Tosher, the dear old dollar-loving Canadian, was a champion of the padre. He was so powerful in the physical sense that he elected himself as a bodyguard. When there was a rough-and-tumble on, Tosher always rescued the gasping curate. There was something real good in the Canadian. If he was no great Christian, he was the best-hearted man in our platoon, and certainly the bravest of the crowd. His M.M. and D.C.M. were evidence of that. And if he did blow his own trumpet, it was not meant seriously, for Tosher, like all Canadians, was fond of 'chewing the rag.' The padre made it his business to take Tosher round all the nice people; indeed, he got Tosher fixed up with a neighbouring merchant's daughter, a most charming girl.

Tosher ceased to violate the moral code.

So far as Beefy and I were concerned, the padre had a lot of work to do. But he kept at it in his own quiet way, and although we never said it, we secretly felt in touch with a better man, and we always accepted a good deal of his advice. Billy worked on 'the chum principle.' He simply wormed himself into our confidence, with the result that we never cared to offend him. When he called me 'John,' there was something so very paternal in it that I became submissive, and a supporter of Billy, if not a perfect ornament of the Church.

The padre was smashing our lax code.

'You know, John,' he said one night, 'I shall be sorry to leave here.'

Why?'

There 's a lot of good work going on.'

Oh!'

'You fellows are not what you were. There 's not half the filthy language or the false bravado there used to be. None of those disgusting photos are around now. And nearly all the boys read in the hut at night. They 're *thinking*, and that 's all we want them to do.'

'What 's done it?'

'Well, the fresh air, the games, the discipline, and the general goodwill. The commandant, of course, is an asset. He 's such a dear old man that they feel they must be decent. And unquestionably Captain Cheerall has been an enormous influence. Just look at all those fellows swotting up military history,' he said, pointing to the crowd with their noses well down on books.

'You like army life, then, padre?'

'Not a bit of it. It has great good in it, and great dangers. All depends on the men you live with. Of course, this is an educated crowd, and they are easy to handle. But I had an awful time in the ranks. And yet I wouldn't have missed this war for worlds. My eyes are open now. I have seen the good in men, also the bad. And I hope it will help me in the future.'

'Do you think we 'll be the better for this war—I mean, in the moral sense?'

'That 's a big question. I think all the educated men will reason more, and I believe they will glorify the home and a good woman. But for the great crowd I 'm not sure.'

'Why?'

'Well, war loosens things. Women go wrong, and the marriage vows get broken. Men in the ranks are like children. One fool can contaminate a thousand. That 's the danger. Still, if we can educate them, and if the parsons will work, we can keep the Old Land going. And, of course, the Y.M.C.A. is a powerful force. I tell you, John, if we had had no Y.M.C.A. in this war, the army would have been a hotbed of drunkenness and immorality. Kitchener was the man who saw this at the beginning. By Jove, that *was* a MAN!'

'You 're a Kitchener youself, Billy.'

'Why?'

'It 's you that 's cleaning this hut up. You 've been a good pal, and we shall be sorry to leave you.'

'Not I, John! Not I!'

'Who, then?'

'The Spirit of God. Good-night, old boy.'

As he walked away a lump came into my throat. I 'm a sentimental ass, I know, but still *that 's* the sort of padre for AFTER THE WAR.

(*Continued on page 522.*)

WIRELESS MESSAGES.

III.—UN JOUR MAIGRE.*

By Mrs W. F. Irvine Bell, Author of *The Forester's Girl*, &c.

I.

'*ANGUILLES! Anguilles! Voulez-vous de bonnes anguilles?*' The cry, echoing in shrill but not unmusical treble up and down narrow, sunless streets, rings in my ears as, *Le Matin* under my arm, I cross from the diminutive *librairie*, with its rows of yellow paper novels, comic post-cards, and newspapers still smelling of the Paris presses, to the generous portal of the ancient 'Bras d'Or,' in the seclusion of whose shaded garden I am to breakfast. Waiting there for blue-eyed Gabrielle to appear with the shining tray, I notice her *patronne*, smiling and *chic* in morning-gown, a spacious basket slung on her plump, bare arm, emerge from the regions of the kitchen hidden away in the depths of the old house, and hasten to the street entrance. Instantly my mind leaps to a conclusion—Wednesday—meatless day—*eels!* I follow mine hostess, and find her standing before a long barrow through whose cracks trickle salty tears, as though in sympathy with heaving masses of damp cloths which cover its stained surface.

Forthwith begins a brisk barter between madame and the owner of the barrow—an old woman, clad in the sombre black dress and shawl of the Normandy peasant, an all-enveloping apron girt about her waist, whose proportions, as well as the rest of her muscular frame and her weather-beaten features, would rival those of a Newhaven fishwife. Dexterously whisking open the confused heap of cloths, she displays, without permitting to escape, her squirming victims, which, thus ruthlessly exposed to the light of day, frantically endeavour to bury themselves in the wet sand which has kept them moist and cool since low-tide of the previous evening. '*Très bonnes, madame—toutes fraîches! Voyez-vous? Toutes vives!*' she declaims, while with coarse fingers she grasps the hapless eels and piles them on the scales. Such an expression of terror gleams in those scintillating round eyes that I speedily betake myself to coffee and bread-and-butter, with the comfortable reflection that *this* meal at least costs neither suffering nor fear.

With the hour of noon arrives *déjeuner*, and, sentiment notwithstanding, it is with no lack of interest I scan the menu, and concede tacit admiration to the ingenuity of the *chef*. *Hors d'œuvres—crevettes*—pink, salty, and alluring. Next—*anguilles!*—all resemblance, however, to those brilliant, electric creatures lost in a shroud of crisp, brown 'fry.' But I don't eat eels even on *meatless* days, so I wait for the next number on the programme—*moules marinières*, black shells widely gaping in a hot element of flavours strangely foreign to that of the unlucky mollusc. These are followed by *raie—raie au beurre noir—raie à la sauce blanche*—and again a cunning camouflage of divers things, beneath which, you may be certain, lurks the inevitable *raie!* Ere the exigencies of housekeeping took me daily to or past the *poissonnerie*, the long, low building whose red-tiled roof and ever-lingering smell of fish are leading features of the busy *quais*, I used to marvel that the supply of *raie* never failed—on the *menu* it *never* did! But a few visits to the fish-market soon set one's mind at rest on that point—boxes full, baskets full, boats full of *raie—raie—raie*, from the giant of its kind, weighing many kilos, to the Benjamin of the tribe—a sweet, nutty little individual whose humble price and succulent qualities make it a welcome addition to the larder in times when sole are eight francs a pound, and turbot not to be even looked upon, except with one's purse safe at home!

II.

A fascinating place is the *poissonnerie* of our little *ville*. There, upon broad, well-scrubbed counters, lies the rich harvest of the sea, with gleam of colour and flash of fin—red and silver, dun-colour and gray—and small mountains of translucent shrimps waving innumerable legs in vain search for the comforts of home! Here is a pile of dark, rough-ribbed oysters, close-lipped and motionless, on a bed of dank seaweed; there are the ivory tints and graceful coils of giant whelks, with, maybe, the pinky 'arms' of a hermit-crab, feeling about for the missing rock, and carrying his stolen house hither and thither through a veritable menagerie of sea-beasts. Not far to seek, too, together with the popular sand-eels, are great congers, and *chiens-de-mer*, and at certain seasons the delicious *coque Saint Jacques*—'cut-fish' our little *femme-de-ménage* calls them, but as the orthography is beyond her, I give the name phonetically. The state of the fish-market, by the way, and more especially the supplies of shell-fish, I soon discovered to be a better indication of the weather than the best of barometers, and woe betide the housekeeper if a spell of *mauvais temps* coincide with the prescribed trio of meatless days! One learns, for instance, that after a storm and a strong wind 'on shore,' fish will be scarce and dear,

* Previous articles of this series of 'Wireless Messages' appeared in *Chambers's Journal* for October 1918 and May 1919.

but whelks and *coques* are plentiful. With long low-tides comes abundance of *moules*; but when for only a brief while the black rocks are accessible to the mussel-gatherer's knife, it is as well to avoid such wares as the old women may have to offer, for drain-pipes and the jetty timbers are not desirable nurseries even for mussels! A visit to the fish-market should be made when, at high-tide, the laden boats return, for it is then one sees it at its briskest and best.

Those stout, complacent-looking dames whom last evening we saw amicably chatting and jesting as they sat, knitting in hand, on the benches beneath the double row of lime-trees, can they be these eager, assertive women, who now, petticoats girt high, with red faces and loud voices, run along the *quais* to help and handle rope and box—who in the auction-hall hand by vie with each other in sharply contested bargains for *maquereaux* or *merlans*, and drag their baskets of dripping, slippery spoils to their respective stalls in the fish-market? Yes, they are the same; and in this one whose patois, perhaps luckily incomprehensible to us, now rises harsh and strident in angry altercation over a box of salted herring, I recognise my special *poissonnière*—Madame Potin, who in dulcet tones is wont to address me as her *petite jolie dame*, while, with a shrug of her broad shoulders and an indulgent smile, she deducts a few *sous* from the price of a coveted plaice. Behind the stall her slim, pretty daughter, masses of black hair shining glossily, deftly cleans one's fish, searches a capacious pocket in her petticoat for the change, and, if one be in high favour (for even paper is scarce and dear), tears off a sheet of *Le Petit Journal* to line one's basket. Will she, too, I wonder, become coarse and fat, loud-voiced and quarrelsome, as are the older women about her?

Of Madame Potin's stall, however, the presiding genius (lacking which no picture of the *poissonnerie* would be complete) is an old black pug, whose ultra-protruding jaw and small white teeth, broken and irregular as the 'pickets' of a neglected New England fence, demand instant recognition of a not remote bulldog ancestor. Securely shelved high above the medley of fish and folk, he makes his presence known by prolonged, comfortable snores, or by sharp provocative barks directed against less privileged fellow-canines, who, in the jostling crowd below, must take their chance of trodden toes or the onslaught of belligerent 'brothers.' Of the latter, moreover, there may be not a few if, as quite frequently happens, owing to stress of weather, boats from the fishing-town of D—— have run into our harbour. For these fishermen, so I am told, have a special fancy for a kind of large black dog (too exact an analysis of the breed of the canine proletariat along the French coast is not to be recommended!), which voyages with them, and at night is left on board to guard the boat, tied up to the *quai*. This practice, by the way, occasionally has disastrous results upon my slumbers; for if one of these four-legged visitors chance to be a puppy or altogether strange to our *ville*, he will—when his master has betaken himself to some snug *auberge*, and the tide sinking, boat and beast sink with it—set up dolorous howls, unbroken, save for brief intervals, until the next 'high-water,' and with it the return of what Maeterlinck calls his *seul dieu*.

III.

On the morning of this particular *jour maigre*, as it happens, both man and his '*bon chien familier*' are at large, and as I stroll along the *quai*, subtle peculiarities not only in the build and the rig of the boats from D——, but in the appearance and the speech of their owners, set me thinking of the curiously persistent stamp and stability of local conditions, even within the limits of a small area. Variance, however, of their respective patois is evidently no let or hindrance to mutual understanding, for mid the tangle of hawsers and nets, of boxes and barrows, behind the *poissonnerie*, masculine tongues wag as volubly as do feminine ones under the red-tiled roof. A cheerful, cheering scene—with broken lines and blending of soft colours which make me envy an old French artist whose gaunt figure and iron-gray hair, curling on a worn coat-collar, are now familiar objects in my idle wanderings, and whom presently I shall follow to the *jetée*, whither at this moment, folded stool, box, and brushes strapped on his back, he is evidently bent.

Just now, though, my attention is caught by a group of figures and a harmony of tints which surely might have given 'points' to a potter of ancient Greece! A patch of blue sky 'criss-crossed' with the bristling masts and yard-arms of crowded shipping lashed to the *quai* of sand-gray stones, and spread thereon, in flowing folds and wavy lines, a quantity of nets—red-brown, grape-brown, and skim-milk blue. Grouped about the nets for purposes of mending, a small sand-coloured dog in attendance, are an old man and some boys, bright-blue trousers and black sabots common to all, but blouses of tints that blend with, and melt into, each other—terra-cotta, light and dark, clear khaki, and one of an elusive plum-bloom hue which awakens in my mind jumbled reminiscences of Phœnicia and Tyre! What a palette of 'notes' for the old artist had he chanced to look this way! He, however, as I soon discover, is already at work.

The tide, now ebbing fast, has laid bare between the *jetée* and the rapidly narrowing waterway a shoal of shining sand, deeply embedded in which are the bones of the *Charlotte*, a fishing-boat from H——, which, caught in a winter gale, was dashed against the jetty timbers. All that is

now left of the once stout bark (for every portable fragment of the wreck was eagerly auctioned) is the sun-bleached red prow, rigidly pointing towards the harbour it was destined never to reach, a few blackened ribs, and the great iron-shod rudder, the tiller still outstretched for the grasp of a 'vanished hand.' Seated in the shadow of the uprearing prow, stool and water-tin securely planted in the sand, is the bent figure of the old artist, transferring to his block, with rapid pencil and brush, the wind-caught sails and heeling hulls of some belated boats endeavouring to run the channel ere it be too shallow. But tide and time wait for no man, so it is with almost breathless interest that I watch the triangular race now afoot between fishermen, artist, and the forces of nature. While mid the rushing current the old men of the sea, with well-judging hand and eye, tack and trim their wayward vessels, on the momentarily enlarging shoal a 'counterfeit presentment' of the virility and grace of those straining sails emerges from beneath the cunning fingers of the painter. Impressionist? Maybe—yet how accurate and convincing the impression! One seems to hear the creak and complaint of overwrought rope and rudder; to feel the freshening wind which fills anew the sagging sails; to see the swirl of the surging water, and, just beyond the pier-head, the red buoy bouncing on its chain. These wheeling gulls, too, their white breasts and outstretched wings flashing in the sunshine—will they also be imprisoned in this living picture? Yes—a deft dab of his brush, the merest touch of his pencil, and the flight of those wild sea-birds is arrested for all time by the miracle of his art. I fall a wondering as to the destiny of the picture that has grown beneath my eyes. Who the purchaser? Where will it hang? Will some one who loves and longs for the sea and *La belle France* feast homesick eyes upon it—treasure it—hear in his ears the scream of the gulls, the murmur of the retreating tide, the hoarse shouts of the fishermen? Or, as the silver-tongued Martial feared for his *parvum libellum*, does an ignominious fate await it, if not exactly as wastepaper for a cook's pantry, yet perhaps to be tossed about, dusty and dingy, in a neglected heap of forgotten sketches? *Quien sabe?* Ah well! instinctively my fingers search for and squeeze the small gray purse in my pocket. Alas! it *also* feels the 'belly pinch' of many a *jour maigre!* Perhaps as well, then, that at this moment a sudden chill wind whistling down my neck, and a wisp of ragged cloud flung darkly across old Sol's bright face, recall my soaring thoughts to the prosaic consideration that one cannot always count upon summer skies—and I don't possess a mackintosh! One more glance, then, ere reluctantly I turn my back upon the stranger artist and the coveted picture. Shall I come across them again—either?—both? At some Spring Salon *après la guerre?* . . .

IV.

That piping wind which spared my purse, while starving my passion for pictures, proved to be but the first notes of a concerted band, which, before the next holocaust of succulent *raie* had done their 'bit' towards providing a meatless dinner, rushed and roared around our little *ville*. It took us by surprise—us summer butterflies of fluffy frocks and thin shoes—and twenty-four hours of cold, pelting rain driven before a hurricane of wind speedily emptied *plage* and *planches*, leaving them sodden and desolate as the shores of Iceland. As for 'her nain sel', however, it requires much more than 'half a gale' to keep her sanely safe indoors, and so soon as the storm-clouds had, like the Texas cow-boy, 'done their durndest,' and, lightened of their packs, were racing out to sea—gray tails streaming, wild manes tossing—I buckle on an old sou'-wester, relic of other times and otherwhere (*altera tempora—alteri mores!*), button my coat snugly under my chin, and, thus equipped, fight my way up the narrow Rue de la Mer, which acts as a funnel for enfilading winds.

Pausing to recover my breath behind the shelter of the big white Casino, I brace myself to battle with a staggering blast which would thwart me of my goal—the *jetée*, the magnet which draws me, fair weather or foul. How changed the scene since yestermorn! Swallowed the sunny shoal, a few hours syne an artist's novel atelier! Swallowed the skeleton of the sunken ship in an all-engulfing smother of surf and spume! Can those sand-bound timbers still stand firm, or will the rigid helm be forced to respond to Father Neptune's iron grip? For now he is master of the situation, and, in league with Boreas, hurls vast gray-green seas against the jetty, lashing the timbers till they tremble beneath one's feet. Fascinated, exhilarated, I grasp the railing and venture to creep along, to listen to the thunder beneath, to watch the wild clouds overhead, and to hazard a guess as to which of the onrushing waves will outleap its fellows and clear the pier-head. Boom! Splash!—a briny Niagara of shattered foam sends me scuttling back to safety! . . . .

V.

Towards evening, the fury of the elements having subsided, I revisit the jetty for yet another look. Now, however, I find myself not alone. A handful of women, black shawls closely wrapped about strained, sallow faces, strands of hair straggling in the damp wind, firmly grip little children by the hand and stare—stare—stare out to sea. First one, then another, points across the misty, heaving waste of waters; eager questions are asked and answered; and at length even my short-sighted eyes can make out two brown sails detaching themselves from the dim sky-line, then two

more, and again two, until, like a flock of scattered sheep, the overdue fishing-boats come trooping home. How keen the sight (sharpened by who shall say how much of love and apprehension?) of the watchers on the dripping jetty! How like a curtain drops from their faces the tense expression! What a glad light for an instant beautifies even the plainest features and tired eyes as they identify this boat and that! Even the children discover and spell out the numbers on the dark, wet sails. '*Quatre-vingt-cinq! C'est le bateau de Simon Lemazurier!*' '*Trente-huit! Ton grandpère, Jean!*' and Jean's mother, with a sigh of relief and a few words of encouragement to the still expectant women, betakes herself with her little son out of the searching wind to the sheltered harbour.

Even an odd-shaped patch on a sail, a greater breadth of beam, a shorter topmast, slight differences undetected by a stranger, are eagerly sought and loudly acclaimed by the fishermen's families, until one by one the battered little craft have safely crossed the storm-swept main, and, mid shouts of the owners, and answering cries from their womenkind, round the pier-head and run the gauntlet of yawning billows, shifted shallows, and cross-currents which threaten to wreck them at the last 'lap' of the race. '*Mon Dieu!*' cries one poor woman, turning deadly pale and covering her eyes, as the yellow prow and the white water-line of the smallest boat vanish for an instant in the curl of a monster billow. '*Mon Dieu! Les vagues sont si grandes et les bateaux sont si petits!*' But the staunch little vessel gallantly emerges from the underworld of water, and shaking the foam from her glistening hull, darts away, followed closely by a portly craft whose rather clumsy build and top-heavy sails I seem to recognise. '*Voilà!*' joyfully then exclaim in unison the watchers on the jetty. '*Voilà le bateau de Saint Jean Baptiste! Ça va bien maintenant!*' Wrapping shawls and babies more closely, with laughter and chatter they hasten towards the *quais*. One only still lingers—a girl with fair skin and wide blue eyes, upon whose hand gleams a bright new wedding-ring. Her husband's boat—it has not yet come, she explains as I approach and question her. He is young, but lame—'*tant mieux*,' for otherwise he would have been '*mobilisé*.' And his boat? '*Mais oui, madame*,' she replies with a little thrill of pride—it is new, and, though small, is one of the best in the fishing-fleet; but, she adds, turning upon me her great eyes in which are written a nameless dread, '*c'est des sousmarins que j'ai peur pour lui*.' In silent sympathy I wait beside her until winds begin to chill and daylight fades. Then suddenly the gray mantle of the sky is rent, the fiery ball of the setting sun glows resplendent before dropping into a copper-coloured sea, and across the golden wake of his departure flits a tiny speck. '*Mon mari!*' cries the girl beside me. '*Dieu merci!*' she adds softly, crossing herself and turning from the angry sea to face the Calvary high on the harbour hill.

Yea verily—it costs much in war-times to provide the fish for '*un jour maigre*.'

THE WAYFARER.

THOUGH far and wide the wanderer was forced to roam,
At last the long road's leading to the hills of home—
I'm faring towards my true love, though the way was steep and long.
I thought to come with singing, but my heart has hushed my song.
The hedgerows break in blossom, and there's music far and near;
The days have come we used to love, the playtime of the year,
When we were plighted lovers, and my heart was stout and strong.
You bade me blend my singing with the happy woodland throng
When you and I were young, my dear, and life was at its spring,
And glad songs, ay, and proud songs, were the songs I used to sing.

Now you're waiting and you're watching in the same old place;
You are waiting with a welcome on your sweet, pale face.
In the little cottage garden where the green lane ends,
I shall see you at the turning where the high road bends;
You will wave and beckon to me with your wild-flower grace.
I am coming, O my sweet,
But a moment, and we meet;
I shall see my true love waiting when the journey ends.

You are waiting for the lover whom you loved of yore;
But you'll see your gay young lover, O my sweet, no more.
You wait to hear the old songs, but you'll long for them in vain.
I cannot sing the old glad songs, the merry songs, again.
For long the road I've followed since we parted, O my dear;
A steep and stony path I've trod, this many a weary year.
A lonely road I've travelled, in the wind and in the rain;
I come to you for healing, love, from weariness and pain.
A heavy heart, an older heart, a burdened heart I bring.
The songs I'm singing now are not the songs I used to sing.

SEVENTH SERIES

THE MAN 'JOHN SMITH.'

By FREDERICK SLEATH, Author of *Sniper Jackson*

I.

WHEN the order came sending the 2nd Eastshires back to the trenches for Christmas, every one of them grumbled except the man John Smith.

He was a sniper, one of the finest of a great sniping section. He liked his work; he hated Germans with an intensity that made men wonder—men, even, who had seen wounded chums shot down as they crawled from the battlefield, and many other things not likely to make them think kindly of the enemy; and so his approbation of the order did not come as a surprise to any one.

Not that he expressed his delight in so many words. That would hardly have been wise in view of the keenness with which the battalion had been preparing to celebrate Christmas, the first spent out of the trenches in three years of war. Instead, he settled himself down in a secluded corner of his billet and played his mandoline. And it was the way he played the instrument that told his comrades what he thought. They generally read his moods in this manner. Smith was a man who seldom spoke except to gibe at them.

It was understood that he had a past, the bitterness of which was still with him. Some vaguely associated it with an injury done to him by the Germans; but where, when, and how it had happened they did not know. Others who knew the seamy side of life even whispered that he had 'done time.' There were one or two that connected both rumours. But all kept discreetly silent, for Smith had the reputation of being a dangerous man in a rough-and-tumble.

Smith himself never gave the slightest hint that would lead to a proper understanding of things. In the trenches he sniped and sniped, playing a lone hand, so that no man knew the true greatness of his tally of victims. In rest-billets he mooded alone and played the mandoline.

Sometimes there was such a devil in his music that men listened, and shuddered to think of the evil of his thoughts. Of such an order was his playing on the night it was known that the Eastshires were going back to the trenches three days before their time. Even Old Dan Carmichael, the sniping corporal, who had seen his two wounded sons slaughtered by a German sniper in the ill-fated fighting down by the Petit Bois, remarked on it.

'Dod! Smith 's in an awfu' mood the nicht,' he said to the little circle around him. 'It 's no dacent for a man to bear sic ill-will agin' onybody.'

'I wish he wud stop it,' murmured young Billy Mackie, looking up from a letter which he was writing to his girl. 'He 's fair aff his heid. I simply canna get on.'

But no one ventured to suggest this to Smith. They had all grown to tolerate his eccentricities, not only from the fact that he invariably got the better of them in argument, but also because of his staunchness as a comrade whenever an awkward German sniping-post had to be tackled.

Sometimes, too, the warp seemed to go out of his nature, leaving him normal, ready to laugh with his companions in the little joys of the trench area, ready to help in alleviating general discomforts. The sight of the distant line at night, with its fairy galaxy of star-shells, a cadence from a favourite piece of music, a golden sunset, anything beautiful, would work such a change in him. On one occasion of the kind he had addressed his officer as 'Jackson,' using the surname so naturally that the officer had scarcely noticed the breach of discipline. It had told him what his snipers had known for a long time, that 'John Smith' was merely the pseudonym of a gentleman gone wrong.

This was an evening when the spirit of unrest seemed to leave Smith's soul, for he broke off the wild music he was playing to begin a more popular melody known to them all. Soon they had laid aside the little tasks with which they had been busy to listen to his music; their feet were beating time; one or two of the younger men were humming the tune.

Then the spell was broken in a rising murmur of imprecations. With a touch like that of a fallen angel, Smith had suddenly shivered the harmony into a series of jarring chords in which seemed to find expression all the evil of the ages. Before they had properly grasped what had happened he had packed up his instrument and stolen from their midst.

II.

Perhaps it was well for him that he had slipped away to enjoy his joke in secret. Old Dan

 [*All Rights Reserved.*]

Carmichael had risen fiercely the moment he disappeared; and Old Dan was the strongest man of the corps. All that evening the strains of Smith's music echoed in their memories, and everywhere they dimly sensed the evil which he had summoned into their circle. It kept them from writing. And men paused uneasily in the midst of a conversation to listen for something that was not there.

The snipers did not readily forgive Smith for his prank. He marched up to the trenches in a file by himself, with none to speak to him. Not that there was much conversation in the section. It was Christmas Eve, and, in addition to their ordinary kit, the snipers were heavily burdened with goods for their Christmas dinner. Even though the day had to be spent in the trenches, they were determined that their long preparations should not be wasted. Rain was falling heavily. The shell-pocked road was difficult to tread. It was a journey of toil for them, cheered only by the thought of the feasting on the morrow.

At first Smith had carried only rifle and equipment. No one had asked him to help in bearing the extra burdens, nor had he volunteered his services. But about half-way up to the firing-line he moved up to Billy Mackie and relieved him of a special cooking-stove, whose weight was proving too much for the young sniper's strength.

After a while, when Billy offered to resume the burden, Smith told him abruptly to go and help Old Dan. It was such little things that made Smith possible in the section.

When the snipers' dug-out was reached, he set up the stove and got it into working order. It was an awkward stove to handle, and he knew its mysteries better than any of them. The snipers began to look at him appreciatively. Smith was evidently going to be on his best behaviour this Christmastide. They wanted him to behave himself, for the officer was taking dinner with them on the morrow, and Smith was an excellent entertainer with song and mandoline.

'Ye 'll mebbe gie us a bit tune on your maundolin, Jone, the morn,' Old Dan suggested to him.

'Sorry, Dan, I can't. I 'm going to be out,' Smith replied.

'You 're no gaun snipin', shairly?' asked Old Dan in wonder. Christmas had always been a blank day for the Eastshire snipers.

'Why not?'

Old Dan could not think of any reason likely to appeal to his comrade, so he kept silent. Smith went to his usual sleeping-place and lay down. He roused himself later to gibe at Billy, who was humming a Christmas carol. Old Dan checked him sharply. Smith rose immediately, snatched up his rifle, and left the dug-out.

'He was juist the same last Christmas,' said Old Dan meditatively, as soon as he had gone. 'He was tearin' mad when the officer sent him on duty doon to the billets.'

'Does onybody ken onythin' aboot him?' asked big Adam Saunders, the ex-gamekeeper, looking up from the dixie of hare-soup which he was preparing for the morrow. 'I doot there 's somethin' in his past that wud mak verra interestin' hearin.'

But nobody knew anything definite. Smith had just come out with a draft. He had always been the same.

III.

Outside the dug-out Smith had paused to test his rifle. The murmur of their voices came out to him. With a start he realised that they were discussing himself. At once he hurried away out of hearing.

A road led up to the firing-line close by the dug-out, swept nightly by the Germans with machine-gun and fixed-rifle fire. Fifty yards farther on was the beginning of a deep, well-made communication-trench. Smith followed the road.

Half-way up, the wicked hammering of a German machine-gun rang out. A rush of bullets sparked off the solid cobble paving in front of him. He slipped off the road into a shell-hole, and the next traverse of fire hissed over him.

A rat, disturbed by the bullets in the midst of its scavenging, hurled itself into the shell-hole for shelter. It cowered down at his feet. A touch of his boot would have crushed the little refugee. Instead, Smith lay and watched the tiny frightened eyes winking at him from the darkness.

When the rat slipped away into the open he rose and resumed his journey. But a hundred yards from the firing-line the machine-gun started to hammer, and again he had to take shelter.

This time the firing was more prolonged. Nearly half-an-hour passed, and bullets still continued to whistle across the road with that irregularity of interval which makes it impossible for even the most veteran trenchman to judge the time of their coming.

Twice he rose in lulls of the hubbub, only to dodge back hastily to cover as the storm broke out anew. At last, tired of the long delay, he jumped up and raced for the firing-line.

He reached it just in time. He felt the deafening rush of a bullet past his ear as he leaped into the trench-bottom.

'Close call that, mate,' murmured a sentry, crouching below the parapet-top.

Without replying, Smith picked a place on the fire-step where he would not disturb the sentry's sleeping reliefs, and sat down to recover from the exhaustion of his race.

'Got a fag to spare?' asked the sentry.

Smith handed him a cigarette. The sentry lit it with a patent lighter, ducking his head behind the sandbags as he took each puff, to shield the glowing end from the enemy.

'How is it you are without cigarettes on the first night in?' asked Smith.

'Dropped my packet in a wet shell-hole.

Won't be able to smoke till the cigs. are dry,' replied the sentry laconically.

'Here, take these,' said Smith, emptying one-half of his case.

'Thanks, mate. What's your name? I'll give them back to you to-morrow morning.'

'Smith,' said the sniper, rising and moving off down the trench.

'God!' muttered the sentry. 'Fancy getting cigs. from him!'

'That you, Smith?' called the sniping-officer as Smith rounded a traverse.

'Yes, sir.'

'Would you mind coming out on patrol with me?'

Smith had come up the line for another purpose, but he readily assented. He liked his officer personally, and also because he was such a tireless and efficient destroyer of Germans. Smith often went out on patrol with him. He knew that from these expeditions came many of the valuable hints the officer gave him as to points worth watching for targets.

The two climbed over the parapet and threaded their way through the wire. The machine-gun fire had ceased. They walked. Less experienced men might have crawled.

But Jackson, the sniping-officer, knew every yard of the No Man's Land, the places where one might go as safely as though many miles behind the lines. Only when within a few yards of the German entanglements did he lower himself to the ground and begin to crawl forward. Smith followed his example.

On reaching the wire belt the officer swung to the right and crawled along its edge, examining its strength and construction. At the entrance to a gap he left his companion, and crawled on alone to the German parapet. Some new work had been done there in the day-time which he wanted to examine. Every night he did this. It was a proverb in the division that the Germans worked in the day-time for Jackson to inspect at night. Every secret of their firing-line was known to him. He could map out the best course for a raiding-party without a moment's reflection, and the raids of the Eastshires were always suddenly conceived operations, surprises even to the men of the battalion, and always successful, no whisper of their coming ever reaching the Germans.

Smith watched his officer in admiration. He saw a dark form crawling over the enemy glacis, only a few yards from him, yet no sound of its passage reached his ears. Then it stood upright, and came stalking boldly back towards him.

'Come along, Smith,' said the officer quite loudly. 'It's just as I thought. The old Boche is holding his line very lightly to-night. The trench is empty. Listen.'

From the distant support-lines came the sound of stringed music and the voices of men singing softly in harmony.

'It comes as a shock that the Boches should think of observing Christmas Eve, doesn't it?' murmured the officer. 'It's difficult to think of them as Christians from our point of view.'

Smith said nothing.

'You may let this patrol stand in place of any duty you may have to do to-morrow,' said the officer when they had walked back to the firing-line.

'I was thinking of spending to-morrow in the old willow, sir,' Smith replied.

'Were you? All right. But look after yourself,' remarked the officer, tumbling over the parapet.

He knew Smith and his vagaries too well to express any surprise at his wishing to do such a thing on a day purposely made easy for the snipers, nor did he attempt to interfere with the man's intention. That was Jackson's way of running the section. He gave individuality the fullest scope, with the result that his men had the best returns of the division.

IV.

Left alone, Smith walked back into No Man's Land. He bore to the left of the course of the recent patrol, where the hostile lines bent away from each other round the edges of a broad belt of marsh-land. There were pools that glittered blackly in the light of occasional star-shells, and bog-holes brimming with green-covered slime, where strange, living things stirred in affright at his passage, and other pitfalls that a day passer-by could scarce have avoided. But Smith pressed forward, safely and without hesitation. It was his favourite sniping-ground, and no creature of the wild knew the marsh better.

The willow-tree where he meant to hide during the coming day was in the centre of the marsh, the giant of a battered clump which the shells had never succeeded in wholly destroying. Before reaching it he paused on a shoulder of dry ground, and lay down with his face towards the German lines.

Smith often rested on that shoulder. From it he could look a long way over both German and British positions, and watch all the night display of star-shells and gun-flashes. The night-murmur of the trenches, mingling with all the rustlings and stirrings of the marsh, was a chorus which never lost its charm for him. He always came there when most restless, to listen to the wild lullaby, and to let the moist earth drain away the bitterness troubling his soul.

Once a German had come there also. Smith had pictured in him a fellow-sufferer, and allowed him to remain unmolested. For many nights the two had lain there in silence only a few feet apart. In any case, they could not have shot at each other, for the flash of a rifle from No Man's Land would have attracted the fire of every machine-gun in the sector.

Then one night the German had pounced on

Smith and tried to strangle him. Smith strangled the German, and tossed his body contemptuously into the marsh. It angered him to think that a fellow human being should spoil the peace of his sanctuary, when the very marsh creatures were wont to come there and rest with him.

The incident came back to his mind as he lay on the shoulder, and also the memory of the rage that had filled him. He wondered at himself for feeling so angry. After all, what was there in his experience that could lead him to expect anything else from a German? He ought to have strangled the fellow on the night of his first appearance.

The sound of stringed music came faintly from the distant support-line. He peered intently in the direction of the playing, trying to discover some sign which would tell where the players were hiding.

If he could only have been sure of their position, he would have hastened with the news to the artillery, forgoing his sniping of the morrow for the pleasure of imagining the shells rushing down and bursting amidst the orchestra. But not a sign did the darkness give him. He rose and made his way towards the willows.

The clump was surrounded by water, but, with the aid of projecting roots and fallen trunks, he reached the centre tree dry-shod. Feeling for the familiar hand-grips, he quickly pulled himself up into his usual hiding-place in the broad pollarded bole.

The lopped branches were thick and massive where they left the trunk and had sprouted again at the pollarding, so that within this natural screen was room and shelter for many snipers. A heavy festoonery of ivy made the cover still more effective. Smith settled down in his wonted corner and coolly went to sleep.

V.

The dawn was in the sky when he awoke. The light was filtering dimly through the ivy-tendrils. Almost as soon as he was conscious of the daylight he knew that he was not alone.

At first he thought an animal was in the tree. Then something moved on the far side, and he saw the familiar field-gray uniform of a sleeping German soldier. Impulsively he leaped forward to grapple with the intruder. His rifle, dislodged by his hasty movement, slithered from its perch in the branches, and dropped with a splash into the marsh water.

The German woke at the sound. He grabbed hastily at his rifle. In his fright he jerked the weapon out of the tree, and it fell into the water as Smith's rifle had done.

Smith had a bayonet. The German had none. The Boche turned white as he saw the steel at his throat. 'I surrender,' he said, in good English; and his hands went up so quickly that he almost overbalanced and toppled from the branch on which he was sitting.

Smith nearly killed him as he struggled to regain his position. Quite apart from the fact of his being a German, he hated the man for his intrusion, and for spoiling his own work of the dawning day.

But as he crouched there hesitating, waiting for the German to recover, it came to him that he could not kill the fellow. The German's voice told him that he had mixed in England with people of Smith's own class. Besides, to kill him in the tree meant filthying his own resting-place; and Smith detested filth. He felt the German all over in search of hidden weapons, and having satisfied himself that his prisoner was unarmed, he lowered the bayonet, and sank back moodily in his corner.

The German crawled into the centre of the tree, and sat down opposite his captor. Several times he tried to begin a conversation. Smith took no notice of him. He was listening to the sounds in the German positions, and staring straight past his prisoner along the No Man's Land, striving not to look in the direction of the enemy's lines, lest his chagrin at not being able to take advantage of the targets which (he knew) were presenting themselves might make him lose his control, and cause him to murder this German.

Hours went by without his altering his position. Noon came. The German produced some food, and began eating it hungrily. Snow had started to fall, and he was pinched with cold. Smith also suddenly felt hungry. He pulled out of his pocket some bully-beef and biscuits, and munched them slowly.

The motion of eating seemed to make the German feel the cold more keenly. He glanced questioningly at Smith's water-bottle. 'You have not a spot of something stronger than water there, have you?' he ventured.

The bottle was nearly full of raw rum, the accumulated soldier's rations of the past two months. Smith handed it over to the German. The man drew out the stopper with eager fingers, and drank off a great gulp of the spirit.

'Thank you,' he said, coughing a little as the rum bit his throat. 'Heavens! what a place to spend Christmas Day in!' he added when he recovered himself. 'For the past four years each Christmas has been worse than its predecessor.'

'You have come down in the world, then,' said Smith quietly.

It struck him as curious that a German with such a command of the English language, a man, moreover, obviously of some breeding, should be only a private.

'Yes,' said the German shortly. 'My country does not readily forgive her failures.'

VI.

Smith looked at the man more interestedly. Failures and outcasts appealed to him. That was

why he spared the rats and other wild creatures when they rested near him.

'Five years ago to-day I was in England,' the German continued. 'Rich, an honoured member of society—don't you call it?—with one of the prettiest bits of business that I ever attempted for my country almost completed. And I failed, just when I thought success was assured. That was the beginning of my misfortunes. I have failed several times since, and now my country has no better use for my services than as you see me. You also have come down in the world, my friend?'

'I was in prison five years ago to-day,' Smith said evenly.

'Were you, by Jove? I only just escaped an English prison.'

'You were spying, then.'

Smith spoke the words sharply. The German was in the act of drinking more rum, but he stopped in surprise at Smith's tone.

'Why, of course! Like nearly every other German in your country. Like nearly every Englishman in ours,' he said.

'You had better tell me no more,' said Smith meaningly.

The German finished his drink before replying. The effect of the first dose of spirit was already beginning to show itself. He was growing more and more confidential.

'Come, come!' he said with a laugh; 'we two are men of the world, and men of the world do not cut each other's throats in a lonely corner because of their ideas of patriotism.'

He settled himself down more comfortably, his hand still resting fondly on the rum-bottle.

'I had been ordered to get the secret of a new manufacturing process in the Midlands. Damn that twig!' he broke off, reaching up and tearing away a willow-offshoot that was irritating the back of his head.

Smith had begun to warn him again against saying anything further; but he stopped suddenly, and let the German continue.

'I came on the scene as a wealthy manufacturer interested in the same process,' said the man. 'But I had to marry the old fellow's daughter before I came anywhere near getting what I wanted. Quite a business, too, I assure you.'

He smirked evilly at some memory, and made to raise the rum to his lips again.

'And you failed?' questioned Smith.

'Yes. It was damned unfortunate. I had already married a wife, and my worthy second father-in-law found it out just a little too early for my convenience. You do not like what I am saying, eh?' asked the German, as he noticed Smith's hand playing nervously with the bayonet-handle.

'I am enjoying the story. Please go on,' Smith assured him.

'Ah! you are a true man of the world.'

The German raised the bottle to his lips, and chuckled as he drank, so that the liquid spilled grossly from his mouth, and dripped down on his tunic. An expression of what might have been disgust showed for an instant on Smith's features.

'Go on,' he said evenly. 'It is dull for only one of us to laugh.'

'Pardon me; but it really was most amusing,' chuckled the German. 'A business of many complications, a cautious old father-in-law, a wooing, another suitor for the lady's hand—"Lucy's young man," as her father spoke of him when first I entered their circle.'

'And you got rid of this Lucy's young man?'

'Yes, poor fellow! He went to prison for forging father-in-law's signature,' said the German mockingly.

He turned to reach for the rum-bottle, but some subtle instinct made him pause to look at his captor.

'Put away that bayonet, man!' he exclaimed, suddenly sobered.

The point of the weapon was within a foot of him. Smith had risen from his seat, crouching like an animal about to pounce, a frightful expression of hatred and triumph in his eyes.

Into the German's face sprang a look of terror, distorting his features horribly. He turned a pasty white. His head shot forward on his shoulders as though to get a better view of his captor.

'Where have I seen you before?' he whispered hoarsely.

Then, as he read his own answer in the face of the man before him, his lips jerked apart in the beginning of a scream. But the first rising note was cut off sharp, and lost its power in a weak throaty gurgle, as with a quick jab forward 'Lucy's young man' drove the bayonet home in the neck of the man who had wronged him.

THE RENEWAL OF ANTARCTIC EXPLORATION.

By R. C. Mossman, F.R.S.E.

THE culmination of the modern Antarctic campaign in the attainment of the South Pole, in the third serious attempt to reach it, has from a popular standpoint accomplished all that there is to be done in this inhospitable Southern continent. When, however, the actual state of our knowledge of Antarctica is impartially considered, it is evident that the most extensive field for geographical exploration, in both its scientific and commercial aspects, lies in the frozen regions of the South.

It may be asked what has been already ac-

complished in this direction, and in reply the geographer would summarise the results somewhat as follows. A narrow wedge, with a base of about four hundred miles, resting on the Great Ice Barrier discovered by Sir James Clark Ross in 1841, has been driven for seven hundred and twenty miles into the Terra Australis Incognita, as far as the Pole itself. This has been done by the combined efforts of Scott, Shackleton, and Amundsen. The high ice-covered plateau of Victoria Land has been penetrated several times in a westerly direction for a considerable distance beyond the immediate mountains, and on one of these sledge journeys the south magnetic pole was located. Coastal patches of insignificant extent, as compared with the great unknown within the Antarctic Circle, have been surveyed by British, Australian, French, and Swedish explorers. Other recent expeditions have done valuable and extensive scientific work in the exploration of Antarctic seas, as distinguished from Antarctic lands, bringing back information of unique interest dealing with the physics of the ocean—its tides, currents, temperature, and density—as well as numerous examples of its abundant fauna, not only from the surface, but from depths exceeding two miles, where the waters are still rich in life. New stretches of coast have also been located on some of these expeditions, the most important being the discovery in Weddell Sea—a prolongation of the South Atlantic—of Coats Land by Dr Bruce in 1904, and its extension southward to within seven hundred miles of the Pole by Filchner and Shackleton.

In all, these explorers have added some four hundred miles to the known coast-line of Antarctica as laid down by the investigators of the Victorian era. Other discoveries of less extent have been made in widely separated regions, but the outline of the South Polar Continent is still unknown throughout two-thirds of its circumference. It is, therefore, no surprise that, with the coming of peace and the return of the world to pre-war interests, Britain, which has ever been in the van of Polar research, should again turn her eyes to those regions which she has so earnestly striven to investigate in the past.

The new British Imperial Antarctic Expedition at present being organised by Mr J. L. Cope, F.R.G.S., who was surgeon and naturalist on Sir Ernest Shackleton's recent expedition, has among its aims and objects the survey of the uncharted coast-line of Antarctica, the location of mineral and other deposits of economic value known to exist in Victoria Land, and the detailed examination of the physical conditions of air and ocean, with all the improved scientific apparatus that has been provided by recent research. The location of areas frequented by whales, with a view to the establishment of whaling-centres similar to that which has been so successfully developed around South Georgia, also forms a part of the programme. From a small beginning in 1905 the South Georgia whaling industry has grown to very large proportions, so that now no fewer than twenty-one companies are operating in the region known as the Dependencies of the Falkland Islands. The value of the whale-oil, the bone, and the guano now exceeds two million pounds sterling annually, and dividends of 100 per cent. have been paid. It is not too much to say that the annual production of over half-a-million barrels of oil from this area was of the utmost value to the Allies in the manufacture of the munitions of war which, in the end, led to such an overwhelming superiority over the enemy. This very profitable industry, which accounts for more than half the world's output of whale-oil, owes its inception to an Antarctic explorer, Captain Carl Larsen; while the establishment of whaling-stations in the far South was rendered possible, in the first instance, by the scientific survey of Graham Land and Weddell Sea by the various expeditions which explored the regions south and east of Cape Horn between the years 1898 and 1909. It is highly probable that similar whaling-centres will be formed in Ross Sea and other far Southern waters, but before commercial enterprise can begin, the areas where whales abound must be located, and suitable harbours discovered. When this has been done, an important industry can be quickly built up, with every prospect of a rich return.

With these varied problems in front of him, Mr Cope proposes to leave England in the summer of next year for New Zealand, in the *Terra Nova*, a ship that has already figured conspicuously in the annals of South Polar exploration. After a geological survey of Macquarie Island has been made, the vessel will proceed through the storm-swept waters of the great Southern Ocean to Scott Island, situated on the Antarctic Circle, where a party will be left in charge of a meteorological and wireless station. The journey southward will be resumed through polar pack-ice to New Harbour, situated among the foothills of Victoria Land facing Ross Island, where Scott and Shackleton had their winter quarters. At New Harbour, from which in clear weather a fine view can be obtained of the volcanic cones of Mounts Erebus and Terror vomiting forth flame and lava from an elevation of twelve thousand feet, the main base of the expedition will be established, and a large hut erected to accommodate twenty-two men for five years. Special attention will here be devoted to the study of magnetism and meteorology, particularly the conditions of the upper air, so that information may be gained that will materially facilitate the aeroplane reconnaissances contemplated. Sledge-parties will further explore the western mountains with a view to ascertaining the position and the extent of the

mineral and other deposits of economic value already known to exist in Victoria Land.

After coal, stores, and scientific instruments have been landed, the ship will proceed across M'Murdo Sound to Cape Crozier, at the western end of the Great Ross Barrier, close to the eastern foot of Mount Terror, where two small huts, provisions, and equipment will be disembarked. One of these huts will shelter a party to study the habits of the Emperor Penguin, and to investigate the Antarctic winter at this point, a research initiated by the late Dr Wilson of Scott's expeditions, but never completed. A sledge-party, led by Mr Cope, and carrying a hut in sections, will set out from this spot over the Barrier surface, travelling as far south as possible, and when some one hundred and fifty miles from the sea will go into winter quarters, in order to investigate throughout the long Antarctic night the physical conditions of what is believed to be the southern pole of cold. That all low-temperature records will be broken at this desolate spot, situated in the midst of a veritable Sahara of ice, there can be little doubt. Amundsen at Framheim, on the coastal fringe of the Barrier three hundred and fifty miles to the east of Cape Crozier, experienced an average temperature throughout the year corresponding to forty-three degrees below freezing-point, with an extreme reading as low as seventy-four degrees below zero, or one hundred and six degrees of frost. It is, therefore, not difficult to imagine the extraordinarily low temperature that will prevail so much nearer the Pole, under true continental surroundings. Some compensation will doubtless be afforded by the circumstance that the periods of greatest cold will be associated with a complete absence of wind and snow.

When the Cape Crozier and Barrier parties have been landed, the *Terra Nova* will return to Wellington, and there load with coal and provisions for a four years' commission. In the following summer the vessel will return to New Harbour, having previously picked up the Cape Crozier and Barrier parties, who will have completed their investigations. About December 1921 the vessel will leave on her great voyage of circumnavigation. Aided by all the experience, the improvements, and the appliances for investigation which the modern Antarctic campaign has suggested, this voyage will nevertheless prove a formidable undertaking, making great and well-nigh continuous demands on the vigilance and the activity of the ship's personnel in their combat with the forces of Nature. It is expected that the delimitation of the coast-line of Antarctica from east to west will extend over three, possibly four, seasons. An element of luck regarding the ice conditions will determine the duration, especially the date at which the vessel will be able to break out of her winter quarters. The navigable period in high Southern latitudes is all too short, even under the most favourable circumstances, and it is quite conceivable that two seasons may have to be passed at the one spot, as happened to the *Discovery* on Captain Scott's pioneer expedition.

The first winter, it is expected, will be spent at, or near, Cape Ann, Enderby Land, due south of Madagascar, and in the latitude of the Antarctic Circle. This land was discovered by that stout-hearted navigator, Captain Biscoe, on 1st March 1831, and has never been seen since. The region is described as mountainous, but Biscoe brought back few details, as in a sailing-ship amidst constant gales and snowstorms he was unable to make a close examination owing to compact field ice and a chain of icebergs. After the *Terra Nova* gets free from her icy prison, sometime in the summer of 1921–22, the cruise through the Biscoe Sea will be resumed, aided by the prevailing easterly winds, and an effort made to keep in touch with the coast between Enderby Land and Coats Land, which will be specially examined. At the end of the navigable season winter quarters will be sought in Graham Land, due south of Cape Horn, where a supply of coal will be awaiting the expedition. In the succeeding summer of 1922–23 every effort will be made to complete the survey of the remaining portion of the Antarctic coast-line between Charcot Land and Edward Land. This great blank space south of latitude seventy degrees south is as little known to-day as in the time of Captain Cook. Finally, about February 1923 or 1924, the expedition will again reach New Harbour, and thence, after picking up the men on Scott Island, return to civilisation.

THE SEARCHERS.

CHAPTER XXXII.

'I MAKE no bargain,' were the words carried down-wind. They were clear and resolute, and the doctor made no reply beyond a shrug of his shoulders.

The two men moved off again, their backs now turned to us, and although the going must have been difficult, they were rapidly widening the distance between them and our party. Soon the receding figures disappeared in a dip, to emerge climbing a scree leading to the abrupt cliffs which crown the Ladder. The name—The Goats' Ladder—somewhat exaggerates the cliff's character, for, although its ascent in some parts means the tackling of almost sheer rock-face, it is not really dangerous to a climber with nerve and knowledge of the place.

At the head of the scree they halted. Guidotti pointed to the top of the Ladder, and 'The Searcher' went first, swinging himself easily up the dark escalade, followed more slowly by the other man. 'The Searcher' climbed quickly, and reached the parapet when the other was little more than half-way. Through the glass I saw him gain the crest, after which he lay down and craned over the edge. Something in his attitude as he crouched, watching the climber coming up foot by foot, riveted my eyes on him. Now he was kneeling, and his hands were busy.

Tony had risen to his feet, and was spying intently. Suddenly he clutched my arm. 'My God! Look!' came from him, and as he spoke a great fragment of rock toppled over. The climber gave one swift glance aloft, and threw up an arm. In the twinkling of an eye the murderous thing crashed down. I heard the dull impact, and the next instant Guidotti was swept like a fly from the cliff's face. No cry reached us. He fell headlong sixty feet before he struck the granite, where he rolled down until a ledge stopped him. There he lay twitching, face upwards, an arm and a leg sprawling over the edge.

'*Criosda leinn!* Murder! Plain murder!' gasped Malcolm.

'Shall we rush him, Tony?' I asked, sick with horror.

'Steady; he is going to save us trouble. He is coming down. If he moves an arm when I challenge him—shoot!'

As Tony spoke the murderer began to descend the Ladder rapidly, and reached the ledge where the other man lay. Having carefully scanned the corrie, he bent over his enemy for a long minute. Then he lifted him—It—and moved with his burden out of our sight behind the giant boulders. An interminable five minutes passed before 'The Searcher' reappeared, and began to lower himself straight down the bottom rungs of the Goats' Ladder. Soon he would be on level ground, and, if he came straight ahead—in our hands. Down he clambered, and began to pick his way among the granite. The distance between us lessened until I could see the whites of his eyes. We crouched lower, well out of sight. I could hear his footsteps on the stones not fifty yards away.

Up sprang Tony with revolver levelled.

'*Good*-morning, Dr Hall,' he called; 'or is it Mr "M'Nair"?'

I own that the villain showed consummate nerve. He stopped dead. Not a word came from him, but although his face was livid, there was calculation, and not defeat, in his eye. For a tense moment or two he stood perfectly still. Then he threw up his head, cleared his throat as if to speak, and coolly put his hands in his pockets.

'Hands up!' shouted Tony in a blaze of suspicion and anger, suddenly pulling me down beside him—not a second too soon, for a revolver cracked, and a bullet hit the ledge behind us with a wicked *phutt*.

'Ah! I thought so!' said Tony. 'He fired from his pocket. I shouldn't have given him a second's law.'

Now 'The Searcher' had wheeled, and was running at top speed on the level ground towards The Knuckle.

'Bolted!' said Tony. 'But he won't go very far.'

We fired simultaneously, but he had a forty yards' start, and was doubling and twisting among the boulders. Although he flung up an arm, neither of us had stopped him.

'Come on!' said Tony, now round the boulder and in the open. 'We'll head him for The Knuckle. Duncan and Finlay and Macbain are up there.'

The fugitive glanced behind, and, ignorant of the hidden sentries over the ridge, believed that to gain The Knuckle would be the safest plan. Once among its boulders, he could pick us off if we tried to rush him. This must have been his scheme, for he made a tremendous spurt and increased his advantage. The pace was gruelling, a fierce onslaught on the lungs up that steep and stony slope, but guilty terror and a vision of the rope gave him the speed and the resource of a hunted animal. He climbed from one stone to another, looking round at us as he dived in and out of his cover, all the time making his way up with astonishing swiftness.

'In here,' said Tony, slipping behind a rock. 'We'll get back our wind. There's no hurry, for we have all the earths stopped.'

Peering round the corner of our screen, I saw the fugitive throw himself face downward on the ground, and lie watching us from behind a stone. In quick succession we fired again, not so much in the hope of hitting him as to drive him up the ridge and warn our men of his and our whereabouts. A minute or two passed, hunters and hunted motionless, watching, when the silence was broken by a shout behind us. It was from Matheson, coming towards us at the double. 'The Searcher' heard the shout, and spurted up the slope. We waved to Matheson to come on, and the chase began again, on our part at an easy trot, for our quarry was making straight to within range of Duncan and Finlay, who were lying hidden on the farther slope of the ridge.

In his bid for liberty, intent on making speed up the rough ascent, 'The Searcher' did not see the waiting danger. There was a deep cleft, a vertical joint in the granite, running to a V-shaped end on the hunted man's left. The cleft dropped to the dry bed of a stream, and on its crest, bare of stones, the ridge's spine arched and fell a few yards to a crevasse—the crossing of which meant a ten-foot leap, easy enough on the flat, but with a difficult 'take off' for a winded man. 'The Searcher,' after a swift glance behind at us, realised that to break to the left where the

crevasse narrowed would lose time, and perhaps bring him within our range. For a second or two he hesitated, and then ran back a few yards to gather himself for the jump. In the instant, as he rose, one arm in the air, a rifle-shot rang out. While one might have counted ten we waited, but the flying figure did not reappear. Then came a long, despairing cry, cut off with a dreadful abruptness. Keene-Leslie and I looked at each other, listening, the same mute question in our eyes. The silence was death-like.

Duncan and Finlay had rounded the point of the cleft, and were now hurrying down towards us, their faces white as paper.

'He is doon there,' said Duncan, pointing to the cleft. 'I fired low, and missed. The bullet went atween his legs. He made the loup, but he fell short, and clutched a rock at the top. He should easily ha' been able to pull himsel' up, but I think ye had hit him, for he hung on by only one hand. I ran doon, and was aboot thirty yards from him. Then he gave yon cry, and let go. . . . *Trocair o Dhia!*'

(*Continued on page 533.*)

ROUND ABOUT THE MOON.

OUR satellite has drawn an abnormal amount of public attention of late years, thanks to air-raids and the part it plays in long-distance flying. But at no time was the moon without her students, some (not counting the astrologers) of a very queer kind.

Juliet may justly be pardoned for bidding Romeo 'swear not by the Moon, the inconstant Moon,' as no proper witness to a lover's vow. A girl of her age and period, over head and ears in love, is not supposed to be scrupulously accurate in astronomical detail. Otherwise Juliet might have remembered that the Sun himself is not more constant to his appointed course than is the Moon to the times and the sequence of her phases. Were she less absolutely punctual, she would be unable to hide from mortal sight the deepest and darkest of her mysteries. Were it not for the invariable law that her revolution on her own axis exactly coincides in time with her revolution round the earth, we should, from time to time, see that face of hers which no human eye has ever yet beheld or, it can safely be predicted, ever will behold.

There is always fascination about an insoluble mystery. And so it comes to pass that the 'turned-away face of the Moon' has been recognised as *the* spot in our planetary system where wonder may wander at will, unrestrained by telescope or camera. Here is the storehouse of all lost things, of all lost opportunities, lost pins, lost labours, lost causes, unfulfilled hopes, unanswered prayers; here are the quarries whence we build our castles in the air; here the limbo of infants, the menagerie of chimeras, the library of unwritten books, the dust-heap of philosophies, the fountain of fancies, the laboratory of dreams.

But the visible face has bred its fancies too. Everybody knows by sight the Man in the Moon, and some profess to see his dog besides, though the latter's existence is disputed. In controversy, moreover, is the said Man's identity. According to some authorities he is no less a personage than Cain, thus pilloried for punishment; according to others, an unnamed labourer, condemned to the Moon for the sin of Sabbath-breaking by gathering sticks on Sunday—as evidenced by the faggot that weighs his weary shoulders down. Science has preferred to find in the same dark portions of the lunar disc volcanic mountains of prodigious height and steepness, with their craters and intervening gorges, and has mapped them out and given them names. Fiction has taken geographical and anthropological possession through the enterprise of Cyrano de Bergerac, Baron Munchausen, Jules Verne, H. G. Wells, and others; while soaring above more or less poetic fact and more or less scientific fiction is the mystic majesty of the Moon-goddess herself—Phœbe, Cynthia, Diana, under whatever name by mortals known. For essentially feminine she is, as all the world has always agreed (it is only German muddle-headedness that gives masculine gender to the Moon, feminine to the Sun). Are not mystery and femininity notoriously synonymous? And though the lunar phases are actually so regular and calculable that they can be reproduced by clockwork, they undoubtedly seem very mysterious to inaccurate observers.

But the Moon's observers are certainly not, as a rule, entitled to plead Juliet's excuse for lack of accuracy. Artists, of all men, ought to be careful observers of Nature; yet far too often do we find them, especially among book-illustrators, depicting an evening scene with a new Moon turning her horns the wrong way; while how many persons, not artists, can say off-hand which is the right one? Fiction, no doubt, has a quasi-poetic license. A grand lunar impossibility is achieved in the 'Rime of the Ancient Mariner,' where the Wedding Guest hears how—

> The Sun's rim dips; the stars rush out:
> At one stride comes the dark;
> . . . . .
> *Till clomb above the eastern bar*
> *The horned Moon, with one bright star*
> *Within the nether tip.*

It is true that the 'Rime' may be regarded as in the nature of a dream. But even dreams—or at any rate literary imitations of them—have their

limitations. Certain of the *Arabian Nights*, for example, are the *ne plus ultra* of dream literature. But not even Sindbad ever reported an impossibility so absolute as the rising of a 'hornèd' Moon at sunset—that is, for the full or a gibbous phase. And not only so, but with a star between the horns! 'Surely, Mr Coleridge,' Dr Johnson is made to exclaim in the *New Lucian*, 'you must have forgotten that, though the illuminated segment of the moon may be shaped like a crescent, the moon itself throughout all its phases remains a disc; and its darkened portion, therefore, must necessarily interrupt our view of any star—unless, indeed, it were one nearer to the earth than our satellite, and none such exists.'

On luck (as on lovers and lunatics) the Moon, of course, has a potent influence. Unhappy the wight who gets a first glimpse of the new Moon through glass! Any one so impolite as to point to Her Highness (two hundred and thirty-nine thousand miles of highness, to wit) has only himself or herself to blame for the ill-luck that penalises so gross a breach of celestial etiquette. On the other hand, to salute the new Moon when first seen (not through glass) with a ninefold bow or curtsy is to secure a clear run of good fortune, and increase of cash therewith if what coins are in the pocket be turned the while.

If, or how far, the Moon affects the weather as well as the tides must be left in controversy for probably many a generation to come. Meanwhile it may be safely settled that such popular science as,

> Friday's Moon—
> Come when it will, it comes too soon,

or,

> Saturday's new, and Sunday's full,
> Was never fine, and never wull,

can scarcely be based on any sound process of induction. And, on the whole, it would seem that Shelley's

> Orbèd maiden with white fire laden,
> Whom mortals call the Moon,

has been rather a 'maker of poets,' as Keats has it, than an inspirer of common-sense. But then, a considerable number of persons, of whom not a few are poets themselves, hold (or appear to hold) that poetry and common-sense are incompatible terms.

JOHN BROWN.

CHAPTER XXIII.—WE DISCUSS THE SCHOOL.

'WELL, boys, in another week we shall have one pip on our sleeves, and be wearing Sam Brownes. Heigho, my lads, for a jolly time! No more guards, no more fatigues, no more school,' said Beefy one night.

'Beefy!' shouted Ginger.

'What?'

'You're a silly ass. The commission, a bottle of "fizz," and a chorus-girl form your entire outlook. Haven't you learnt anything here?'

'Oh yes, a little. I'm quite grateful, and I'll do my best. I'm not a marvellous fellow with my headpiece—and know it—but I'll try to do my job. You're a wet blanket, Ginger. Because a fellow laughs and fools about, you think he hasn't got guts. Have sense, you silly old book-guzzler.'

'You'll make a good bombing-officer, Beefy. A strong arm and a soft head are all you require for the Suicide Club,' remarked Nobby.

'And you'll be in the A.S.C., bringing up the bully-beef. A soft job for a Radical. I know your crowd. You curse the public schools, but you push us into the infantry. Nobby, you are a ruddy fraud.'

'Let's sum up the school, boys,' I said.

'Right. Lead off,' commanded Ginger.

'It isn't really a bad show. The first time I saw it, it looked a penitentiary; and when I spotted all you toughs dropping in, it promised to be a Hades. But it's panned out fairly well. There's a great lack of intellectual meat—a few of the instructors ought to go back to school—but still, we're cleaner, we're smarter, we know a few things, and we'll make at least half-decent subs. And I think we ought to be very thankful, considering that the fellows who received commissions at the beginning of the war got no training at all, but had to go straight to the trenches and find things out. And we have been lucky to have such a good old sport for a "com.," as well as that priceless chap, Cheerall. He's the backbone of the school. There has also been a moral improvement. Ginger has had a wash, Beefy doesn't go out after cooks, Nobby has ceased to pray for Asquith, and Tosher has suddenly become respectable. I think we ought to leave with no grouse, and it's up to us to give thanks to the commandant and his staff. They've treated us well, and done their best.'

'I second the motion,' said Nobby. 'The school is a useful institution, and on the whole has done good work. They have certainly paid attention to our bodies. We are all healthier, heavier, hardier, and therefore more fit for our job. The great defect is, as John Brown says, a lack of brain-power. But there is this idea in the military system: "A man of action cannot be an intellectual." And all these old fellows argue, "If they want us to be butchers, they cannot expect us to be professors." To me this is simply an excuse for mental sloth, and adherence to pre-war pleasure-loving ways

War is a science and a conflict of ideas. The army which is most scientific and has the greatest number of ideas is bound to win. This country of ours is packed with ideas; but we are so conservative, so cursed with classical ways, that it is a crime for a hustler to start pushing his ideas to the front. We're tied up to seniority, "form," and rotten old traditions, which simply choke good fellows off. Reverses have improved us, and disasters have helped things on. But why wait for disaster? Why not let every mother's son contribute some ideas to the war-machine, and so help to end the war?

'The soul is certainly sound, as Captain Cheerall says; but what's the good of a soul if you haven't got push and go? Certainly, we have improved since 1914, and we are going to win this war all right. Still, I am not so sure that youth is having its chance. There are too many old fellows knocking about. What I want to see is all those young G.S.O.'s getting the jobs, and then we'll have a good time. Look at Cheerall! He's an absolute treat! There are hundreds of men like him in the Old Army and the New Army. We fellows, who are new to the business, don't give a tinker's damn whether an instructor or a staff-officer is a Cecil or a Henderson. We want the goods. We're willing to learn. We'd pawn our boots to go and hear men like Maude, Allenby, Robertson, and Wilson; but we've got a contempt for all those old blighters who sneer at us, who think we're not gentlemen, and regard us simply as cannon-fodder. The army isn't democratic enough. It's a close preserve, and we Liberals are going to shake it up. All the same, I don't dislike this school. As John says, the commandant is a dear old father and a gentleman. If it weren't for men like him, we'd all get fed up. As for the sergeant-major, he's a terror; but he *does* know his job, and he has taught us a lot. These men are all right. It's the system that's all wrong. Yet I'm sorry to go, for I have had a good time with you fellows here. One thing the army does teach, and that is friendship. I wouldn't have been out of this job for a fortune, and when we part I'll be a sorry man.'

'Hear, hear!' roared Beefy.

'Gentlemen,' said Ginger, rising, 'you've just heard my honourable friend, the member for the Manchester School, heave things off his chest. Having done so, he's perfectly happy, for the great secret of keeping such a person in order is to let him talk—talk hard and talk long. He's a most terrible Radical, and should he be the Secretary for War in the next Government, it will be necessary for me to remove him with a BOMB.'

'Keep to the point,' said Nobby.

'Very well, the point is the school. Much of what Nobby has said is true. Now and again we've been terribly bored with the "padding" some of these fellows stuff into their lectures. The majority are afraid to be original. Still, on reflection, I think it fair to say that many never expected they would have to be schoolmasters. Again, nearly all of them were brought up under the old system, when thinking was very bad form. Nevertheless, they have worked hard. They have treated us well. The defects which exist are due to the system, and not to the men. Unfortunately a few imagine we are Tommies who have never been to school. They import into their lectures a lot of stuff which is pure bluff and part nonsense. We have seen the defects of the General Staff, and we are prepared to realise all their difficulties, as well as to note their triumphs. But it is sheer nonsense to paint them as supermen. That is a good enough stunt when talking to a platoon who cannot reason things out, and who, if told of little things, would expand them into big things and commence to grouse. But if we are going to be officers, then we want to know all the wrinkles. As Cheerall insists, study *where* we failed, *why* we failed, and *how* we might have avoided failure. It's no good cloaking things. We were at Loos. We were at Cambrai. But it is frequently forgotten that we can see things, for many of us are educated. We're not here for fun; we're here for business.

'What is always forgotten by military mandarins is that the nation is in arms. Again we are fighting for our very lives. But I *don't* think we can apply Nobby's sweeping reforms in the middle of a war. Remember Russia! There they abolished the salute. What happened? The army became a mob, and Russia was sold to Germany. The defection of Russia is the condemnation of Democracy—at least, of Lenin's Democracy. And I, for one, am up against all Bolsheviks. Nobby, of course, doesn't mean all this. Still, it takes an Oxford man to balance his impetuous moods and keep the ship right.'

'Don't swing the lead, Ginger,' cried Nobby.

'I am not swinging it, old chap. Your political strategy is one-sided, and sometimes lacks vision. Frequently you throw out constructive ideas, but you want to achieve them by destructive methods. You can't do that, or at least, if you do, there will be chaos. You keep shouting for Democracy, but you've had it for three hundred years. You really want the moon. I'm with you, heart and soul, when you talk about brains, but I'm up against your method of reform. Go slow, old man. Work your reforms one by one, without creating panic and disorder. There are tremendous forces at work to-day. Unreason and anarchy are rampant. Give the mob its head and this old Empire will tumble like a pack of cards. You condemn Oxford, you curse the classics, you tilt at the historical and true political instinct, and you fail to note that the

old system made us what we are—the greatest Empire, the greatest people, one of the most democratic on the earth.'

'Question,' said Tosher.

'It *is* a question,' retorted Ginger, turning to his interrupter, 'but it's a question concerning your educational defects. You are not taught these things in Canadian schools. It's not your fault; it's your Government's. But there's no excuse for Nobby. He accepts the whole "Democratic" scheme with all its blunders. You can carry out his ideas in a parish council, but you can't do it with an army. And while I have endorsed a good deal of his plea for intellect, I am not blind to what we have accomplished. He's a lawyer, but he's not judicial, for he has not given the other side of the case. We started with an army of one hundred and seventy thousand strong. We now have an army of five million. We have increased the corps of officers from ten thousand to one hundred thousand. When we started at Mons we had only shrapnel, and that was short. Now we have the finest Ministry of Munitions in the world. We have shipped an army of millions over the seas, and lost only two thousand men by drowning. Thanks to the navy, of course. There were no such schools of instruction in 1914; now there are hundreds. It's all very wonderful. It has been done slowly, quietly, effectively. True, there have been horrible blunders, and we have had reverses. So has the enemy. But in all manœuvre battles we have beaten the Germans.'

'Hear, hear, Ginger!' some of us shouted.

'Now you see where Nobby is wrong. He concentrates on the failures and forgets the triumphs. And that is the greatest defect of his Radical friends. For all that, I'm not going to say we're perfect—no army is perfect; but I do say we, as a nation, have done our best. Certainly, there are much-needed reforms. I'm with Nobby on the subject of brains, but I'm not going to back up his horrible methods of smashing down to build up. You can't do that in war-time! Graft the new on to the old, *and we'll win.*

'As for the school, it has been a priceless boon for fellowship. I've really learnt to love old Nobby, and tried to understand him. And Tosher, the man-eating, constitution-smashing Canadian—well, we've just taken him into our arms! Like all Colonials, he's a good fellow. Then there's Beefy—dear old Beefy!—the king of the ballet, the god of the bar, yet the toughest devil who ever came out of Cambridge. He's real good! John Brown, of course, is a dreamer. He revels in romance, girls, and philosophy. You'll find him in a barrage writing to Adela and moralising about the smell. Finally, there's dear old Pieface, the best fellow who ever wore a holy collar.

'Now, to be serious, boys. I like the school; but I like you more. We've learnt a lot about war; but we've learnt more about each other. We may not live; but if we do, then "The Dauntless Six" will meet at Ciro's, fill a bumper, and drink long and deep to the happiest school-days of our lives.'

'Hear, hear, Ginger!' we shouted as he sat down.

'I guess I've got to get into this business with my feet,' said Tosher.

'Try your head,' mumbled Ginger.

'It's right there, old child, every time,' answered Tosher, touching his forehead. 'We ain't no one-eyed chicks from Alabama; we get our wisdom-teeth in a hard country, where the snow buries you for six months, and the sun bakes you in the summer. Why, it just makes me sad to see the Balliol joint pumping out, "Go slow," "Steady up," and calling old Nobby a Bolshevik. Nobby is the only spring chicken in the crowd—but you don't understand him. He wants to sweep up all your old institooshuns, and give you all a real good time.'

'Keep to the point, Buffalo Bill,' said Beefy.

'I'm sitting on it, and it's real hard. Now I'm going to skin your eyes. I likes this institooshun. It's durned slow, and there ain't enough ginger in the Old Man. Yet I reckon I've got wise here. They've knocked all the Tommy's grouse out of me, and given me hope of a better land—a commission, a servant, and a waiter to bring me cocktails and fat havanas. They've shown me how to eat an omelet, and warned me off drinking out of a finger-bowl; taught me how to sign myself "Your obedient servant" when I don't feel like it; and to say "sir" to all the chicks that'll want a job from me after the war. They took me in, a tow-headed gum-chewer, and they reckon they're turning me out real prime, first-class, lead-'em-to-hell stuff. As one of those old professors said, "He was a Canadian when he came; now he's a gentleman."

'Well, boys, I'm real grateful for it all, though I haven't much time for etiquette, and ain't no use at the "How d'ye do?" business. Out West we introduce with revolvers, and get our photo taken when there's a hundred dollars on our head.

'We ain't here for amusement; we're here to fight. You can't do that with kid gloves. It's red fighting that will kill the Hun—not talking. And as Nobby says, we need more brains. That's a plain proposition, and I'm his man. However, we haven't been skinned in this saloon bar. The Old Man is a white man. He has been real good to me and you. Our time's been a happy time. I've learned to love the Old Country. We Canadians may be tough, we may even seem white-fanged gunmen, but I tell you, we're in with you to the end.

'God help the Huns when I go back!'

'Hear, hear, old Tosher! You're the goods,' shouted Billy, rising to wind up our informal discussion.

'And now, boys, a last word. Tosher has shown you the real soul of Canada, the spirit which brings the Canadians over, and in which they die. To us all it is a great revelation. He has been a good pal, just as you all have been, and our time here has been one of joy. Never mind this eternal discussion about brains. Leave that to the powers that be. Look at ourselves. Are we better men? Are we better soldiers? Are we really fit to lead our own clean boys? That to me is the real issue. Somehow, I think we'll do fairly well. We are all agreed about fighting the German. We are determined to do so. In this school they have improved us, and made us more fit for the task. We have had a dear old gentleman for a father; our instructors have all been kind; every one of the staff has done his duty. It is up to us to show our appreciation, and when we leave here, to serve our God, to honour the King, and die, if need be, like true British soldiers.'

We got up silently, and went to bed.

The thought of parting had gripped the soul!

ASHANTI IN THE TWENTIETH CENTURY.

By David Boyle.

IT is now nineteen years since the siege of Coomassie Fort. In 1900 the Ashantis, bereft four years earlier of their king, Prempeh, and angered beyond measure at an unfortunately-timed request for the unpaid indemnity of 1874, turned on Sir Frederick Hodgson (Governor of the Gold Coast) and his party, and broke into open revolt. It would be difficult for any one revisiting Coomassie to-day to recognise the savage capital of last century, hemmed in as it then was by the great Ashanti forest with its steamy silence, undrained, and uncivilised except in the immediate neighbourhood of the fort. A succession of wise rulers, after the suppression of the revolt, beginning with the late Sir Donald Stewart, has had a sure result in social, commercial, and political progress, and there can be few parts of the Empire that have been more quickly and more completely remodelled.

Ashanti occupies a remarkably advantageous position with regard to the West African coast, for while, thanks to the railway, she can keep in touch with the ocean trade that every year is becoming a larger asset to the Gold Coast, she also taps the interior roads that lead down from the French Niger country through our Northern Territories. There is a marked difference between the close-forested area of the south and west, and the semi-open or orchard country of the north. Cocoa, cocoa, and yet again cocoa, spells the secret of the extraordinary prosperity of Ashanti to-day—a prosperity interfered with, indeed, by the war, but only temporarily. Mineral development is, of course, also to the fore, principally at the great Ashanti gold-mines at Obuasi. Ground-nuts, shea-butter, rubber, kola-nuts, all contribute their quota to the general increase of commerce; while the cattle trade with the north and the south, for which Ashanti occupies a half-way house of exchange and broking, is responsible for no small turnover in money. But cocoa, first, second, and always, is the handle of the country's wealth.

German enterprise had not extended far into Ashanti before the fateful summer of 1914. It was chiefly confined to the politico-religious activities of the Basel Mission, a German Swiss society whose stores almost invariably followed the pastor's moving tabernacle within a few months. But the Hun benefited not a little by Ashanti's progress, a large proportion of the exports being sold to Hamburg and shipped direct. Truth to tell, the German steamships of the Woermann line were well patronised by our officials and others in those days, for they offered many little comforts and courtesies that our own Elder Dempster did not think it worth while to give one. 'The devil shows himself in many guises,' and doubtless it was all part of a plan, as the venerable German missionary declared when, with a perfectly unruffled exterior, he awaited at Coomassie station the arrival of 'Wife, one, as per invoice,' sent out to him from the Fatherland as a reward and a helpmeet for his labours. (This is a fact. I remember the mild excitement caused by the arrival of the lady, a tall, fair, good-looking German girl of about twenty-three.)

The chief need of Ashanti after the 1900 'show' was, of course, a railway. At that time one had to land at Cape Coast, march many a weary mile through the Coast scrub and the Ashanti forest, ford innumerable streams, and spend several sleepless, mosquito-haunted nights before emerging on the clearing that contains Coomassie. So a railway was made—by the mile, it is said. This would seem to be true, to judge by the curves that in places almost enable a person in the last coach to shake hands with the engine-driver. But a railway there is, and you may now leave Sekondi, the Gold Coast port, at 7 A.M., with reasonable prospect of completing by 6 P.M. the one hundred and sixty-nine miles that lie between you and Coomassie. There are no night trains, and no refreshment-cars on the day trains, but everybody is accus-

tomed to inconveniencies in West Africa, so the time passes fairly well. About midday, or soon after, the train crosses the Offin River, which separates the colony from Ashanti, and plunges into the thick forests of southern Ashanti. Great tall cotton-trees stand sentinel on each side, while countless other trees of from eighty to one hundred and twenty feet in height present the appearance of an impenetrable green barrier. Here and there a small hill is seen; and at last, between a number of hills denuded of all trees for firewood and a few mounds of old workings, the train pulls into Obuasi. This busy mining-centre is the chief town of the southern province of Ashanti, and is about three and a half hours' run from the capital. It is the usual tin-roofed, bustling mining-village, with the endless clatter of machinery, blasts of whistles, and ceaseless toil characteristic of such places.

The European bungalows are perched on little hills, as there is hardly any flat at all except the railway valley. They have a lonely, unsociable look, each on its own little pinnacle, and even electric light (connected up with the mines plant) hardly makes up for the difficulties of intercommunication. This may sound feeble; but go and live in a dampish, hot, depressing country like West Africa, get through your day's work till tea-time, and then, feeling really ready for a rest, or a tonic in the shape of new ideas, see if you are prepared to walk down your hill, along three or four hundred yards of old railway line, and up another hill steeper than your own, to see a man who knows all your stories as well as you know his, who has no interests in common with you, and who perhaps has an absolutely maddening habit of whistling 'Tipperary' in silent intervals! You won't be so keen on leaving your own little hill-top then.

From Obuasi north the cocoa industry is much in evidence; even from the train one can at intervals catch sight of the golden pods hanging in the dark shadows of the long-leaved trees, and at every station bags, barrels, and baskets of the fermented bean assail the eye and the nose —it is rather a sickly smell, never forgotten. Probably a merchant down from Coomassie for the day will join the train at Akrokerri or Bekwai—to name but two of the intermediate stations—and will at once find a friend in the carriage to whom to talk on crops, prices, markets, &c. Perhaps, if you are in luck, the Chief Commissioner or some other political officer will invade the train with orderlies, officious servants, Union-Jacks, baths, chop-boxes, and all the paraphernalia of camping. Examine well, if you get the chance, for this is how our small colonies are governed, and that hot-looking man in khaki shirt and shorts is perhaps building more than he knows. Soon after half-past five the line starts climbing a slight incline, and on the left passes an attractive botanical garden, in which sheds and bungalows and neat beds of various fruits and vegetables are visible through the straight lines of planted Para rubber-trees that here border the line. Then, on the right, a long, low series of tin-roofed barracks, where the Mendi transport-carriers are lodged, a glimpse of red and white houses, stone buildings, a spire, and a shout from the daily assemblage of natives who seem to live for this one moment of meeting the train. 'Coomassie! Coomassie!' cries a black porter, and you jump out to collect your kit.

Unless one has friends here, or introductions sent on beforehand, one will probably have to resort to the rest-house that is near the station; but when one has one's own boys and cooking materials, there is little discomfort in that. It will be too late to see much of the town that evening, and after the journey, eleven hours' hot continuous jolting in a gritty atmosphere, one will be, if not too headachy, quite ready for bed. Next day it will be advisable to rise as early as possible, and see as much of the town as can be managed before 10.30, for the sun seems to centre on Coomassie in the middle of the day, and the glare is almost unbearable. A short walk up the little rise in front of the rest-house brings one to the corner of King's Way by the post-office; there you may look across the green cricket-ground to the fort, the fort of 1900, now modernised as a residence for the Chief Commissioner, or down the red laterite road, with its gorgeous border of flamboyant trees, to the mess and lines of the Gold Coast Regiment, W.A.F.F. On each side of the road are bungalows in gardens screened by mangoes and other trees, and a small open space of grass-land leads up to the white walls of the prison. Turning your back on that side for the moment, you may look down King's Way, with its fine European stores, to the factories and the yards where the cocoa is sorted and packed, and, while you look, perhaps a dozen little motor-lorries will fly past from the great north road with their freight of the ubiquitous bean. Down the hill from the post-office you can quickly reach the native town, with wide ordered markets, including a fine meat-market but lately completed. Up the hill again on the other side, beyond the Ashanti town, you may arrive at the Zongo or Mohammedan quarter, where the Hausa traders of the north are housed, with the large cattle-kraal under their management lying to the side of it.

Retracing your steps past the rest-house to the other side of the valley, across the railway, you ascend another small ridge, formerly merely a polo and parade ground, but now—thanks to a brilliantly ambitious programme of five years ago—laid out as a European segregation area with solid stone houses, all standing in their own little gardens, and completely isolated (except, of course, for their servants) from the native population. By this means it is hoped

to improve the health of our men at outposts such as this, and by sanitation and better housing, if not entirely to defeat the West African climate, at any rate to counteract it. From this ridge one can get a fine bird's-eye view of Coomassie, as it is now, with its red-roofed fort and bungalows, its business centre to the right, and the smoke and the indescribable hum of voices ever rising from the native town in the middle distance. A bugle calls, and away in the distance too we hear a band playing. Nearer by the Union-Jack flies modestly at the fort entrance—no longer the emblem of an alien conqueror, but a common rallying-point of absolute loyalty and devotion to the Empire. Not a bad record that for a race which is among the most war-like in Africa, and among whom, until quite recently, human sacrifice was a common practice. By money and gifts in kind, the chiefs and the people of Ashanti have vied with each other to help in the war. They have even recruited some of their own men for service over-sea. Who of those that headed the 'Relief' in 1900 would have dared prophesy such a thing?

THE RATS OF ST L——.

By W. Coats-Bush.

I.

IT was in August 1920 that I again visited the village of St L——. My first visit had been during the Great War when my battalion was quartered there, and it was there that I had met Yvonne, now my wife. It was one of those lucky places which, though perched on the very edge of war, had by some miracle escaped with slight damage.

My father-in-law's farm lay some little distance from the village, and, with the exception of two small cottages, his was the nearest house to the enclosure of St L——, or, as it was more popularly called, 'No Man's Road.' Immediately after peace was signed the French Government had taken the strip of land (in places forty miles wide) stretching from the coast of Flanders to the Swiss frontier, over which the tides of trench warfare had ebbed and flowed till the very ground was rotten with the horrors of war, and had securely wired it off, except in certain places where roads and railways had been cut through it, linking up the civilisation on each side. Thus it was divided up into huge enclosures. No Man's Road indeed! A grim, noisome land, rank with weeds and horrors, shunned by man, bird, and beast—except the rats. Rats in thousands—millions. And such rats! Terrible, fierce creatures, which it was said no dog would face; in fact, none of the dogs that lived round the enclosures would venture into them even in daylight. It was whispered that strangers who had incautiously wandered into these enclosures at night had never been seen again.

The St L—— enclosure had been fairly free from these pests, but as the enclosures above and below were cleared by the Government reclaiming-gangs the numbers increased at an alarming rate. Owing to shortage of food, the rats became very daring, and every now and again raided one or other of the small farms, and cleaned up every living thing that came in their way. In fact, so many complaints had been made to the Government by the peasants that the enclosure had been specially wired, in such a way as to pen in securely its terrible inhabitants.

The gang of professional rat-killers had arrived at the village, and were preparing to start work on the morrow. I had strolled down to the *estaminet* to smoke a pipe and listen to the tales these men told. They all agreed that the St L—— enclosure was the worst they had so far encountered.

'It's absolutely alive with them,' a big, burly man said. 'And, *mon Dieu*, so fierce—the fierceness of hunger! Look at my coat,' he added. This coat, a stout leather garment, was scratched and bitten all over. 'I just looked into what had been a dug-out, and flashing my lamp round, I saw a hundred pin-points of light—rats' eyes. As I turned to climb out again I fell, and out went my lamp. In a second they were at me, squealing, biting, scratching like furies. Luckily my mates heard my shout, a dozen lamps lit up the hole, and I was pulled out.'

'Ay! they can't stand fire or light,' said a small, dark man in the corner. 'The good God help any man who falls among them in the dark! You remember Henri Despois?'

A murmur of assent ran round the group. I scented a story, and ordered more wine.

'It happened at the —— enclosure,' he went on. 'Henri was my mate, a braggart, but no coward, and fond of his bottle. Some one heard him boasting of what he had done one evening, and bet him a hundred francs he wouldn't walk across the enclosure alone and without a light that night. Henri took him. I did my best to stop him, but the wine was in, and when he was like that the Blessed Virgin couldn't have turned him. The enclosure was only three miles across at this particular spot. We all saw him off, and proceeded to walk round the end, so as to meet him on the other side. When we arrived, there was no sign of Henri. We gave him another half-hour, and as he did not come, we got lamps, entered the enclosure, and started

to walk across to look for him.' The speaker paused to light a fresh cigarette.

'You found him,' I ventured.

'What was left of him,' he answered grimly. 'Just a still warm skeleton, picked as clean as a whistle—with a broken leg. He had fallen and broken his leg, and the rats had got him. He died fighting, as a score or more rats lay round him.'

I shuddered at the picture this conjured up, and rising, bade them good-night. My way lay parallel with the enclosure, and I confess I cast more than one apprehensive glance at the dreary waste, now rapidly darkening as the summer evening deepened into night. The day had been hot and oppressive, and the sky had an angry, threatening look; while even now a flash of lightning heralded the approaching storm. A curious restlessness seemed to take possession of me. I felt a peculiar creeping sensation of the skin, and the hair on my head seemed alive and moving.

'Damn!' I thought; 'the rats have got on my nerves.' I quickened my steps, and soon reached my father-in-law's.

II.

I must have been in bed about three hours when I suddenly woke with a start, every sense on the alert, and a feeling that something was about to happen—a feeling I had proved to be a sure guide during my days in the trenches. My fellow-officers had dubbed me the 'Boche barometer,' for if ever the Boche was up to any devilment I was sure to get that queer, alert, waiting feeling. The lightning was now very vivid, and was accompanied by a curious sound, like the crackling of thousands of small pieces of glass.

I slipped out of bed without disturbing my wife, and looked out of the window. My eyes instinctively sought the enclosure, and as a flash illumined it I saw the wire and its supports sway as if in a strong wind—yet there was not a breath of air. I rubbed my eyes and looked again. The next flash showed me the wire clearly. It was alive with rats, jumping, clinging, tearing, hanging on to it with teeth and claws—a solid wall of writhing vermin, driven by some unaccountable impulse to break through the fence that held them prisoners. I had barely time to take all this in when, with a crash, the posts gave way and the wire was down. With a rush the rats swept over it in seeming millions. Up to this moment they had not uttered a sound, but now they sent up a squeal of fiendish triumph—a sound so horrible, it froze the blood.

A man from a cottage opposite, in his night attire, opened the door and stepped into the road. In a moment the rats were on him and he was fighting for his life. I saw him go down, under a seething mass of rats, then stagger up—rats hanging all over him—and attempt to reach and close the cottage door. But the rats forestalled him, and hundreds poured into the cottage, from which a woman's scream issued a moment later.

The noise now became a pandemonium. Above the squeals of the rats came the cries of bird, beast, and man attacked by them. A horse came thundering down the road, mad with terror, rats hanging on it and leaping up at it as it passed. In front of my window it slipped and fell. Instantly it became a heaving, struggling mass of bodies.

I stood spell-bound with horror, when my wife's voice from the bed brought me back to our own peril. I slammed the window to, only just in time, as a large gray rat which had climbed up the ivy leapt on to the window-sill.

In a few hasty words I explained to my wife what had happened, and persuaded her to remain in bed and bury her head under the clothes. We were safe enough for the moment, as the room had no chimney, and with the door and the window shut the rats could not enter. I could hear them pattering on the roof and running along the landing outside. I could even smell their fetid breath and the stench of their filthy bodies.

I banged on the wall and shouted to my father-in-law what had happened, telling him to stay where he was.

Suddenly a new sound struck my ear above the din, a steady drumming. Rain! In another second it broke over us—but such rain! The heavens seemed to open and vomit water. Hour after hour it continued till morning broke, and with it the horrors of the night passed away. The rats had either been drowned or swept away in the flood. The few that had managed to find refuge in house and barn were easily despatched.

The French Government kept the affair out of the papers, but a semi-official report admitted the death of two men, two women, and three children, besides many domestic animals.

THE VOYAGE.

At night I take a little ship
That's moored beside a shadow quay;
No sails I rig, no oars I dip—
I navigate a magic sea.

I drift across the Drowsy Straits—
To windward lie the docks of Day;
Beyond Cape Nod's dim headland waits
The sheltered cove of Sleepy Bay.

Across its placid depths I steer
A craft that knows nor sail nor oar,
In happy languor drawing near
The fertile stretch of Slumber Shore

Its harbourage I gain at last—
Before me lies a silver strand;
In Port of Dreams I anchor fast,
And wander into Fairyland.

THE HEART OF THINGS.

By Henry Leach.

London, *Yesterday.*

THE capital of an empire was never so unhappily masked, never made such puny representation of its own value, as when in due course the first season of summer rest and recreation came round after the interruptions, the privations, the detachments of horrid war. From armistice to peace there prevailed disorder and grossness, the hottest pressure of a life that on its surface appeared all of materialism, utterly lacking in sympathy with high ideals. There was a vulgar living for the day, and contempt for all thereafter. The farther hopes were seemingly abandoned; faiths of old were as nonsense, were forgotten, neglected. Even city and commercial grades of honesty were displaced by new schemes of greed, selfishness, and spoliation which Government connived at, and, indeed, in some measure adopted. Men of conscience complained that in high places ideals were no more preached or practised, and that it was lack of idealism and simple sincerity in Government that was pushing the people into moral chasms from which they would not easily emerge. However it might be, the scene appeared vulgar, pantingly hot, and morally depressing to such as reflected on sacrifices made by sons of Britain. Despite material gains of sorts, it seemed that the Conference in Paris was a pretty failure. The idea had reacted upon the people, and an undercurrent of feeling was now running strongly that war was indissolubly of the world, the flesh, and life, as they are known; that another great conflagration was in the making; that the Conference might, indeed, unwittingly be speeding the onset of the next clash of arms, the horrors of which were not to be imagined. People seemed to be asking who believed in life. Yet leaders were trying to whip up political faith in themselves again, and still, while screwing more and more from the life and the resources of the people, prattled of the future, though now (for reasons) they spoke little of patriotism. London in the high summer of Peace Year was conspicuous for crowds, controls, and cant. What was once a city of grand inspiration, which lifted men's thoughts and spurred on to good achievement, was now poor for the spirits of those who dwelt therein. Those who loved it most were pleased to deliver it to others for the celebrations that were proclaimed by order. Afterwards it will perhaps right itself again, and, with thinning crowds and cooling brains, return to its good normal. The months of armistice, and the doubtful achievements of Governments in that period, have surely, it is said, spoiled the prospect of peace celebrations. The borough councillors of Lambeth the other day objected to the report and recommendation of their Peace Celebration Committee, who advised the imposition of a halfpenny rate to pay for certain forms of celebration, the children to have buns and tea; and, rejecting it, asked the committee to think again. In truth, there are few who feel that the idea of such celebrations is worth a halfpenny of the money of any one. So much for the peace for which there was such hungry yearning for more than four years, the peace which has been so much botched and bungled by politicians! A friend, in sarcasm, sends a note from Paris with information that the present measure of popular esteem for, and faith in, political leaders is suggested by the circumstance that in the people's quarters there are roundabouts of hobby-horses, and these wooden animals (variously spotted and bearing upon their backs youthful Armand and little Jeanne, happy Jacques and dainty Claire, making their circuits to the Yankee tune of 'Over there!') have painted upon their necks — which but yesterday bore the titles of equine heroes of the race-course — the names of the leaders of the Peace Conference. 'Orlando' and 'Clemenceau,' 'Wilson' and 'Lloyd George,' thus gallop around, whipped by gamins.

* * *

Is it not the case that in London and other cities there has been for long past an oppressive sense of a loss of faith in leaders of humanity? While some in deep seriousness have doubled sharply back on their own spiritual resources, knowing that they have too much trusted, and that for their good *morale* they must raise up a standard of conduct within themselves for themselves, others have appeared to be given to a wild abandonment in manners and conduct, laughing it forth that nothing matters—scarcely anything can matter. Some of these libertines, if they could be brought to reason, would say that leaders to whom they had looked for good example had neither ideals nor sincerity. They would say

 [*All Rights Reserved.*]

that by the leaders was the example of foolish and shocking waste most conspicuously set; they would ask what was rightly to be demanded of a people to whom the first public appeal in a matter of pressing national importance was made on the day of some of the worst revelations of scandalous waste in high places, of Ministers practising the utmost extravagances in the use of the most luxurious motor-cars for trivial purposes at the people's expense, when the people themselves, for public economy's sake, were not permitted to use any motor-cars at all; and, again, they would murmur of aeroplanes in large numbers being made at factories after the declaration of armistice in order to give employment to persons whose task was ended, and of the self-same aircraft being conveyed thence to other workshops, and there destroyed for the purpose of giving employment to other such persons—these not being tales of fiction, but official statements contained in official reports and duly published. And beneath it all was heard continuously the slow rumbling of discontent and great political desire among vast masses of the people, the proletariat—a foolish proletariat, it may be, but one that had been provoked, they would say. Everywhere, then, the spirit of unrest was abroad; confidence was shattered. Not for long had mammon seemed so little righteous. So it appeared a good thing in summer to go away and seek balm by the sea, upon the slopes of hills, in the bosom of the country. Not for health and refreshment only, but for the realisation of utter truths, the adjustment of senses, and the regulation of ideals and conduct is the green bath of Nature the most certain and delightful corrective. Never was the country in its purity sweeter to townsfolk, ridden with impurity, than when the season of rest and change began this year. Change? In five summers what a change! People left the cities five years ago with the assurance to themselves that in a month or so they would be most happy to return. Now. . . .

* * *

The point seems to be appreciated that of all the special periods that people have known in their lives, this now is the best for the recasting of old holiday schemes and systems, the inspection of habits and conventions followed hitherto without thought or consideration. Two essentials only were demanded by the bulk of the British holiday-making public, the joyous and not generally overworn masses; the one was change of scene, and the other was fresh air. A section of these masses demanded also some light and artificial entertainment, preferably in the form of popular music discharged by bands on or off the constructions known as piers. The essentials—with the supplementary desideratum, of course—were met by a visit to the seaside. Truly, it is an admirable form of holiday, most excellent in its health-giving properties, and it is appropriate that a nation of seafarers, of island dwellers, should for once or twice in the full season seek their shores and gather delight from a simple vision of the blue main upon which such glory has been earned and whence such riches have been gathered. These visitations should not, and never will, cease. You will find that the dwellers in central Europe, the middle states of America, and other places that are far from the coast possess no instinctive desire to visit it, to look upon the sea, most rare and wonderful sight as to them it might be. The love of the sea is seemingly a special instinct; it belongs only to the seafarers, so is strong in the Briton and the Scandinavian, as centuries back it was in the ocean adventurers who set forth from the ports of Spain. Never were the coasts so thick with British humanity as this year; never before have our people proved their instinctive attachment to the briny so thoroughly as in this summer following a winter in which the sea yielded them the most dazzling, the most amazing, triumph in all naval history—a spectacle of such a kind as man with his enlarged views of possibilities still believes to be impossible of recurrence. Yet for all the good instinct, there is something crude, often much that is very vulgar, about the general scheme and system of these seaside sojourns. Above all in this and other modes of holiday it is realised now that our people have been too conventional, too little thoughtful and ingenious, and have been unfortunate accordingly. They have too often forgotten the country lanes, ignored the mountain paths, been heedless of the plashing murmur of summer streams. Tawdry convention has misled them. But these are days of convention collapsing; there have been four seasons of makeshift holidays, a break away from the old customs; and now there is a recasting of such schemes, the quest of new pleasances for summer and autumn days, introspection to determine the true nature of personal needs and desires, with a close investigation of the extent to which these are satisfied by such procedure as was adopted up to the beginning of the disrupting war. The report that people ultimately make to themselves upon these matters is one that is conducive to change, and concludes with a strong recommendation to a more intimate association with Nature, insisting that it shall be conducted with sincerity, and shall be in no wise affected or artificial.

* * *

The new ideas being at work, the intelligent holiday-maker who realised upon the signing of the Armistice that his next summer's vacation would open up a new era for him, and, in wise and thoughtful anticipation, established an information bureau in his mind accordingly, naturally filed among the most important documents for future reference a schedule—he would mark it A—which was provided by the

Minister of Education on the first day of the present year. Mr Fisher is a man of ideas, of perspicuity, conscience, and sincerity, and he has nothing to say upon the advancement of life, upon human equipment, and the good exercise of effort that is not deserving of the best attention. On this occasion he was addressing a conference of educational associations, and, following many wise words upon the maintenance of efficiency and the business of keeping alive in education, he came to this question of holidays, and became bold upon it, even to the degree of dogma. It was a delightful study; a delicate imagination that had shunned convention always played upon it. Even though in the chilliness of January it were scheduled and marked A in every individual bureau, it is yet the most interesting and valuable contribution to constructive philosophy on holidays, so that in simple duty it must be publicly produced when the sunshine of August glistens on our land and calls the people from their labour to their vacation. Teachers of all degrees often appear to some as a class rather distant from the rest, folks of an odd groove with peculiar ways, not dreamers like artists and clerics, and yet not, as it has seemed, concerned with the stern everyday affairs of life, of business, living rather in a world of Peter Pans who do not mature, where the youthful view, the youthful way, and the youthful sense abound always. But that is a good atmosphere in which to live. If it sometimes breeds monotony, it is yet an atmosphere of freshness, of innocence, of sincerity, truth, and hope, and one would say of the teacher that he could hardly be a good and honest teacher and yet a bad man or woman. Odd as these folk may be, they need their holidays as much as any, and their plans and intentions concerning them are generally better than those of the conventions, contempt of which is provoked by thought and study. What is good for these, then, is good—perhaps better—for us. The Minister of Education puts it to us all, through them, that the right use of a holiday is one of the sovereign secrets in the practice of the noble art of keeping alive. He propounds to us the advantageous thought that leisure is only valuable if it improves the quality of work. A holiday is not an end in itself, but a means to a general improvement of the working life; and the test of whether a holiday has or has not been well used is the supplement of zest and vigour which it has contributed to our proper labours. Every holiday should bring with it a real development of experience. And then, upon the excellent plan devised by Mr Wilson for the determination, collocation, and compression of concrete points, the statesman puts forward fourteen of them, truisms, perhaps, as he himself has called them, and yet neglected and little thought upon, sparkling in seeming novelty, interest, and happy incitement now. In such a matter we should not paraphrase, and so we present the exact words of the points. The first is: 'Plan your holiday carefully, but be ready to abandon your plan on the slightest provocation.' Herein we see the wise recommendation towards freedom from restraint, from obedience to task, from that discipline to routine which cramps our lives. For all of us, no less than for the instructors, the time-table is the blight of refreshment for the soul. It is of the essence of convention, of formality; it forbids the exploration of new delight. Yet it is the fault of many to harness themselves closely in their times of vacation to harsh and cramped time-tables, upon which honest indulgence should set a ban for the havoc they create. In these time-tables are often massed ponderous packs of neglected duties; reading that has been too much overlooked is fitted tightly in them, and often constitutes an uneasy reproach through languorous days. The second point of the fourteen that the Minister consecrates to our holiday welfare is this: 'Never go North when you can go South.' In this he may be challenged; and, anyhow, for metropolitans at present it is not an easy thing to move any distance south, to cross the Channel, when timid Governments, having urged people to fight for freedom, conceive that there are fearful risks in permitting them to leave their own for foreign lands, and ordain that for permission to do so they shall be subject to grave inquisitions and much contemptuous treatment by the underlings of passport offices. If we cannot move by southward ways, then to the north we go, and happily with delightful prospect. 'A change of work is itself a holiday,' Mr Fisher's third point, is more readily endorsed in dreary January than in sportive August. The fourth point is: 'Never drive when you can walk, and never walk when you can ride.' It is Fisherian philosophy of much merit, but not, perhaps, incontrovertible. Then, the fifth point: 'In a cross-country walk there is seldom time for short cuts;' a true maxim this. 'A good holiday is like eternity; there is no reckoning of time,' is the sixth of the points. The seventh—'One of the best fruits of a holiday is a new friendship'—calls up a gallery of grand memories. There are delights and regrets among them. Some of the human figures in the gallery have been in their way large or small as lasting influences; others might have been but for that after-neglect which is common with such August-fashioned friendships. Mostly they are ephemeral things; these people have flickered in our lives like the fancies of a dream and have gone for ever, each to the comedy and the tragedy of his own existence. The long history of these summer associations often makes a doubtful contemplation, and there is a moral to it sometimes, that in this business we must be cautious and it were better to be sincere. We are midway through the points,

and the second half of them is perhaps better than the first.

* * *

The Minister of Education says for his eighth point: 'Stay where you are happy.' In this there is gentle counsel towards placidity, a contention against that fevered restlessness which is of the age, and there is an argument against the time-table also. 'Soak yourself in the atmosphere of a new place before you study the details,' he enjoins us (ninth), and in this perhaps there is some oblique warning against the vulgar habit of investigating the local sights, the often meretricious relics, the overpraised scenes and the doubtful marks of history that are attended by visiting people as a duty to conscience or custom, found mostly to be irksome, and discharged with eyes that do not see and minds that do not comprehend, but with lips that marvel automatically and in sad insincerity exaggerate in after-narratives. These local sights are commonly the most pernicious things, and they are worse for evil when attached to time-tables. Is it not better to soak longer and longer in the atmosphere? Would not the wayfarer who knows not the characters of columns nor what constitutes the Gothic style be doing better for his soul by asking questions of a milkmaid than by peering with his guide-book into the corners of the village church? The tenth point is made of the plain maxim: 'The best holiday is that which contains the largest amount of new experience.' In this we are thrown back upon that old and consoling idea that holidays end, but recollections endure and ripen until there is no further compensating service for them to do. The good holiday begins its happiest work only upon its termination; the memories of sunlit streams, of rocky coasts, of the ineffable music of summer breezes playing through the leaves of trees, and adventures among them all, serve for the gladdening of many days and nights in after-times, and at each remembrance life should seem a little fuller and better worth the living. It is not twenty or fifty or a hundred pounds spent upon a month, but so much devoted to the enrichment of all succeeding life. To how many of us does not the memory seem richer, more romantic, than the experience? We view ourselves objectively in those distant places, wonder at the dispositions, the caprices, the motives of our former and now much-changed selves; we smile, and pass on to another novel formation in this strange kaleidoscope of our lives. (Suggestion: A diary in brief—and better of thoughts than of facts?) Mr Fisher for his eleventh point says that 'holidays come up for judgment before the next term's work,' and we may let that pass, and, again, the twelfth—'In the choice of holiday books, act on the principle that one of the main uses of leisure is to feed the imagination'—for no better reason than that for even the moderate treatment of such a text we should need a thousand times the number of words that serve for its bare enunciation. Point thirteen will touch some of us to the quick: 'The principal experts in the art of taking holidays are painters, naturalists, travellers, and historians; the worst person to consult is a golfer.' And it has been computed that there are nearly a million golfers in these isles, and they are notorious for their enthusiasm, and envied for it! They will say that never since Adam laboured first in Eden and took a holiday, perhaps, have holidays been better spent than on the links. But there are two classes of golfers, the thoughtful and the thoughtless, and with increasing years the former realise better and better for themselves the inner truth and meaning of what the Education Minister says. The eleventh hole at St Andrews is a wondrous thing, upon whose small and aggravating proportions there have been many controversies, but are they right who think it better worth their speculation than the records of a dead civilisation at Pompeii or the awesome mysteries that arise in the mind of a man of imagination and sensibility when he treads alone among the mountains and sees the setting of the sun amid such changing and extensive colour as mocks an artist? The painters and the naturalists have it, the satisfaction of the spirit, and in these times more than any, for the grandeur and the supremacy of Nature, her omnipotence, were never so manifest as when mankind in thin endeavour seems for a season to have failed so sadly. As his fourteenth point, Mr Fisher adds lightly and pleasantly that 'on occasions a very good holiday can be taken at home if you change the hour of breakfast;' and with that he leaves us.

* * *

We are older than we were when the war began; we are more than five years older. A chasm lies between us and the often careless people who went upon their merry-making in the summer days of 1914. Those who will may have their jazz bands, may seek the strange pleasures of new inventions, the 'improvements' on the old. But the better part of our victorious islanders turn back for solace in anxious times upon simpler and more heart-refreshing ways. Many will find a strange delight in visiting the haunts of earliest youth, pacing slowly now and in deep reflection those paths upon which lads' feet tripped so gaily in the long ago, and which perhaps have not, through an odd neglect, been visited since. This instinct towards the renewal of such old and good acquaintance with the magic places where we played when life and hope were young somehow seems stronger in the days of upheaval and so much doubt than ever before. By the same process, or one allied to it, the minds of harassed men may now strangely revert to some simple diversions that have been abandoned since school-time. They begin anew by this reversion,

and begin well, leaving the conventions to which they became attached as they grew up. A box of paints! There is no better thing in the world for a man to possess and use on holiday than a box of water-colour paints, such as he has not possessed, in most cases, since childhood—never thought of, indeed. But now he cannot paint, he says; he never learned; he knows not the simplest rules. But he can try, and in the trying what a fascination, what delight! You will discover that there is nothing like it. It is provocative of great and continuous endeavour. It is for ourselves, and comparative failure does not matter. Besides, there is improvement continuously, and increasing joy. To play with colours is a most pleasant thing, for the love of them is a human instinct. See the passion of Nature for her colours, and her unerring blend of them! Often she seems uncertain of her lines, but never in her tints, her harmonies and contrasts. So he who would take up again a box of paints (or tubes and some sable brushes costing the pound that aforetime was not forthcoming) should practise upon Nature. He will do right in that, and will not be presumptuous or offend. Ignoring the artist standards, giving no thought to Turner, painting in sincerity and to please himself, he will gather a splendid joy. It is not only that he will play with colour—in a thoughtful and novel way for him; he will see the colours and the world as never before. Nature will have a new meaning for him, the evening skies their first real enchantment as he may set himself to match them in his water-tints on paper—the happiest form of practice. So by appreciation he may become a finer being. It is an atavism in our individual minds that can hardly fail of good. You take up a hedge flower or a garden bloom and seek to copy it, and wonder awakens thus. And he who fully comprehends a daffodil may have much pity for the politicians.

THE SEARCHERS.

CHAPTER XXXII.—*continued.*

WE tore down the slope and made our way into the cleft. Fifty yards from its entrance we came on him, dragging his broken body towards us. I was within a few yards of him before he looked up. Not a word did he say, but when his eyes met mine there was in them what I never wish to see again.

'Are you hurt?' I asked, bending over him.

'Not enough, worse luck!' he answered. 'A pity you did not finish me. My leg is smashed, and you winged me in this arm.'

I gave him some brandy, and propped him against a boulder. For a long time he said nothing, shadows creeping round his mouth; but his eyes, curiously alive in their mask of dead white, narrowed to steel points, were watching Keene-Leslie.

'It was you,' he said dully, almost as if speaking to himself; 'it was you who ran me down, Keene-Leslie. . . . I wonder how you did it.' . . . He looked from Tony to me, and getting no reply, added, 'Not that it matters now!' His free hand made a groping movement towards the lapels of his coat, but Tony swiftly caught his wrist. 'The Searcher' looked at him with a faint smile on his white face. Then he said in a startlingly clear and composed voice, 'Ah! I see what you mean. The revolver! You'll find it in my hip-pocket. Your precautions are, I admit, justified, but I was about to present Forbes and you with a far more interesting souvenir. I know when I'm beaten. The game is up. This is the end of the paper-chase!'

Tony took the revolver from his pocket and unloaded it.

'And now'—'The Searcher' turned his head to me—'you want the paper, Forbes. I wish I had never seen it. Put your hand into this pocket and you will find something. You are welcome.'

I did as he asked, and pulled out an old pocket-book. I recognised it at once.

'Yes,' he said, watching my face; 'the same pocket-book! Rip up the lining. I was "M'Nair" on the night of the fog in Edinburgh. I came back next morning to Jura Street, and recovered my property. That was the night when Guidotti—you'll find him up there in the rocks—knifed Salvi in Durham Place, and nearly got me at the same time.'

'And I met you in the Caledonian Hotel next day?'

He nodded.

'I am tired. . . . Take me away from these accursed stones. I am in no great pain, and . . . I'm not going to cheat the gallows . . . just yet. Like King Charles, I apologise for death's delay. It's none of my seeking, God knows!'

Leaving the others to look after him for a moment or two, I turned to Tony and opened the pocket-book. There was nothing in the pockets; but I ripped up the lining, and soon found the little paper. A glance at it—the serrated edge and '*ossahumiliata* †' at the foot—told me that here at last was what we sought, the few words over which the centuries had woven their web of intrigue and crime. Keene-Leslie and I withdrew round a bend in the cleft, where I took out the copy of our half, and held the two together. They fitted like the parts of

a puzzle. Before us was the key to Father Hamilton's grave!

Here is the complete document:

Anno Redemptoris I^mD.LXIII. |
Y^e month Aprile. . . . From Gleann Cluin His house | IV
Houres to Y^e Learg Ghruamach Itts North Jawes & in other | IV
Houres from Itts Jawes to Y^e Saddle and High^st P^t |
of Y^e Pass. . . . Now First thrue | Y^e Jawes & up Y^e Drove
track till yow do come neare | Y^e Saddle & High^st P^t Itt
lyeth among Greate Monta | ines & Rockes Past Belief
a Toyle to enconter | . . . there leave Y^e drove track
Strike to Y^e Heart | of Y^e Wilde Turn on youre right
Sron na Lairg | Itts Shoulder heeing on youre Left
ontill yow do come | to Y^e Rise & spring of one narrowe stream
Itt runeth but no | distance then doth itt joyne
one neybour Wa | ter. . . . Now do yow there discretlie
Salute oure Three trustie friends | who awaite oure comin
Anent these I did fullie in | structe yow in one seperat Wryting
from Y^e tall | est do yow stepp her own high^th &
no more | faire & strait W. Go no furth^r Here is bless^d ground
† Exultabunt Domino | ossahumiliata †

The instructions in it were clear. We had to leave the drove track (or, rather, the line where the old drove track had once been) near the top of the Larig, and then 'Strike to the heart of the wild.' Keeping Sron na Leirg on our left, we should find the source of a short mountain stream, which we were to follow until it joined another—'ane neybour Water.' There the 'Three trustie friends' were waiting for us. The word 'tail' in the third last line of our half of the paper puzzled us for a little, but from the neighbouring half it was plain that we had misread the indistinct writing. The letters were 'tall,' not 'tail,' and the whole word was 'tallest.' The last direction enjoined us to step straight west, the same distance as the height of the tallest of the 'Three trustie friends.' Our exultation can be imagined. The grave—if it existed—could not be far away.

By this time all our men had joined us, and a suggestion by Duncan that the two stalkers should carry 'The Searcher' down the Pass to the shelter-hut below Cairn Toul was adopted. A stretcher was improvised from a plaid and a couple of rifles, he was lifted into it, and the party went down the slope.

The rest of us turned to the Ladder, where the dead Guidotti, his last hazard played and lost, lay among the boulders. It was easy to find his body, for the track from the ledge to the spot where his enemy had hidden it was crimson. It lay behind a boulder, and one glance at the gruesome wound on the temple told us that he must have gone to his black account in the twinkling of an eye. We took turns in carrying the corpse down the Pass, and soon it was laid outside the hut into which the stalkers a short time before had borne 'The Searcher.'

Inside the hut a couch had been made from the plaid and heather. 'The Searcher' was lying on it. He had not spoken a word beyond 'Thank you,' but he never closed an eye, and lay watching us, his face peaked.

'You have something to tell us, I think,' I said.

He pondered a little.

'A confession? Well, perhaps, on the whole, it is due to you. You have won the paper-chase, and no doubt you are anxious to test the truth of the instructions in the accursed paper,' he said slowly, with great composure. 'I think that they are genuine. . . . I wish I could go with you. . . . As for my story'—he hesitated, and then went on deliberately—'if you give me pencil and paper, I can write down anything I have got to say in your absence. It will help to pass the time.'

Keene-Leslie tore out part of his pocket-book, and handed it to 'The Searcher' with a pencil. Old Angus was left in charge, and the rest of us stepped out of the hut into the bright sunlight. I was last, and at the door I turned. 'The Searcher' lifted his head and looked at me. His eye and voice were steady. 'Good luck—and good-bye,' he said.

(*Continued on page 553.*)

THE SHALE-OIL INDUSTRY.

I.

A STRANGER passing through any of the districts where the Scottish shale-oil industry is carried on may be painfully surprised at the sight of those blots on the landscape, the 'bings' or miniature hills of spent shale, cast up from the retorts after yielding their quota of oil, sulphate of ammonia, and other by-products. The works we allude to are situated in one shalefield in West and Mid Lothian. Its centre is about twelve miles west of Edinburgh; and it stretches from the Firth of Forth at Hopetoun southwards for sixteen miles, with a width varying from three to eight miles. Four refining companies—Young's, Oakbank, Pumpherston, and Broxburn—with a capital of some three millions sterling, employ about ten thousand men, including miners, for the shale is mined like coal. The marketable commodities produced include shale-spirit, lamp-oils, internal-combustion-engine oils, fuel-oils for the navy, oils for gas-making and gas-enriching, lubricating-oils, solid paraffin, still-coke, and sulphate of ammonia. The shale-measures are situated in the calciferous sandstone series, and lie under the Carboniferous Limestone and above the Old Red Sandstone.

A Munitions Committee reported favourably on further boring for oil in Great Britain, and a fuller development of the Scottish shale-oil industry. A Petroleum Bill was introduced in Parliament in order to protect the oil-pools of the country from indiscriminate and wasteful

boring, and prohibit boring and searching for petroleum without a license. The firm of Messrs Pearson, of which Lord Cowdray is the head, placed its geological and oil expert staff gratuitously at the disposal of the Government. Drilling operations were undertaken in Midlothian, in north Staffordshire, and in Derbyshire, where oil was discovered in May near Chesterfield.

A valuable communication was made to the Society of Chemical Industry on the 'Shale-Oil Industry' by Mr D. R. Steuart of Broxburn, and reprinted from their *Journal* of July 31, 1916. To this among other sources we are indebted, as well as to some manuscript notes from Mr Steuart supplementing the authoritative article by Mr W. Love on 'Paraffin' in *Chambers's Encyclopædia*. Mr Thomas Wilson, of the firm of Messrs Thomas Wilson, Son, and Company, mineral prospectors, Edinburgh, has also placed a paper at our service, giving the experience of a lifetime in boring for shale.

There is warning as well as encouragement in what Mr Steuart tells us regarding the incidence of thin seams of shale found all over the coalfields of Britain. These were retorted in the early bright days of the oil industry. There was considerable manufacture in Wales for some years. But foreign competition put an end to all working many years ago, except in the case of seams situated in the calciferous sandstone. A hundred small works were thus killed off in Scotland (many on the shalefields, some on the coal-measures), representing a loss of some millions of pounds. 'The larger works,' says Mr Steuart, 'were increased so as to be worked more economically, and have continued to exist, sometimes paying dividends, and sometimes not. The through-put of shale has always kept increasing, and in 1915 was three million tons. New fields may still be found in Britain. Oil-shale has been discovered in the western islands in Raasay and Skye; there is an outcrop (not worth working) on the Northumberland coast; and we have always the Kimmeridge Clay, stretching across England from Dorset to Lincoln and Norfolk, with its thin seams of oil-shale yielding a very sulphury crude oil.'

Within and around the areas desolated by the shale-works and their sordid surroundings still survive regions of great natural beauty and romantic associations. That poet, professor, and principal of St Andrews University, John Campbell Shairp, was born at Houston House, Uphall, right in the heart of what is now an industrial area. The clever and learned, but eccentric, eleventh Earl of Buchan, and his two famous brothers, Harry Erskine, Lord Advocate, and Thomas, Baron Erskine, Lord Chancellor of England, have associations with this region. The Almond, beside which Harry Erskine built Amondell as a home for his later years, is no longer a pellucid stream. The Earl of Buchan, who had his early training under a tutor at what is now Uphall Manse, was buried in Dryburgh Abbey, which he purchased in 1786, as he told George III., from the wreck of the family fortunes. His brothers rest in the chancel of Uphall church, near the vault of the Shairps. A gaunt, tall house, called Kirkhill, near Broxburn, has associations also with the eleventh Earl of Buchan. It is now occupied as a farm. Vain and eccentric, the earl does not figure very favourably in Lockhart's *Life of Scott*, but Archibald Constable and others credited him with many sterling qualities, both mental and moral. He was a chief founder of the Scottish Society of Antiquaries, and was indefatigable in his admiration of celebrated men. In a bundle of over sixteen hundred letters which he left, fifty-four were from royalties, eighty-seven from his brother, Lord Erskine, one hundred and six from famous Americans, including Washington and Benjamin Franklin. When the earl expressed surprise at his brother's choosing a site for Amondell in the vale of Almond where there was no view, Harry retorted, 'You forget, my dear David, that I have always the prospect of your estate.' Here many guests of taste and culture were received. No one, young or old, could ever tire in the society of Harry Erskine, who radiated happiness, and who, after a brilliant career, enjoyed what he called 'otium cum diggin-a-tate' at Amondell. Houston House is a queer, picturesque relic of a past age, and figures in J. C. Shairp's *Kilmahoe* as—

An old white lofty-gabled Lowland home;
Up to the sunshine, and the breezes all,
For ages o'er the ancestral trees have clomb
Its stalwart chimneys tall.

Far seen, wide gazing, the old mansion gray,
Adown the long lime avenue, from its doors,
Looks here to rich, tilled lands, yonder away
To meditative moors.

The outlook has greatly changed since the days when Sir John Shairp, advocate to Mary Queen of Scots, came into possession, and left as relics a cabinet and gloves which had belonged to the queen.

II.

The shale-oil industry, now a characteristic of this region, began in quite a small way in the middle of last century, under the patent of James Young of Kelly, who produced paraffin and paraffin-oil from coal. He was the first to obtain solid paraffin on a large scale, and to make it industrially profitable. Experience with a Derbyshire oil-spring prepared him for dealing with the rich Torbanehill mineral in works erected near Bathgate, and for distilling at a low heat an analogous oil from the coal. The yield was from ninety to one hundred and twenty gallons per ton of shale. Success led to imitation and competition, and much litigation, before his patent expired. The story of the industry is one of continued expansion,

helped by the improved retorts of Henderson, W. Young, Beilby, and others, and after 1864 the greater attention paid to by-products such as sulphate of ammonia. But for the ammonia industry, the manufacture might have ceased long ago. Mr Steuart considers the home-made sulphate of ammonia a better and safer manure than the foreign nitrate of soda, if applied at the right time, and if the soil be kept neutral with small doses of lime. The nitrate tends to kill off the beneficent microbes in the soil that produce plant food; the ammonia encourages their increase.

It is to be regretted that no biography has been written of James Young of Kelly (1811–83), pioneer in this great industry, although he finds a place in the *Gallery of Western Worthies* by J. S. Jeans. Trained as a working joiner under his father, he studied at the Glasgow Andersonian Institution, and became chemistry assistant under Dr Thomas Graham. He taught David Livingstone, the future missionary-explorer, when a student here, the use of tools and lathe, and they struck up a lifelong friendship. Young thought Livingstone the best man he ever knew; and the great traveller named an African river after his friend, who 'had shed a pure white light in many lowly cottages and in some rich palaces. I, too, have shed light of another kind.' Livingstone was proud of Young's achievements, playfully addressed him as 'Sir Paraffin,' and once expressed a wish, if he died at home, to be laid beside him.

The war, which increased the price of products, also increased their cost of production. The soda is now causticised by the firms themselves, and two of the companies make their own oil of vitriol. Mr Steuart further informs us that in paraffin-oil from shale, besides liquid paraffins and the olefine series, there is also a proportion of the hydrocarbon series called naphthenes. Russian petroleum is largely naphthenes. The loss in process has been reduced from 30 per cent. to 25 per cent. There has been at the same time a reduction in the quantity of chemicals used—sulphuric acid and soda. The shales now worked are poorer than those mined in the past. The best came first to hand. The shales now yield from eighteen to twenty-five gallons of crude oil per ton; of ammonium sulphate forty to sixty pounds per ton of shale.

In the distillation of the crude oil there is a series of boiler-stills working continuously, with residue stills receiving the heaviest portion, and, distilled to dryness, giving a large yield of still-coke. In coking, great quantities of the very richest gas are evolved, and this formerly passed into the air and was lost, besides causing some nuisance from the hydrogen sulphide in it. This gas is now caught, motor-spirit is got from it, and the refined gas is used for lighting and heating. It may be mentioned that Broxburn and Uphall are lighted from the Broxburn Oil-Works.

The ammonia is distilled from the ammoniacal liquor much as before; but now the sulphate, instead of being put into bins to drain out all the solution retained mechanically, is put rapidly through a centrifugal machine, and the salt dried at once. Draining in the bins, the salt solidified into a lump difficult to break up. It also solidified in the bags. The centrifuged salt is a dry powder, which, bagged at once, *remains* a loose powder.

The works, after using the sulphuric acid twice over in the extraction of oil, recover the acid, and use it for sulphate of ammonia making. Now, however, the solution of ammonium sulphate so got is evaporated in vacuum-pans.

The paper by Mr Thomas Wilson, already referred to, gives the experience of a long lifetime in boring for oil-shales. His examples are culled from a wider field than West and Mid Lothian. He has become so familiar with the sections that he has only to look at the outcrop of a shale to discover by its appearance, and that of the surrounding strata, its kind and relative value. He takes a section of two thousand five hundred feet and shows how the shales are distributed, and considers it true of these, as of mankind, that they can be known by the company they keep. The knowledge of the strata was not gained by one continuous bore, but by many made at different times and places. An inferior coal-shale is of sedimentary origin, and was washed down in the form of fine silt from the land, to be accumulated in lakes and quiet areas of the sea-bottom. It is the bituminous shales, or those rich in carbon and hydrogen, that are the chief sources of illuminating oils. The shale-beds always lie in a certain series from above to below. What is the principal shale in one locality may be useless in another. There is greater regularity in point of distance between different seams of coal than in the case of shale-measures. The first shale found in the section of two thousand five hundred feet is Raeburn's, from the name of the proprietor on whose ground it was first found, in the neighbourhood of Mid-Calder. It yields about forty gallons of crude oil per ton, and the seam is about two and a half feet in thickness. About one hundred and eighty feet lower in the section another shale is reached called Mungle, from Mr Mungle of West Calder, who first worked it in that neighbourhood. It has not been popular for use, but sometimes acts like a finger-post or guide to something better. Blaes is the prevailing character of the shale in this section. Between Mungle shale and Steuart's coal there is a distance of one hundred and eighty feet. This coal, named from Mr Steuart of Westwood, West Calder, has a varied and many-sided character. In some cases it is an ordinary soft house coal, in others a mixture of coal and blaes, or partly household and partly gas coal, as found at Drumcross, near Bathgate. Elsewhere it may prove to be shale of a very superior

quality and partly coarse, black-band ironstone, as at Fivestanks, near Uphall. At Loanhead, Midlothian, it is called paper shale, and is rich in oil. After the next one hundred and eighty feet there comes Houston marl (from Houston estate, Uphall), blue, brown, or of a reddish colour, an outstanding landmark in the geological world, there being nothing else quite like it in the shale-measures. Immediately below the marl there is the gray shale, about one foot nine inches in thickness, which has not been extensively worked, but is believed to be rich in paraffin-scale. Because of its thinness it might not pay working expenses. Some thirty-six feet below the gray shale lies the Houston coal, its usual thickness being about four and a half feet; but it is unreliable. Like the prophet's figs, when good it is very good, and when bad, very bad. At Houston, near Uphall, it is seen in its best condition. Another one hundred and eighty feet below this coal is Fell's shale, two and a half feet to three and a half feet in thickness. This was the shale that Young's company worked largely in the Addiewell district. It stands higher in yield for burning-oil than most of the shales, but much lower in other and more valuable products, such as sulphate of ammonia and paraffin-scale.

About two hundred and forty feet farther we come to the Broxburn shales, the intervening strata being composed mostly of marl for two hundred and thirty feet, much harder than the marl that overlies the Houston coal. Some of it is almost solid limestone. Although there are three, or sometimes four, seams, the lower or main seam, about five feet in thickness, has, as a rule, alone been worked. There is a thin seam of shale, sometimes only eight or ten inches thick, that lies, roughly, one hundred and ten feet below the Broxburn main seam, called the Lower Gray shale, found just on the top of the famous Binny sandstone. Three hundred and forty feet below the Lower Gray shale are found Dunnet, Straiton, or Burntisland shales. Sandstone and flakes bulk very largely in this part of the section, and some of the sandstones are exceedingly hard, especially the Burntisland. There are occasionally three shales in this group, but it is the lowest one that is generally worked. There is sometimes a distance of seventy feet between the upper and the lower, while the under seam may assume large proportions. In one place it was fifteen feet thick, in others from four to six feet. This shale is rich in paraffin-scale. About one hundred and twenty feet farther is got the Barracks' shale, but it has not been much worked. It lies a few feet above the Burdiehouse or Camps limestone. Then follows a distance of eight hundred feet between the limestone and Pumpherston shales, three in number, some about ten feet thick. The yield of oil from these is very low, perhaps not more than from fifteen to eighteen gallons per ton. However, they are rich in products, yielding some 15 per cent. of paraffin-scale and between fifty and sixty pounds of sulphate of ammonia per ton. At one time it was considered there were no shales below the Burdiehouse limestone, but Mr Wilson is strongly of opinion that there may be another series below the Pumpherston variety. There *are* lower shales than the Pumpherston series, Mr Steuart points out in this connection. One is found at Dalmahoy, and others occur at Wardie and Granton—twelve-gallon shales at the outcrop, with a possibility of twenty gallons farther in.

JOHN BROWN.

CHAPTER XXIV.—THE COMMANDANT'S FAREWELL.

THERE was no mock hilarity on the final morning. We had too much to do. Kits had to be packed, books returned, the hut scrubbed out, and everything left shining and in order, for the pride of an army is 'handing over' in a spotless condition. That is always a good test of a well-trained and disciplined unit. Hitherto we had not been bothered about falderals; we were learning and swotting, and the commandant had little use for eyewash. But this day we knew he expected to see tables—nay, floors—off which a king might eat his food. The 'Old Man' was not disappointed, for we all desired to leave the school with his fatherly benediction.

The boys were a bit sad. Tosher, Beefy, Nobby, Ginger, Billy, and myself—thanks to the good offices of Captain Cheerall—were to be gazetted to the same battalion. This was a piece of luck. But there were other good friends who were being scattered to the four ends of the earth. Many were bound to be killed; others we might never come across again. They were our brothers-in-arms, and we loved them as only men can love. The war and the army had opened our hearts. We men of all classes, all professions, have been linked into a loving community, which only death can sever.

'Stand to your beds!' roared the sergeant-major. We sprang to attention, and the colonel entered. His keen eye saw everything spotless and shining. He smiled and muttered, 'Splendid, men!—splendid!' and went off round the other huts. When this was over we were marched to the lecture-room to hear the 'com.'s' farewell.

'Gentlemen,' he said, 'this will be a happy day for you. You are going forward. The King's commission will shortly be yours. You

will join battalions already famous. The good name of those regiments and the honour of our country will then be in your keeping. We have done our best for you, and I feel you will not let this school down. We have had our hard times, our sad times, also our jolly times, together. No doubt you were often bored, and did your share of grousing. That is only human. If you cannot see a marked improvement in yourselves, I can see it in you. You were more or less rebellious when you arrived. You all had different ideas of discipline, training, tradition, and *esprit de corps*. Many of these ideas were sound; others were not at all practical. But by steady grinding, patient teaching, and persistent application, my staff have created at least a seedbed in good soil, and it is for you to develop the fruits of our instruction. We have not aimed at making you generals. Our job was to make you subalterns. There are other schools to teach you the arts of the higher command. Perhaps this elementary curriculum was too slow for the more brilliant, but these bright ornaments must remember that in a school like this we have to adapt our arrangements to the intellect of the majority, and not of the minority. The brainy minority can take care of themselves. It is for us to help the less fortunate, and give them confidence and the hall-mark of efficiency. I have a reason for making this remark, for I know we have intellectuals here, and I should regret if they left the school feeling we have not given them enough.

'You must also remember that your training has been crammed into four months instead of three years, which we used to put in at Sandhurst. We are at war, and we cannot go into the bowels of everything. Still, considering all our disabilities, such as the absence of many brilliant men at the front, I do feel we have reason to think that, on the whole, the course has been successful.'

'Hear, hear, sir!' we shouted.

'I said at the beginning you will no doubt feel glad at going forward. I also am glad; but I am sorry too. This has been the most interesting of all my "courses," and there are faces I shall miss, even that of my good Canadian friend, who, I understand, rejoices in the remarkable sobriquet of "Tosher."' (Loud laughter.) 'I can assure you, gentlemen, I have learnt a lot from you. Here we have a pleasant mixing of the classes and the masses; likewise a sprinkling of splendid fellows from overseas. This confirms my view that ours is a Democratic army, also an Imperial army. I rejoice! This is a splendid signpost to the future. When the job is done, we shall settle down in more friendly fashion, without the class distinctions and the horrible class war that were the curse of this country prior to 1914. You will also be interested to hear that, if you men are going forward, I too am about to receive promotion. I am taking unto myself a charming lady'——

We cheered tremendously. (By the way, the lady in question was none other than my aunt Jane.)

'Yes; and next week I leave the school and the army—for ever. I am old now. My day is done. I came back again only to help the Old Land in its hour of pain and woe. Yet I think I have the wisdom of my race. This is a young man's war. It is not for me to keep youth and vigour back; to stand a bulwark against progress, and put back the clock, so that I, a soldier of the past, may continue to enjoy the fruits of command. No! That is folly! We must win this war. Age cannot do it! It is beyond us! To youth we must hand the sword and the laurels! And yet, when I take off my Sam Browne belt and shove on my tweeds, I shall feel like a captain without a ship, like a man without a cause. However, there's my lady. She will help me through!'

'Hear, hear, sir!'

'Another intimation. My successor is Captain Cheerall. This officer is of the Old Army, yet of the New. To me he has been a loyal colleague, a zealous friend, and an invaluable assistant. He is an extraordinary compound of intellect and emotion. Every time he talks to me, I feel I must clap him on the back. The school is, therefore, in good hands. When I have gone, perhaps the intellectuals will not feel so bored.'

'You never bore us, sir,' shouted Ginger, and all of us gave a cheer.

'Thank you, gentlemen. Your kindness will lighten my coming darkness. But it's of you I must speak. Do not think me a great Christian, for I am not. But this war, somehow or other, has brought me face to face with the fact: IT IS A HOLY WAR. We are not out for LOOT. We are out for PRINCIPLES. It is our testing-time. GOD and THE BRUTE are struggling for mastery. The religion, the morality, the safety of nations, mothers, and babes are in your keeping. Should we lose, the Cross will lose. I do beseech you to think it out, to lead clean lives, to go forward with the heart and the aim of crusaders. It is not a burden! It is a privilege! There is no question of false glory. It is DUTY! And DUTY is the hall-mark of honour. Would to God that I were as young as you, so that I might fight the good fight and lead you on! Again, you have all got mothers, sisters, sweethearts; some of you have wives, perhaps bonny little babes. It is for you to guard them. The dripping sword must not be seen by their eyes, nor their blood stain your hearths. Think of Belgium! Think of Serbia! Think of Rumania!

'Do not waste your time hating! Your work is KILLING. War is Germany's religion! Brutality is her philosophy! Domination is ever her aim and vaunted creed!

'*You must destroy the loathsome gods of the Huns.*

'Well, gentlemen, I think that is all. I shall watch your careers. I shall keep your records in my study. Each great deed will be noted in my little book. The higher you go the more I shall be pleased. And never think of me as your commandant. Think of me as your friend, as a father—for to me you're boys, just dear boys, and I love you because you are going forth to help this dear Old Land.

'Good-bye,' he said with emotion, and turned away.

Tosher Johnson led a terrific cheer, and cried, 'Let's carry the "Old Man" round.' We rushed him, lifted him high on our shoulders, and carried him across to the officers' mess, singing:

'For he's a jolly good fellow,
For he's a jolly good fellow,
For he's a jolly good fellow,
Which no cadet denies.

'Hip — hip — hooray! Hip — hip — hooray! Hip—hip—hooray!'

Thus the New Army parted from the Old.

THE END.

ACOUSTIC ECHOES OF THE GREAT WAR.

MANY interesting incidents bearing on the science of acoustics were reported from time to time during the war by observers of phenomena of sound in connection with gun-fire. It was frequently noticed that inside a dug-out the din of a distant bombardment could be distinctly heard, while to those standing in the open it was inaudible. The Vicar of Rusthall related in a letter to the press how his sexton told him that, when he was digging a deep grave one day in August 1917, the noise of the guns was tremendous compared with what it was above-ground; and about the same time an army chaplain wrote from Chatham that near the house of a friend of his living at Cobham an excavation had been made, in which no sound was discernible until a layer of chalk was reached, when an extraordinarily loud noise was heard. Hence we may deduce that the clamour of the guns was conveyed by the earth, and either that calcareous matter is a better conductor than other accretions, or that this particular bed was a continuation of the one on which the cannons were standing on the other side of the Channel. There may, however, be another explanation. Several years ago, when at Eshowe, Zululand, from which the sea is distant but a few miles, I used to notice that so long as I remained *en plein air* no sound of waves ever reached me, but that on my entering my tent the small partially enclosed volume of air readily took up the vibrations from the earth, and the moaning was unmistakable.

By applying one's ear to the ground the guns in France could often be distinctly heard in this country when the sound was not conveyed by the air. 'On the afternoon of Sunday, 24th June 1917,' wrote one observer, 'at the time of a heavy bombardment in France, I was lying full length, with my head on the ground, at the top of Blackdown Hill, in Sussex, when I very distinctly heard or felt the reverberation of the guns. I drew the attention of my companion to the fact, but she protested that she heard nothing, until I made her also lie down on the ground, whereupon she too distinctly heard the sound. On resuming the sitting position, we again heard nothing. We repeated this again and again, with the same result each time.'

There is still doubt as to what causes these earth-pulsations, termed by scientists 'elastic waves somewhat analogous to sound-waves.' The concussion of the ground owing to the fall of a heavy shell is, no doubt, considerable, but hardly enough to set up a wave of sufficient strength and magnitude to reach these shores, since the main force of the explosion escapes upwards and in all directions into the air. The recoil from the charge in a heavy piece fired at a high angle, coupled with the resistance thereto, imparts a far heavier blow to the ground; so that what we hear is more probably caused by the thud of the gun than by the fall and bursting of its missile.

That the earth, like water, is a better conductor of sound than the air is well established. It was often remarked by occupants of a subterranean shelter that the fall of a shell in its vicinity produced a twofold effect upon the ear—one, through the medium of the earth, of a subtle hardness, shortly followed, through the agency of the air, by the other, the dull resonant thud of the projectile on the ground. The difference in the two sounds is due to another ratified truism, that sound transmitted through a solid or a liquid undergoes a marked alteration in character. In the winter of 1875 I was driving on a very still evening along the Mall in Peshawar, northern India, when, for no apparent reason, my horse suddenly took fright, and behaved in an extraordinary manner. The cause soon became evident when, a few seconds later, I heard the ominous rumbling that heralds an earthquake. Judging from the aimless way they tumbled about, the birds had received a synchronal warning, though their antics may have been due to the change in atmospheric pressure which precedes a severe tremor, as this one proved to be. The horse was affected by the

earth's groanings before any aerial disturbance had occurred.

Another thing often remarked upon was that heavy firing could not be heard in this or that locality, but that on one's retiring some distance it could. This was, no doubt, due to layers of air of different temperature, and therefore of varying density, and to wind blowing more strongly at a height than near the surface of the ground, where its velocity would be retarded by friction, the waves of sound being distorted, moving upwards and then down again, missing the interlying region. Of course, it may be argued that these so-called *zones of silence* are nothing new. We learnt at school that if two people were separated by a wall, the one standing at some distance from it on his side, the other close against it, communication between them was impossible; and I have been told by one who saw it that a lighted candle placed on the top and on the windward side of the Menai tubular bridge when a strong wind was blowing burnt perfectly steadily, the air, impinging on the side of the tube, being deflected upwards, and then flowing downwards, like water over a dam, leaving a space of absolute calm where the light was placed.

There is another very rational explanation of this absence of sound. The Somme district is called by its inhabitants 'The Silent Land' from the fact that noises within ordinary earshot are there frequently quite inaudible. This is ascribed to the configuration of the landscape, a series of parallel ridges, the consequent disturbance in the strata interrupting the carrying of sound. On this head a non-commissioned officer wrote: 'I was standing one night on the ridge west of, and above, Beaumont Hamel, watching the most intense of bombardments from Thiepval, only a mile or so away, round Combles, to Péronne, and yet I was unable to hear a sound. I remember the scene perfectly, as for once I understood the "glamour and beauty of war." There was a twenty-mile curve of star-shells, red and green flashes from the guns, and the destructive scarlet-lit smoke from the bursting of the gigantic high-explosive shells. Yet, as I said, although the firing (an attack was about to start) began practically at my feet, a whisper could be heard. I was told afterwards that at Amiens and Doullens the noise was appalling.' This experience was fully borne out by another writer ten days later.

On the firing of a high-velocity gun, in which the initial velocity of the projectile exceeds that of sound, two separate and distinct noises were clearly distinguishable within a zone bounded by lines emanating from the muzzle, and forming an angle of about fifty-five degrees on either side —namely, a sharp crack caused by the flight of the shell, very distressing to the ear, succeeded in a very few seconds by a dull boom, the true sound of the firing of the piece, which shook buildings and shattered windows, but did not affect the auditory nerve. This double sound was not perceptible when the initial velocity of the missile was low, as when fired from a howitzer, nor to one outside the limits of the afore-mentioned zone; and it was also found that the higher the initial velocity, the longer the interval between the two reports.

On those parts of the front where the contour was rugged or the country well wooded or abounding in houses, the discharge of a high-velocity gun was followed by a majestic echoing *roll*, which has been compared to 'a mixture of thunder and the music of a mighty bass orchestra.' Mistaken by many for the actual noise of the travelling shell, this roll proved to be the effect of a series of echoes from the numerous obstacles in the path of the sound-waves, which so magnified the din as on several occasions to exaggerate the number of hostile guns, as was proved on one's approaching the firing-line.

Among additions to our vocabulary contributed by the war is the compound word 'drum-fire' (*trommelfeuer*), which was invented by the Germans to describe the impression produced by our massed artillery. To those behind the guns it was nothing but a dull, continuous roar; but to those in front of them, each individual shot stood out distinct, the whole concert resembling the beating of many drums.

The French scientific paper *L'Astronomie* reported the appearance of visible sound-waves that could be seen without the aid of apparatus when violent cannonading was in progress. These were described as parallel arcs of light and shade rapidly moving over the sky. In one case the bands were seen on a cloud by all the members of a battery, who noticed that they moved with the speed of sound-waves, that their appearance coincided with the successive discharge of particular mortars, and that the space between the bands was greater for those of large than for those of small calibre. Their visibility, which lasted for about ten minutes, depended apparently upon the relative positions of the observer, the cloud, the weapon, and the sun. This calls to mind a letter I received from my son in the Royal Artillery during the siege of Kimberley, in the South African War, telling how, by searchlight signals flashed on to the clouds, communication was established between that town and the relieving force under Lord Methuen when it was held up on the Modder River.

With the copy of a letter written from a farm 'somewhere in France,' narrating a curiosity in natural history, this epitome may be brought to an end: 'We often hear the sound of a shell coming, and yet there is no burst, and we always say, "Hallo! there's a dud." But the other day I was sitting in the yard in the sun, when I heard a shell coming, as I thought,

close by. As it appeared to be just about to burst, it suddenly stopped. Two minutes later the performance was repeated, and I saw that the noise was being made by a hen! Whereupon a cock made a similar noise, and it was the exact imitation of a falling shell. I often heard the birds making the same noise, and called the attention of the others to it, and they verified my statements. I then questioned the old Frenchman about it, and he says that the birds have learnt to make the noise since the war commenced, and keep it up sometimes for a long time.' A commentator on this remarked that it would be a valuable addition to the instances of domestic instinct referred to in *The Origin of Species* if the imitation of a falling shell (not an egg-shell!) could be shown to be transmitted as a fixed habit in the hen's progeny. The continuance of this imitative habit would be a strange memorial of the Great War.

THE MONTH: SCIENCE AND ARTS.

A CHEAP PARAFFIN NIGHT-LIGHT.

WHAT may be called the night-light type of paraffin-lamp has now become common, largely owing to the economies forced upon us by the war. Lamps of this kind are freely used in places where only a dim light is required, even by householders who employ gas or electric lamps for ordinary lighting. A very simple and cheap lamp of this type, known as the 'Tweenie,' has recently made its advent. It consists of a tin saucer, provided with a handle, upon which is mounted a hollow cone of tin filled with cotton-wick. The apex of the cone is cut off down to a point that leaves an aperture large enough for the wick, which is adjusted by means of a pin through a small hole in the side. At the bottom, the cone is cut away slightly at each side. This lamp is not filled in the ordinary way; in fact, there is no filling-hole, but paraffin is poured into the saucer, and runs into the cone until the wick is saturated, when the lamp can be lit, and will burn for about twelve hours. The 'Tweenie' lamp is painted in various colours, and, being so simple, it can be sold at a very low price.

ELIMINATING FATIGUE IN THE FACTORY.

Factory management has been scientifically studied during the war with a view to obtaining the highest efficiency from the workers, and much attention has been given to the elimination of every avoidable source of fatigue. In some industries periodical rests have been found actually to increase the output. The old-time manager would have been horrified at the present-day practice of providing chairs for employees to sit upon whilst carrying out operations which have hitherto always been done in a standing posture. An interesting article appeared recently in *Engineering and Industrial Management*, in which Mr James F. Butterworth gives descriptions and illustrations of factory chairs devised by Major Frank B. Gilbreth for minimising fatigue. These include, for a worker at a vice-bench, a chair of such a height that the operator can either sit or stand at his work, and always be at the same distance above it. It is fitted with wide foot-rests, which enable him to work with a file with greater ease, speed, and efficiency when sitting than when standing. Another example given consists of a chair fitted with spring feet and felt-lined foot-rests to deaden heavy vibration from high-speed sewing-machines. Workers provided with these chairs are able to do more work with less fatigue than under ordinary conditions. Perhaps the most interesting device described is the 'Marshall' chair, consisting of a seat mounted on ball-bearing wheels which run on a track, so that the worker can change his position along a bench with a minimum of effort. The track is supported on two posts, and swivels outwards or inwards on one of them, thus giving a wide range of position. An adjustable foot-rest is also provided. A chair for typists gives the same position for the hands relatively to the keyboard whether the operator sits or stands. He or she, therefore, can stand when tired of sitting, and *vice versâ*.

THE LARGEST AEROPLANE IN THE WORLD.

What is believed to have been the largest aeroplane yet built—the 'Tarrant'—the attempted initial flight of which resulted so disastrously, possessed some very interesting features. This machine was a triplane, and had an extreme span across the middle wings, which were the widest, of one hundred and thirty-one feet; while it had a length of just over seventy-three feet from nose to tail. When the aeroplane was standing on the ground, the top of the uppermost wing reached to a height of more than thirty-seven feet. Even the tail was gigantic, being in the form of a biplane thirty feet in width, with the planes ten feet apart. The fuselage or body was no less than eleven feet in diameter, and it had a framework built up of wood lattice rings and longitudinals. These were constructed on a special system, devised by Mr W. G. Tarrant for aeroplane spars, which is claimed to give both great strength and lightness, and to lend itself to rapid production. Unlike that of most other aeroplanes, the fuselage was open from end to end, and was said to be capable of accommodating one hundred persons. It was covered

with a skin consisting of two layers of thin wood, in strips one and a half inches wide, which were glued together with the grain of one set crossing that of the other at right angles. On the outside of the wood skin was a layer of fabric, which was well varnished, and then enamelled. The machine was driven by six Napier 'Lion' engines, each of which was capable of developing over five hundred horse-power, and these were expected to give the aeroplane a speed of one hundred and ten miles an hour when it was fully loaded. Even with two engines disabled, the speed, according to the estimates formed, would have been ninety miles an hour. Four of the engines were located between the middle and bottom wings, two on each side, about sixteen feet out from the fuselage. The two engines were in tandem, the forward one driving a tractor, and the rear engine a pusher propeller. Directly above each pair of engines, and between the middle and uppermost wings, was a single engine, fitted with a tractor screw. The tractor screws were twelve feet in diameter, and the pushers slightly smaller. All the engines could be started and controlled from the cockpit at the forward end of the fuselage. The machine itself, with the engines and accessories, weighed just over eleven tons; while the tanks, when filled with sixteen hundred gallons of petrol and ninety-two gallons of lubricating-oil, weighed about six tons. The normal weight when the aeroplane was loaded being calculated at twenty tons, a lifting capacity of about three tons would thus be left for the crew of five, their guns and bombs, and other necessaries. Loaded in this way, the Tarrant triplane was estimated to be capable of covering nine hundred miles at the maximum speed; while by running only four engines, and with these throttled down, journeys of twelve hundred miles could have been undertaken. Two of these machines were ordered by the Air Board with the special object of carrying bombs, and it is believed that they would easily have been able to fly to Berlin, drop their load of five-hundredweight bombs, and return home again. Naturally so heavy a machine required enormous landing-gear, and the two front-wheels, which were of the triple type, measured nearly ten feet in diameter. These, of course, would take the main shock of landing; but a huge tail skid was also provided. At the time of writing the second aeroplane is not completed, and no doubt modifications will be introduced to eliminate any risk of an accident similar to that which occurred with the first.

DRIED MEAT.

Of late years much attention has been given to the drying of vegetables in such a way that they will retain all their essential salts, keep for long periods with their cellular structure unimpaired, and assume their original freshness when soaked in water. Hitherto heated air has been exclusively used for this purpose; but recently, under the direction of Professor Ralph H. M'Kee, a new drying process has been investigated at Columbia University, which promises to be as effective for meats and fish as for vegetables. The drying is done in a vacuum by the application of heat, which is so regulated that the albumens are not coagulated and the fats are not fried out. In other words, the dried meat is still *raw* meat, and retains its original composition except for the absence of water. Moreover, this method of preservation does not involve the destruction of the vitamines, which form such an important feature in all fresh foods, and which are mostly destroyed by other methods of preserving meat and fish. At present further details of the vacuum process are withheld, but according to the *Scientific American* it has proved highly successful in the experimental stage, and can be applied even to such juicy vegetables as tomatoes, which would take a very long time to dry by the air process. The advantages claimed for the new method include the elimination of any possible risk of contamination from germs in the air, and the drying of the food in one chamber instead of passing it through several. In the experimental apparatus used at the university the vacuum is produced by an electric motor, but pumps worked by steam-power will probably be employed for carrying on the process commercially, in which case the exhaust steam can be utilised as the source of heat.

THE WORLD'S LONGEST WARSHIPS.

Many new vessels were added to the British Navy during the war of which no particulars were allowed to be published; in fact, some of the larger craft were referred to with bated breath as 'hush ships.' Among these not the least remarkable were the two colossal battle-cruisers, the *Repulse* and the *Renown*, the dimensions of which have recently been given in the technical journals. Measuring close on eight hundred feet in length, these vessels have a breadth of ninety feet, and require twenty-five and a half feet of water to float them. They are the longest and most powerful warships in the world, and although their displacement (twenty-six thousand five hundred tons) is less than that of the last battle-cruiser completed before the war, this is owing to their fine lines, which allow two knots more speed to be achieved. The propelling machinery consists of geared steam-turbines capable of developing no less than one hundred and twenty thousand horse-power, which is applied to the turning of four propellers on four shafts. Officially the speed of these vessels is given at thirty-two knots, or about thirty-six miles an hour; but when pursuing German ships in the North Sea the *Repulse* is said to have done thirty-five knots, or about forty miles an hour. Forty-two

huge boilers are provided in each vessel to raise the enormous quantities of steam required for the turbines, but no coal is burned in the furnaces, the necessary heat being obtained entirely from liquid fuel, jets of which are blown into the furnaces by compressed air. Besides other well-known advantages, such as clean stokeholds, fewer stokers, and no coal-trimmers, the employment of oil instead of coal allows of fuel being taken on board from a 'tanker' at sea with comparative ease, while in port the 'bunkers' can be much more quickly filled with oil than with coal. This feature proved to be an immense advantage during the war, and contributed greatly to the mobility of the British Fleet. Like other modern warships, the *Repulse* and the *Renown* are divided up into large numbers of watertight compartments by bulkheads. These are carried up well above the water-line, and in order to pass from one to another it is necessary to come up and go down again by means of lifts. The main armament of each vessel consists of six fifteen-inch guns, each capable of hurling a shell weighing almost two thousand pounds a distance of nearly twenty miles at intervals of forty seconds. Seventeen four-inch guns, with two three-inch anti-aircraft guns, constitute the secondary armament, while two torpedo-tubes are installed. A belt of six-inch armour passes nearly round each ship, and the big gun turrets are protected by armour-plates eleven inches thick. Immunity from the evil effects of torpedoes and mines is sought by the provision of a swelling, commonly called a 'bulge' or a 'blister,' below the water-line on each side. Should a vessel unfortunately come in contact with either mine or torpedo, the destructive power of the resulting explosion would be largely dissipated in the 'blister,' and the real hull of the vessel would remain practically uninjured. According to Mr Hector C. Bywater, who contributed a description of these interesting vessels to a recent issue of *The Navy*, the conning-tower in each is a 'pear-shaped, two-storied erection,' having the lower part protected by ten-inch armour, and the upper storey by six-inch armour. Huge as are the battle-cruisers which form the subject of this note, their dimensions are exceeded by those of the *Hood*, which is due for completion in the autumn of this year.

FLYING 'STUNTS' ON THE GROUND.

Before the budding airman is allowed to fly he is put through a course of training on the ground, with a view to minimising the risk of accidents in the air. In some schools this course now includes the practice of 'stunts' in a machine known as an 'orientator,' in which the conditions closely resemble those met with when actually flying. The 'orientator' designed by Mr William G. Ruggles of New York consists of a series of rings mounted on gimbals, and turned by electric motors which are under the control of the pupil, who is strapped into a dummy fuselage gimballed to the innermost ring. The outer ring is gimballed to both the ceiling and the floor, a motor at the ceiling gimbal imparting the necessary turning motion. Inside this outer ring is another ring mounted on horizontal gimbals, one of which is turned by a motor. Finally, at right angles to these gimbals are others which support the fuselage, which is also rotated by electricity. All the motors are controlled by the usual joystick and rudder controls, and the pupil can put himself through every conceivable combination of motions, including such as closely approximate to the spinning nose-dive, the falling leaf, looping the loop, and other well-known 'stunts.'

WATER-PIPES THAT DO NOT FREEZE.

Among the many matters in connection with the housing question which have been brought to the attention of architects by housewives is the demand for 'water-pipes that do not freeze.' Such a demand appears at first sight extravagant, but in reality it is far from being so. It is apparently not known in Britain that this problem was solved long ago in America and Canada, and in a very simple, ingenious, and inexpensive way. In British houses, as most householders know, the water-supply is turned on or off in each individual house by means of a stop-cock which is invariably placed outside the house. In the case of American and Canadian houses, the place of this stop-cock is taken by an extremely simple and ingenious device known as a 'stop and waste' cock, which is always placed inside the house in a very accessible position. Without entering here into technical details, we need only say that this 'stop and waste' cock is of such construction that whenever it is turned off, all water-pipes in the house leading from the main are automatically and immediately drained, and are thus prevented from freezing. When the 'stop and waste' cock is turned on, it admits a full supply of water to the house, precisely like the British stop-cock. It is absolutely 'foolproof,' and is just as simple in operation as any common tap. While the 'stop and waste' cock is always buried, so that it cannot freeze, it has a long handle firmly attached to it, which projects upwards through the floor, and by means of which it is turned on or off. It is usually placed in the kitchen close to the sink, experience having shown that to be the most generally suitable position. Obviously, water-pipes in a house are most likely to freeze at night; consequently, in severe weather, the householder turns the cock off before going to bed, in absolute certainty that no frozen water-pipes will await him in the morning when he turns the cock on again. Why British architects have not, long ere this,

insisted upon the adoption of this simple and inexpensive device, in addition to the outside stop-cock, is a mystery. As matters stand at present, it is compulsory in Britain that there should be an outside stop-cock. This is usually placed in the pavement in the street, and a key, which can never be found in an emergency, is required to turn it on or off. Hence, if a pipe bursts, hardly one householder in a hundred knows where or how to turn the water off; the great majority are compelled to stand helplessly by and witness the devastation caused by the flood of water until a plumber arrives. With the provision of an inside stop-cock, all danger of this would be obviated.

A NEW APPLIANCE FOR SCRAPING WATER-PIPES.

The interior of the iron pipes used for the conveyance of a supply of water gradually becomes coated with a layer of iron oxide, which, in the course of time, materially reduces the carrying capacity of the pipes. To remedy this, Mr Thomas Davis, one of the outdoor superintendents on the city staff of the Glasgow Corporation Water-Works, has devised an appliance to which he has given the name of the Helix Pipe-Scraper. The apparatus consists of a spiral steel band which forms the scraper, a light set of rifling-rods with screwed joints, a crab winch, and a steel-wire rope. With these appliances it is claimed that the water-pipes can be efficiently cleaned by the ordinary pipe-laying staff employed by the local authority, no skilled mechanics or other experts being required. The work is done, we are informed, without any abrasion of the interior surface of the pipes, and without damage to the brass ferrules occurring at the points where leaden communication-pipes branch off. To carry out the operations, openings must be made in the pipes at intervals of about one hundred yards, but if these openings are carefully cut, collars are the only new material needed for rejoining the pipes. The saving to be effected by scraping pipes instead of scrapping them is so obvious that the invention seems to merit the attention of all local water authorities.

THE FAMOUS MOUNT MORGAN MINE.

Situated in Queensland, under the Tropic of Capricorn, at an elevation of eight hundred feet above sea-level, is what was for a long time one of the most remarkable gold-mines of the world, though its palmy days as a gold-producing proposition are probably now over. To reach it the traveller must go to Rockhampton, either by steamer or by rail. By aeroplane the distance thence would be about ten miles, but the journey by rail is twenty-four miles, and occupies a little over an hour. After running twenty miles the railway proceeds into what looks like the dead end of a mountain gorge, five hundred feet above sea-level. Here the train is met by a small, 'dumpy' rack-engine. This is the beginning of Queensland's only rack railway. In fifteen minutes the rack-engine hauls the whole train a mile farther to the top of the range, a climb of three hundred and seventy-five feet. The works are now in full view, as also is the town of Mount Morgan, which nestles down below and climbs up and round the sides of the neighbouring slopes. Nominally the mine was discovered by the Morgan brothers, but really by an old prospector who was friendly with the Morgans, and showed them some specimens of a reddish peacock-coloured ore, which the Morgans had assayed at Sydney. The result of the assay was a tremendous surprise, in that the gold contents were fabulous. This was in 1882, and the secret was closely guarded until the Morgans secured the ground. From 1883 on the mine has been worked continuously, first by the Morgans—who sold out for what was then considered a large sum—and afterwards by the present company. From 1886 to quite a recent date the present holders produced 4,578,362 ounces of gold, valued at £18,637,867, and 86,678 tons of copper, valued at £6,054,975. Prior to that £242,248 worth of gold had been taken out of the mine by the original holders, thus making in all a total of nearly £25,000,000 as the earnings of the mine. The very valuable gold-deposits were found near the top of the mountain. There apparently at one period had been a bubbling volcanic spring, the froth from which settled down into the peacock ore, forming the crust of the mountain after the volcanic energy had left.

To Correspondents who wish fuller information regarding new inventions, publications, &c. mentioned here, addresses will be furnished, when possible, provided a stamped and addressed envelope or post-card be sent to the Editor, 339 High Street, Edinburgh.

THE GIFT.

LIFE cannot give to either of us two,
In all the days yet ours on this dear earth,
A nobler gift, a boon of greater worth,
Than that it gave when first we blindly drew
Together, out of all the world, and knew
Unmeasur'd joy, true solace, and clean mirth;
And taking this, rejoic'd in love's glad birth:
You have my all, and I have all of you.

Thus, in my dreams, I dare to claim you wife
And dearest comrade still, when open wide
The seas uncharted of another life;
When we, once more together, meet the tide
That bears us far beyond these lands of strife,
No matter whither: we are side by side.

A. T. CORKE.

*** TO CONTRIBUTORS.

1*st*. All communications should be addressed to 'The Editor, *Chambers's Journal*, 339 High Street, Edinburgh.'

2*nd*. For its return in case of ineligibility, postage-stamps should accompany every manuscript.

3*rd*. To secure their safe return if ineligible, ALL MANUSCRIPTS, whether accompanied by a letter of advice or otherwise, *should have the writer's Name and Address written upon them* IN FULL.

4*th*. Poetical contributions should invariably be accompanied by a stamped and directed envelope.

Printed and Published by W. & R. CHAMBERS, LIMITED, LONDON AND EDINBURGH.

THE AIRY PRINCE.

By ARTHUR BEVERLEY BAXTER, Author of *The Blower of Bubbles; Mr Craighouse of New York, Satirist;* &c.

PART I.

I.

ON a hillock that overlooked a mill-stream in Picardy, a girl of sixteen was lying, face downwards, reading a book. The noise of the water tumbling over the chute was a song to which her ears had grown accustomed, but more than once she looked up as the October wind rose and fell in a chromatic whine. A dark, thickening cloud crept sullenly towards the earth, throwing its shadow on her book.

She gazed up at it and sighed.

A black cat, his green eyes glowing suspiciously in the fading light, stalked from the mill-house and furtively watched a wanton leaf that was flirting hilariously with the autumn breeze, until, still coquetting, it was caught by the stream and carried to destruction.

The cat's teeth showed for a moment in a sinister grin. Cautiously measuring each step, he climbed to the top of the hillock, crouched suspiciously as a blade of grass moved in the wind, then scampered boldly up to the girl, and settled ostentatiously upon the open pages of the book for a siesta.

'*Tiens!*' The girl started, laughingly caught the offender by the ear, and pulled him to one side. 'Louis, you have very bad manners,' she said, speaking in French. 'You come so, without asking permission, and you go to sleep on *The Fairy Prince*. Wake up, Louis! To you I am speaking.'

The cat opened his eyes, bent them on her with a reproving look, and slowly closed them once more.

'Louis! Wake up—listen! I will read to you *The Fairy Prince*, and if you go to sleep I 'll have you gr-r-r-r-ound into black flour. See there now!'

Louis scratched his ear with a hind paw, rubbed his nose with a fore one, sneezed, opened his eyes to their widest, and generally indicated that he was thoroughly awake—in fact, was not likely ever to sleep again in this world. His little mistress gathered her shawl more tightly about her shoulders, and, crossing one foot over the other, shifted her position to secure the acme of comfort.

'Now then, my friend, attention! This is all about a little girl—like me, Louis; only, she was pretty. Tell me, Louis, am I pretty, eh? Stop yawning when I ask you a question. You sleep almost all day and all night; and when you do wake up—you yawn. Pouf! Such laziness! So—this is the story. This little girl, she lived like me in a house away, ever so far away, from everything, and she was very unhappy. You understand, Louis, she was *so* lonesome. And every night she would cry herself to sleep—as I do sometimes, because—because—— Wake up, you wicked cat!'

The feline culprit stretched his paws and sat up rigidly, like a slumbering worshipper in church who has been detected in the act, but tries to indicate that he has merely been lost in contemplation of the preacher's theme. The girl frowned at Louis, and, laughing gaily, rubbed her cheek against his head.

Her laugh had hardly ended when, as her ear caught the note of melancholy in the wind, she looked up, and her face, which had hovered a moment before between a frown and a smile, was shadowed by a musing expression that left her eyes dreamy and her lips drooping in the slightest and most sensitive of curves. Her dark hair, rippling into curls, fell back from a forehead whose fullness and whiteness added to the spiritual innocence of her countenance. Without being faultless, her face had an elusive mobility of expression that altered with each mood as swiftly as the surface of a pool lying exposed to the caprices of an April morning.

'Is it not a pretty story, Louis?' Of a sudden the filmy dreaminess of her eyes had lifted, and their dark-brown depths sparkled with life. 'I am so glad that at the convent they made me learn to read. But it is dreadfully difficult, my friend—there are such big words, you see. Well, Louis, this little girl went one day for a walk to the top of a hill—but you shall hear exactly how it is.'

She carefully found the place in the book, and, with a finger following each line in case she should miss any of it, proceeded to read in that ecstatic and unreal style of voice common

 [*All Rights Reserved.*]

to young people when uttering other thoughts than their own.

'" . . . . Reaching the top of the hill, the most beautiful little girl in the world, whose eyes were brighter than stars, and whose lips were redder than the heart of a rose" (like me, Louis—yes?), "sat down on a fallen tree, and started to sing a song which she had learned from a solitary shepherd near her home."—It does not say, Louis, but I think, perhaps, the music goes like this:

"Maman, dites moi ce qu'on sent quand on aime.
Est-ce plaisir, est-ce tourment?
Je suis tout le jour dans une peine extrême,
Et la nuit, je ne sais comment.
Si quelqu'un près . . . ."

'"And just then she saw a handsome cavalier approaching on foot." (Is it not exciting, Louis?) "He was tall and young, and was the bravest soldier in all France. He was so brave and handsome that every one called him 'The Fairy Prince.'"—Listen, Louis, to the wind!'

The lowering clouds threw black shadows over the fields; the hurrying water of the mill-stream turned the colour of ink as it made, shudderingly, for the fall of the chute. Through the ominous rise and fall of the October wind came the sound of an aeroplane in the clouds, to be lost a moment later in a boisterous rush of wind that swept the girl's tresses.

'Come, Louis, under my shawl—so! It is cold, is it not? As soon as we finish this part of the story, we shall go in by the stove and work until bed-time; then . . . Do you ever dream, Louis?'

The black cat opened one green eye and closed it with the solemnity of an all-understanding wink.

'I often dream, my cat'—again the wistfulness lingered about her face—'and always it is of the world that is past the village. . . . Is it that I must stay here, and never, never see that world but when I dream? *Voyons*—what has all this to do with the Fairy Prince? I continue, Louis: "As soon as the handsome cavalier saw the loveliest little girl in all the country, he came towards her. . . ."'

The droning sound grew louder. She looked up and watched the dark billows of clouds hovering over the fields, when, suddenly, through the heavy, underhanging mist, an aeroplane appeared, descended swiftly towards the earth, straightened out its course, and soared into the clouds again.

She could hear the whirring of the machine as it circled round and round, like an angry hornet outside its nest that has been entered by an invader. The sound of the engine grew increasingly loud; again the mists parted as foam from the prow of a ship, and again the aeroplane swooped towards the earth. She could almost make out the features of the helmeted occupant, when, with a deafening roar, the machine checked its downward flight, and rose once more until the clouds took it to their bosom and hid it from sight.

'Louis!' Her voice shook. 'I am frightened. Louis, we will go in and pray to the Virgin, you and I. It may be an *Allemand*, and, so 'tis said, they eat little girls—and black cats too.'

The whir-r of the engines grew angry with intensity, then fainter as the machine rose to a greater height. Suddenly the droning ceased. The tumbling waters of the chute seemed insistently loud, as though jealous of the brawling monster that had dared to challenge its incessant song. The girl had just stooped to resume her book, when, above the whining breeze, there was a sound like that of a saw-mill she had once heard in Étrun—but it came from the air—far over by the village road.

With a catch of her breath, she saw the aeroplane pierce the mists once more, and realised that it was pointing towards her as it descended. Rising to her feet, she pressed her hand against her mouth to keep from screaming, while ominously, noiselessly (but for an occasional hum such as wires give on a frosty night), the giant bird sped lower and nearer.

'Louis!' she cried. 'Louis!'

Weak with terror, she grasped for the cat, to find that that ungallant protector had bolted ingloriously to the mill-house. Unable to move, she watched the monster as it touched the earth, bounded lightly, felt the ground a second time, and staggered unevenly over a rise in the ground. There was a final Wagnerian crescendo of the engines, and the aeroplane stopped, motionless, less than fifty yards from her.

The aviator climbed from the pilot's seat and looked about with a puzzled air. He was dressed in a leather coat which reached to the top of his riding-boots, and his head was encased in a leather helmet. Raising his goggles, he looked toward the mill-house, and, for the first time, caught sight of the girl.

For a moment he hesitated, then made towards her, taking an extraordinary length of pace for one of his medium build, and raising his knees, as a bather will do when wading through surf. He paused, irresolute, about five yards from her, saluted, unbuckled a strap, and removed his helmet with a carelessness that left his generous supply of light-brown hair standing straight up like the quills of a porcupine. His face was rather long, and, except for his eyes, which twinkled humorously, bore a look of exaggerated solemnity. Constant exposure to the sun had tanned his face a vigorous brown, but his moustache and eyebrows, which were of a size, appeared to have completely faded, and stood out, glow-worm-like, against the background of tan.

For a full minute they gazed at each other, the girl with parted lips and heightened colour,

the new-comer's gravity slowly giving way to the good-humoured persistence of his light-blue eyes, until, with a smile, he ran his fingers through his rumpled hair.

'Phew!' he said.

With something between a sob and an exclamation of delight, she clapped her hands together twice. '*Ciel!*' she cried; 'but I am so happy!'

The mill-stream had ceased to shudder, and had resumed its song. . . . With an air of furtive preoccupation, Louis emerged from concealment and proceeded towards them after the manner of an unpopular Mexican President walking down the main street of an unfriendly city. . . . The darkening shadows blended with the early approach of night. . . . And her heart was beating wildly, joyously.

Adventure had come to the lonely mill-house in Picardy—and, after all, one is not always sixteen.

II.

'Will you please tell me where I am?' The young man spoke in French with ease, but with more than a trace of an English accent.

'This is my uncle's mill.'

'Of course. And that road?'

'But the village road, monsieur — what else?'

'And, Mademoiselle Elusive, what village may it be?'

''Tis where the church is, monsieur; and every Sunday I go there to mass.'

The pilot produced a pipe, and, extracting a pouch, proceeded to fill it with tobacco.

'I am lost,' he said complacently. 'My compass was shot away, and the clouds are hanging too low for me to follow any landmarks.'

He looked about at the steadily thickening twilight. 'How far is it to the village?' he asked.

'Five kilometres—and a little better.'

'The devil!' He made a screen from the wind with the flap of his coat, and lighting his pipe, puffed it with evident satisfaction. 'I shall have to leave the old "bus" here. As a matter of fact, she's so nearly "napoo" that I rather expected to come riding home on one plane, like the old woman with the broom. But, mademoiselle'——

'Monsieur?'

'I am very tired and distinctly hungry, and I know of a mill-house with a cosy fire in the kitchen, where a pretty little fairy that'——

'There is no fairy—only Louis.'

'And who the deuce may he be?'

'The cat—*le voici!*'

He surveyed the feline with an air of tolerant gravity. 'Do you think Louis may object if I remain for supper?'

'Ah—but no!' She laughed gaily; then a look of doubt changed the expression of her features in a moment. 'But my uncle—he never has any one in the house. For many years I have lived alone with him. Only when the curé comes, perhaps once a month, does any one visit the mill. My uncle is very surly, a perfect bear, and often he gets drunk as well.'

The young man raised his absurdly light eyebrows. 'A pleasant relative, mademoiselle. And, pray, what is his grievance against his fellow-men?'

'I know not, monsieur. All week he works alone, except when he takes the flour to sell, but on Sundays he always goes to church and leads the chanting. He was taught Latin by his father, who was a grave-digger in Paris and learned it from the tombstones. So on Sundays my uncle, from his seat in the chancel, performs the chants in such a terrible voice that almost always some children scream with terror, and once Madame la Comtesse fainted.'

The aviator relit his pipe, which had gone out, but did not remove his eyes from hers.

'Once,' went on the girl, plucking a blade of grass and making a knot with it about her finger, 'two villagers, Simon Barit and Armand Cartier, were requested by the curé, who is very small and weak, to tell my uncle to sing no more. Ah monsieur, it was terrible!'

'Yes?'

'My uncle he is a very strong man; he threw Simon Barit into the stream, and the other he chased almost to the village.'

'And so, like the mill-stream, he goes on for ever?'

'Ah yes, monsieur, like the war—for ever. Listen!'

A great voice, sonorous as that of the fabled giant calling for his evening meal of an Englishman, rent the air. The October wind seemed to quiver to its lowest note, and the water racing over the chute was quieter than it had been for hours.

'I must go, monsieur. It is his supper he wants.'

'And may I not come too?'

'Ah—but no! I am frightened.'

'Of me?'

She raised her wide brown eyes to his, and her eyelashes, which so jealously guarded those guileless depths, parted grudgingly, revealing to him their full beauty. . . . Another roar shattered the air, and she laid her hand upon his wrist. 'You must not come,' she said earnestly. 'He would throw you into the stream.'

His melancholy face gave way to a boyish grin. 'If he did, mademoiselle, my ghost would haunt him for ever. All night it would sing outside his window—and, in truth, my singing is no less terrible than his.'

There was another roar, followed by a

reference to the untimely decease of ten thousand devils.

Without a word, she reached for her book, and, throwing her shawl over her left shoulder, hurried away. The aviator watched her girlish figure with its unconscious grace; then, turning about, he strolled to the machine, and, sitting on the side of the fuselage, surveyed its bullet-punctured carcass.

'Five kilometres and a little better,' he soliloquised in English, 'and a doubtful prospect of a meal. . . . Contrast that with what the gods offer here—a cosy fire, coffee, eggs and chips, I warrant, and the daintiest of little maids—to say nothing of a musical uncle with an amiable propensity for throwing visitors into the stream. By Jove! it is chilly. . . . Over in dear old England they'll be roasting nuts and telling ghost-stories to-night.'

The fast-thickening shadows deepened into the blackness of an October night; the wind grew quieter, but there was a bite in the air that made him draw his fur collar about his ears.

'What excellent French the little lady uses!' he went on. 'I wonder who her parents were, and why the deuce she has to live with this ogre. And what eyes! Enough to make one invent new songs of Araby just to see them sparkle and soften. . . . One moment sad, another tender — and always lovely. Steady, the Air Force—you're becoming sentimental.'

He looked at the battered machine and shook his head; a solitary raindrop lit on his face and slid down its surface like a tear.

A belated gust of wind smote his face and left it moist. He rose in a determined manner and adjusted his helmet.

'*Adieu*, my Camel!' He took a last survey of the machine. 'The kitchen is calling to my appetite; a storm is brewing in the heavens; a pair of dark eyes are urging all the romance within me; so—mill-stream or no mill-stream—*mon oncle*, I come.'

He squared his shoulders, and, with the rather absurd long stride and the odd raising of the knee, made for the cottage door, from underneath which a faint glow of light was timidly emerging.

III.

In response to his knock there was a roar from within, and the door opened enough to show the young lady in the doorway.

'Good-evening,' he said gravely. 'I saw the light in here, and decided to accept its kindly invitation.'

She glanced over her shoulder; but the airman, gently putting her to one side, entered and looked serenely about the room, which appeared to be kitchen, dining-room, and parlour in one. Beside the stove he noticed the stooped figure of a man, whose huge black beard straggled over a suit of overalls that had once been dark blue, but had become a dirty white from constant association with flour.

'Good-evening, monsieur.' The airman handed his helmet to the girl, and proceeded to unbutton his coat.

The miller's blotched eyes rose sulkily to the visitor's face. 'What do you want here?' His voice was nasal and slovenly, and there was a hoarse growl in the words, as though his throat was parched and rusted.

'I am doing myself the honour of taking supper with you, monsieur.' The airman's face was full of melancholy dignity as he divested himself of his coat.

The miller's mouth opened, and a rasping, deep snarl resonated disagreeably. 'There is the village, five kilometres that way.'

'Ah—but that is five kilometres too far.'

'You cannot stay here'—the miller's voice rose angrily; 'there is but food for two.'

The Englishman tapped his pipe against his heel, and blew through it to ensure its being empty. 'Then, monsieur,' he said, 'you must go hungry.'

The Frenchman rose to his feet and brandished both arms above his head. 'Go!' he bellowed, and swore an oath that comprised a reference to the sacred name of one dog and the sudden demise of the afore-mentioned ten thousand devils who, it appeared, rested heavily on his conscience.

'Mademoiselle' — the young man turned politely to the girl—'I apologise for this gentleman. Shall I throw him into the stream, or would a cleansing spoil his particular style of mottled beauty?'

The miller became eloquent. His language was threatening, blasphemous, and deafening. His whole ungainly body vibrated with a fury which, at certain moments, grew to such a pitch that he would raise his chin upwards until all that could be seen was a forest of beard, the while he emitted an unearthly roar that could have been clearly heard on the village road. The girl, who had been making preparations for supper, glanced timidly at him, but continued her work. The cat, slumbering by the stove, opened his eyes dreamily, as if some sweet strain had come to his ears, then settled to slumber once more.

And the whole room resounded and quivered to the hurricane of sound.

With an air of complete imperturbability, the intruding guest slowly backed towards the table, and became engrossed in the task of refilling his pipe, though beneath the glow-worm eyebrows his eyes (which were very clear and blue, as if his excursions into the last free element of nature had blown all the dust and grime away) held the orator in a steady look.

'Fill your pipe?' he said cryptically, choosing

a moment when his host was filling up with a breath that promised to burst his ribs.

The response was startling.

Exhausting the air from his lungs with the noise of steam escaping from an overcharged boiler, the miller rushed blindly forward, crouching so low that his beard against his discoloured clothes suggested an ugly bush against a background of slushy snow.

With the precision of a Guardsman forming fours, the airman took one pace to the rear with his left foot, and one to the right with his right foot. This manœuvre, successfully completed, placed the table between himself and his assailant, and, tilting it dexterously, he swiftly thrust that article of furniture forward, where it came into violent contact with the irate miller's knees and shins. With an indescribable howl the worthy man fell back in a paroxysm of agony, grasping his knees with both hands, and rocking to and fro like a demented dervish.

The airman bowed gravely to the girl. 'I learned that,' he said, 'from a gentleman by name Charlie Chaplin. If you can oblige me with a custard-pie, I shall hurl it at your uncle, and thus complete the Chaplinesque method of discounting violence.'

The young woman's brows puckered. The spectacle of her uncle's discomfiture had not disturbed her so much as this new kind of a person who could bow so courteously, whose eyes twinkled humorously, and whose words were full of gravity on the subject of custard-pies. She came of a race that co-ordinated gestures and the play of features with speech; but this stranger of the air—*Sapristi!*

The moaning of the uncle grew less, and his figure stopped its rocking; but his red, blotchy eyes looked furtively at the young man, biding their owner's time for a renewal of hostilities.

With an air of deep dejection the airman gazed at the unlovely spectacle, then, very slowly, unfastened his holster and drew a revolver.

'Monsieur,' he said, 'I offer peace. The alternative is—that I fill you full of holes—which would interfere with your singing. I intend to have supper here, because I saw hens outside. If they have given no eggs, we shall eat the hens themselves as a punishment. We are allies, you and I; let us be friends as well. Monsieur'—he struck a Napoleonic attitude—'*Vive l'Entente!*'

The swarthy face of the miller, who had retained his posture on the floor throughout, wrinkled hideously into a grin, which developed into a roaring laugh that set a solitary vase jingling.

With a doubtful air of appreciation, the airman surveyed him, his head inclining dubiously to one side. 'Come, monsieur,' he said, after the miller's unpleasant mirth had subsided, 'you sit there—at the far end of the table; mademoiselle—when you have given us the supper-things—here; and I, at this end. Just to show how completely I trust you, my host, I will keep my revolver beside my plate; and should it be necessary for me to blow your brains out during the meal, it will be with the very keenest regret that I lose a friend for whom I have acquired such an instantaneous and profound affection.'

Thus the young lady with the guileless eyes, the youth who had descended from the clouds, and the stentorian miller with the painful knees sat down together for their evening repast.

And the mill-stream, chuckling as it sportively tumbled over the chute, made a pleasant serenade.

'THE BALANCE OF NATURE' AND THE NEW ENTOMOLOGY.

By C. A. EALAND, M.A., Author of *Insects and Man, Insect Enemies, &c.*

I.

WE are all too prone to consider the birds and the beasts, the fishes and the insects, which abound in this world of ours as a mere heterogeneous collection of living organisms, without relationship or interdependence. As a fact, the activities of all living things are closely allied; one group of organisms cannot increase inordinately without another group being adversely affected. In short, nature is always in a state of equipoise. Cruel she may appear at times, but her very cruelty is a necessity if the wheels of the world are to run smoothly.

Darwin, with that rare intuition which more than anything else won him fame, summed up the phrase 'balance of nature' very aptly. He showed how the yield of a clover-crop depended upon cats. From cats to clover seems a far cry to the ordinary man; not so, however, to Darwin. Every one knows, or should know, that clover will not set its seed unless fertilised by bumble-bees. Amongst the enemies of these bees are field-mice, and field-mice, in common with all others of their kind, are eagerly devoured by cats. Professor J. Arthur Thomson carried the story a little further by the naïve remark that the yield of a clover-crop depended upon the number of maiden ladies in the district.

There are many links in nature's chain, and

if any be weak or wanting, something untoward will happen. It is the interdependence of living creatures on one another that maintains the balance of nature. The equilibrium is so nicely adjusted that the upsetting of it is easily accomplished; and man, above all, with his ruthless methods of civilisation, is the main factor in doing so. We may well consider how man has wrought this havoc, together with the efforts he has made, and is making, to undo his work.

The dodo, for some unaccountable reason, is the one extinct creature known to every one. (No doubt Lewis Carroll did much to popularise this extinct pigeon.) Now, the dodo, and its congener the solitaire, once reigned supreme on the islands of Mauritius and Rodriguez respectively. The absence of enemies, combined with a plentiful food-supply, rendered wings useless to these birds, so that in time they lost the power of flight. Then came man, and slaughtered the creatures in his usual inane fashion; furthermore, he introduced his pigs, which found the birds' eggs palatable. Man and his attendant swine upset the balance of nature in a small way, but so surely that the dodo and the solitaire are no more.

The moa, a huge wingless bird, whose home was once in New Zealand, met with a similar fate, passing into oblivion before the Maoris, who in turn have been greatly reduced in numbers by the white man. The great auk, another flightless bird, remains with us in name only; and the albatross, powerful flier though it be, is assuredly going the same way, by reason of its confiding nature during the breeding-season and man's insensate slaughter at that time.

St Helena, so rich in valuable ebony and redwood at the date of its discovery, is now a barren, storm-swept island, and the reason—the Portuguese introduced goats in 1513, and they, browsing, as is their wont, on all manner of vegetation, soon killed off the seedling trees. Primitive methods of forestry did the rest.

Let us bring the narrative a little nearer to our own time. Not so very long ago the common rat of this country was a neat, jet-black creature of engaging habits; but he has been ousted by a later introduction in the shape of the odious brown rat, a beast full of guile and cunning. A similar story applies to the cockroach. Our common cockroach, popularly but wrongly called a black beetle, itself an Asiatic alien, is being slowly but surely forced into obscurity by its more robust, more recently introduced, American relative.

About fifty years ago the balance of nature was rudely disturbed; events of far-reaching import occurred in the animal world. At that time the Phylloxera, a near relative of our green fly, was accidentally introduced into France from America. In twenty years it totally destroyed one-third of the French vineyards, and seriously damaged most of the others. Man restored the equilibrium by introducing resistant stock, curiously enough, from America.

The next false move on man's part was the introduction of rabbits into Australia. It was thought that the rodents would provide good sport. They have provided more sport than their sponsors bargained for. Of natural enemies there were none in the land of their adoption, and the rabbit is proverbially prolific. The game animal rapidly developed into a serious pest, costing the country seven hundred thousand pounds annually.

About the same period witnessed the accidental introduction of the gipsy moth into America, and though the insect has not spread over a very large area, it has increased in numbers so rapidly that the United States Government spend more than a million dollars a year on its control.

The tragic story of the mongoose is another brilliant example of man's efforts to improve on nature. The mongoose is an inveterate enemy of the rat, and rats were becoming a nuisance in the West Indies. Numbers of mongooses were introduced from India, and they certainly exterminated the rats in an incredibly short time. Then, being short of food, they proceeded to exterminate the ground birds, insectivorous birds for the most part, with the result that, though the rat plague was ended, a more disastrous plague of insects ensued, for there were no insect-eating birds to keep them in check.

The Argentine is the home of a war-like little ant, which is rapidly becoming a pest in the warmer parts of the United States. This insect, during the Boer War, contrived to get himself introduced into Madeira. The climate suited him, and he lost no time in establishing himself in the island, and in killing off all the native ants. At the present time the Argentine ant reigns supreme in Madeira. He is a nuisance; but to him belongs the credit of having upset the balance of nature.

One more example from the present time. Comparatively recently a few American gray squirrels were set free both in the Duke of Bedford's park at Woburn and in the Zoological Gardens in London. As the animals grew in numbers, these areas soon became 'centres of dispersal,' those from the Zoological Gardens wandering into Regent's Park, and thence to Hampstead and elsewhere. In a few short years the gray squirrel has spread over the home counties, and gives promise of travelling still farther, unless means are taken to prevent him from doing so. Our native red squirrel, a beautiful little creature, cannot hold his own with his more robust gray cousin—a serious enemy of the farmer, by the way, and looked upon as vermin in America.

Other striking examples of man's handiwork

might be quoted, but sufficient has been said to show that it is dangerous to trifle with nature. The dodo, the solitaire, and the great auk vanished from the earth because their enemies were more powerful than they. The gipsy moth in America, and the rabbit in Australia, prospered because they had no natural enemies in their adopted homes, and they were favoured, too, by climate and a plentiful food-supply.

II.

Every summer we are accustomed to read in our daily newspapers that the balance of nature has been upset. Certainly the information is not given to us quite in that form; it usually relates to a plague of caterpillars in some part of the country. Now it is the antler moth which is responsible for the trouble, now the cabbage white, our only harmful native butterfly. Again, the ermine moth, with its curious, tent-like larvæ shelters, or the lackey moth, whose egg-rings are common on the winter twigs of our fruit-trees, or the vapourer moth, the insect with the bizarre larvæ and the wingless females, may be to blame.

The damage caused by these and other insects has been recounted time and again; the reasons for their appearance in large numbers are less often considered. Usually the weather is presumed to be responsible for these visitations; many natural phenomena are ascribed to the weather, from the souring of milk to the spread of potato disease. Just as certain atmospheric conditions are favourable to the growth of milk-souring bacteria, or the fungi causative of potato disease, so are other weather conditions encouraging to insect life; but weather alone is a minor factor in the problem.

Arguing from the case of the gipsy moth, change of habitat would seem to be favourable to rapid numerical increase. In Europe the moth has never increased so inordinately as in the land of its adoption. The reason for its spread in America is not one of climate, however, but of practical immunity from all natural enemies. A ground beetle kept the gipsy moth in check in the Old World; but, the beetle being unknown in the New World, the moth was there left free to increase its kind unmolested.

This question of parasitic and predatory enemies is at the bottom of the majority of modern insect plagues. When enemies are plentiful, or present in reasonable numbers, the balance of nature is maintained; when they are few, their natural prey increases out of all bounds. Under the stimulus of a liberal food-supply, the parasites increase in numbers enormously; but they can only multiply at the expense of their prey, with the result that the following year sees a number of parasites with little or no food to meet their needs and the needs of their offspring. Then the pendulum swings in the other direction, and the next season is one of many insect hosts and few parasites; there is, in short, a plague of insects.

How does man contribute to these insect visitations? In his wisdom, he has contrived two methods of regulating the natural economy of the world around him—the slaughter of queen-wasps and the inauguration of the sparrow club.

Now, the wasp and the sparrow are not without guile; that must be admitted. The former has a sweet tooth, and takes its toll of the fruit-crop; the latter has been aptly termed the 'avian rat.' This, however, is one side of the question. There are few greater enemies of other insects than wasps; the queen-wasp is prolific, and her numerous progeny are fed, not upon honey, as with the bees, but upon flesh in the shape of insects. Exterminate the wasps in a district, and other insects, more harmful maybe, will fill their places.

The sparrow club is a more serious matter. The bag of the average sparrow club would make any ornithologist weep. Sparrows there may be in plenty; but warblers of all sorts, whitethroats, fly-catchers, tree-creepers, and other purely insectivorous birds swell the total. Anything brown is considered a sparrow by the petty sportsman seeking an excuse for wholesale slaughter. The sparrow club is a sham, and a dangerous sham.

Our knowledge of the feeding habits of birds is lamentably meagre; yet it is a question of the utmost importance, when everything possible should be done to conserve our food-supply. That the birds, in general, are our greatest allies in the fight with insects there can be no denying. In the aggregate, they destroy millions upon millions of injurious insects. A starling has been observed to visit its nest, when feeding its young, no less than three hundred and forty times in seventeen hours; a great tit fed its young more than three hundred and eighty times in the same period. Allowing for a period of twenty days from the time of hatching to the time of the young birds leaving the nest, it is clear that one brood of tits would consume between eight thousand and nine thousand insects. Many nestlings consume their own weight of insect food in twenty-four hours; in fact, it has been computed that a young robin will eat fourteen feet of caterpillar in twelve hours. As the rearing of young by the birds is going on all over the country from March to August, the destruction of insect life must be prodigious; and, for the most part, harmful insects are the more palatable. Even the sparrow feeds its young upon insects. If we destroy the birds we shall assuredly upset the balance of nature. They and parasitic insects are more effectual in the battle with injurious arthropods than any insecticide.

III.

Recognising that insect may be pitted against insect to man's advantage, certain entomologists have made deep and practical study of this newest branch of entomology. We use the word newest, because it is the most recent branch of the science to be taken in hand seriously. Its inception, however, dates back to 1602, when Aldrovandi, an Italian naturalist, discovered some parasitised larvæ of the cabbage white butterfly. Nearly a hundred years elapsed before another Italian, Vallisnieri, elucidated the phenomenon which had puzzled his predecessor. One of the greatest of the early authorities on insect parasitism, Ratzeburg, 'did not believe that insect control could in any way be facilitated by man'—an opinion, by the way, which is shared by many entomologists at the present time.

It is interesting to trace the history of artificial insect control from these early times to the present day, when ladybirds, used to control plant-lice in California, are dealt with by the ton, 'boxed in sixty thousand lots each, in screened cases and in special cold storage, run into a chute and handled like grain.' This stage has been reached in less than twenty-five years. The whole science 'is based on the fact that nature is in a state of equilibrium, that all life, in its native home, is kept in check by other forms of life which prey upon it.'

In an earlier article in this journal the story of the successful introduction of an Australian ladybird into America was told. That ladybird freed the orange and lemon groves of California from the destructive cottony cushion scale, an insect which must not be confounded with the totally distinct woolly aphis. At the present time the beetle is bred in large numbers in Sacramento, and despatched, in quantity, to any part of the state in which an outbreak of the scale insect occurs. The successful introduction of this beetle was not without its concomitant tragedy—a false step, of which the opponents of artificial or man-aided insect control have made much capital. Another American state, hearing of the success of the beetle, and being under the heel of another species of scale insect, applied to the authorities of California for a supply of the ladybirds, and of the cottony cushion scale for their nourishment till they became established. The scheme was well laid, but it went agley; for quite unaccountably the ladybirds died, and the cottony cushion scale, thriving in the orange-groves, became a worse pest than the insect its arch-enemy had been summoned to control.

In the case of moths there is a well-defined seasonal history, which is wanting in the scale insects. On this account they are the more difficult to control by means of artificially introduced parasites. They must be attacked in the egg, larval, pupal, and even adult stages. Acting on this fact, the American entomologists relied on a single enemy to control their scale insect; but they introduced a varied assortment of parasites and predators—no less than thirty-seven species—in their attempt to check the ravages of the gipsy moth. An abundant parasitic fauna preys upon certain insects; other insects, however, may support only a single species of parasite. Only when the host insects are practically identical in life-history and habit does the same species of parasite attack them.

'In a country where the conditions are settled, each species of insect is subjected to a certain fixed average percentage of parasitism, which in the vast majority of instances, and in connection with numerous other controlling agencies, results in the maintenance of a perfect balance. The insect neither increases to such abundance as to be affected by disease or checked from further multiplication through lack of food, nor does it become extinct, but throughout maintains a degree of abundance in relation to other species existing in the same vicinity, which, when averaged for a long series of years, is constant.'

Whatever one's opinions may be concerning the ultimate success of the new entomology, even its bitterest critics—critics who see in this latest phase of the science not a certainty of maintaining the balance of nature, but a grave risk of disturbing the equilibrium—are agreed that it is pregnant with romance. Thereby lies its danger, according to some.

The full story of the artificial control of insects, were it written, would be as absorbing as any work of fiction ever penned. Entomologists have scoured the earth in search of the natural enemies of pests which damaged their crops. They have measured the rate of progress of a predaceous beetle larva over a continuous period of seventy-two hours, and found that it travelled nearly ten thousand feet, at a maximum rate of almost five feet per minute. Such activity gave promise of slaughter in the field. They have fought, at times, a losing contest with hyperparasites, exasperating insects which prey upon the primary parasites, and so nullify their good work. They have even called fungi to their assistance, and by their aid spread disease among insect pests. Time alone will prove whether the new entomology, as yet in its infancy, will maintain or upset the balance of nature.

THE SEARCHERS.

By JOHN FOSTER, Author of *The Bright Eyes of Danger*, &c

CHAPTER XXXIII.

SUNLIGHT now flooded the Pass. In the valley the heat must have been sweltering, for the wind had fallen, and even at that altitude the rocks were warm to the touch. With the men carrying the spades and the picks, we stepped out briskly up the Larig. The air cooled as we mounted to the highest point of the Pass. Keeping the shoulder of Sron-na-Leirg on our left, as the paper enjoined, we struck into the wilds, and soon came upon trickles of water threading the waste. Two of these we followed until their junction (as the paper put it) with 'ane neybour water.' The 'Three trustie friends' was obviously a reference to some outstanding physical feature, but there was nothing of mark in the surroundings—nothing but sour-looking bog-land, with the everlasting granite thrusting its strong shoulder out at intervals.

Back we went for about half-a-mile to the source of a third stream, which we followed for a hundred yards or so, when it led us round a spur into a little defile. Keene-Leslie and I, in front, stopped dead in the same instant. The defile had widened into a cup-shaped hollow, and in the middle of it, straight in front of us and not two hundred yards away, there stood up, in sharp isolation from the débris scattered on the floor of the hollow, three tall, black rock-pillars.

'Look, Neil! What if these are the "Three trustie friends"?' exclaimed Tony.

The rest of the party overtook us, and I turned to Finlay.

'Has this place a name?'

'No, sir,' said he. 'But in the Gaelic they will be calling the big stones there'—pointing to the three singular rocks—"*Na tri bantrichean*," meaning "The Three Widows."'

Tony and I looked at each other.

'Salute our "Three trustie friends,"' I quoted, and, much to the mystification of the men, we doffed our caps.

Here was a discovery! This must be the spot indicated in Father Sempill's paper. We hurried forward, and in a few minutes were at the base of the middle rock. It was the tallest one, but its sisters were only a few feet short of it.

The directions in the paper were clear. From the tallest we were to pace its own height straight west. Duncan Ross, who was exactly six feet in height, was placed near the middle rock, and his shadow was measured. It was eight feet. The shadow thrown by the tallest of the three rocks was fifty-six feet in length. A simple calculation determined the rock's height, forty-two feet, which we measured from its foot due west by the compass. There we found a granite heap about four feet high, near the edge of the burn. It ran seven or eight yards along the top of the bank, and was roughly eight feet broad. The heap did not look very promising, but the instructions in the paper were explicit, and without delay we set to work to clear away the stones. Some of them were no bigger than slates, but others were great lumps which had been embedded for years. An hour's hard work revealed nothing except a bed of rock three feet down, as hard as ferro-concrete. We took turns with the men, sweating hard, but at our rate of progress a long day's work would have made but little impression on the stubborn heap. The great cicatrices on the slope of the hill showed that it was in the direct line of avalanches and landslides. The whole face of the place must have changed with the years, but it was clearly the spot indicated in the paper; and after a spell off, we set doggedly to work again.

An hour or two afterwards Tony and I were on the bank beside the burn, examining the strata of the rocks, debating whether an assault from the side might not give better results. All at once one of the men shouted a warning. We were just in time to get clear, when the stones in the middle of the mound bulged outwards, and a couple of yards of the formation collapsed and crashed down to the mossy ground below. In our apparently futile digging, a stone which had acted as a linch-pin must have been moved, and, the balance thus disturbed, the side of the heap had given way.

This was a piece of great good luck. Its result lessened our labours considerably, for the big stones were now loosened and more easily lifted. An hour's work cleared them out. Below them were a number of flat pieces of granite. Tony was pitching some of the smaller ones into the burn, when he suddenly ceased, and stood staring at something in his hand. It looked like a small discoloured and misshapen melon covered with mould, and I wondered why he wasted time in turning the uninteresting object round and round. Presently he went down the slope and dipped the thing in the burn, after which he scoured it carefully with sand and water, scraping the mould away. It was hollow, and when he held it up, little arcs of water, glittering in the sun, ran out from two holes in it.

'Catch!' called he, tossing it lightly to me.

I caught it, and almost threw it away again as soon as I touched it, a glance at it filling me with a strange mixture of repulsion and elation. It was a human skull.

'*Ossa humiliata!* Father Hamilton's grave!' Tony exclaimed, and pointed to the cavity, where more flat, thin slabs of granite lay in orderly sequence. Very carefully we raised them, and saw, protruding from a shallow layer of earth, the ribs of a skeleton. A few minutes were enough to enable us to uncover what had once been a man—the man who had died centuries ago in the storm in the Larig.

He must have been a small man—'of frail body,' according to Father Sempill—for the femur bone was slight, and the skeleton, without the skull, was scarcely five feet long. It lay at full length, a few wisps of rags clinging to the ribs; the finger-bones of one hand overlapping the other, between them a tarnished crucifix. It was not difficult to visualise the last scene: the dauntless priests, upheld by the simple courage born of faith and duty, watching their comrade dying; the last rites in the blinding storm; the laborious covering of the body with stones to guard against discovery by man or prowling beasts of the mountain; the two survivors staggering on into the blast. 'Here is blessed ground. *Exultabunt Domino Ossa Humiliata.*' The words recurred in their extremest force.

Under our directions the men lifted the skeleton out of the grave and laid it on the ledge. The stones on which it had lain were for the most part inconsiderable in size, but there was one striking exception. At the head of the narrow bed lay a large flat slab, the priest's pillow in his long sleep, and round it some lesser stones, the regularity of their places in the setting of earth suggesting that they had not come there by accident. I bent down and tried to move the slab, but the earth held it firmly. It required a couple of wrenches with the pick to turn it over, but when it came away I felt a sudden throbbing in my temples, for below it, bare of earth, was a flat surface, dark, except for a yellow scratch where the pick had glanced off it.

Tony's voice broke the silence. 'You have come to your own, Neil.'

My pulses quickened as I scraped the earth away from the sides and lifted the thing out. It was an oblong box, black with age; but a closer examination showed that it was made of brass, and on the lid was the Ciuin coat of arms. Any lingering doubt I had vanished.

It was locked, but the old rust-eaten hinges offered little resistance. The lid was easily wrenched open. On the top lay a cylindrical packet, six or eight inches long. I lifted it out, and drew a long breath, for below it was the top of a Latin cross, crusted with jewels. The cross had been snapped in pieces to fit the casket, and was studded with magnificent square emeralds. Underneath was a little silver ship, much tarnished, but of the most delicate workmanship, and bordered with gems, which afterwards proved to be superb black pearls. We found heavy gold candlesticks, a rosary, and another large crucifix, all inlaid with precious stones; two fine ropes of pearls; and the Scottish Lion exquisitely designed in sapphires on a tiny ivory shield. A smaller casket (like the larger one, with the Ciuin coat of arms on its lid) was full of jewels. To be exact, there were fifty-nine, and a glance was enough to show that in them alone there was a fortune.

The casket was now empty, but there still remained unopened the packet that had been uppermost. Its outer covering was of hide or skin of some sort, specially prepared with a waxen substance, which the years had hardened into a scaly integument. A sharp knife cut it open easily, and inside we found an old parchment in excellent preservation. It was a full inventory of the jewels. Enclosed in it was a little object, sealed at both ends, like a large walnut in shape, colour, and size. The seals were carefully broken, when the shell fell apart and disclosed a superb gem.

I held it up to the sun.

'The Leopard's Eye!' cried Tony.

And so it proved to be.

It was the last item—'This and None Other is ye Greate Leppard's Eye'—in the old inventory.

It was almost as large as a pigeon's egg, a magnificent chrysoberyl, the true Oriental Cat's Eye. After its dungeon life for some three hundred and fifty years, at its first startled meeting with the sun, the eye watched us like something alive, shining now with the wide unblinking stare of a beast of the jungle, now with a soft and mellow radiance, but always with a remarkable interplay of colour and sheen in a trichroism spun of delicate straw tints, light hazel, and rich amber, and with the wizard 'line' peculiar to the Oriental Cat's Eye gleaming in mysterious life. This 'line,' formed by minute striations in the gem, was unusually well defined, running vividly from end to end across the middle of the stone, like a restless impatient spirit, as the jewel's different angles leaped to the sun. It was beautiful, but the fancy seized me that it knew of dark secrets, and that at times a shadow touched it, as a baleful memory clouds a lovely face.

I laid the strange, fascinating stone on the ledge along with the glittering contents of the casket, and Tony and I glanced at each other. Heaven knows, we had talked enough about our quest; but now, at the moment of its sudden finish, the restraint which often seizes intimate friends at great moments fell on us. Although I knew that wealth and all it stood for were mine, the knowledge froze the springs of speech. Not a word did we exchange for some minutes, but fingered the treasures one by one, awkwardly, like a couple of children, the men standing, curious-eyed, a little distance away.

AN ENGLISH GIRL'S ADVENTURES IN TURKESTAN.

II.—SAMARKAND.

By FLORENCE FULLER-NEARY.

I.

THERE are certain cities, giant cities of the East, whose very name is an appeal to the imagination. They were capitals of great empires, centres of power and splendour and luxury. Each has risen, phœnix-like, on the ashes of its predecessor; and the first was Babylon, and the last Samarkand, the city of Tamerlane. Legend hovers over them persistently, and endows them with all that the heart desires. Samarkand is a link, almost the only link, with the great conquerors of the past, for even Baghdad preserves no shadow of the days of the Caliphs.

Like Mecca and Lhassa, Samarkand is a guarded and mysterious place, which, though its name is familiar to all, no one visits. In one of his books, Mr Stephen Graham claims to be the first Englishman to visit Turkestan since Colonel Fred Burnaby. But Colonel Burnaby's famous ride to Khiva did not take him so far to the eastward; and, from the somewhat perfunctory description that he gives, it would seem that Mr Graham's stay in Samarkand was not protracted. It was pleasant to feel, when we left Tashkent for Samarkand, that I was probably the first Englishwoman to enter that famous city. It has always been extremely difficult for a foreign subject to obtain passports to Turkestan; Samarkand itself is by law forbidden ground; and my own papers did not take me beyond Tashkent.

Before its capture by General Kaufmann in 1868 Samarkand was lost to the Western world. In an article in the *Quarterly Review* of 1820, on a history of Asiatic discovery, it is said that since the visit in 1403 by Clavijo, ambassador of Henry III. of Castile, no European had entered Samarkand. Clavijo was entertained by Tamerlane at a banquet, magnificent as the feast of Belshazzar, where the king and his nine wives drank from great cups of gold, set with gems. The Castilian speaks of the glory of the streets and the gardens. The population was at least two hundred thousand, and outside the city itself were mansions and villas, built amid the network of canals that watered the rainless country. 'Of its present state,' says the reviewer, 'we know no more than of the capital of the Grand Lama.'

The city is built on the banks of the Zarafshan, one of the great inland rivers of central Asia, which rises in the Kok-Su mountains, and is eventually lost in the desert sands near Lake Kara-kul. It stands on the edge of a wide plain, at the foot of low hills, behind which rise the jagged summits of mountains. Samarkand is one of those fertile places, set in the midst of the desert, where men have ever congregated, and in Oriental tradition it is one of the four Terrestrial Paradises. In ancient days it was called Maracanda, and was capital of the province of Sogdiana. It was destroyed in 329 B.C. by Alexander the Great, but it was soon rebuilt, and then appears under the name which it has borne ever since. In the tenth century, in the golden age of Arabic culture, it was the royal residence of the Moslem Samanids, and became one of the centres of learning and civilisation. In 1220 it was captured and sacked by Genghis Khan, who deported to China thirty thousand of its skilled craftsmen; but it appears to have saved itself from utter destruction by paying an indemnity of two hundred thousand pieces of gold. Its size in those days may be gauged by the statement in the contemporary histories that the army which it gathered for its defence numbered one hundred and ten thousand men.

But it was under Tamerlane and Ulug-Beg, his grandson, that Samarkand attained the zenith of its fame. The great Tatar emperor took the city in 1369, and at once made it his capital. He swept through the East, burning and destroying, and all the vast wealth of his pillage was brought to this city. There, to the present day, stand the great buildings which he and Ulug-Beg built to embellish their beloved city and to perpetuate the memory of their own greatness. After its capture by the Uzbegs at the beginning of the sixteenth century, it steadily declined; and in the eighteenth century, when it was probably under the Chinese, it was almost deserted. Then it was annexed by the Amir of Bokhara, from whom it was finally wrested in 1873 by the Russians.

II.

We arrived at Samarkand towards evening, when the light was fading, but before the setting of the sun. The city has been spared the desecration of a railway station, and the line passes about a mile from the town. We drove in a rather dilapidated carriage along a straight road, very dusty, which led through fields and orchards and gardens.

The Russians have laid out at Samarkand, as at Tashkent, a European quarter, and here we found a hotel, unpretentious, but clean and comfortable. The head waiter was an Austrian prisoner whose brother was interned somewhere in England. But the European quarter is smaller—much smaller—than at Tashkent, and the city is essentially Oriental. The hotels, offices, and shops, which make up this European settlement, are to the west of the main town, and divided from it by the big citadel, a new building erected in 1882.

We went out early the next morning and explored the maze of winding streets, so narrow that two laden camels could hardly pass. The walls of the flat-roofed houses are square and unbroken, except for occasional window-slits, hardly bigger than archer loopholes in a medieval stronghold. The streets are unpaved and very dusty, and not so clean as those of Tashkent, with its system of canals. However, we soon found our way to the enormous Rigistan Square in the centre of the town. Hundreds of scantily clad natives were sitting on the ground with baskets of bright-coloured fruits—peaches, apples, grapes, figs, and melons—in front of them, and though no one seemed to buy, all the time they were shouting the price and the quality of their wares. Three sides of the square were formed by buildings whose façades were covered with bright mosaics and intricate carvings. They were of all colours, gold, and red, and green, but above all the purest turquoise blue. On the right of the square, from where we entered, was an immense gateway, worked with mosaic. In the middle was a huge pointed arch, bricked in at the back and pierced by a single door leading into a courtyard. On either side of this immense portal is a great carven column towering well above it. The brightness of the mosaics at first hides the signs of age and defacement, but the columns lean slightly, and two great lions wrought in gold-leaf that glare at each other across the arch are disfigured by time and the vicissitudes through which the city has passed since this wonderful building was completed, more than five centuries ago. The buildings around are the three colleges founded by Ulug-Beg, the grandson of Tamerlane, who was to Samarkand what Solomon was to Jerusalem—the art-loving successor of the grim warrior to whom the refinements of peace were impossible. He founded these colleges not only for the training of priests, but as a university where astronomy and mathematics could be studied, and Samarkand again became the centre of Eastern learning. All trace of his observatory has been lost, but these colleges, or *madrasahs*, are now the great Mohammedan seminaries. We procured a Sart guide, who took us through the great archway into a stately courtyard. Here we were allowed to look inside (but not enter) an empty hall where the students are taught in the winter-time.

We spent half-an-hour there, and when we came out into the square the din was greater than before. The natives seemed to arrange themselves in little groups, but so thickly were they clustered, and so animated were their voices and gestures, that it was with the greatest difficulty that we made our way through them. I asked our guide the cause of the commotion, and, to our amazement, he informed us that they were telling each other fairy tales. We re-entered our carriage, taking with us our Sart guide, and drove through the winding streets of native shops until we came right outside the town. Then we stopped at a building like a mosque, called Char-Zind, which stands quite alone on the slope of a bare hill. A number of white-robed Sarts sat on the ground at the foot of a flight of stone steps, under the shadow of a squat tower, carven, and closed in with a domed roof. From the outside it was a long building, or, rather, a succession of connected buildings, with many of these carven towers. I thought at first that we should not be allowed to enter, but our guide said something in his native tongue, and they let us pass. We went up several flights of steps, along a narrow corridor, and came to small landings where on either side was a little cell containing two, sometimes three, tombs. All the walls and ceilings were wrought with the same blue mosaic that had predominated on the walls in the Rigistan Square. This great mausoleum, our guide told us, contained the bodies of the wives and the children of Tamerlane. The building is chipped and battered, the bombardment by General Kaufmann having done more damage than the passage of five centuries. Pigeons make their nests in the burial-places of these princesses and royal children, and ghoulish robbers have broken some of the marble sarcophagi.

At length we came to the entrance of a mosque that stands on the crest of the slope. Here, too, our guide took us, after removing his shoes, and carefully wiping ours with a cloth that he found at the door. This was the only mosque, except that containing the tomb of Tamerlane, that I was ever permitted to enter. Inside, the light was very dim, and at first I could only see that the square walls were bare, and that in the centre of the roof there seemed to be a high dome. There were no lamps burning, and light came only from a few tiny windows. Then, as my eyes became accustomed to the darkness, I could descry on the walls a few strange decorative designs, and Arabic writings which faithful pilgrims had brought from Mecca. In one corner was a pole, covered with pieces of ribbon and embroidery, offerings of the Mohammedan women who come there to pray that Allah will send them a son, and not a daughter. Then I saw in another corner praying figures. So still were they that at first I thought they were carved in stone. Then one of them slowly rose to his feet, and with bowed head walked towards the doorway. It would seem, as one watches Mohammedans at prayer, that for a while their very life departs from them. It is a breathless, unmoving absorption that would be impossible to a European for more than a few seconds. Beneath the grave and gentle immobility of the priests and the devotees there is still the sweeping fanaticism that once carried the arms of the Prophet in triumph over Christian and pagan lands. On our way down

the guide told us to give some silver to the priests for candles. I slipped a little money into the hand of one of the white figures seated at the gateway, and he at once rose and bowed to us with dignified courtesy.

III.

The next day we drove through the noisy bazaars to Gur-Amir, a beautiful college with the mosque that contains the tomb of Tamerlane. After a short stretch of dusty road, we approached a peaceful courtyard planted with tall trees. There was a quietness in this lovely retreat like the calmness in the close of some English cathedral. We had left all the dust and the noise and the bustle far behind, and were now in a place where time and change were not known. It was the very embodiment of Oriental repose, with its atmosphere of wisdom and peace and seclusion. Here, too, were silent priests in white robes, sitting on the ground, lost in prayer and contemplation. However, after a pause, one of them rose and came towards us, and then showed us round the building.

The tomb itself, and the mosque enclosing it, have the grandeur of perfect form and perfect simplicity. It was dim and unlighted, a very high building, rather longer than it is broad, and the flat roof broken by the blackness of a semicircular dome. Right in the middle is the long, narrow tomb, an uncarved block of green marble, the colour of jade. On each side is a similar block, about half the size, marking the resting-place of a favourite wife and daughter. The walls of the mosque are of dark stone, but the first four feet from the floor are paved with the same glistening substance from which the tombs are made. The walls are flat and bare, except for a few weird arabesques of gold and turquoise. At the head and at the foot of the tomb was a tall pole, hanging from the top of which was a kind of crest, like the long tail of an Arab war-horse. Our guide told us that these were not the real tombs, but that the bodies were in a crypt below. He lit a small lamp and opened a trap-door, and we followed him down narrow steps into pitch blackness.

We were in a low chamber of the same length and width as the mosque above. In the centre were exact replicas of the green marble tombs we had already seen. It was a cold and eerie place, and I had followed our guide with sudden fear as the darkness swallowed us up. All at once the sense of our helpless isolation seized me. We were in a place never before seen by Western eyes, and, as at Tashkent, a feeling of unreality came over me, as though the phantom of some land of enchantment had materialised, and I, unwittingly, had wandered into it. We were in the forbidden city of Samarkand, in the secret tomb of Tamerlane the Great. I looked at the white-robed priest, as he stood by the tomb holding the little Eastern lamp above his head. His face was covered by a long beard, but his eyes, sombre and expressionless, seemed hard as the eyes of an Inquisitor. We were in his power, unbelievers and enemies of the Prophet. I wondered what secrets and what strange rites those orbs that regarded us so fixedly had rested upon, and visions of all the mystic horrors of Eastern religions rose vaguely in my mind. All the time I took care to keep between him and the narrow steps that led to the trap-door. He asked us, speaking a quaint dialect of Russian, to place a piece of silver, for candles, at Tamerlane's head and foot, and when I had done this, we moved to the entrance.

We visited other tombs and reliques of the past. There was the audience-hall of Tamerlane, a long building, carved within and without, and surrounded by a colonnade of pointed arches. There is at one end a great slab of green marble, the Kok-tash or stone of justice, on which the throne of Tamerlane was mounted. The audience-hall is on the rising ground west of the city, where the Russians have constructed a citadel. We also saw the blue-domed mosque built over the grave of Bibi Khanum, the most beloved wife of Tamerlane.

Although a great part of Samarkand consists of crowded and narrow streets, there are many fine houses set in the midst of beautiful gardens. The grounds are laid out in formal style, with fruit-trees, and fountains, and gravel paths between beds of red and yellow roses. There are numbers of shaded avenues, and from the distance the city seems almost buried in masses of foliage. Fragments of the old wall may exist, as at Oxford and Chichester, but, as in those towns, it is hidden among houses and gardens that spread out into prosperous suburbs. Also, the population is given as only about one-third that of Tashkent, whereas to me Samarkand seemed quite as large as that town.

There is a calm beauty, worthy of its name and tradition, that cannot fail to make the deepest impression on all who visit Samarkand. It stands, as it did in the days of forgotten empires, a rare jewel, set in a desert land. The river flows past it, feeding now, as in remote ages, the canals that water its fields and gardens and vineyards. It is a city of learning and religion, for the two hundred and forty mosques and the forty-three colleges create the peaceful atmosphere of Samarkand, and the noisy bazaars are only incidental to its life. As at Oxford, there are buildings, unique and beautiful, where for centuries the abstract wisdom of the past has been taught without heed of the changing life beyond its cloisters. The spirit that in England pervades our own centre of scholarship is also found in this ancient city of Asia.

[It should perhaps be explained that in the preparation of the two articles descriptive of her personal adventures, Miss Fuller-Neary has had the assistance of Mr B. T. Barrett.—EDITOR C. J.]

MISS BULLEN'S LACE.

By HEADON HILL.

I.

I AM advised that the door is banged, bolted, and barred against the war story henceforth and for evermore; but as the incident here related is not fiction at all, but sober, solid truth, I venture to write it down, despite the fact that if there had been no war it could never have happened. It is a mere by-product from the great crucible, and as such I offer it, perhaps actuated by an old man's vanity.

When the tocsin sounded in August 1914 I was living in the country, sixty years of age, and engaged in the most peaceful of pursuits. Having been a soldier in my youth, I was annoyed that age and rheumatism rendered me worse than useless as a fighting-man, and for a month I led my small household a pretty dance. Then, suddenly, it was brought to my notice that there was an opening for brains as well as brawn, and that as a proficient in three European languages I possessed the necessary qualifications. Within a fortnight I was spending my days in a Whitehall office, censoring letters.

The work was interesting, and every now and then exciting, when one's suspicions were aroused by some trick of phrasing or penmanship in the correspondence that passed under scrutiny. What vexed me was that I never knew the result of what it pleased me to consider was my acumen. I was not told whether or no my censorial nose had followed a true scent. It would have been so much more satisfying to be assured that the writer or the recipient of the doubtful letter had been shot at dawn in the Tower Ditch.

I had been at it six months when, by an almost incredible coincidence, I was enabled to lay my own hand on the spokes of the wheel for a brief spell.

In the ordinary course I one morning opened a postal packet addressed to a German civilian prisoner in an internment camp. The name on the envelope was, let us say, Herr Fritz Schubert. On extracting the contents I found that they consisted of a letter and the photograph of a good-looking young woman in a low-cut evening dress. After a casual glance at the picture, I laid it aside for the moment and carefully read the letter.

It was a very ordinary communication in English, signed Gertrude Bullen, and dealing with the state of the weather and the health of the writer, both being described in prosaic terms, without a spark of vitality or warmth. It was, I think, the lack of all intimacy or of any compelling interest that caused me at once to read the letter through again. On this second perusal I was struck not so much by what the letter contained as by what it omitted.

In the first place, there was no address; in the second, there was no reference to the enclosure, unless it was hidden in some cryptogram of the wording or concealed on the blank spaces of the paper by the cruder device of 'sympathetic' ink.

We had our own methods for detecting such tricks, and presently I would have them applied, but it remained to subject the photograph, so unsung and unheralded, to a closer scrutiny. I took it up again, and fixing my gaze on the face that stared at me from the cardboard, made an amazing discovery. The features of the pretty lady were perfectly familiar to me. I had seen them, and admired them from a distance, every day for the last two months.

On coming to London I had taken up my abode in a Bloomsbury boarding-house, and the original of the photograph regularly passed the window of the dining-room as the inmates sat at breakfast. I was not alone in my admiration for the aloof beauty of the early wayfarer, my younger fellow-boarders singing her praises in terms which would have been foolish in one of my years and more or less venerable appearance. There was also much speculation as to where the charming young lady hailed from, and what was the goal of her daily pilgrimage.

One of the more adventurous spirits had soon solved both these points. She lived in the same street, and only six doors higher up, in a similar establishment to our own. Discreet inquiries, the nature of which our informant did not particularise, had revealed the fact that her name was Miss Bullen, and that she was employed in a city office as typist.

With the idea of what I meant to do slowly shaping in my mind, I locked the photograph in my desk, and took the letter up to the laboratory, where suspicious letters were submitted to photographic and chemical tests. Two hours later it was returned to me with the report that nothing had been detected in the way of hidden writing. Miss Bullen's dull screed then spent the afternoon in the room of our champion code-decipherer, with the same negative result. It came back to me just before closing-time, with a curt statement on the accompanying slip that the expert had been unable to detect any sign of a code in the words or characters employed by the writer.

I locked the envelope away beside the photograph, and, with the letter in my pocket-book, went home to Bloomsbury.

II.

The amenities of the boarding-house dinner that night seemed more than usually tedious, but the horrid meal ended at last, and, slipping out of the house, I made my way to the rival establishment six doors off.

It was on the very threshold that I encountered what, at the time, I took to be either a happy omen or an amusing coincidence. My ring at the bell was answered by an obviously undesirable alien, a slovenly man-servant, who had probably passed muster as a "Swiss," though his brutal brows and sloping chin simply clamoured for barbed wire. He was of the type common enough in London boarding-houses before the war, appealing to landladies by their indifference to wages.

'Does Miss Gertrude Bullen live here?' I inquired.

The fellow did not reply, but scowled at me ruminatively.

'You heard what I said?' I brought him to book sharply.

'Yais, Miss Bullen, she live here,' he answered.

'I want to see her. Tell her I've picked up something belonging to her.'

He gave me another dour look, but motioned me to enter, and showed me into a sort of anteroom off the hall. The tinkle of a piano upstairs told that the boarders had finished dinner, a fact suggesting that I should not have long to wait. The surmise proved to be wrong. It was nearly a quarter of an hour before Miss Bullen came in rather breathlessly.

'I am sorry to have kept you, but I was playing bridge,' she said. 'I hear that you have found something of mine.'

An undeniably handsome woman, this denizen of the neighbouring boarding-house, and it struck me that she was holding the weapon of personal charm in readiness in case it should be needed. I was conscious that she was regarding me with a friendly gaze which, while it veiled a keen scrutiny, was capable of being converted into a genuine 'glad eye' without much effort. And I had sense enough to recognise that that masked battery of mixed calibres, turned on an elderly gentleman with white moustache and eyebrows, hardly made for sincerity.

'Yes,' I said, fishing out the letter. 'It doesn't seem important, but as I live close by I thought I would bring it round.'

She almost snatched the letter, glanced at it, and broke into a silvery little laugh.

'But I don't understand,' she said. 'My address is not on it. How did you find me?'

'One of my youthful fellow-boarders supplied the deficiency,' I replied with a bow. 'A young lady of your attractions cannot expect to hide her light under a bushel.'

She frowned as she pondered this, and then she asked suddenly where I had found the letter.

'I picked it up in the street,' I lied.

'Just as it is, without an envelope?'

'Just as it is. If there had been an envelope I could have posted it to the address.'

'Of course, you would have done that,' Miss Bullen readily assented, as if paying tribute to my gentlemanly instinct. "Would you mind telling me just where you picked it up? You see, the friend to whom I wrote must have dropped it, and I should like to call him over the coals for his carelessness.'

The fine eyes grew a shade harder as they searched mine.

'I picked it up in Russell Square, just off this street,' I lied again. 'Might I suggest that your friend was on his way to see you when he dropped the letter?'

This was intended for a trap, since I knew that the 'Dear Fred' to whom she had written was interned in a northern county. It was possible, I thought, that she might give herself away by accepting my theory. Nothing of the kind. This was a lady for whom it was vain to set snares of such amateur devising. She waved the suggestion airily away.

'It could not have been that,' she declared. 'My friend has not been in London for a considerable time. To be quite frank,' she added, laughing again, 'he is an unnaturalised German, and is very properly paying the penalty for his oversight by suffering durance vile in Yorkshire. He is quite a harmless creature, and I saw nothing wrong in sending him a line, with my photograph. You didn't see the photograph, I suppose, knocking about in the gutter?'

I echoed her laugh as naturally as I could. 'If the photograph was in the gutter, it did not catch my eye,' I replied. 'As there was nothing in the letter about a photograph, it did not occur to me to look for one. Well, I mustn't keep you from your bridge. Good-night, Miss Bullen.'

She was nearer the door of the little room than I was, and she stepped out into the hall. 'Good-night, and thank you so much,' she said. 'The man will let you out.'

She ran upstairs, and I turned to the front-door. It was promptly opened for me by the beetle-browed servant, who was standing ready. The door was slammed behind me, and I embarked on a short walk—during which I believe I was nearer death than I shall ever be till the real call comes.

III.

I had come to two conclusions from my visit. The first was that Miss Gertrude Bullen carried too many guns for the like of me, and that she had seen through my suspicions of her. The candid avowal that her friend was an interned German pointed unerringly to that being the

case, and to its having been made as a species of bluff. If I had been taken at my surface value, the avowal need not have been made at all, there being no hint by name or otherwise of any German taint in the letter. She must have suspected that I had seen the envelope as well, and her bold declaration was aimed at leading me to betray that fact. I wondered if my facial expression had withstood the assault. Whether that was so or not, I was conscious of a more serious flaw in the fictitious case I had presented. I had fairly given myself away in the matter of the photograph. While denying all knowledge, I had practically confessed not only to having seen it, but to having traced her by its aid. Without it all the information gleaned by my fellow-boarder would have been all but useless, because, but for the picture, I could not possibly have told that the letter had been written by this particular Gertrude Bullen.

The second conclusion was that the secret communication to 'Dear Fred' was hidden in the photograph at present reposing in my desk at the office. I argued this from the fact that she was wearing the same low-cut bodice, but with this difference—the fluffy lace corsage which she had worn for the sitting had been removed. Did this mean that, when she had confronted the camera, the lace had served a special purpose?

These questions had hardly taken shape in my mind when I came to my own boarding-house, and turned sharply to mount the short flight of steps to the front-door. My change of direction must have surprised the individual who had followed me. He had evidently assumed that I was going farther, where I should have fared worse, for his dagger missed my back by a hair's-breadth, striking the area railing with a metallic clash, and clattering into the basement below.

Wheeling round, I saw clearly by the light of a near-by street-lamp the beetle-browed manservant from six doors higher up. I raised my fist at him, but, weaponless, that was not his way. Growling a guttural curse, he fled up the street, with enough Hun cunning left to direct his flight in the opposite direction from his place of abode.

IV.

I was early at the office next morning, and again sought the laboratory where photographic and chemical experts toyed with treachery. They were a little tired of me, I think, after the abortive task I had set them the day before.

'What maggot is biting you now?' the head of the department asked as I handed him the photograph of Miss Gertrude Bullen.

'I want that photo enlarged to its utmost capacity,' I replied. 'You will find a message in the lace, which, though invisible in the original, will appear in the enlargement.'

'You are very confident,' said the expert.

'Naturally, since that pretty lady tried to have me murdered by a compatriot last night because of my discovery,' I replied; and I detailed the dangerous game I had played.

'But, my dear fellow,' the expert protested, 'this charming young person and her accomplice will have taken to wing hours ago if there is anything in all this.'

'Probably,' I said; 'but their flight is not likely to carry them far. Before I went to bed I took the liberty of communicating with Scotland Yard on the personal matter. The police will effect an arrest the moment they have the corroborative evidence hidden in that lace.'

The superior person caved in.

'In that case,' he said, 'there is a quicker way than enlarging the photograph, though that, of course, shall be done too. I mean the method by which the recipient would have read it.'

He took up a magnifying-glass the size of a small frying-pan, and, after a minute's scrutiny, got busy with pencil and paper.

'You've done it,' he said, handing over the result. 'The message is woven in the lace, and they didn't even trouble to code it. Herr Fritz Schubert, you see, being a valuable spy, was to be assisted to escape, and this gives him all the necessary pointers.'

'Thank you very much,' I said meekly. 'I will phone the police to go ahead. I had thought of chucking censorship, but now I shall carry on for a bit.'

AT DUSK.

WHERE the paven streets go down
To the edges of the town,
Where the long white roads begin,
Leading far from stress and din,
Look! he beckons us away,
Floating in the shadows gray.

Where the paven streets arise
To the starry evening skies,
Where the long white roads begin,
Leading far from toil and din,
Winding through calm hills of night
To the round moon, distant, white,
See! he beckons us away,
Up there in the shadows gray.

Far away from din, from noise,
Banging guns and shouting boys,
Clattering cart and jolting car,
Out to where still places are—
Country places, lonely, calm,
Hazy in the evening's balm—
Look! he beckons us away,
Beckons 'mid the shadows gray.

And a song blows through my ears,
Throbbing mirth, yet throbbing tears,
And a mist floats in my brain
As I see him, here, again,
Beckoning—where the streets go down
To the edges of the town,
Beckoning—away! away
To the wild at close of day!

Chambers's Journal
SEVENTH SERIES

STOLEN GUESTS.

By ALBERT G. MACKINNON, Author of *Hospital Jock.*

CHAPTER I.—THE DISEASE.

MISS MARY SMITH suffered from an incurable disease. At least, it would be incurable so long as she continued the method of treatment she had adopted. She was afflicted with *shyness*, and had banished herself to the remote Highland parish of Auchinbruich.

In her heart of hearts she yearned for a little human society, and yet she fled from it. Once she had been a poor relation, and it was during those years that she had developed that shrinking timidity which was the bane of her life. Then her relatives, one by one, began to die, and all in turn left her their possessions, until now she was no longer poor—except in friends.

She was tired of wills and bequests to 'poor dear Mary,' and only wished that her kinsfolk would show their regard for her by remaining alive and cheering her with their presence, instead of putting their pity into a codicil. Her uncle had really done her the cruellest turn of all by leaving her his pretty little Highland cottage, so far away from everywhere. In an evil day she had gone to visit her new property, and she had never had the courage to face the big world again.

Auchinbruich was the very last place in which she should have buried herself, for it simply bred the microbe of shyness. When she came to the parish she was in a pretty hopeless state, and her few years there had rendered her recovery well-nigh impossible. She could count on her fingers all the people, her equals, to whom she had spoken during that time. Yet she had not been idle. She had made a really charming home of her Highland cottage. She was gifted with extremely good taste, and her drawing-room was 'a perfect dream.' All it lacked was some one to appreciate and admire it.

Janet, the cook, certainly remarked every time she entered it, 'It aye makes me think of a fairy palace, whateffer.'

But then such abodes had always a prince and a princess and a host of lesser spirits to enjoy their beauty, whereas Auchinbruich Cottage wasted its sweetness on the desert air.

True, in an act of desperation Miss Smith had purchased a motor and engaged a good chauffeur—but only to take her excursions farther into the mountains with her lunch-basket and her dog.

On this particular morning she was surveying the work of her hands with supreme satisfaction. She had just arranged the flowers in their vases. Never before had she blended such perfect colouring. Then she sighed, 'How I do wish some one would only call!'

But, of course, that was a vain desire. Her nearest neighbours were many miles away, and she had never returned their visits.

Just then the telegraph-boy came riding on his bicycle through her gate and up the avenue. He actually had a little brown envelope. Instinctively Miss Smith began to count over in her mind all her relatives. Were there any that were not yet dead? Did this mean that she had lost another kinsman, and inherited another legacy? No, she could think of none, except her second cousin Marion, who lived in London, and was 'not the dying kind,' or at all likely to leave her a single sou. Once in the days of Miss Mary's poverty this same cousin had patronised her, and taken her into her home to act as nursery governess to her nieces. The memory of those months was a nightmare now. What snubs, what reproaches, Mary's tender little soul had endured, until one day her prosperous cousin happened to come upon her talking to a certain young man! It was the first and only time she had ventured such a daring deed, and it was a bit of the most wretched ill-luck that she should have been discovered in the very act by her cousin. The latter had a fit of righteous indignation, and had turned poor Mary out as unfit for the charge of her nieces. No, this message could not be from Marion, her one and only surviving relation.

With nervous fingers Miss Mary Smith tore open the envelope, while Janet and Margaret, the cook and the housemaid, loitered in the hall; for nothing so sensational as a telegram had come to the cottage for many months.

'General and I arrive by last train from south to-night. Please send car to meet us at station. Can stay a week if convenient.—JACK WRIGHT.'

Miss Mary read the telegram several times

 [*All Rights Reserved.*]

before its meaning penetrated her amazement. Guests were coming. Whoever they were, she would have to put them up for the night—there was no hotel or other house within miles. By the time she had completed her sixth perusal of the message she was wonderfully calm. After all, she was made for emergencies. This was really the first big one that had ever come into her life, but she rose to the occasion with a clear head. She was conscious that her staff was waiting impatiently for some inkling of the news, and she had a duty towards it.

Surprised at her own coolness, she turned to the maids and remarked in a tone quite unperturbed, as if it were an everyday occurrence, 'A nephew, who is bringing a general with him, will arrive to-night by the last train, and will probably spend a few days with me. We 'll put the dinner back to half-past eight. Tell Macleod that he must have the car ready to go to the station. And, let me see, Margaret,' she added, addressing the housemaid with deliberation, 'we will give the general the front spare room. He can use the adjoining one as a dressing-room. We will have the door between them unlocked. The bedroom at the back will do for my—er—nephew.'

Only for a second did she waver over the word, so subtly did deception bait the hook; but already Miss Mary had made up her mind that she was going to take possession of these stray guests.

She was a born hostess, though not till that moment had she discovered it. What a pity that such gifts should remain unused! This was the very first opportunity she had ever had of displaying her arts as an entertainer, and she was not going to let it pass. Never had hours been happier or busier. She knew instinctively just what kind of dinner men would like after coming off a long journey, and she was a clever cook. It seemed as if her whole life had been a preparation for that hour. Janet was flurried, but not so her mistress. Nothing was forgotten. It was wonderful how well stocked Miss Mary's larder was—just as if she had been expecting guests.

She had time to go into the garden and select flowers for the bedrooms. How pretty the general's room looked when she had added the finishing-touch that filled it with the beauty and sweetness of summer! Very carefully she made a selection of a few books that might especially interest him, and placed them on a book-shelf near his bed, with a small lamp on a table close by.

Amongst other things, her uncle had left her in the house several boxes of the choicest cigars, which he had received as presents from sundry potentates during his travels in the East. His wine-cellar, too, she had hardly ever opened before. Thus the preparations for the coming guests proceeded apace.

At last the motor rumbled off, well laden with rugs and cushions, for, though it was midsummer, the nights in the north were chilly. Then Miss Mary bethought herself of evening gowns. She knew how to dress to perfection. There is a zest in doing things when one feels certain of appreciation, and notwithstanding that Miss Mary had never seen this mysterious Jack or his friend the general, she was convinced that they would admire her gown.

As the hour approached for the return of the motor, Miss Mary had to confess to a little flutter at her heart. What if her guests had already discovered their mistake, and refused to come farther than the station? She would have to eat her tasty dinner all alone, as she had done during those many years. The very thought gave her a distaste for the dishes upon which she had expended so much trouble. All her decorative art would have been in vain. As she waited impatiently she felt a sinking at her heart, an overwhelming sense of solitariness. Just as she was escaping from her past, it seemed to rush on her again. Now that she was really going to have guests, how lonesome her days appeared!

At last she saw the lights on the road. The motor was coming bounding along as it had never done before. It was certainly not Macleod's driving. She took heart at the sight. The car swung into the little avenue and flew up to the door as if on wings. There in the front seat, with his hand on the wheel, was a young officer—just a boy by the look of him; and inside—yes, there was the figure of the general. The cooking had not been in vain.

With a sigh of relief Miss Mary stepped forward. She had mastered her shyness by a supreme effort. She had said to herself with determination, 'I have allowed it to ruin my life up to now, but for the next few days I will bid it defiance.' Besides, it is easier for a woman to be brave in the presence of men, if no other of her kind is watching and criticising.

CHAPTER II.—ITS UNEXPECTED TREATMENT.

THE khaki-clad driver was over the side of the car in a second, and holding her hands in his.

'Well, aunty, here we are!' he exclaimed. 'But, I say, what a ripping car you have got! I hope you will let me drive it while I am here.'

'Of course, Jack,' she answered quite naturally, acting with perfect ease the rôle thus assigned her (the very rôle, fortunately, that she herself had determined to play). 'I see you are an accomplished chauffeur. You must take us out every day for a run.'

Meanwhile the figure inside the car was divesting himself of his rugs.

'Come, aunty, I must introduce you to my friend, General Cockburn Davidson.—He's a jolly big gun, you know,' Jack added in a whisper.

'General, here is my aunt, Miss Smith.'

The senior officer had stepped out on to the gravel path. Certainly he had a most distinguished bearing—every inch a general, thought Miss Mary to herself. Really a young old man, he carried himself well, though many campaigns had left their furrows on his face.

'It is awfully good of you to invite me with your nephew,' he said, as he took the hand of his hostess. 'What a charming spot you have here amongst the mountains! It is just the kind of place I have been searching for, far away from anywhere. I hope you get no mails here.'

'Just once a day. We always receive our morning paper in time for dinner,' she answered with a smile.

'That's ideal,' said the general. 'I want to forget that there is an outside world, and I think I can do that here.'

Miss Mary was conscious that already her gown had made an impression; but it was not until twenty minutes later that she got the first direct compliment. Jack had finished his toilet much quicker than his senior officer, and came bouncing into the drawing-room, then stopped amazed. It was not a large room, but it was really perfect, and there in the centre was Miss Mary, a vision in pale blue and white.

'I say, aunty, I never knew you were so lovely before,' he blurted out in his exuberance of spirit. 'I remember long ago, when I was a kid in Australia, seeing a photograph of you in my mother's album; but it did not impress me then, and I had not the faintest idea you were like this.'

There was admiration in his tones, and that gave Miss Mary confidence.

'A woman's appearance changes so much with the fashion of the moment. Possibly I wore my hair quite differently in the photo you saw. Now, we have a great deal to talk about. You must tell us all that you have ever done. What a distinguished-looking man your friend is, Jack!' remarked Miss Mary, as if she had known this young man from childhood. Her disease of shyness had suddenly been cured.

'Rather!' replied the youth. 'He is one of our crack generals on the Western front. I had the greatest bit of good luck last year. The general got wounded in the big German offensive. We were being pushed back, and he would have fallen into the enemy's hands if I had not managed to carry him in. He has taken a fancy to me ever since, and had me staying down with him in his rooms at Hove. At first when you invited him he did not feel like coming north; but I think he is jolly glad already that he has come. He is charmed with this place. He said to me just now that he had never seen a prettier bedroom in all his life.'

'In his rooms? Has he no house of his own?' she asked in surprise.

'No; he "baches." You see, he has been all over the show, and has never had time to settle down.'

'Or marry?'

'No; he is not that kind. He is a born fighter—though I think he ought to be getting a little tired of it by now. There is no war, however small, that he does not seem to have had a hand in. To hear him talk makes one feel how shocking one's history is. He mentions all kinds of scraps one has forgotten about. You will enjoy his company, and I am certain that he will yours—though he told me that he did not care much for women. The thought of meeting you almost kept him from coming north, and it is only because I pressed him that he came.'

'I am glad that you won your point. Now, I want to give you both a good time while you are here, so you must just tell me what you would like best to do.'

At that moment the general entered. Miss Mary noted with admiration how graceful his figure looked in his well-cut evening clothes; while he could not hide his appreciation as he glanced round the room, and then rested his eyes on his hostess. The gong sounded, and Miss Mary, conscious of victory in the drawing-room, led the way to fresh triumphs round the dinner-table.

'I know what you would like to do to-morrow,' she said between the courses, just as if she had a thorough acquaintance with men and their tastes.

'I am sure you are going to suggest something nice,' responded the general.

'A day's fishing,' she replied. 'I know a splendid pool for trout about ten miles from here. We shall start in the car after breakfast, and take lunch with us. You gentlemen will find rods and everything in the gunroom, and we shall have a splendid basket of trout for dinner.'

'Ripping!' exclaimed Jack. 'And, I say, aunty, you have hit the bull's-eye so far as the general's tastes are concerned. He was just asking me if I thought we could get any fishing about here.'

'Really, Miss Smith, I fear you are going to spoil us,' added the general.

And if ever two men were spoiled, these two were the next day. The weather joined in the conspiracy; the sun smiled its benediction all day. The Highland stream, with its shady pools, proved an anglers' paradise; and the luncheon-basket was a perfect marvel of delicious

surprises. The two officers vowed that they had never spent a day like it. The general was too tired even to ask for the daily paper after dinner—perhaps he preferred the talk in the drawing-room.

'To-morrow I have arranged that we shall have some deep-sea fishing. I have secured a boat,' Miss Mary announced at dinner, and her suggestion was applauded. The second day was voted even a greater success than the first by her guests. On reaching home Miss Mary picked up the daily paper and took it to her room. A general could not go missing without the public discovering it. The guests themselves did not know that they were lost, but the fact could not be hidden.

It was just as Miss Mary feared. There was a short paragraph, headed 'Mysterious Disappearance of a Famous General,' stating that General Cockburn Davidson, C.B., D.S.O., and a young friend, Lieutenant John Wright, were missing. Last seen on their way north to Scotland, they had, for some unaccountable reason, never arrived at their destination.

Miss Mary clipped the paragraph out, and then took the paper down to the drawing-room.

'Would you like to read the latest news?' she asked the general as she innocently handed it to him.

'Really, Miss Smith, in such a delightful spot as this one begins to forget that there is an outside world. Just to assure myself that it is still in existence, I 'll glance at the headings; but we must let nothing encroach on our game of cards.'

So, while Miss Mary was arranging the table, the general hurriedly scanned the news of the day, oblivious of the fact that, like himself, an important paragraph was missing.

Next morning at breakfast the hostess announced that they were going to try inland loch fishing for a change. She knew a delightful little lake away up amongst the glens of Sutherlandshire, and she had already wired to the proprietor and obtained permission for a day's sport there. A boat would be in attendance. It was about forty miles distant, but the road lay through some of the finest scenery. Jack drove, and the chauffeur sat beside him; while Miss Smith and the general made themselves cosy with rugs in the back-seat.

She had the art of being a good listener; and, before he knew, her companion found himself telling her the whole story of his life. She was a great discovery to him, for he had never before met one whose sympathy had such a magnetic power. It seemed to draw out all that was in him. She was a bigger discovery to herself. All of a sudden she found that she was possessed of a startling capacity for holding another's interest, she who had shunned society, and had accepted the lot of an outsider.

Jack, when he was disengaged, took as much delight in her company as the general.

As they sat on the heather eating lunch, he looked up at her with all the admiration that is a nephew's privilege.

'I say, aunty,' he remarked, 'I'm jolly glad I accepted your invitation. At first I thought it would be a bore—relations usually are—and that you were just having me as a matter of duty; but when you kept pegging away at me'——

'Did I?' said Miss Mary, arching her eyebrows and smiling.

'And when you insisted on the general coming too, I capitulated; and it was the luckiest thing I ever did.'

'So you were very hard to win,' she teased. 'And how did you discover this out-of-the-way place?'

'Oh, I knew it was "Auchin" something, so I looked up a gazetteer, and found it on the map. After that it was plane sailing. I piloted the general along without a slip. It was really worth coming so far. I have never been in Scotland before. You see, until I joined up I had never been out of Australia.'

By piecing little bits of the conversation together Miss Mary gathered, without betraying undue curiosity, a sketch of her 'nephew's' past history. What was more difficult to discover was where he had intended to go. One of the greatest surprises of the whole experience was the spirit of naughtiness Miss Mary detected in herself. These two strangers had, through no scheming on her part, become her guests, and she did not mean to give them up.

When they returned that night she was quick in laying hands on the paper. To her consternation, she found a whole column, the last on the page, devoted to 'The Missing General.' What was she to do? Then her inventive genius came to her aid. She found an old paper, and after cutting out the tell-tale column, very skilfully gummed in its place a column advertisement of 'Somebody's Summer Sale.'

'I do not think he will ever notice,' she said to herself.

Then she read the account which she had excised so cleverly from the paper. Apparently General Cockburn Davidson and Lieutenant Wright had been expected to visit a Miss Smith at Auchinbreck, which is in the south of Scotland.

'Of course I know now,' murmured Miss Mary; 'that is my cousin Marion. I did hear that she had taken a shooting of that name. So she is the disappointed one!' and Miss Mary smiled a naughty smile. Then she added, 'That being so, I will just keep them a little longer. I have an old account to square with Marion.'

BEYONDS.

By Bart Kennedy.

I OFTEN think and wonder about them. I think of the glorious lands there are in the worlds that whirl as they move on their stupendous journeys around the shining suns. I think of the many and varied beings that live upon them. For to me these worlds of the far beyonds are inhabited. I mean that they must surely have their time when there comes to them what we earth-men call organised life.

How glorious it would be to adventure forth to them—to pass from strange world to strange world! That would be a voyaging indeed.

And there are times when I feel that we do go forth into these beyonds. I feel that immortality is no mere myth born of human imagination. We change and pass, and change and pass, and change and pass.

Death is but a gate that opens to a voyage of wonder.

This I feel at times: Souls go out to the worlds that circle round the stars, and to the worlds of the stars behind the stars. Life on this whirling atom of a planet is but the thing of an hour. Our souls go for ever on an infinite journey, passing from strangeness to strangeness.

And well may it be that we meet in some world of the beyond beings whom we loved and were at one with here on earth. Who is there to deny that this may be so? No one. For no one knows, any more than you or I. True, there are arrogant men who would measure all things by a little gauge called human reason —a gauge woven mainly from our blindness and egotism. But these men are not to be heeded. They turn away their heads from the light of faith.

To me the fact that these worlds of the beyond teem with life at the appointed time is as simple and as clear as the fact that our earth teems with life.

These wondrous beyonds! Is it that we get a glimpse of them sometimes in dreams? Do our souls ever go out to them when we are in the half-death that we call sleep? Are the vague monstrous dreams that come upon us scenes from vague monstrous worlds? Are beautiful dreams scenes from beautiful worlds? I wonder. And I wonder if the people who have passed through the gate of death, and whom we see in dreams, are really seen because of some sense that comes to our minds as we lie in sleep.

The power is not given to us to answer these questions, for our consciousness in the waking life is at best but a blind thing. Consciousness holds sway in a realm as yet uncharted. There are powers and lapses in the mind of man that it knows not of.

It is the soul that is all. This earth-envelope is but a thing transient and passing—the vesture of a moment. It falls from us, and we go forth.

We go forth to lands of unimaginable beauty that are away in far worlds; or we go forth into lands of worlds monstrous and horrible. Heaven is surely no myth born of the mind. Neither is Hell. These two concepts have been cramped and mutilated by stupid, iron dogma. But they are surely in themselves real. Man is dealt with in the lives to come in accord with his actions here on earth.

There are times when I dream that I am in a world of mighty, stretching plains; and times when I dream that I am in a world of music of a beauty inconceivable; times when I am in a world of tumultuous waters where lands exist not; times when I am in a world of palaces transcendent, where live gods; times when I am in a world where beings reign that are shaped not as men. I have received, as it were, messages even in the midst of the waking life as I have listened to certain music.

Surely dreams are of the woof of the mysterious, stretching life that lies behind the small figment that we call reality. True, it may not be so—but who is the one that knows?

These magical beyonds! They stretch out and out and out. To them there is no end. End is but an arbitrary notion that man has conceived for the measuring of things that are limited by his touch and his vision. There is no end to the beyonds—no boundary. To grasp their extent defies the power of the imagination. Nay, there is not extent, for extent contains within it the concept of limitation. These beyonds stretch and stretch and stretch into illimitableness. There are stars behind the stars, and stars behind these, and stars on and on and on.

Strange is it to think of the wondrous, never-ending immenseness that is out from our earth. And strange is it to think that, small though we are, we are still of it. We are even of these stretching beyonds.

We are the heritors of God. We are the heritors of a glorious destiny, immense and profound. We are of the woof of change that has always lived and ever will live.

How glorious for the soul to pass out through the far stars!

Death! It exists not in the sense in which it is pictured by the blind minds that have not faith. It is often a gate of joy and strange beauty, an opening to light effulgent, a stage in an eternal journey. So fear it not.

The destiny of man is the destiny of God. It leads to harmony—harmony even for the soul that is blind.

For man to have the faith that gives him the power to see that he lives for ever is to have the secret of content. He has then attained to the highest wisdom. He looks into the unknown with the calm of a god. He takes pain and sorrow and joy and happiness as they come.

And when he faces another phase of his profound journey, he faces it invincibly.

THE SEARCHERS.

CHAPTER XXXIV.

OUR energies had been focused in a singular degree upon the search, and in consequence thoughts of the murder and the man-hunt had in a measure been checked; but now, with the grave beside me and in the knowledge that our quest was at an end, my mind turned sharply to the hut down the Pass, where, his body broken, his evil schemes in the dust, 'The Searcher' lay watching a shadow—the grim shape of the gallows—creeping closer to him.

His sudden entrance into the Chanter Corrie had stunned me, and, truth to tell, I was still shaken and bewildered. In my attempts to unravel the affair, a thought of the doctor had never crossed my mind; and now, as I recalled his professional equipment, his friendliness and sympathy, his offers of help, the knowledge that I had seen him do cowardly murder, and that beyond doubt he was the 'Prowler' at The Bield, still filled me with complete mystification. Who was Dr Hall?'

Tony was looking at me, a smile in his eye. 'Well, Didymus?' quoth he.

'Who is "The Searcher," Tony?'

To my surprise, he shook his head. 'I don't know, Neil,' he replied. 'Indeed, I can tell you very little about him further than that he is not a known criminal, and I don't think he is a professional one. However, he realises (in his own words) that "the game is up," and I fancy that he may yet confess the truth. There is a lot that I can't fathom. Let us go back to the hut. One of the men can take a message to the police, and on the way down I'll tell you the story of how I got on the trail.'

Duncan was despatched to the Glen with a message for Sparke and the police, and to arrange for two conveyances to be ready at the end of the forest road. Tony and I with our own hands placed the skeleton in the hollow, and, having covered it over with stones until such time as we could return to give it decent burial, we left the defile, carrying the long-lost casket and its amazing contents, and turned towards the Pass.

Hardly had we struck the track of the Larig when I heard a shout from away behind us, and with a field-glass picked out Duncan and three others. These proved to be Sparke and a couple of police-officers. Duncan must have met them within half-an-hour of leaving us. Soon they joined us, and in a few minutes Sparke had been told the story and a formal statement had been given to the police. Then all turned towards the hut below Cairn Toul.

Sparke had something to tell us which tightened the noose about 'The Searcher's' neck. On the previous evening, while loafing in the Afries Wood, near the south road, having a quiet pipe after his day's work, and keeping his eyes open, he had spotted Dr Hall, alone, walking briskly towards the forest. 'He did not see me,' said Sparke; 'but even if he had, in my working rig-out he would have put me down as one of his humble patients. I had arranged that the inspector—who, in case of accidents, had a warrant for his arrest—would take possession of his belongings at the surgery during his absence. I lay low and watched him long enough to be reasonably certain that he was marching into the Chanter Corrie trap. The rest, I thought, could be safely left to you! When you didn't turn up, I got a couple of conveyances, and, with the inspector and his man, drove up to the end of the forest road, and—here I am! I hurried, you bet; but, my hat!'—he mopped a steaming brow—'the Larig isn't Ludgate Hill! I wish I had arrived in time to see the finish.'

'Never mind, my friend,' said Tony. 'Between us we contrived a pretty useful round-up—better than we bargained for, since we have accounted for two "Searchers" instead of one. I wish we had roped in old Benedetto as well. I wonder where *he* is! However, this is the *coup de grâce* to the gang, I fancy!'

'All thanks to you, Mr Keene-Leslie,' was Sparke's verdict. It was a generous one. If it was Tony who had first hit the trail and planned 'The Searcher's' capture, Sparke had been an alert and capable ally.

On the way down the Pass towards Cairn Toul, Tony told me his too long delayed story.

'On the day after the colonel's funeral,' he began, 'I was sitting by an open window in the dining-room, reluctantly making up my mind that I was beaten. The doctor—I doubt if we shall ever know his real name—was bending over his car at the door. He had found something wrong with the starting-gear, and after tugging away without result, straightened himself and rapped out an ill-tempered oath. A detail this, but two points in it instantly strung me to attention. Firstly, the oath, "*Sangue di Dio!*" was in Italian; secondly, no sooner were the words out than he checked himself and

looked round, on his face a shadow of apprehension, come and gone in a second, swift as the sudden flight of a swallow across one's line of vision. I drew back at once, and he did not see me. Once more he looked cautiously round, and, whistling softly to himself, bent to the car again. After a minute or two he started it and went off.

'The use of Italian might have been a mere accident of speech, but often the look on a man's face when he thinks he is alone is illuminating. The real man shows. Here, his instant check and the swift wariness in his eye, like a fencer recovering his guard, struck me as curious, and at least worth attention. Was it possible that there was a link between this quiet and competent professional man and the Duff Street gang? I passed the rest of the day shut up in the library, studying the situation and the history of the affair. I confess that I thought the idea too fantastic, but I did not throw it aside as negligible—nothing in my line is—and I thought that it would do no harm to see a little more of Dr Hall and satisfy myself that I was wrong. Suddenly I began to suffer from insomnia.'

'And you consulted him?'

'Yes. Although I had never lost a night's sleep in my life, I described a few imaginary symptoms in detail, and found him a very sympathetic listener—the same well-mannered, thoughtful-looking man as ever.

'Now, in a matter of this kind my maxims are cast-iron. Suspect nobody. Absolve nobody. However far-fetched a clue may seem, exhaust it. At my first meeting with him I chatted carelessly and watched carefully. After the professional part of the interview, a casual reference to the mysterious affair at The Bield gave me a chance of telling him that it was clear we were beaten, and that to worry longer over the business would only be a waste of our time and nervous energy. Apparently rattling on quite carelessly, all the time I kept well in front of him the notion that we were sick of the whole affair, and weren't going to bother any more about it. He agreed with my view, and when we parted I had something to think about. He had lied to me at least once.

'I had purposely turned the conversation to foreign travel. From travel to foreign languages is a short step, and I contrived to get out of him the statement that he did not know a word of Italian! Lie number one! A man in a temper who thus blurts out an Italian oath, with an excellent accent, has more than a smattering of the language. My interest in him grew wonderfully. I telegraphed for a copy of the Medical Register, and found only one man of his name in its list. Here is a copy of the entry.' He produced a slip of paper and read out: '"Hall, Kenneth Richard, Logan St Mary, Galloway, Licentiate Royal College of Physicians, Edinburgh, 19—; Licentiate Royal College of Surgeons, Edinburgh, 19—."'

'I understood that he had been abroad lately,' I cut in. 'I had a vague idea that he had been a ship's doctor. He came here not many months ago to take up the late Dr Marshall's practice.'

'Yes. His recent arrival might have been easily explained, but I wanted to make sure of this. It was necessary to trace his movements before he came to the Glen, and at our next meeting I cast a few flies over him. I had to throw them warily. An unguarded word, a look too anxious, and he would have winded danger like a stag. But my chance came. I could not put a direct question to him, but after one or two gambits, I began to talk about big game. I never mentioned Logan St Mary—the place in Galloway where he was supposed to have practised—but from big game I "engineered" the conversation to big-game hunters, and mentioned that one of my best trips had been after caribou in Newfoundland with Sir Jim Dunbar. I was considerably interested to discover that the suave doctor, whose address in the Medical Register bore that he had once practised in Logan St Mary, had never heard of Dunbar. Lie number two! Jim is a well-known sportsman, and laird of half the parish of Logan St Mary! No one could have lived in that somnolent district without having met or heard of him. But it was plain that the doctor was ignorant of his name. From that moment I knew there was something fishy, and perhaps worse.

'I wrote to Dunbar asking him if he knew Dr Kenneth Hall, who used to be, and, for all I knew, still was, at Logan St Mary. The reply was that a doctor of that name had been in practice there some years ago. Dunbar had often met him. He was a clean-shaven chap, afflicted with an incurable thirst, through which he had ruined his chances. He had gone abroad, and Dunbar said that he would be surprised to hear that he was alive. This made it clear that the doctor was either using a false name, or that he had returned from abroad, and, not wanting his whereabouts to be known, had pretended ignorance of Logan St Mary! So far, so good!

'But during all this time something was worrying me. There was something which I felt I ought to remember—something mislaid, asleep in my brain. It was irritatingly vague, yet it refused to be dismissed. I was haunted by the idea that there was a possible link which I had neglected in the chain. For a time it baffled me; but one morning, lying awake, I sat bolt-upright, for I remembered in a flash that you had met the doctor on the day after the foggy night in Edinburgh! I rose early and wired the C.I.D. people. Sparke arrived next day, and had a long interview with me.'

'A most interesting one,' Sparke contributed.

'After I got the facts, hoping that I might "spot" a previous acquaintance, I called at the surgery in the working-kit of a lumberman, and pitched a tale about indigestion. But I was disappointed. I had never seen him before, and I was certain that he was not on our books.'

'The peculiar thing about Sparke's subsequent calls,' continued Tony, 'was that the doctor was invariably out, and that Sparke had to wait for him in his surgery. As you probably guess, I arranged this, for, when the doctor was at The Bield in the evenings seeing you and me, friend Sparke had always a note of the hour, and made a point of calling at the surgery in the doctor's absence.'

'And when there,' said Sparke, 'I took the liberty of giving a "run through" my medical adviser's rooms. I found, among other things, some hair-dye and a carefully concealed pair of heavy boots.'

'Not the ones with the triangular mark?'

'The same, Mr Forbes. Of course, I left them where they were.'

'From that moment "The Searcher" was doomed!' Tony went on triumphantly. 'We didn't want to scare our bird, for the essence of the business was to collar the other half of the paper as well as "The Searcher." Sparke watched him night and day, and in case of emergency—an attempt to bolt, for instance—had a warrant for his arrest ready. But "The Searcher" suspected nothing, and I began the fashioning of a trap to catch him with the paper in his possession. Have you heard of ceralac?'

'Never.'

'The making of it is a secret. Indeed, there are few people know of its existence, but I have some here.'

He took from his pocket a little glass phial filled with a light-gray fluid.

'Detection by finger-prints is nearly infallible if your man is a known criminal, but the difficulty sometimes is to get an unregistered man's finger-prints. Now, ceralac can be artistically smeared on any surface—a piece of paper, a table, or a door-handle. Exposed to the air for ten minutes, it becomes invisible, and can hardly be detected by the touch of one's finger. The prints on your shirt at Edinburgh were those of a right thumb and a right forefinger.—Sparke, while I light up, oblige me by continuing.'

'When I called at the surgery,' said Sparke, 'Mr Keene-Leslie always took good care to keep the doctor at The Bield long enough to give me time to lay the "bird-lime" there. I got two fairly clear prints, both from newspapers, but Mr Keene-Leslie got a beauty at The Bield—as good a one as I have seen, and I've seen a few thousands.'

'Yes, I was lucky,' said Tony, taking out his cigar-case. 'As you may remember, the doctor liked a good cigar. My cigar-case, you observe, has a "pull-off" top. I prepared it with ceralac, and when I handed it to him, I noted with great delight that he drew the top off exactly in the way that I had hoped. He used his right thumb and right forefinger! Next day I sent the three sets of prints to London.'

'I remember! On the night when you came home late from fishing on Loch Ruie there was a reply waiting,' said I.

'From the Yard. It told me that the print was identical with the Edinburgh one. You know the rest. The bait of the bogus half of the paper was put in the escritoire.'

'How did he know that it was there?'

'I played the gabbling, indiscreet ass, reiterating that the old story of the lost jewels was a myth; that the paper was a cabalistic string of letters; that neither you nor I cared two straws about it; and I wound up by asking him (in the strictest confidence, of course!) if he would care to see it. He controlled his face admirably when I took the "cooked" paper out of the escritoire, and having looked at it, handed it back with a shrug and the remark that he agreed with us that it was probably a mare's nest. My back was towards him when I replaced it in the escritoire, but I knew that he was watching me for all he was worth. I laid the key down, and when I turned there were two bright spots of colour in his pale face. Before he took his leave I made another appointment with him at The Bield, and left instructions with the maids to ask him to wait if I happened to be out. That was the day when you went to Castleton. Of course, I too made a point of being out when he called. The coast was thus left clear for him. He was gone when I returned; but, as I proved to you from the little tell-tale specks of paper, the escritoire had been opened, and although the paper was still there, it had been taken out and replaced.'

'And he had made a copy of it?'

'Nothing more certain. From that moment the Chanter Corrie filled his mind. I must say that his make-up was excellent. He was always closely shaved. His hair and eyebrows were carefully dyed black, with a streak of gray, and not a trace of reddish hair could be detected. His real colouring was, I think, too indeterminate to show on his hands, and I dared not stare closely at them. But I knew that he was "M'Nair," and Sparke shadowed his every movement. You thought you heard suspicious footsteps in the shrubbery when you parted from the doctor at the lodge gate on the night before we left The Bield. You were right, but the footsteps were those of the vigilant Sparke, who, of course, knew every detail of my plan. Well, it has been a good week,' Tony wound up, 'and I don't think I shall ever put in another like it.'

By this time we were nearing the wild country

at the base of the striking mass of Cairn Toul. The air was very hot and still. We had halted to drink from one of the many ice-cold springs in these altitudes, when Duncan's keen ears heard distant cries. They were from the south, and wondering what their portent was, we clambered up a hillock of tumbled granite and looked down the Pass. The cries came from one of the watchers at the hut. He was signalling excitedly to us, and when he saw us coming in his direction, he hurried back towards the hut. Something had happened. An uneasy silence fell upon us. We covered the last half-mile at a cracking pace, and about fifty yards from the hut Angus ran forward to meet us, his face very pale.

'I left him for a minute or two. . . . When I went back'—— He broke off, and pointed with a shaking finger to the shelter-hut.

We hastened towards it. The door was half-open, and a deadly odour met us on the threshold. I flung the door wide open. The sun cast a broad bar of light across the floor, and in its bright centre lay 'The Searcher,' his eyes closed. Tony bent over him.

'Gone, quickly and quietly. Cyanide of potassium, probably! I didn't think of that, I confess,' said Tony.

On the floor a little phial lay on its side, empty, and beside the dead man was the section of notebook, its leaves covered with writing.

Tony bent closer over the body. 'Look!' said he, as he turned back the dark hair behind the dead man's ear. Near the scalp a curious rusty shade showed.

'"The red-haired traitor!"' I whispered.

Tony nodded.

SILVER.

By R. MORDAUNT

THE currency system of England from the time of the Saxons to the days of Henry III. was based entirely on silver. About forty years after his accession to the throne Henry III. coined gold pennies, and from that time (1257) to 1816 England was a bimetallic country—both gold and silver were recognised as legal tender. Silver coins of various denominations were circulated, while the gold piece varied in quality, value, and name during the reigns of succeeding monarchs.

It was not until 1696, in the reign of William and Mary, that it was discovered that an enormous number of shillings had surreptitiously disappeared from circulation. On inquiry it was found that they had been undervalued, and that twenty-two silver shillings, which were recognised as equal in value to the then golden guinea, were worth more than the equivalent gold piece. In consequence it was decided that twenty-one silver shillings should represent the value of the guinea, but even this was intrinsically about fourpence too much. The silver coin continued to disappear, and as time went on dealings were made entirely in gold, England became accustomed to recognise gold as the medium of exchange, and when rearrangements in currency were made in 1817, gold was adopted as the standard of the coinage in the United Kingdom; and by the same Act silver ceased to be legal tender for sums exceeding forty shillings.

Silver was first discovered in India about the ninth century. The metal was known to the ancients, and it is repeatedly mentioned in the Holy Scriptures. In the time of the patriarchs it was employed in the transactions of nations.

The United States is the greatest silver-producing country, the silver-mines in the State of Nevada having proved the richest in the world. Mexico, Peru, and Chili are other most important silver-producing countries; while on the continent of Europe, Spain, Norway, Hungary, Saxony, and Bohemia produce appreciable quantities of the metal. As silver is found associated to a large extent with gold, the territories under the authority of the British Crown which produce gold, such as South Africa, Australia, Canada, India, &c., also contribute silver towards the world's output.

America is, nevertheless, the greatest silver-producing country, and nearly all the countries in the world rely upon her for their necessary requirements of silver for coinage and commercial purposes. In 1917 the output of silver from the mines in the United States amounted to seventy-one million seven hundred and forty thousand three hundred and sixty-two fine ounces; in 1918 it amounted to sixty-seven million nine hundred thousand fine ounces. The world's total silver production for 1918 is computed to be one hundred and seventy-nine million nine hundred thousand fine ounces.

A good deal of silver occurs native, and it has been found in a pure state in Cornwall, although it is frequently found mingled in ore with other metals, such as gold, copper, lead, &c. Sulphide of silver is one of the commonest forms of combination in which silver occurs in nature.

The mode of extracting silver varies according to the nature of the ore in which it is found. A silver ore—that is, an ore worked for its silver contents—may be either free milling or

refractory. By the former term is meant one that yields its silver contents by simple amalgamation with mercury; and by the latter, one that necessitates a more complex process. The different methods may again be classified under the heads of 'dry' and 'wet,' the 'wet' process being subdivided into extraction by amalgamation or by dissolution of the silver, leaching, and precipitation.

In the dry process the silver is recovered by smelting, either alone, if the ore be sufficiently rich, or in conjunction with lead or copper, which are used as collectors.

In the wet process, the silver, if it occurs native, may be recovered by direct amalgamation with mercury. The ore is first crushed in batteries, and then passed into tube mills, where, in a grinding process, the silver 'freed' by crushing amalgamates with mercury with which the tubes are charged. The 'pulp' may then be separated into sand and slime, which undergo further treatment of cyanidation. The silver and mercury, called 'amalgam,' is distilled in iron retorts. The mercury evaporates, and is recovered by condensation and used over again; while the melted silver is poured into moulds, and then refined.

A method of extracting silver from ore if it occurs as sulphide, either alone or associated with other sulphides, is by crushing and roasting with common salt. The chemical reactions that take place are rather complex, but the ultimate result is that the silver sulphide is converted into chloride of silver. The ore is then transferred to pans or barrels, mercury being added, and sometimes copper sulphate. It is then well mixed, either by revolving the barrels or by grinding-arms in the pans, and intensely heated. The silver chloride is converted into a fluid amalgam with the mercury, which acts as a collector. This is distilled, the mercury is recovered, and the silver remains.

There are other processes of extracting silver from ore. There is the leaching process, by which the silver mineral is converted into chloride and leached with strong solution of common salt, the solution being then led over copper, on which the silver is precipitated in metallic form. Another method is, after conversion of the silver into chloride, to bring it into solution, and then precipitate with sodium sulphide, the resulting silver sulphide being roasted in a muffle-furnace for elimination of sulphur and the recovery of metallic silver.

A leaching process which has within recent years come into favour is dissolution of the silver mineral in potassium cyanide, and subsequent precipitation on zinc or aluminium dust. More recently still, advance has been made in the treatment of silver ores by flotation, in which the coarser particles of valuable mineral are separated by oil from the bulk of the ore. These concentrates, as they are termed, are then treated separately for the recovery of the silver by cyaniding or other process, whilst the bulk of the ore containing the silver values is treated direct by cyanidation.

In 1816 the market price of silver was five shillings an ounce, and an ounce of silver was converted into coins of the nominal value of five shillings and sixpence. But with the opening up of new silver-mines and increased outputs, the price of the metal depreciated until in 1914 it was about two shillings per ounce. During the war, however, its price doubled, to about four shillings an ounce, and would have further appreciated had not the American and British Governments prevented it and fixed its price. But on 7th May of this year the United States Government withdrew its control, and a day or two later the British Government intimated that the official maximum price was removed. The immediate effect of this release was very great. The price leapt in one bound from four shillings to four shillings and sixpence, thence to four shillings and tenpence, the latter constituting a record price since January 1877. The price has, however, eased, and from its present quotation of four and sixpence per ounce experts believe that it will gradually decline. The call for silver during the war was so great that America passed a measure, known as the Pittman Act, providing for the melting down and sale of silver dollars. In all two hundred million ounces were disposed of in this way, the whole of which went to India.

In India perhaps more silver is being used as currency than in any other country in the world. This is explained by the fact that India, like all the Great Powers, withdrew gold from use as currency as a result of the war, but, unlike other empires, was not able to substitute notes as a circulating medium. It was consequently forced to coin silver in abundance; indeed, sufficient quantities of the metal were not available, and the Indian Government was compelled to release gold coins.

The peoples of India in the presidency towns of Bombay, Calcutta, Madras, &c. readily use paper money. But the native population—in the rice, jute, and corn districts—are suspicious, and have never been induced to accept money in the form of notes; metallic currency only has been recognised. Its use is traditional; it is bound up with age, long habit, and custom; and it has been found impossible to convert the masses to the use of paper money. The silver coin, in the whole, the half, and the quarter rupee, is what the natives love. They cherish and hoard it. This habit of hoarding, implanted in the Indian native's mind, is another influence responsible for the huge amount of silver used for the population of over three hundred and fifteen millions, scattered over an area of one million eight hundred and three thousand square miles.

TWO RAILWAY STATIONS.

By William T. Ellis.

I.

KIEV, RUSSIA.

Mist and Mud,
Over and under all.
A soldier mob—
Unordered, uninformed, unorganised, aimless;
Homeward bound, but not knowing how.
Officials, obsequious, but not efficient.
Of system—civil, military, railway—there is none.
All is crowded chaos,
Plus incredible patience.

Waiting-rooms, hallways, dining-rooms, platforms,
All are jammed with patient, gray-brown troops,
Every man burdened, but no two bundles alike.
Hundreds stand for hours in the muck,
Munching sunflower-seeds,
Waiting, waiting, waiting.
Sour odours reek from their clothes and persons,
And vermin pass from man to man.
So stand cattle in the stockyard sheds,
Leaderless, dumb, and stolid.

Other hundreds lie on the ground
And sleep—
Yes, and dream
Of distant village homes,
And unforgettable fond faces.

Every passageway and platform and room
Is a chamber of slumber
For weary waiters.
Though they wear the nation's uniform,
No man cares for their souls,
Or their bodies.
The thickness of the crowd,
Which prevents haste,
Also saves the sleepers from the feet of their fellows.

Out of the mist comes a train,
Unannnounced, unexpected, and with destination unknown.

Rushing madly, the multitude make for it.
Through the doors and windows they struggle,
Screaming the while,
In ineffective altercation.
Every seat is overfilled;
Luggage-racks hold men;
Corridors are impassably jammed;
Platforms are so crowded that some men
Have each but a hold for one hand and one foot.
Couplings, too, are weighted with men and women;
On the roofs are crowds of fortunate ones;
While others have thronged the footboard of the engine.
Importunate ones scream and struggle;
Women weep;
Oft-disappointed men show white and panicky faces,
And curse their fate and the world.
There is no authority,
No order,
No helpfulness,
No patriotism,
For this is Russia.

II.

VICTORIA STATION, LONDON.

Grim grayness;
Mist, but no mud.
A quiet, almost like Sabbath,
Enwraps the soldier scene.

These are the men from the trenches,
Each with his ordered kit.
Grimy, but not dishevelled;
Eyes tired, but not wavering;
Faces strained, but serene.
These men have been doing business with death,
So they are neither merry, like schoolboys,
Nor yet panicky, fearful, nor dismayed.
Red, raw reality
Has been their daily companion,
So their souls have been steadied,
Like ships that have outridden the storm.

By trains arriving on time at the expected spot,
In ordered lines they come,
Self-assured and self-respecting,
For the restful touch of the homeland.

Great London opens out her arms to them—
Her strong, sufficient arms,
And her tender, guiding hands.
Without haste, without confusion,
All things having been made ready,
The tired heroes are led away to hostels and homes,
Where baths and sleep and pleasure await them.

There are no bands, no flags, no shouting, no singing, no excitement.
Deft and tireless women,
Past all posing or parade,
Serve food and drink to the lines,
In token that these boys have come home to their own;
While women in khaki,
Soft-spoken, sure, and soldierly,
Guide detachments through the city,
That harpies may not enmesh the tired feet.
There are no flirtations or idle jests;
For these noble women are also about the business of war,
Ministering to the men who serve the nation.

Others, men who cannot fight,
Also serve the swift lines of soldiers,
Without fussiness or delay or heroics.
All is ordered and efficient,
After our Anglo-Saxon heritage.

Men wearing the Maple-Leaf
Stretch the home-hand to boys from overseas—
Not in fulsome words, but in sure service,
Quietly given and naturally accepted.
Self-consciousness is gone
From both helpers and helped,
Since this is war,
With system in service,
And brotherhood expressed by action.

Outside the railing,
Scanning the orderly lines,
Wait women and children,
Whose work in war is waiting.

There are no idle crowds.
Each expectant face seeks one man only.
When he comes—
Ah! the joy of hope fulfilled!—
There is no outburst, for this is England.
Instead, for one man in a hundred,
A kiss,
A swift embrace,
A child's leap to arms that are strong from carrying a rifle;
And, quietly, soldier-wise,
Off to all the indescribable happiness of home they go.

A strange contraction grips my throat,
Tears steal from eyes not wont to weep,
Thrills course my being,
As I watch how our people,
Soldiers, women, stay-at-homes,
Thus 'carry on' beneath the burden of war.
This steadiness,
This simple strength,
This sufficiency,
This order and adequateness,
This sentiment shown in service,
This patriotism in practice—
This is Britain!

THE AIRY PRINCE.

PART II.

IV.

THE airman glanced at his wrist-watch; it was half-past nine. The miller slept by the side of the stove, his chin crushing his beard against his chest. Louis also slept, having curled himself into a black, furry ball, apparently possessed of neither head nor tail. A clock, brazenly stating the time to be five-thirty, ticked lazily as though, finding itself four hours behind the correct hour, there was no chance of its ever catching up, and it only kept going because it was the sporting thing to do. Just over the clock a picture of Marshal Joffre gazed paternally on the quiet scene.

Seated at the table, which was covered by a geranium-shaded cloth, the girl and the airman sat silent, while a shaded lamp lent a crimson glow through which her deep eyes gleamed, like the first stars of a summer evening.

To her romance had come.

She was no longer the miller's niece, but the girl who had seen the Fairy Prince. All the sighs, all the questionings, all the longings of her girlhood had culminated in this amazing adventure of a fair-haired knight who, descending from the clouds, had proceeded to terrorise her uncle, who was feared for miles around. It was wonderful. And he was so droll, this young man; and his voice had a little soothing drop in it, at times, that left a fluttering echo in her heart.

She had left the convent when ten years of age, on the death of her mother. Her father—but then gossip was never kind. He was an officer who had deserted his pretty little wife for another woman—or so rumour had it; and her mother had died, a flower stricken by a frost. The daughter had been taken by a relative, the owner of a lonely mill, and for six years had lived in solitude, her horizon of life limited to the adjacent village, her knowledge of women gained from the memory of a sad, yearning face, paler than the pillow on which it rested, and an occasional visit to the curé's sister. Of men she knew only her uncle and the few villagers that had not gone to fight for La Belle France.

From unquestioning childhood she had passed to that stage in a girl's life when the emotions leap past the brain, fretful of the latter's plodding pace. Her mind untutored, unsharpened by contact with other minds, left her the language and the reasonings of a child; but her imagination, feeding on the strange longings and dreams which permeated her life, pictured its own world where romance held sway over all the creatures that inhabited its realm.

It is the instinct of a little child to picture unreal things—the unconscious protest of immaturity against the commonplaceness of life. But with the education of to-day and the labyrinth of artificiality which characterises modern living, the imaginativeness of childhood disappears, except in a few great minds who, retaining it, are hailed by the world as possessors of genius.

Unhampered (or unhelped, as the case may be) by association with the patchwork pattern of society, the miller's niece had retained her gift of imagination, without which the solitude and the monotony of her days would have been unendurable; until, blending it with the budding flower of womanhood, she found mystery in the moaning of the wind. When the sun danced upon the grass her spirit mingled with the sunlight; and when the moon exercised her suzerainty of the heavens the poetry in her soul thrilled to sweet dreams of lovers' wooings (though her unreasoned rapture often ended in unreasoned tears upon the pillow). . . . She found melancholy in the colouring of an autumn leaf, and laughter in the music of the mill-stream. . . . There were smugglers' tales in a north-east gale, and fairy stories in a summer's shower.

The doctrine of pleasure so feverishly followed by her sisters to-day was unknown to her—as was its insidious reaction which comes to so many women, with the dulling of the perceptions, the blinding of eyes to the colours of life, the deadening of ears to the music of nature, until they cannot hear the subtle melody of happiness itself, so closely allied to the sombre beauty of sorrow.

'Little one'—the aviator's voice was very soft, so that the ticking of the clock sounded clearly

above it—'in a few minutes I must go. It is a dark night, and of necessity I must get to the village to-night, and be on my way before dawn.'

Her eyes were hidden by her drooping eyelashes. 'You will return—yes?' she asked, without looking up.

He smiled rather wistfully. '"When the red-breasted robins are nesting,"' he quoted slowly, '"I shall come."'

The clock ticked wearily on. . . . A few drops of rain fell upon the roof.

'Monsieur'—the crimson in her cheeks deepened—'you must not smile; but it is in my book, here.'

She took from the table *The Fairy Prince*, and handed it to him. He gazed at it with a seriousness he might have shown towards a book of Scottish theology.

'You know, monsieur'—she appeared deeply concerned in the design of the geranium table-cover—'I never leave the mill-house unless to attend mass, and sometimes—perhaps you would think so too—it is very lonesome; no brother, no sister; just Louis and my uncle.'

He nodded, and, with an air of abstraction, his brow wrinkled sympathetically, and his fingers strummed five-finger exercises on the table.

'It must be very dull,' he said.

'But no, monsieur'—her eyes looked up in protest—'not dull—just lonesome.'

He sustained an imaginary note with his little finger, frowned thoughtfully until his eyebrows almost obscured his eyes, then came down the scale with slow and measured pace.

'Well, little lady who is never dull, and what has all this to do with *The Fairy Prince?*'

'It is because I have no sisters, no friends, that—that I pretend. But you do not understand.'

He played some chord with both hands.

'Very young people and very old ones pretend,' he said, with dreamy sententiousness; 'pretending is what makes them happy. But the Prince?'

She smiled deprecatingly. 'When I read, monsieur, then I think that the girl—there is always a girl, is there not?' He nodded gravely. 'I do not think it is she,' she went on, 'but myself; and when the book is finished, and she marries her lover, then I am happy . . . and dream.' . . .

'"We are such stuff as dreams are made of,"' he murmured, and trilled with his first and second fingers.

'So, monsieur,' she continued, glancing shyly at him, 'in that book'——

'There is a girl.'

'Yes. And a Fairy Prince who was very handsome.'

'Like me?'

'It does not say, monsieur.'

'Ah!'

'But I think so,' she said earnestly, 'for he was the handsomest man in all France.'

'It said nothing of England?'

'No, monsieur, only France.'

He nodded with great dignity, and motioned her to proceed. She leaned forward with her elbows on the table, and rested her chin on her interlocked fingers.

'To-day I was reading it to Louis,' she said, 'when, just at the moment that they met—*vous voilà!*—you came. Monsieur,' she said naïvely, 'are you a fairy prince?'

He considered, with his head characteristically on one side.

'N-no,' he said, 'I cannot claim that; but'——

'Ah yes?' Her face lit up with delighted anticipation.

'I am a prince of the air.' He struck an attitude, and held it.

'Oh!' Her lips parted in ecstasy, and her cheeks, which had been crimson, became scarlet. 'You—are really a prince?'

'Of the air, mademoiselle.' He folded his arms and tilted his chair back. His face was still grave, but his voice had a sense of distance in it, and his light eyes widened as though they saw the world his words were picturing. 'My kingdom is greater than all the kingdoms of the earth, and when I ride, my steed with wings takes me towards the stars. For sport I play with clouds and race the wind; at night the moon gives me light; and when I travel there are no mountains to climb, no lakes to cross. I go faster than the swiftest horse, and ride from villages to cities, out into the country, and over the sea with a steed that never tires.'

'But, monsieur,' she cried, 'this is wonderful!'

He looked frankly into her eyes. 'It *is* wonderful,' he said.

For a few minutes neither spoke, and the soft symphony of raindrops played through the quietness of the night.

'Your Majesty,' she said timorously, 'are you very brave? You understand,' she hurried on as a slight blush darkened the tan of his cheeks, 'in fairy books the prince always fights a dragon or a wicked giant.'

'Don't uncles count?'

She made a pretty *moue*.

'As a matter of fact,' he said slowly, 'there was a wicked Emperor—a blustering popinjay with a madman's vanity—who decreed that all the world should be his slaves, and sent his armies into France and Belgium to enforce his will. My brothers heard of this, and came from countries and dominions thousands of miles away. Across great continents of water they sailed, and, with their brothers from the little Islands of the North Sea, came to France.' . . .

'Your voice is very sad,' she said tenderly.

Her nature, that knew every mood of a summer breeze, had caught the inflection of his words, understanding by their tone what the vagueness of his words hid from her mind.

'So many have died,' he said, looking away from her. 'Almost every day some one rides out into the sunlight to his death, young, brave, and smiling. . . . Mademoiselle, it is wonderful how they smile.'

Tick—tick—tick.

For more than a minute neither spoke; then, with a smile that was strangely boyish, he squared his shoulders and ran his fingers through his rumpled hair.

'Ha!' he laughed; 'what fancies get into a scatter-brain like mine when the rain 's a-pattering on the roof! If you will allow me, little Pippa, I shall smoke.'

'Little Peepa?' she laughed delightedly.

'Pippa,' he assented, puffing smoke as he lighted the pipe. 'I think I shall call you that. You see, according to her biographer, Mr Browning, she worked in the silk-mills all the year, but one day she had to herself, from dawn to midnight, and so as to enjoy it to the full she—well, she pretended, like you.'

'But that is droll,' she said eagerly, 'for every Easter, after Sunday, my uncle, who is fatigued from so much chanting in the church, always goes to Boulogne and becomes drunk for one whole day. On Wednesday he returns. These six years he has done it always the same; and on the Tuesday it is wonderful. I am alone with Louis, and we ask all the people in our books to visit us.'

A sudden gleam of excitement lit his eyes.

'The Tuesday after Easter?'

'Always it is so.'

'Pippa,' he said, then checked the remainder of his words. He placed the pipe in his mouth and ran five-finger exercises at a terrific speed.

'Pippa,' he said again, then, ceasing his display of virtuosity, leaned back and gazed at her from beneath his eyebrows. 'Next spring, on the Tuesday after Easter, I will come for you.'

She caught her breath deliriously.

'Beyond the village road,' he went on, speaking slowly and distinctly, 'I saw a big pasture-field at the top of the hill. Be there as the sun is just above the horizon, and I will come in an aeroplane.'

'And, your Majesty, you will take me to your kingdom?'

'For one day, Pippa, to the great city of London—the city that is open to all who possess a golden key. We shall return by the stars at night.'

'Then'—her voice shook, and the brilliancy of her eyes was softened by sudden tears, as the rays of an August sun are sometimes tempered by a shower—'then—at last—I am to see the world?—boys and girls and palaces and'——

'To say nothing of prunes and potentates.'

'Oh, but, your Majesty, it is too wonderful. I am certain it will not come true.'

He rose and quietly placed his chair against the wall. 'Pippa,' he said, 'there are only two things that could prevent it. One, if there is a storm and—the other'—— He shook his head impatiently.

The girl took down a work-basket, and after searching its contents extracted a tiny trinket.

'You mean,' she said, stepping lightly over to him, 'that you might go to join your brothers—those who smiled so bravely?'

'We never know, Pippa,' he answered.

She reached for the lapel of his coat and pinned the little keepsake on it. 'Tis a black cat,' she said. 'I saw it in the village store, so small and funny, like Louis. It is a gift from little Pippa, who will pray to the Virgin every night that her Prince may not be killed—unless'——

He looked at the little mascot, which dangled above a couple of ribbons.

'Unless?' he said.

For a moment there was a flash in her eyes and a sudden crimson flush in her cheeks that startled him. For the first time in her life she had felt the instinct of a tigress—that strange fusion of passion and timidity that comes to women of her kind when it seems they may lose the object of their love.

'Unless he—forgets.' The words were spoken between lips that hardly moved.

'By the sacred bones of my ancestors,' he said, with a sort of sincere grandiloquence, 'I promise to come. So that I shall always think of you, my Pippa, I will paint a black cat upon the machine, and woe to the Hun who dares to singe its whiskers!'

A few minutes later the heavily coated figure of an aviator was ploughing its way, through a drizzling rain, along a dark and solitary road. His pace was extraordinarily long for his height, and he appeared to be stepping over a perpetual array of obstacles at least one foot high.

By a casement window a girl, with hair like the dusk, stood gazing towards the road that was hidden in darkness. Silently and motionless she watched the melancholy drops of rain as they fell upon the glass, until, unconsciously, her lips parted and she sang, very softly, the little song taught to the maiden in the story by the lonely shepherd:

'Maman, dites moi ce qu'on sent quand on aime.
Est-ce plaisir, est-ce tourment?'

She paused in the improvised melody, and repeated the words slowly:

'Est-ce plaisir, est-ce tourment?'

And then the little mistress of the mill laid herself upon her bed and wept profusely;

but whether it was because she was happy or because she was sorrowful, let those explain who understand the psychology of a woman's tears.

Downstairs, Louis and the miller slept profoundly.

V.

It was several months later that an airman emerged from his hut into the chilly air of an April night that was lingering grudgingly over its last hour of darkness. There was a sullen rumble of guns borne on a restless breeze that stirred the long grass of the fields and set the leaves in the trees whispering and quivering. The drone could be heard of a lonely aeroplane returning from its night-ride over the enemy lines. . . . Above the distant roll of the artillery, one gun stood out like a pizzicato note on a giant bass violin.

The airman passed the silent aerodrome, and, with difficulty accustoming himself to the darkness, made out the shadow of a machine in the adjoining field. He heard the sigh of cylinders sucking in the petrol as the mechanics warmed the machine, and walked over to it. For a moment he spoke to the men before climbing into the pilot's seat. There followed the incisive monotone of the flier's incantation between himself and the non-commissioned officer.

'Petrol on: switch off.'

'Petrol on: switch off.'

'Contact.'

'Contact.'

The propellers were swung into action, hesitated for a moment, then wheezily subsided.

The incantation was repeated; the propeller-blades coughed, and leaped into a deafening roar. The mechanics sprang aside, and the machine, stumbling forward for a few yards, turned into the wind. There was a sudden acceleration of the propeller, a crescendo from the engines, and the machine made swiftly across the field, rising as it attained flying speed, and disappearing into the night.

A few moments later its light was mixing with the dulling stars, and the drone of its engine could be heard only at the whim of the breeze.

'I wonder what the Black Cat's up to now,' said mechanic No. 1, rubbing his hands together for warmth. 'Rum beggar, isn't he?'

His companion slapped his breast with his arms and blew on his fingers. 'Mad as a March hare,' he growled; 'takes a two-seater out at this time of night.'

'And did you notice the extra outfit?'

'He's mad,' repeated the before-dawn psychologist—'mad as a rabbit.'

'But he's a mighty stout boy,' interposed the N.C.O., who was torn between his duty of keeping discipline and his love of character study; 'and he sure puts the wind up Fritz when he takes off with his Black Cat Bristol fighter.'

The blackness of night was beginning to give way to a dull and sullen gray as the solitary pilot made a detour over the lines. In the gloom beneath he could see a long crescent of orange-coloured flashes where the British guns were maintaining their endless pounding of the enemy. Farther east was a large patch of winking, yellow lights, giving to his eye the same effect as flakes of gunpowder dropped upon a heated stove: it was the bursting of the British shells. Beyond that field of death he could see other and larger flashes, and knew the Hun was replying in kind.

Everywhere the darkness was being penetrated by long, rocket-like lights with a white, starry burst at the end, and, as though to give variety to the scene, a few red and green bursts mingled garishly with them.

To the airman, from his refuge of height, it all combined in an uncanny pageant of fireworks—a weird spectacle of death, as though hell had opened and the passions of men were feeding the flames to make a devils' holiday.

A searchlight woke him from his reverie. A couple of anti-aircraft guns barked at him. With a smile he noticed the rapid approach of morning's light, and turning to the west, he set his course by the compass and made for the lonely mill-house of Picardy.

VI.

From a meadow at the top of a hill a girl watched the horizon of the east as the first glow of daylight heralded the arrival of Aurora's chariot. The hurried walk from the mill-house and the climbing of the hill had set her pulses throbbing with vitality, and as she watched the dull gray give way with the promise of dawn, a wild, unthinking spirit of exaltation seized her. Like the Pippa of Browning's song, she felt her spirit rise with the triumph of nature:

Day!
Faster and more fast,
O'er night's brim, day boils at last:
Boils, pure gold, o'er the cloud-cup's brim
Where spurting and suppressed it lay,
For not a froth-flake touched the rim
Of yonder gap in the solid gray
Of the eastern cloud, an hour away;
But forth one wavelet, then another, curled,
Till the whole sunrise, not to be suppressed,
Rose, reddened, and its seething breast
Flickered in bounds, grew gold, then overflowed the world.

But he had not come—her Prince with the solemn face and the laughing eyes. Day after day, through the long winter, she had lived for this hour, thrilling over it, picturing it, dreaming of it—both awake and asleep. . . . And he had not come.

Supposing—supposing——

Her heart leaped painfully. She had heard a sound, like the humming of an insect—faint—then more clear. The hum became a drone, and in sheer intoxication she reached her hands towards the east as the sun, well above the horizon, illumed the sky with gold-red flames. Blinded by its brilliancy, she turned away; but her ear heard the cessation of the engine as the pilot brought his machine towards the earth. She knew that he must be approaching her; yet she kept her face averted, on some caprice of sixteen years, until she heard his voice calling, a few yards off.

He bowed very low as, with lowered eyes, she gave him her hand; then, indicating a coat on his arm, he leaned towards her, with some effort making his voice heard above the impatient throbbing of the aeroplane's engine.

'Take off your hat,' he cried, noticing with quick approval the pretty costume she wore (for, however poor she may be, no French girl is without one becoming frock), 'and slip your curls into this helmet. It's the largest I could find.'

She did as she was bidden, laughing delightedly.

'Now then, youngster, climb into this.'

He wrapped her in a fur-lined leather coat, and after buttoning it securely, lingered for a moment over the amusing and dainty picture she presented. Then, picking her up in his arms, he carried her over to the machine and deposited her in the observer's seat, fastening the belt. He was just about to climb into his place in front, when, changing his mind, he leaned over to her and placed both hands on her shoulders.

'Frightened?' he smiled, speaking so close to her ear that a truant curl brushed against his cheek.

She shook her head decisively—for a considerable period she had been beyond the power of speech.

He looked into her eyes, which seemed to have borrowed something of the sunlight, and patted her reassuringly on the shoulder. . . . And Mademoiselle Pippa, niece of the absent miller, would have gone straight to the moon with him had it been his wish and in his power.

She watched him wonderingly as he lifted a heavy sandbag, used as ballast, and dropped it on the ground. The next moment he was in the pilot's seat, there was the crescendo of the engine, a waddling sensation as the aeroplane went forward, the sudden development of the crescendo, the burst of speed, and . . .

The earth was receding!

She caught her breath, and hid her face in her hands to stifle a cry and keep the sight from her eyes. She had been afraid that she would faint with dizziness, and for a full minute sat, terror-stricken, until, gaining courage, she tremblingly parted two fingers and cast a timorous glance below. A cry escaped from her—but it was not one of fear.

Beneath her, though she was not conscious of height, the country-side spread, a great masterpiece of colour, the light brown of ploughed fields standing out vividly against the green of meadows where sheep (she laughed out at the thought) were huddled in little groups like peanuts; roads had become paths, and cottages were dwarfed to miniature dwellings for the tiniest dolls.

But—she felt no height.

Only, the landscape, refreshed after its long winter repose, kept closing in—closing in, displaying new beauties every minute, as though she were in real truth a Fairy Princess summoning villages and rivers and farms into one vast tapestry of nature.

And this was France! As far as the eye could see, it was France, the mother of greatness. For the first time she pictured the wide, charred plains where the Hun had been, and scalding tears hid everything from her sight.

Several times her cavalier of the clouds had turned around to see that she was not frightened, and, as often as he did so, she nodded excitedly, and waved both hands after the manner of an orchestral conductor calling for a fortissimo. Once he shut off the engines, and they seemed to lie in the wind, a becalmed ship of the air.

'All right?' he queried inelegantly.

She tried to think of some word to summarise her emotions, but, failing utterly, raised her goggles and thanked him with her eyes. A woman's methods are not affected by altitude.

It seemed to her that they had flown for an hour, when, in her tapestry of landscape, she found the gradual inclusion of the steeples and the roof-tops of a city, the streets of which gave the impression of having been drawn with a brown crayon with the aid of a ruler. The aeroplane appeared to be turning with the wind, and she grasped the side of the fuselage, when the whole scene was obliterated by a sea of billowy foam that left her cheek wet. She laughed with delight, and reached out with her hands, as though she would grasp the foam and compress it like snow in her fingers. She sang and clapped her hands in sheer joyousness. She was alone with her Prince in a world of dreams. The billows of foam grew less dense, became a mist through which light gleamed, and they emerged once more. Beneath them lay the Channel, shimmering in the April sun. The magic wand drew the Strait to her gaze as it had done the fields of France. . . . Suddenly there was no throbbing of the engine, and they seemed to float, motionless, in space.

He turned around and pointed to a border of white that lay against the blue of the water.

'*Enfin!*' he cried. 'England!'

THE ROMANCE OF THE SMYRNA FIG.

By CHARLES RAY.

MAN'S conquest of the plant world is a romance than which nothing more thrilling could be written; and of the wonderful stories that make up that romance none illustrates more strikingly the triumphant persistence of the human mind than the establishment of the Smyrna fig in the United States of America. It is a romance of modern times, and shows the thoroughness with which our kinsmen across the Atlantic carry out any task on which they set their hearts.

It is scarcely necessary to give a reminder of the prominent part that the fig has played in human history. Its abundant growth in the old cradles of civilisation, and its high nutritive value, have always rendered it an object of desire and a symbol of fruitfulness. It was in this latter sense that Cato used it when, denouncing Carthage before the Roman Senate, he plucked fresh figs from the folds of his toga and exclaimed, 'This fruit has been brought from Carthage—so near to us is a city so strong and prosperous. Carthage must be destroyed.'

History and literature are full of references to the fig, as when the wife of Nabal appeased David with a gift of figs, and Lycurgus decreed that figs should be one of the principal articles of food at the common meals of the Spartans. Curiously enough, we have a reminder of its early importance in our word *sycophant*, which means literally 'an exposer of figs.' This fruit was considered of such value by the Athenians that they prohibited its exportation from Attica. Many persons, however, found the illicit trade in figs exceedingly profitable, and a class of informers grew up known as sycophants, from two Greek words meaning 'a fig' and 'to show,' who denounced the smugglers for gain. Informers are never popular, and the word soon came to be a term of contempt, and has survived as such to the present day.

It is not, however, with the ancient history of the fig that we are here concerned, but with the most modern development in its culture, and the story of how fig-rearing became one of the settled industries of the New World, after successive failures extending over three hundred years or so. Of course, the Spaniards, after their conquests in America, took the fig-tree across the ocean, and the French also carried it to their colonies; and for several hundred years it flourished and bore fruit of a kind. But while the figs that were produced could be eaten green, they could not be dried so as to compare in appearance, size, and flavour with the well-known and luscious Smyrna figs. They were shrunken and sour and had no seeds, and although horticulturists and botanists spent much time in studying and experimenting, nothing could be done to remedy this defect.

It must be explained that the pear-shaped objects which appear on the fig-tree in summer are not fruits at all, but flowers. Their curious form may perhaps best be explained by comparing them to a sunflower or a daisy, the florets or rays of which, instead of being spread out flat in a disc, are gathered up and made to meet. This construction gives the fig-blossom its fruit-like appearance, and we may see the florets by cutting open any fresh fig that has formed on a tree in a British garden. The blossoms, when fully grown, may be eaten; but as they are unfertilised, they do not form seeds or mature into fruits, and so are deficient in the sugar that is essential if they are to be dried and preserved.

How could the blossoms be fertilised? was the great problem that the American horticulturists set themselves to solve about the year 1880, and it took twenty years of hard work and careful experimenting before success crowned their efforts.

So far back as the time of Pliny, the Roman naturalist, it was known that the wild fig, or caprifig, as it is called, was necessary to the fertilisation of the cultivated variety, and that in this work a tiny insect was concerned, though exactly what it did Pliny could not say. As a matter of fact, it has taken nearly two thousand years to get at the actual truth, and to the perseverance of our American kinsfolk we owe the knowledge that we now possess of the life-stories of the fig and the fig-wasp.

The method of fertilisation followed from time immemorial in Asia and North Africa is to grow a certain proportion of caprifig-trees—that is, wild fig-plants—in the plantations where the edible or Smyrna figs are cultivated, and then, when the Smyrna fig blossoms appear, to tie on the boughs above them branches of the wild fig-tree bearing caprifigs. The fig insect, which is really a small wasp, leaves the wild fig, where it has been hatched, and, covered with pollen,

 [*All Rights Reserved.*]

penetrates the cultivated fig, after which the latter swells and becomes the rich and luscious fruit that we know so well in its dried form.

Now, in 1880 a Californian fruit-grower, having determined to produce Smyrna figs in the United States, took over from the Old World cuttings of plants, which by care and attention he reared, so that they produced figs. But these would not ripen, and while still small dropped off the plant. The attempt had proved a failure. Nothing more was done for about eight years, and then Mr George C. Roeding, a planter of Fresno, California, went over to Asia and himself selected choice Smyrna plants. He used the utmost care in choosing these, thinking that possibly the previous failure had been due to the supply of cuttings being from inferior stocks. He also took with him to America some caprifig-cuttings.

The plants took kindly to the new soil, and in two years both Smyrna and caprifig trees bore figs. Mr Roeding believed in the necessity of fertilisation, and so collected pollen from the caprifigs, and introduced this into the Smyrna figs by means of a quill. There was great jubilation when, as a result of all these costly efforts, four ripe figs were obtained. The next year the process of artificial fertilisation was extended, and a glass tube was used, with the result that one hundred and fifty ripe figs were produced. It had taken nearly a dozen years to obtain these, and there was much satisfaction at the measure of success that had been obtained. At the same time, it was realised that if the Smyrna figs were to be produced in large quantities on a commercial basis, the slow, laborious, and costly method of mechanical fertilisation would have to be replaced by natural methods.

In the Old World this was evidently carried out by the tiny fig-wasp, *Blastophaga grossorum*, as it is called, which was hatched inside the caprifigs. But on the young cuttings of caprifig-plants which had been imported there were, of course, no figs, and therefore no wasps. The next step was to introduce the fig-wasp into America; but before this could be done a thorough study had to be made of the life-history of the insect.

American men of science came over to the Old World and gave their unremitting attention to the subject. They found that the caprifig of the Mediterranean regions has three crops—one in the spring, another in the summer, and a third in the autumn, which last remains upon the trees through the winter. It is in the figs of this autumn crop that the little wasp spends the winter, living upon the substance of the fig, and coming into the light of day during the spring. It finds the spring caprifigs already forming, and, creeping into them, lays its eggs. Then, having done its duty of propagating the race, it dies. The eggs soon hatch out, the insects live upon the spring caprifigs, and then, when they have exhausted the supply of food, go in search of further nutriment.

These spring caprifigs are full of pollen, and when the wasps emerge they are covered with it. Now, it is the branches bearing the spring caprifigs that the natives of Asia and Africa take and tie upon their Smyrna fig-trees in order to bring about fertilisation. What really happens is this. The wasps come out of the spring caprifigs, covered with pollen, and in the ordinary course enter the summer caprifigs and there lay their eggs, which in turn hatch out, the wasps eventually emerging and entering the autumn caprifigs, and remaining inside for the winter. The people of Asia and Africa, however, have learnt that they can deceive the little insect and make it work for them. They take the branches with the spring caprifigs and tie them to their Smyrna trees, and when the wasp comes out it is deceived into thinking the edible figs are caprifigs, and goes into them to lay its eggs. But the edible figs are constructed differently from the wild figs, and the wasps are unable to find comfortable positions in which to operate. They therefore blunder about for a time, discover their mistake, and eventually come out and fly elsewhere in search of caprifigs. While they were in the Smyrna figs, however, they were rubbing much of the caprifig-pollen off their bodies, and this in due time fertilises the Smyrna figs, which swell up, produce seeds, and ripen.

So much, then, the American entomologists discovered by infinite patience and perseverance. It was clear that the wasp was essential to the production of ripe Smyrna figs suitable for drying, and therefore they decided that the wasp must be introduced into California and acclimatised there. The first attempt was made in 1891, when boxes of autumn caprifigs were packed in North Africa, and carried across the Atlantic Ocean and the North American continent to California, where they were unpacked and placed under a caprifig-tree in the plantation of Mr James Shinn of Niles. The season, however, was too far advanced, and the experiment proved a failure. The Americans were not to be beaten. The United States Department of Agriculture had taken up the investigation as a matter of national importance, and, after several further attempts, at last in 1899 success was attained.

Caprifigs, with the hibernating wasps inside, were taken to America from Algeria, and placed beneath a caprifig-tree in the orchard of Mr George C. Roeding, and the tree was covered very carefully, so that the wasps, when they emerged from the figs, could not escape. In the autumn it was found that the tree was loaded with fruit, and that the caprifigs were full of wasps ready to settle down for the winter. One or two wasps had escaped through the covering and had fertilised Smyrna figs in other parts of the orchard, while a few had gone into caprifigs on adjacent trees, there to spend the winter.

Here was the promise of success, and great excitement prevailed among the entomologists

and fruit-growers of California. The original caprifig-tree that had been covered and two others were found to have on them about a thousand figs containing wasps. They were carefully covered with canvas houses so as to be protected from frost, and then everybody settled down to wait for the spring, which would tell whether success had been achieved or not. At the beginning of spring special experts from the United States Department of Agriculture visited the orchard to spend their days watching for results. At last, at the end of March, the wasps woke up from their winter sleep and began to come out to see what the world looked like.

The caprifig-trees were producing their spring crop, and into the caprifigs the wasps went to lay their eggs. The swelling of the wild fruit showed that the eggs were hatching out, and in the early days of June, having eaten up the insides of these spring caprifigs, the wasps began by ones and twos to emerge. Now had arrived the really exciting moment, the climax of the experiment. Would the wasps go into the Smyrna figs as they did in the Old World, and change them into the rich and luscious fruit so much sought after? It all depended on what happened during the next few days.

Parties of workers gathered the caprifigs containing the wasps and carried them to a building in the orchard, where they were tied in bunches and hung across long poles. Then these poles bearing the caprifigs were taken into the orchard, and the figs were suspended on the branches of the Smyrna fig-trees. It was a strange sight to see these bunches of wild figs hanging on the edible fig-trees up and down the rows in the orchard.

The watchers—entomologists, Civil servants, and fruit-growers—almost held their breath as they kept their eyes on the caprifigs to see what the little wasps would do. Would they come out; and, if so, would they go into the Smyrna figs? At last all doubt was set at rest. The wasps began to emerge, and after looking about for a time, entered the edible figs. It was a great moment for the men who had spent years in trying to establish the Smyrna fig in America. The insects remained inside some time, and then, coming out once more into the light of day, sought for caprifigs, into which they crawled and laid their eggs. The Smyrna figs were now carefully watched, and soon they were seen to swell—the sure sign that they had been properly fertilised, that seeds were forming, and that they were ripening, with plenty of sugar to preserve them and render them palatable when dried. The American fruit-growers and entomologists had scored one of their greatest triumphs.

That season about fifteen tons of fine Smyrna figs were produced. They were dried, packed in boxes, and when examined later were found to be equal, if not superior, to the Smyrna figs imported from Asia and Africa. Three years after the crop had increased to sixty-five tons, and now very large quantities of Smyrna figs are grown and dried in California, and they will no doubt eventually supplant the figs of Asia and Africa on account of greater cleanliness exercised in their packing.

The fig, it may be added, when dried is, weight for weight, more nourishing than bread, and a pound and a half eaten per day would supply four-fifths of the total amount of nutriment required. The fig contains nearly as much gluten as wheaten bread, and is 16 per cent. richer in starch and sugar.

THE SEARCHERS.

CHAPTER XXXV.

I TOOK the notebook-leaves, and we stepped into the clean air outside the hut, where the men were standing in awe-struck silence.

The dead man's statement was addressed to me. After a glance at it, I took Keene-Leslie and Sparke aside, and in the shadow of a boulder read it to them. Around us a profound stillness, and the old, wise, scarred mountains—where Nemesis had been keeping her immemorial vigil—looking down upon man's littleness and the two enemies in the equal sleep of death, made fit setting for the telling of tragedy.

Here is the black, strange story:

'Do not try to find out who I am—I mean, who I was.

'"Once upon a time"—— No; I'll begin again.

'I was once keen on research, and although the worldly rewards for pioneer-work in Britain are contemptible, I, being young and foolish, proposed to dedicate my life to it. But when I was eight-and-twenty my career was murdered: my name was struck off the Register by the General Council, a chartered anachronism with powers greater than King, Lords, Commons, trade unions, or any institution in this country—powers wielded without intelligence by a camarilla steeped in blind prejudice, and with neither judicial training nor equipment.

'The details are unnecessary. Only let me say that I strove with heart and brain for my goddess Science, and that the charge against me was blind and stupid, brought by reactionaries, terrified at the thought of a revolt against their moss-grown conventions. A few years hence and the savagery of my punishment will be regarded as a medieval horror, impossible in a civilised community as burning at the stake.

'For nearly a year my reason left me. When I came back to the world I was broken in health, penniless, and filled with a sense of injustice that bit like an acid. A few good men, who knew the inner history and the true perspective of my degradation, interested themselves in my behalf. I threw myself as a free-lance into my work again, and for a time found in it a blessed relief, for I was fool enough to dream that if I helped humanity by original work I might regain happiness. But my story pursued me. I soon discovered that a free-lance in medical science (unless he has money or backing) is an impossibility. I was a pariah. Gradually the mixture of despair, *ennui*, the sense of defeat—what men call a broken heart—crushed me, and, weary of it all, I disappeared. Followed years of wandering abroad; poverty; unspeakable loneliness; worst of all, the torture of uncongenial work.

'I contrived to make a living. There are avenues—some of them sombre enough—for a man under a cloud, if he has medical skill. Two years ago I found myself assistant—no questions asked—to the doctor in a mushroom township of tents and hutments, peopled by a couple of thousand Italian navvies who were laying a railway-track in South America, north-west of San Paulo. The doctor's name was Kenneth Hall, and he had once been in country practice in Logan St Mary, Scotland. On a generous estimate he was sober two days a week, but he paid me decently, and left me alone; and there was not much to do except dose his cut-throat patients with quinine and stitch them up after their brawls. While there I fell in with a lovable rolling-stone, Hugh Forbes, your uncle. Why he took to me God knows, for I was soured to the verge of misanthropy, while he was cheerful, kind, and a "white man," if ever one lived. Yet with all my heart I wish that I had never seen him, for it was through him that I first heard of the Glen Ciuin jewels.

'He loved to speak of the Old Country. Many a night when the camp was quiet I joined him in his quarters, and the talk harked back to his younger days in the North. Little thought had I of the dark road down which a chance remark of his was to lead me. A few belongings had stuck to him in his wanderings—a photograph or two, a water-colour sketch of the Glen, perhaps ten or a dozen books. One night—it is etched on my brain—I happened to look at the water-colour. The talk drifted to folklore, genealogy, and so forth. Clan traditions were touched on, and he showed me a little piece of paper, a duplicate of one at The Bield which had been in his family for generations. It was supposed to be part of a clue to some lost jewels. He regarded it merely as a curiosity, and the jewel story as a hazy family legend, but he had carried the paper about with him so long that, as a matter of sentiment, he did not care to burn it. Truth to tell, I was not interested in it, and neither was he.

'I fancy that Hugh Forbes never could stick long at one job, and I was not surprised when he threw up his post in the contractor's office and said good-bye. He promised to send his address, but I never received it. He was the only gentleman I had met at close quarters for years, and when he left I felt very much alone.

'The only other man whom I met at your uncle's was an Italian. He was one of the overseers, a suave old man of education and capacity, a good linguist, travelled, interesting, and of an imperturbable temper. I suspected that he had a "history." One does not find his type herding Italian navvies. You will be interested to learn that his name, or the name the old fox chose to go under, was Benedetto Alfieri.

'After your uncle left, old Benedetto asked me to attend a fellow-countryman of his who was ill. I went, expecting to see one of the wage-grubbing Dago crowd; but I found an exceedingly handsome and well-bred-looking man, palpably out of place in his environment. I wish my first visit had been my last, for he was the man with whom I have just been forced to settle accounts—Guidotti. When first I saw him he was pretty far gone with typhoid. Thanks to his constitution of steel, I pulled him through; but it was a long time before he was fit to crawl out, and I saw him every day, and became—worse luck!—friendly with him.

'About this time my employer completed the slow process of drinking himself to death, and I was offered his post. I hesitated, for I was sick of the life in the place; and when Guidotti, who had plenty of money and was grateful to me, offered to pay my passage home, I jumped at the chance. Would to God that I had remained where I was, at honest work! I came with him to London.

'I need not narrate the story of my downfall. Guidotti was rich. My scientific knowledge interested him, and his was a dominant and in some ways a fascinating personality. In the end I joined "The Searchers." He confided in me, and told me the origin of the gang's name: how they had kept from generation to generation one half of a certain paper; that the other half was in existence somewhere, and that the junction of the two would establish a clue to hidden wealth.

'At the time I thought Guidotti's story fantastic; but when he let me see "The Searchers'" half of the paper I could hardly believe my eyes, and blurted out, "Why, the Englishman Forbes who used to be in the railway camp showed me the other half!" I could have bitten my tongue out the moment afterwards. Questions showered on me. Who was Forbes? Where was he? Had he written me? What had he said about the paper? Had I read it? Could I remember it? Guidotti's intense and unconcealed excitement steadied me, putting a curb on my tongue. I told him the truth—that I knew nothing of Hugh Forbes's whereabouts or

whether he was dead or alive, and that I had not paid the slightest attention to the paper. But I did not tell him the whole truth—that I knew that its duplicate was in Glen Ciuin. Never a word did I let fall that might have put Guidotti on the track of the paper at The Bield. I knew my man. He would have used my knowledge, and given me a jackal's share of the spoil.

'In a week I had thought out the general idea of a scheme. I kept the secret of the whereabouts of the duplicate to myself, and set to work devising ways and means whereby I might get a copy of the paper which "The Searchers" held. Guidotti kept all the arcana of the brotherhood at his own house, but I had hopes of one of the gang called Salvi. His position was indefinite. He was next in importance to Benedetto, a sort of half-secretary, half-factotum of Guidotti, and a man devoured by an overmastering vulgar passion—the love of money. It took me a couple of months to ingratiate myself with the creature, but in the end he rose to a bribe, and agreed to copy the paper for me at the first opportunity. This required a considerable time; but while I was waiting impatiently for him to earn his money, there came a strange fall of the cards.

'One day I was turning over a medical journal, when an advertisement caught my eye. It concerned a country practice for sale in—of all places—Glen Ciuin! Fate had thrust the cards into my hands. Could I play them? No sudden lucky snatch at a trump, but a carefully conceived, indefeasible plan! I read and re-read the advertisement. My scheme took more definite outline. Why should not I, by one stroke, break from "The Searchers," and further my design on the paper at The Bield? To practise under another man's name would be a risk, but not so great a risk as might be supposed. The number of undetected cases is surprising.

'I had a little money saved, enough to serve my purpose, and the name of the dead doctor—Hall—of the railway camp in South America suggested itself at once. Personation is never an easy undertaking, but there were compensating features. Hall's name was not an uncommon one. He had been abroad for years; in life he had no link with the North; I knew something of his history; I was familiar with his looks and his colouring; to "make up" like him would not be a difficult matter.

'I found out that the practice in the Glen was a fair one, and—most important this!—the owner of The Bield was a patient of the former doctor. I had no time to lose, for medical practices are disposed of quickly. So one fine morning a dark, clean-shaven gentleman, "Dr Hall," began practice in the quiet northern Glen. "The Searchers" knew Royce—that was the name I then passed under—no more. I had dropped out suddenly and completely, concealing my whereabouts even from Salvi. His letters to me were sent to an address which I had given him, and were then forwarded to me. He told me that Guidotti and Benedetto were puzzled and suspicious about my sudden disappearance, and could assign no reason for it.

'The practice grew. I made a number of friends, and one of them, as I had fervently hoped, was the colonel.

'Two or three months passed before Salvi had an opportunity of copying the paper, but at last a telegram from him was forwarded asking me to meet him at a rendezvous in Leith. If I arrived first I was to wait for him. From the Glen I went to Leith, and lay low for three days. The rendezvous was not one suited for a decently dressed professional man to be seen at, and it was quite possible that a stray patient might recognise me. By the end of the three days the clean-shaven doctor had disappeared, and in his stead was a sandy-haired, shabbily dressed vulgarian. Doubtless you remember M'Nair! Two days afterwards Salvi turned up with the paper, but in a state of pitiable terror. He had very nearly been caught in the act of stealing it, and had just had time to pocket it. He had no chance of copying and replacing it, and he knew that when "The Searchers" missed it—as they speedily must—swift and certain vengeance would follow. I don't blame the poor devil for being in a cold sweat. I once saw a suspected member of "The Searchers" when Guidotti was "persuading" him to confess. I don't want to see another.

'Salvi lost his nerve, and, like a fool, bolted and hid in London. "The Searchers," of course, were at once on the alert, and discovered the theft. (Guidotti told me a few hours ago that he divined instantly that Salvi was in league with me.) They were soon hot on his track, but he managed to shake them off, and, after a couple of days in hiding, got, as he thought, clear away. My own belief is that from the first they never lost sight of him, but laid their plans to capture or kill us both.

'Terror-stricken, convinced that he was a doomed man, Salvi was a helpless hindrance. The problem of getting him safely away almost baffled me. But one night there came a dense fog. You remember it! I gave him his choice between risking slipping out under its cover along with me or being left to his own devices. He came with me. We had a nasty drop from a back-window, but we managed it, and with the precious bit of paper in my pocket-book, rolled up to resemble a cigarette, made off quietly up Leith Walk. But the devils were too many for us. They must have been watching like cats at a mouse-hole, and when we were in Durham Place—a quiet enough street for their purpose—Salvi was knifed. There was no scuffle. He dropped like a stone.

'I made off for dear life, and in Jura Street just missed the same fate, for the sailor-man

with the ear-rings, beside the railings, whom you stumbled across in the fog that night, was Guidotti himself—disguised, of course; but I knew his voice. He heard my running footsteps, and closed with me. Luckily, I managed to swerve in time, and doubled back with nothing worse than a cut shoulder. Then came our strange meeting when I collapsed at your door. I knew you at once, and thanked my stars that I had dropped my doctor's disguise and was my sandy-haired self. Let me concede that self-preservation compelled me to act somewhat disingenuously under your hospitable roof.'

'"Disingenuously" is good. A cool customer! He lied most skilfully for half-an-hour, didn't he?' commented Tony. 'But go on, Neil.'

'My knowledge of dialect was useful (I regret to say that I have some Scots blood), and for the night I appeared as "M'Nair," the bewildered clerk, and deposited my pocket-book and some odds and ends with you, as evidence of my *bona fides*. I didn't want any police meddling! After I left, a shave, a little attention to details such as the colour of my hair, and a change of clothes transformed me into Dr Hall again, and a few hours afterwards I called in your absence and recovered my pocket-book and its contents. Had you been at home I should have introduced myself as your uncle's doctor—which, by the way, I did about one o'clock on the same day, when I met you by accident at the Caledonian.

'You know the rest, all except the darkest chapter—one so dark that I hesitate to set it down. But the sands are running out. I shall tell it to you.

'I returned to my quiet country practice with half of the precious paper. My plans were ripening. Could I contrive to get a copy of the other half at The Bield, what a vista opened to me! A fortune, abundant leisure, means to pursue my research-work, fame, rehabilitation, victory over the crass blockheads who had ruined me. Call it revenge on the world if you like. The world had treated me scurvily, and I had no scruples in getting even with it. I saw myself, my back turned on the black and meagre years, snapping my fingers at Fate. But no man escapes the reckoning. The Devil, with all his faults, keeps his appointments.

'The plan was designed so as to turn the slightest suspicion from myself, and to induce the colonel to show me the paper. An atmosphere of disquiet was essential. I created one. "The Prowler" who left imprints of large, peculiarly marked boots was, as you now know, myself. I lied about the man with the melodeon. He never existed. Nor was there any one who consulted me—it was I who left the tell-tale footprints in the Afries Wood. The scheme succeeded up to a point. Although the colonel spoke to me about the mysterious Prowler, it was a long time before I managed to locate the paper. But bit by bit, a hint here, a casual question there, I found out that it was in the little hidden safe, and that the colonel kept the key on his person. So far, so good. I played a waiting game, and lost no opportunity of impressing you with my concern for the colonel's health.

'Then came your brush with the gang in Duff Avenue. I was horribly certain that Guidotti would discover your connection with The Bield, and find his way there. If that happened, my fate was sure, for my disguise would not deceive him. Both of us had occasionally found it prudent to change our appearance.

'Every day brought the danger nearer. Delay might mean disaster. I dismissed the thought of trying to break into the safe. I was not a professional cracksman, and the safe was a fire-and-burglar-proof one. I decided to play a bolder and a safer stroke. The colonel himself would be the witness of the dark Prowler's theft of the paper.

'To have "doped" him with an ordinary sleeping-draught would have been easy, but it might have caused suspicion to fall on myself. But after I joined "The Searchers," Guidotti showed me, among many queer things, a mysterious poison of peculiar power, which, he said, had been in the hands of "The Searchers" for hundreds of years. He may have been lying, but the drug was quite unknown to me, and my own view is that it actually had been handed down from medieval Italian days.

'"The Searchers'" drug fascinated me, and Guidotti, knowing my interest in it, had given me access to it when I chose. I made countless experiments with it on animals and twice on myself, studying it patiently and thoroughly until my labour was rewarded. I mastered it, and decided to administer it to the colonel. It has similar properties to the well-known drug curare, with which the South American Indians poison their arrows. Like curare, it paralyses the motor nerves, but for a purpose such as mine it has tremendous advantages over curare. It is, for example, tasteless; it can be administered in a liquid; and if death occurs, it resolves into cadaveric alkaloids, the metamorphosis rendering it untraceable. I had foreseen the possibility of my being forced to use it; hence my suggestion to you that the colonel's heart was weak, and that a sudden shock might be dangerous. But I swear that murder was never in my mind. I had, I thought, tested the drug until the results of its action were mathematically certain, and at the worst I anticipated that the colonel might be in bed for two or three days after my giving him it.

'Now I come to the "burglary." It was a night of wild wind. I sat with the colonel until about half-past ten o'clock, and slipped the dose of the drug into his glass when I was helping myself to soda-water at the sideboard. I left shortly afterwards, went back to the surgery, and waited. I knew to a minute when to return. Having changed into the black-bearded

one with the hob-nailed boots, on the stroke of twelve I made an easy entrance to The Bield. I had seen to the unfastening of the gunroom window. I found the colonel exactly as I had anticipated—paralysed, speechless, but conscious of what was going on. Nothing could have been better. Any evidence by him afterwards (as was actually given in his deposition) would make it clear that the person who had entered the room was identical with the Prowler. I should be the last man in the world to be suspected. I took his keys and his papers from his pocket, and opened the safe before his eyes. In a few minutes I was back in the surgery, and found that the paper from the safe for which I had risked so much was an illegible half-sheet, yellow with age, and the papers from the colonel's pockets were trivial! I burned them all on the spot. Soon there came, as I expected, an urgent summons to The Bield.

'There I saw at once that the colonel had not long to live. I shall not describe my feelings. You would not believe me. I had overestimated his powers of resistance, and I was, therefore, the cause of his death; but, on the brink of the Unknown, I tell you that it is false to say that I designed it.

'With his death, my hope of getting the paper was farther off than ever, and the possibility of Guidotti's appearance in the Glen haunted every moment. I had almost made up my mind to vanish abroad again, when your friend Keene-Leslie had a conversation with me in the Laird's Room. He was communicative enough to show me a copy of your paper, and careless enough to leave it where I could lay hands on it. I thought him much too confiding, but to-day's events have caused me to revise this view. I regret that I shall not be able to follow his career. He ought to go far.

'I took the paper from the escritoire, copied and replaced it. Next day I watched you leave, as I thought, for the South. In the evening I started for the Chanter Corrie. At nightfall I hid in Glenmore Forest, and at daybreak went up the Larig, never dreaming that you were there, waiting for me. Nor did I know that my worst fear had come true. Guidotti was here—had seen and recognised me. After the Duff Avenue affair, he had lain low for a time; but having discovered your Edinburgh address from the letters which Benedetto had taken from your pockets in the car, he had traced you to the Glen. The luck of his master the Devil followed him, for in tracing you he found me. All this I got from his own jeering lips a few minutes before his death. Through one of the village hotel windows, he had seen me passing in my car, and as I had used a similar disguise in his company in many a left-hand business, he recognised me. He watched, saw me start for the hills, and followed later under cover of the dark; but he lost me, and at dawn found himself near the Larig, below Muich Dhui.

'You saw the rest. When Guidotti confronted me, I pretended to give in, surrendered my revolver and pocket-book, and to gain time told him that I believed the cache of the jewels to be near the top of the Goats' Ladder. But although I felt sure the secret was in the lining of my pocket-book, not for all the jewels in the world would I have shared it with him. I knew that, sooner or later, he meant to kill me. It was my life or his—and I took his.

'And now—FINIS. *Cras? Ubi ero, cras?*'

(*Continued on page 596.*)

R. L. S. AS PLAYMATE.

By 'LANTERN-BEARER.'

I WAS a mere child when I first made the acqaintance of Robert Louis Stevenson, and in a sufficiently unusual and dramatic manner. His father and mine were friends of a lifetime, drawn together by some likeness of character and the same profession, and interested in one another by the dissimilarity that frequently cements a friendship. I had in my quiet, guarded childhood, passed in a lovely and all-sufficing old garden, smaller occasion and less liberty for adventure than the wild spirit of R. L. S. He was spoken of as 'a curious boy,' unlike others; and perhaps the mothers of my generation had an unacknowledged distrust of the thin, elfin lad with the brilliant eyes. In any case, we had not met save at those terrible entertainments called 'children's parties,' and had eyed one another with the reserved and clear-sighted silence that in thoughtful children is the substitute for older diplomacy.

Our family had in the 'sixties settled for August and September at North Berwick, then a small, unfashionable seaside place, with an East Bay, and a very nebulous West, that had about half-a-dozen villas. The East Bay was to us then a real Elysium—rocks, sea, a safe beach called 'the sands,' on which we had any amount of unusual liberty; and, under the eyes of tenants of the line of villas, little danger could come to the boys and girls who played and dreamed there. The Black Rock was an Alp to be climbed, and I had, with another playfellow, a dear cousin now long dead, begun the ascent. The rock was very hot and dry, and polished in places by the many feet that had gripped in its few niches. Just at the top I found I had the wrong foot foremost, nothing to hold to, and a sensation of fear. My head barely reached the top, but my hat did. To my relief, a thin, brown hand with long

fingers came over the edge of the rock, and a thin, brown face, with very keen, interested, gray-brown eyes, looked over. 'Take my hand,' said a boy's voice, and the fingers curved for the grip. I looked at the very thin, very long wrist that reached out of a pepper-and-salt shabby coat, and hesitated to trust to it, it looked so very unequal to any efficient help, then up to the eager gray eyes bent on me, and felt that I might trust to the owner's willingness. 'All right,' I said, and put a sandy paw in the thin one. 'Hold tight and change your foot;' then, 'One, two, three,' and a good pull landed me on the top. 'I am Louis Stevenson,' the boy said. 'I was lying up here in the sun, on the warm rock. Isn't it fine?' I still think of him as 'Louis,' French fashion, without an 's,' as his surname obliterated the final consonant, and it was many years before I realised that it was the English Louis. Our elders, for some unknown reason, never spoke of him without the surname, a kind of unconscious tribute to his difference of temperament. It had a curious effect on my young mind. 'Bob,' 'Fred,' 'Jim,' 'Harry,' seemed a homely crowd, but 'Louis Stevenson' stood out with a kind of uncanny glory to that strange thing, a child's mind.

We soon 'made friends,' and began on the top of the Black Rock a firm friendship that was never broken, although life set our paths wide apart in his early manhood, and death's dark river flows between us for a time. Louis was two and a quarter years older than myself; we were both Mercurians in colouring, hair, and eyes; both dreamers and readers. We loved adventure—and its shadow in fancy, for our area of liberty was not very great. But even now, in middle age that verges on the hateful 'elderly,' the East Bay of North Berwick holds for me the glamour and richness that was so great for us in that long-gone childhood. The mound that rises at the end, rippled all round by old sheep-tracks, was to us an ancient fort. Louis thought if we dug into it we might find bones of dead Vikings, or their equivalent in North Berwick. Children accept such ideas without cavil when the rainbow of fancy plays over them. Many a game we played on that little terraced hill, and many a time did we run down, to the imminent danger of our legs. Once, indeed, I fell and dislocated my left arm very badly, and suffered great pain. But the leeches that were put on to reduce the swelling were so black and mysterious, so interesting to talk over with Louis afterwards, the sling in which my painful arm reposed so important, that I felt the injury was a feather in my cap. For a time my share of digging sandpits was suspended, and I was a wounded warrior recovering for fresh feats of arms! Louis was sympathetic and kind, and had a wonderful way of making everything, even injuries, an adventure. A modern Don Quixote, who could stifle the common-sense and dull accuracy of his followers and make them see the giants he saw—the light that never shone here—perhaps the truth that is so well hidden from so-called wiser eyes. In the years that followed, the long years of early youth, Louis and I and some cousins had many ploys together on the Pactolian sands of North Berwick. When the tide was out we fished for a large-headed, stout little fish called a 'podley,' and put partan-cleeks into crab-homes on the red rocks near the harbour. Where these red rocks merge into the yellow wave-marked sand of the lower beach are many mounds of sand beaten by the waves into a kind of embryo rock, covered with green grass-like weed. Here the falling tide leaves clear pools, in which shrimps dart and burrow. One day Louis and I were wading there, he with very skinny legs well displayed by much rolled-up thin trousers. 'Were you ever marooned?' he said suddenly, with the strange look in his eyes that always indicated with him 'an idea.' I was not at all sure what 'marooned' meant, but, unwilling to show my ignorance, said, 'No,' while wondering if it was something Louis meant to do to me. 'Well, look here, suppose you were on a desert island with nothing to eat, what would you do?' I had not the faintest idea, but suggested, 'Fish.' 'Silly, how could you catch fish in the sea? They aren't trout that one can guddle. Shrimps now—there are lots in the sand, and not bad to catch.'

I suggested that we should need a pot to boil them, remembering the pink dainties of a sea-side tea-table.

'No,' said Louis, with sparkling eyes; 'raw would do. Father eats oysters, and I once had one; it wasn't very nice, but I heard him say they were very nourishing.'

'Oh Louis!' I cried. 'Those nasty gray things!'

'Yes,' he replied; 'I think shrimps much nicer-looking. Let us be marooned and try some.'

So we imagined ourselves alone in the wide ocean without food or fire. That was easy. Then we caught a few silver-brown wrigglers, and paused.

'Where are we to begin, Louis?'

He looked at the morsel, and said slowly, 'The head would be best; it would die at once—bite quick!'

So we bit quick with sharp young teeth, and found the shrimp quite as good as Louis's oyster; but somehow the movement of the small fish made the meal more cannibalistic than the lethargic oyster would have done. It was, however, an experience added to our store, and Louis was always on the look-out for something new and uncommon.

There was a gloomy building to the west of the bay that always appalled us. A long dead wall without windows, and only one small door. It was the beach door of the 'abattoir,' and once only did Louis and I look in there. One glimpse was enough, and we fled, sick and horrified, to remember for ever the description

in the Book of Isaiah, to reject, as too hideous for acceptance, the interpretation of the metaphors of the Bible. 'Could you do that?' we asked, and needed no reply. I see yet the snowy victim, hear the beating of my heart, and the hurried closing of the dark, dreadful door.

The foundry was another whilom haunt, where we watched the glowing iron of our partan-cleeks beaten into shape, bent, and plunged into the water with a hissing sound of remonstrance against the embrace of the enemy of Fire. The grimy figures that worked the iron in the firelit gloom were to us good-natured devils, the skin-aprons and hairy arms helping the delusion, for in the wonderful brain of the boy Louis everything suffered a seaside change into something rich and new. Sometimes we went, with some older comrade to shepherd us, to a bay far to the east, beyond the dark tufa cliffs. Round by the rocks we picked our way, and sometimes paused to look at the green lips of the sea moving against the weed of the far-out rocks. Clear and deep, streaked with streamers of brown tangle, the sea seemed to breathe and pause, and we felt unsafe on the edge of the deep pool. Farther on, the sea-pink nestled in crannies above the reach of the waves, and glowed like tiny rosettes on the breast of the cliff. At our feet the empty houses of dead, wonderful sea-beasts, with sometimes a bit of rope, a broken spar, and once a baby's mattress-bed. Of things like these we wove, with Louis as taskmaster and inspirer, strange tales of wreck and sorrow on the sea, till, as the successive Augusts and Septembers multiplied, we had a store of witching fancies, from which one of us wove masterpieces of thought and literature.

Later we all haunted the West Bay, where more houses were beginning to be built, and, being larger, were more suited to growing families and purses. Here our ploys were huge sand-pits, and lantern expeditions, golf, and croquet for a very short time. But the latter game was no favourite with us; there was no make-believe about it, no glamour, and far too much standing still at a 'beastly hoop.' Of the sandpits I have written elsewhere, and the Argonaut voyages we made in the brown herring-boats drawn up and glistening on the beach. A favourite but rare adventure was enjoyed at the spring-tides. For a very short time the long line of jagged rocks below Point Garry, a kind of rampart of the shore, was possible to our reach by wading. There starfish of unusual colour and size abounded, sea-urchins with encrusted jewelled shells, and feathery sea-anemones. By dint of long legs and very short trousers the waders might spend a few delightful and dangerous minutes before the tide turned. Louis was in his element then, anywhere that was off the beaten track, with possibilities of danger, otherwise adventure. His eyes glowed; his very hair, long and lank, seemed to stiffen into more elf-like locks. He always led the band, was always the master-spirit and inspiring force. A kind of magnetism seemed to emanate from him, some of his great, though then undeveloped, personality. Animals came under his charm as readily as we did, and he was always tender to the lame or unlucky, although his sympathy showed itself in the robust form of understanding without words, and his power of diverting the attention to other things. His odd faculty for adventure, his power of throwing glamour over everything he touched, must have been to himself a source of immense pleasure. Dull he could never be, even in sickness. In a letter to my cousin he described himself when ill as a 'pallid weevil in a biscuit.' His extraordinary gift of self-observation suggested a power of detachment of the inner mind, and the exercise of an onlooking faculty.

One game we had with other children that I have not seen mentioned in the many notes on Louis's boyhood. An old gentleman, Mr Girle by name, passionately fond of young people, used to gather round him a little crowd of boys and girls, vowed to look the other way and sent to a little distance; then Mr Girle hid in the sands a china egg, for which whoso found it got sixpence. We scraped in the dry golden sand like rabbits or dogs, and of course saw the china egg as more like that of the fabled roc. Louis was not energetic as the other boys, held by his delicate health from strengthening his slender body. But his eyes shone with that fire of concentration that made him later 'a sedulous ape,' and he always invested our most homely game with a kind of magic, which still endures in the memory of his playmate.

There was in one part of the sands a broken drain, from which bubbled a black and evil-smelling stream. This, Louis had told me, was like the 'Sticks,' as I spelt it in my mind. It fascinated me with its slow, thick ooze, and, regardless of typhoid and diphtheria, we speculated on its origin. One day I went too near; the sand and pipe crumbled, and my leg went in to the knee. This was very amusing to the others, but I was punished for my daring. My parents sent me to my room to wash and be clean, with dry bread for my early dinner. There was a hot raspberry-and-currant tart for that meal, and the strong, fine odour of that dainty still recalls my longing for the forbidden fruit, with a queer memory of gloomy Styx. There are not many things that one can more easily recall than smells, or that so bring back other memories.

My father sometimes joined our games, and set us to one called 'Rosamond's Bower.' He drew with his walking-stick on the smooth, wet, unmarked sand, after the tide went out, a series of lines that started from a semicircle and went round and round in interlaced and crossing lines. I think the secret of getting into the bower was to keep always to the right. But, in any case,

we might wander for an hour if the rule was not kept. Mr Thomas Stevenson and my father were martinets over this puzzle; we must go on till we arrived, and no shirking was allowed. To Louis and myself the thin furrow in the sand was a green hedge above our heads, and we always hoped to see a fair Rosamond in the bower. Perhaps she was just as real to these little kings who ran round the maze as some less fair who engaged their fancy in later years. The ideal was always before Louis, and he passed on the power of seeing wonders to his devoted followers. I wonder if any one now draws Rosamond's Bower on the North Berwick sands; if the children of to-day have half such a good time! Louis was an object of envy to me for many an August and September, for he had an iron spade, and I only a wooden one. My mother had once seen a bad accident with the metal delver, and feared to give the opportunity of another to her children. This iron spade somehow set Louis on a pinnacle, and, like other child memories, is clear and strong. As if with wood and iron we worked in later life, and the results were as then, the iron spade cut clean and true to the heart of the sand, and the wooden one confused the outlines we had traced. In nearly every ploy that I remember there is the light of fire. If possible at all, Louis must have a fire. As a boy, the small smoky altar in the sand-house was the core of his enjoyment, and the hidden eye of the little lantern at his feet gave his wild heart dreams and thoughts that till manhood he himself did not understand. In a wind-swept, almost roofless cottage, where we played long ago, the fire was his share of housekeeping, and other joys paled before its ruddy glow. 'More fair than laughter, lo! the flowers of fire.' To him it was a wizard with its change and movement, and strange, vivifying light. Red in all its tints called to him as the master-colour in the rainbow, and his red tie, then a source of derision, became famous the world over. Strong, pure colour attracted his keen sight, as in a savage, and he saw nature from a barbaric point of view. In his love of wild, untrammelled life, sought for then in sand-houses and ruined cottages, he unconsciously reverted to a more primitive condition, a less civilised age. Given the strength that was denied him, but of which he dreamed, he would have looked on the 'bright face of danger' in untrodden lands, would have climbed great mountains, to see below him 'the snowy hills lie bowed like flocks of sheep.' The life of tent and caravan would have called to his fearless spirit, and been transmuted to golden story by his alchemist brain. He saw life and nature unroll their endless magic web, and caught something of their own fire and colour. 'On the loud stairs of honour' he looked back to the joys of childhood and youth, and found in the glamour that his own mind has cast over simple, everyday events more music than came from the clamour of praise, the loud blast of fame. His dreams, beginning in early boyhood, carried him on the wings of the morning to high, enchanted places, and lasted to the end, through seeming failure and hard misinterpretation, and the more dangerous conditions that follow the glory of this world.

As I write I see, not the writer in Vailima, famous the world over, but the strange, thin, glowing face, the slender hand that came down to my aid on the Black Rock with the words that were perhaps the unconscious watchword of all his work—'Take my hand.'

STOLEN GUESTS.

CHAPTER III.—THE RELAPSE.

IT was a little shooting-lodge that Miss Marion Smith had rented in the small parish of Auchinbreck, in Kirkcudbrightshire. Thither she had taken from London her family of nephews and nieces. Since the death of their parents she had brought them up, and made a good thing of it, for her brother had left his children well off. Years before one of her sisters had gone to Australia, and married out there. Beyond occasional letters, she had never kept much in touch with her. Recently, however, she had received a letter saying that her sister's son Jack had been wounded in France, and taken to a hospital in England.

'That means that I must invite him to Auchinbreck when he is convalescent. I hope he is not a dreadful Colonial,' said Marion in rather contemptuous tones to her niece. Ever since her sister had married an Australian, she had made slighting references to the Antipodes. Possibly they were prompted by jealousy.

She sent a rather lukewarm invitation at first to the wounded youth, which he was long in answering. In his reply he mentioned that he was staying with General Cockburn Davidson. Miss Marion, who had made good families the study of her life, knew all about this famous officer—that he was considered one of the great prizes in the matrimonial market for ladies of mature years. At once she wrote to her nephew a gushing letter, begging him to come, and to bring his friend, and picturing in exaggerated terms the attractions of Auchinbreck. Jack was not at all eager to accept, but her persistence won the day, and he prevailed on his host to come with him.

'Whereabouts is it?' asked the general.

'Oh, somewhere in Scotland. I'll look it up on the map and in the time-table, and steer

you straight.' But Jack, in his thoughtlessness, turned up Auchinbruich instead!

'It is away up in Ross-shire,' he said; 'but my aunt says she has got a motor, so I am asking her to send it to meet our train.'

Thus had arisen the mistake which had brought an unexpected flutter to the heart of Miss Mary, and dismay to that of Miss Marion.

The latter had got a post-card (addressed before Jack's exploration of gazetteers and time-tables) stating that the general and her nephew would leave on a certain day, and that a wire would be sent later mentioning the train by which they would travel. On the strength of this Miss Marion had invited all the best people in the neighbourhood to meet the distinguished general on the day following his arrival, and her invitations had been accepted. Great were the preparations that she made for this dinner-party. She had ventured to ask people who hardly knew her, so proud was she of the celebrity she was about to parade.

The day came for his arrival—and passed without even a wire. That night poor Miss Marion could not sleep, as the fear haunted her of the chief guest being absent on the morrow. In the morning she telegraphed to Hove asking for an immediate reply as to when she might expect the general to arrive. The reply she got caused consternation. It was that the general and Lieutenant Wright had left two days before, and were going straight to Auchinbreck, where they ought to have arrived on the previous evening.

The day dragged on and the hour of Miss Marion's dinner drew near, but there was no sign of the general. She wired to the leading hotels in Edinburgh and Glasgow to find if the missing pair were there, but no trace of their whereabouts could be discovered. Poor Miss Marion! Her guests arrived, but the distinguished man they were to meet did not appear, nor had he deigned to send any explanation. It was a terrible affront. Inwardly she vented her wrath on Australia, blaming the casual ways of the Colonial, and yet that left much unelucidated.

'But surely the general, if he had accepted your invitation, and was in any way prevented from coming, would have sent you a wire,' insinuated one of her lady guests in a tone that implied that Miss Marion had not been quite straight.

Never was a dinner-party so flat. In vain did Miss Marion protest that the general had promised to be present. Her excuses only provoked unbelieving smiles. The conclusion of her best friends was that she had been let down badly, and that there must have been some reason for such a snub, or the general would not have inflicted it.

Then the matter got into the papers, and Miss Marion felt more relieved. A British general had actually gone amissing in his own country. Some journals hinted at foul play and the hidden hand of revenge, but as the days passed the mystery only deepened. The unconscious fugitives were too busy enjoying themselves by river and loch to be concerned with how the world was occupied with them.

Only one inmate of the cottage had a guilty conscience, and that was poor Miss Mary. She did so enjoy having guests. She tried to soothe her guilty qualms by the thought that they had come to her house uninvited, and to put off from day to day the evil hour of explanation. In fact, at the very thought of it her heart almost stopped. What could she say? Meantime she was happy, and her dinners surpassed each other, and the sun shone, and the hours sped far too quickly. Fortunately no other person in the parish got a daily paper, but the Saturday weekly would soon arrive. Of course, it would be full of the sensation of the hour, and then the cottagers who had noted the strangers might draw conclusions. Yes, it would be impossible to keep up the deception much longer, and yet she was so happy—and so were the general and Jack. They never grumbled at not getting letters.

'I told my man to forward my correspondence here,' said the general, 'but I think he wants to give me a holiday.'

Meanwhile it was arriving at Auchinbreck in budgets. Letters and telegrams were piling themselves up for the general, while he was innocently playing dummy whist in the little drawing-room at Auchinbruich.

'Really, aunty,' said Jack on the Friday night, 'you have given us such a jolly good time that we are loath to go, but we cannot stay here for ever.'

'Just one more excursion,' she pleaded. 'I want to take you up to a new loch to-morrow.'

The general assented at once, and Jack readily acquiesced. But Miss Mary had other intentions. She realised that the hour had come for confession, but she had not the courage to do it openly. She would write a note to Jack that night, and escape by the first train in the morning. She would go to London, and hide herself there, and never come back to her Highland home again. In her inner soul she felt that it had been worth it. Never before had she enjoyed such a week. Now there was the price to pay; but she had a stout little heart, and did not flinch.

She gave orders that night for the motor to be ready to take her to the station to catch the 6 A.M. train for Inverness on the following morning. Then, when the house was quiet, and her guests had gone to bed, she sat down in her drawing-room to write her confession.

It was the most difficult piece of composition she had ever faced. Several times she tore up what she had written.

'I must not make it long. Jack and the general hate lengthy epistles. I'll try to get it all on this little scrap of paper,' she said to herself as she spread out a small sheet, and began again.

Miss Mary Smith wrote that she thought that there must have been some mistake, and that her guests ought to communicate at once with Miss Marion Smith of Auchinbreck, as possibly they might have been expected there. Still, as they had come to her, she had tried her best to extend to them Highland hospitality, and had thoroughly enjoyed their visit. She was sorry she had to leave so unceremoniously, but she would be glad if they remained as long as they liked. She had quite liked being 'aunty' to Jack, and if they ever met again, she hoped they would continue their relationship.

Folding the paper up, she tiptoed along to Jack's room, and shoved it under the door, and then went to complete her preparations for departure.

About five o'clock next morning Jack Wright was disturbed by the throb of the motor. Lazily getting out of bed, he walked over to the window. To his amazement, he saw his aunt loading it up with travelling-trunks, and then springing in herself and driving away.

'Where can she be off to at this unearthly hour? I hope she is not going to desert us, she is such a ripping aunt. Possibly gone to order the breakfast at the nearest town. She has taken no end of trouble to make us comfy. It must mean a lot of planning to run a house in this out-of-the-way corner. Well, I will have a smoke to console myself.' Putting on his dressing-gown, he seated himself in an arm-chair, and searched in his pockets for matches. In the box there was only one left.

'What a nuisance! Ah, there is an odd bit of paper on the floor. I will use it as a spill.'

Walking over to the door, he picked up the folded note, and in the uncertain light—for the curtains were still undrawn—he did not notice his name scribbled on it. In fact, he never dreamed of there being any message for him. Very deliberately he rolled the paper into a spill, and lit it with the match. Then he applied it to his pipe, and when it was half-burnt flung it into the grate, and unconsciously watched Miss Mary's effort at composition end in smoke.

The general and he found their usual appetising breakfast waiting for them—but no hostess.

'Where is Miss Smith?' asked the general with some concern after a few minutes of impatient waiting.

'I saw her set off in the motor this morning at five o'clock,' answered Jack carelessly.

'Alone?' The general was getting a little tempery.

'Yes, except for no end of trunks and bandboxes, as if she were going off for a regular week-end.'

'And has she left no message?' The general was showing signs of desperation.

'No; but Margaret let out to me that she thought her mistress had gone to London.'

'To London! Without even saying good-bye! Jack, my boy, I'm to blame for this,' groaned the general as he sank into a chair, leaving his coffee untasted.

'You, sir?'

'Yes. I do not mind confessing to you, but I made a silly ass of myself last night. When we were playing bridge I pressed your aunt's hand under the table while I was handing her a card she had dropped. That has frightened her, and she has flown, terrified, this morning. I have been a brute, Jack.'

The young man, with an effort, kept his face straight. The anguish on his senior officer's face was too real not to evoke sympathy.

'She has lived a very quiet life up here, sir, you see,' he said. 'She told me herself that she seldom had any visitors.'

'Yes, that is the charm of the place—and its mistress,' murmured the general. 'Both are absolutely unspoiled. I ought to have been more careful. And now she is gone! Can you get her address in London?'

'No, I fear not. Even the servants don't know. She said that she had never any letters to send on. She would write them instructions in a fortnight.'

'A fortnight!' gasped the general. 'That is an eternity to wait. Can we do nothing?'

'We could stay on here, sir, until she returns. She left orders that we were to have the free use of the house as long as we wished.'

'But without her it would not be the same. It is beautiful and all that—a perfect little paradise. I could spend the rest of my days here in perfect bliss—only not alone. It is horribly empty without your aunt. We must try to find her.'

'Let me see,' pondered Jack aloud. 'I remember studying the time-table when we came up here. I thought out our return journey at the same time. I did not imagine then, of course, that we should be remaining so long. There are just two south-going trains in the day. The one that leaves at six in the morning is awfully slow; it stops and shunts at every station. I do not know what made my aunt choose it.'

'She was in a desperate hurry to get away; that's why,' interrupted the general.

'The other is the fast mail, leaving at ten-thirty. I believe now that it catches the first one up at Perth.'

'Catches it up!' repeated the senior officer, rising from his chair in his excitement. 'Are you sure of that?'

'I will get the time-table and see,' responded Jack as he went over to the writing-table and picked up a railway pamphlet.

Miss Mary Smith, like many stay-at-homes, was a poor traveller. She looked up only the starting-hours of trains. She never considered how long they took on the journey. Besides, in this instance it was imperative that she should slip away unnoticed, and she was in such a mood that she did not mind whether it took a week or a month to reach her destination. Her one

desire was to leave Auchinbruich behind her for ever.

'Yes, my aunt has selected an abominably slow train. The mail gets exactly the same connection at Perth,' was Jack's comment on the information he had extracted from his study of the time-table.

'Then tell that chauffeur to hurry with his car. You drive, Jack, for you can make the thing go. If we miss the train here, we must race it to Inverness. We shall catch your aunt yet. Never mind packing up. Perhaps we may bring her back with us, when I have apologised.'

Jack had never seen the general in such a flurry before. He obeyed orders, and in a few minutes they had started in pursuit of their fugitive hostess.

LACONICS.

By GEORGE F. M. COCKS.

THIS is not an art to which orators seem likely to become addicted. They all pay it lip-service, admit the necessity for compression of the other fellow's speech, and, having caught the Speaker's eye, will advocate it for hours without showing the least desire to be accounted a wit by the exhibition of that brevity which is proverbially the foundation of all wit. Yet short and successful—and successful because short—speeches have been made. Let us give pride of place to Lord Tredegar, who confined his speech to one word. He was down to reply to a toast, but the company insisted upon his responding to an earlier one than the programme had arranged for. He rose, and into the consequent silence dropped the one word, '*Resurgam*,' which some understood, and all appreciated. Lamb perhaps went one better. Believing that 'a speaker should not attempt too much, but leave something to the imagination of his audience,' he rose to reply to a toast, bowed to his audience, said, 'Gentlemen,' and then resumed his seat. That seems rather like taking a mean advantage of good imaginations.

If in our search for the words few but fit, we turn from the orator to the soldier, we are cheered on the threshold of our search by Cæsar's classic report to Armintius of his victory over Pharnaces at Zela in 47 B.C., '*Veni, vidi, vici;*' which, however, is beaten by Drake's legendary report to Elizabeth of the Spanish Armada, 'Cantharides' (the Spanish fly). That report was equalled by Lord Napier's despatch, as terse as apochryphal, '*Peccavi*' (I have Scinde), which is surely the greatest pun that Tom Hood did not coin.

Cæsar's despatch has been paraphrased on at least two occasions. When the Poles beat back the tide of Moslem invasion from the walls of Venice, their leader, John Sobieski, sent the standards he had captured to the Pope with the message, 'I came, I saw, God conquered.' Turenne's paraphrase had no mock-humility about it. Recovering Dunkirk from the Spaniards after Dünen, he reported, 'The enemy came, was beaten; I am tired. Good-night!' And we must not forget our own Admiral Blake, who won a fine victory and penned a fine despatch which ran—nay, *galloped* rather, 'Please your honour and glory, met with the French fleet, beat, killed, took, sunk, and burned as per margin. Yours, &c.'

If now we turn from soldiers to men of letters, we find that they are not always, like Pascal, too busy to be brief. Of the living two deserve mention—A. B. Walkley, and an unknown American critic quoted by *The Bookman*. When the former was dramatic critic on *The Star* he went to a play entitled *A Dreadful Night*. At the head of his critique he put the title of the play, added the word 'Exactly,' and then let the matter drop. The American literary critic was equally to the point. He set down the title of the book, added its price and the author's name, and all he had to say in addition was 'Shake!' a review pleasing both to author and publisher.

But it is the French who have the best reputation for polished precision; it was one of their authors who confessed that he had a craze for packing a volume into a chapter, a chapter into a phrase, and a phrase into a word. Talleyrand, for instance, is credited with having written two letters to a widow. His letter of condolence was '*Hélas, madame!*' and when, a few months later, he heard of her engagement his note of congratulation ran '*Ho! ho! madame.*'

The rage for brevity seized upon Voltaire, who challenged Piron to a trial of epistolary terseness. Voltaire went into the country, leaving for his competitor the following letter, '*Eo rus*' (I am going to the country). If he thought he had won, Piron's reply disabused him. All it said was '*I*' (Go). But Victor Hugo and his publisher did even better. When *Les Misérables* was being published the author sent off a letter, the sole contents being '?' The publisher's reply was equally brief and entirely satisfactory—'!' After this one hardly dare venture to quote the shortest letter to *The Times;* it seems positively verbose in such company. It appeared under the heading 'How to Make Burial Harmless,' and all it said was, 'Sir,—Put in the coffin, quicklime. J. HOSKYNS-ABRAHALL.

'Coombe, Oxon., *Dec.* 21.'

Epitaphs cannot be excluded, though they are usually not sparing in words. There is the

classic instance in Westminster Abbey, 'O rare Ben Jonson!' Dr Fuller's epitaph runs 'Here lies Fuller's earth;' but Dr Fuller suggested an even shorter one for Dr Caius of Caius College: '*Fui Caius*,' which just managed to beat Maginnis's for brevity, '*Finis Maginnis*.' Douglas Jerrold suggested that Charles Knight's should be 'Good Knight,' and for Camden the title of his chief work, 'Camden's Remains.' Upon an auctioneer's monument was engraved, 'Going—*Going*—GONE.'

But a monument so inevitably marks the end of one's aspirations that we will bring this article to an end on a note of 'happy-ever-afterwards' by giving the shortest of marriage services. It is performed daily by the Milwaukee justices. 'Have her?' 'Yes.' 'Have him?' 'Yes.' 'Married. Two dollars.'

THE AIRY PRINCE.

PART III.

VII.

THERE was a knock at the door of 'The Plough and Crown,' which, in spite of its similarity to the title of a treatise, is the name of an exceedingly cosy little inn less than twenty miles from the outskirts of London. The landlady answered in person, presenting just the stout, apple-cheeked, buxom appearance that any one would expect from the owner of so cheery a hostelry.

'Good-morning to you, sir—and to you, miss,' said the estimable woman, as the unlocked door revealed an airman of solemn mien, and a blushing young lady whose hair had been blown into utter and captivating disorder.

A small dog appeared, irritably, from some subterranean passage, and, taking in the sight of strangers, proceeded to bark with such energy that, with each effort, he was shunted several inches to the rear, like a gun recoiling after discharge, until from very ill-temper he barked himself completely off the scene and out of this history.

'Good-morning, madam,' said the aviator. 'This young lady and myself would like to have breakfast at your house.'

The girl glanced furtively at him. It was the first time she had heard him speak in English.

'Bless your baby faces!' cried the woman. 'Come in out of the chilly morning; though what you be doing at this hour is beyond the likes o' me to fathomate' (a word which performed its function by being thoroughly understood).

She led them into the coffee-room, where he removed his coat and helmet, and threw them, together with the girl's flying-costume, over a chair. A sleepy-eyed and slovenly young woman-of-all-work appeared on the scene, and proceeded to build a wood fire in the grate; while the landlady, after the manner of her kind, bustled about, shifting chairs, colliding with the fire-making girl, removing glasses from the bar to the table, from the table to the shelf, and back to the bar again, all the while talking incessantly, or making comfortable noises when words failed her (which was very seldom), and, in short, giving that feeling of hospitable activity handed down from the good old days when passengers used to arrive by coach at 'The Plough and Crown.'

'Madam,' said the flying-man, seizing a moment when a more than usually severe jolt against her assistant had deprived the good woman of breath, 'I must telephone the aerodrome at Hounslow to send for my machine, so I shall stroll to the post-office down the road. In the meantime—this young lady speaks no English'——

'Bless her heart! What heathen country'——

'——speaks no English,' he persisted, 'and has travelled a long distance in the air'——

'Well, I've often said that'——

'——in the air,' he repeated, stifling her philosophy in its birth, 'and I shall be grateful if you will give her any attentions that your kind heart may suggest. She is cold, and I suppose she wants to make herself look pretty.'

'Leave her to me, the sweet innocent. If she were my own daughter, me not having any, but'——

'When I return, may we have breakfast?'

'A simple breakfast 'twill have to be,' said the hostess, emitting the words with a forcefulness reminiscent of a geyser that has been supporting on its chest a mountain which has obligingly shifted its position. 'Things is awful bad, and the Government don't trust no one these days. But I'll see what I can get for you two children, for you're an officer gentleman, and my own good man's in the army—London Scottish he is, though he ain't any more Scottish than the Pope of Rome; but he always had a fine figure, had my man—Jacob Wilson is his name, for thirty year owner of "The Plough and Crown," which always is welcome to them as wants a pint o' bitter or a bed for the night, and always will be as long as Jacob Wilson or me is to be found in the taproom when opening-time arrives.'

After this announcement of the past and future policy of 'The Plough and Crown,' the worthy woman seized a chair that was innocently gazing out of the window, and placed it directly opposite a highly coloured picture of a young lady in pink, talking to a blue young gentleman, while a yellow horse, in proportion a little larger than the horse of Troy, looked soulfully at them over a hedge.

Having done this, she rested her hands on her hips and sighed like a woman who knows she is overworked, but is resigned to her fate.

'Excuse me,' said the airman politely, then

turned to his companion, who had been staring in wide-eyed bewilderment at the activities of Mrs Jacob Wilson. . . . Frowning heavily at his young passenger, he inserted his pipe into his mouth, and left the inn without another word, sauntering along the roadway, where hedges and meadow-larks and cosy thatched cottages were combining in the merriest of madrigals on the beauty of Old England.

Upstairs, in 'The Plough and Crown,' Pippa's toilet was being superintended by the estimable proprietress, whose hospitality, surmounting the difficulty of language, poured out in a stream of garrulity.

She described to her little guest how Mr Jacob Wilson first appeared in kilts, causing her (Mrs Jacob Wilson) to throw her apron over her face and bid her lord and master go upstairs and clothe himself in propriety. She further confessed that he was a poor correspondent (though a man of deep intellect, for he was given to long spasms of silence); but every time he wrote from the trenches, which was once a month (though one month he had written twice, but in September—or was it October?—he had not written at all)—at any rate, he always said that he had a cold in his head and would she send his medicine, which he had used for eight-and-twenty years, and which had never failed to cure him.

After this testimony to Mr Jacob Wilson's recuperative powers, despite his susceptibility to colds, his wife became confidential, and told the girl of the adoration showered on her during her honeymoon by the aforesaid absent gentleman, together with other and romantic details which, being told in the strictest confidence, naturally have no place in these pages.

And the little girl from the Picardy mill-house listened. She may have understood that somewhere in the landlady's bountiful breast a noble heart was beating, that behind her cheerfulness lay the shadow of the trenches, and that any moment 'The Plough and Crown' might be robbed of the good man who had marched away with the London Scottish.

She may have understood less than that—or more. Who knows?

Half-an-hour later the Airy Prince returned, and they sat down together to a breakfast served to the tune of chortling fowls and the neighing of a near-by horse, while the fire chuckled and crackled in enjoyment of some joke of its own.

'Well, Pippa,' said the Black Cat, seizing a moment when Mrs Jacob Wilson had absented herself from the room, 'and what do you think of the English?'

The girl of the mill-house pictured the only two she had met.

'I think,' she said timidly, 'that you are—how say you it?—great talkers, yes?'

'Bless my soul!' said he, cutting a loaf of bread with the melancholy of an executioner beheading an esteemed relative; 'aren't we?'

VIII.

The train for London came round the bend, and drew up, panting, beside the platform. The airman and his little companion glanced into four compartments which were completely filled, and, hearing the admonition of the guard, were forced to enter a first-class carriage containing five occupants, who glared at the intruders with that triumph of rudeness found only on an English railroad.

'Sorry,' murmured the airman, and added something unintelligible about the train being full. A fierce-looking gentleman looked up from the *Morning Post* and lowered the window to its fullest extent. An anæmic woman opposite sneezed and fixed a devastating stare on the fierce gentleman. A very young officer of the Guards felt his lip, and stroked that portion of it which was pregnant with promise of moustache, while his mind wandered into the future. Would he cut Lady Dazzrymple's beastly dance, and content himself with only three that evening? Or, dash it all! should he go the whole works? What a bore! . . . A young woman with a face of deep intensity read the *New Statesman*, every now and then looking up from its pages (as a horse drinking at a trough will raise its head between draughts), apparently defying any one to challenge her on anything.

With his hands lazily in his coat-pockets, an Australian captain leant back in his corner and took in the freshness and winsomeness of the French girl, with an admiring frankness that inspired sudden doubt in the airman's mind whether it was really desirable to maintain a huge Empire.

For ten minutes, in a funereal silence, the train hurried towards the Metropolis, while the temperature of the compartment, both actually and temperamentally, dropped to freezing-point. Once, as an unusually pretty meadow met her eye (and where are there such meadows as one sees in England?), Pippa emitted an exclamation of delight and clapped her hands.

A look of horror from the fierce gentleman caromed off the *Morning Post* to the face of the offender. The anæmic woman stopped blowing her nose, and concentrated all her energies on a disdainful sniff. The very young Guardsman brought his eyes out of the future, and stared right through the girl—rotten form, what! The intense young woman frowned and made a mental note that she would write an article on 'The Girl of To-day'—or, perhaps, a letter to the *New Statesman* would be more effective. One never knew, these degenerate times, if an author was writing from conviction or merely writing for a living.

The Australian smiled generously, and burrowed his hands deeper into his capacious pockets.

Very timidly the erring daughter of France shifted closer to her protector, and her hand reached appealingly for his, which caused all eyes

but the Australian's to disappear like the legs of a troupe of Japanese acrobats from a cross-bar.

'Your Majesty'—— she said.

'Hush, Pippa! You must call me just "monsieur."'

'But why?'

'Well—you see, a prince is very important, and'——

'Then that is why these people are so solemn? They know you are a prince, yes?'

The airman tapped the bridge of his nose meditatively. 'N-not exactly,' he said.

'But they are so sad.'

'They are,' he agreed; 'but my countrymen sink to their greatest melancholy when they travel.'

'But why, monsieur?'

'That,' he said, 'I cannot tell you. Perhaps travelling on a train reminds them of the brief journey of life itself. At any rate, all really well-bred people who travel resent others doing the same thing.'

'What are well-bred people?'

He gazed at an advertisement for pyjamas.

'Well-bred people,' he said sententiously, 'are those who base their superiority on such intangible things that they leave nothing on which one can contest it. Do you understand me?'

'No,' said Pippa frankly; 'but I like your voice.'

'Thank you, little one. It was one of the first things I learned at Harrow—to say something well rather than something worth hearing.'

'I wonder if Louis had his breakfast,' said she, at a tangent.

'I think so,' he said, with a man's vagueness towards domestic economy; 'but, to finish my definition of well-bred people'——

'Louis will be angry at my leaving him,' she said musingly.

'Pippa, you must listen to me,' he said gravely.

'But may I not talk as well?'

'Really charming women only listen.'

'*Tiens!* What a droll country! Do these people understand what we say?'

'I don't think so, youngster. Most Britishers look on foreign languages as immoral.'

The fierce gentleman, who had been growing bluer with cold every minute, suddenly endeavoured to suppress a sneeze by smothering his face in a large handkerchief, with the result that he produced a combustive cohesion of sounds, which caused a gurgle of delight from the miller's niece. Violently blowing his nose, the irate one resumed his newspaper, first turning his coat-collar about his ears as the bracing April air blew full against him, and looking as genuinely bad-tempered as his somewhat immobile features would permit.

'But he is amusing, is he not?' cried the little French girl, then shrank back as the New Statesmanist fixed her with a look of ineffable and disapproving intellectuality. 'Monsieur, why is it she looks at me so?'

The aviator transferred his scrutiny from pyjamas to a picture of Canterbury Cathedral.

'She is the New Woman,' he said; 'and all New Women resent the Old.'

'I am old?—but no!'

He lowered his eyes from the cathedral to her happy, flushed face.

'Pippa,' he said, 'you are as old as Cleopatra.'

'Cleo-patra. How many years has she?'

'Oh, about two thousand.'

She pretended to be offended, and ended by looking such a thoroughly engaging little figure, with her dark hair and innocently intriguing eyes, that the airman resumed his study of architecture from sheer self-defence, and the Australian contemplated the odds against his knocking the student of cathedrals on the head, and, *à la* caveman of old, eloping forcibly with the damsel.

Chimney-pots! Hundreds of them—thousands of them.

Chimney-pots! Standing like regiments in stiff and orderly array, waiting for a review that never took place.

Chimney-pots! Short ones, stout ones, crumbling ones; gray, blue, and indigo ones; pots of no colour at all, and just as little character.

Chimney-pots! Racing by, mile after mile; industrious fellows, some of them, puffing out black smoke as though the mist over London were their private and personal concern.

Chimney-pots!

'Waterloo!' yelled a dozen voices, and the bewildered Pippa heard a stamping of feet, a rattling of trucks, the din of two porters in a semi-religious discussion concerning the right of way, the din being aided and abetted by a young gentleman possessed of a voice which had recently broken, who howled, alternately in a deep bass and a shrill treble (giving the general effect of a Swiss yodeler running amok), that, in exchange for coin of the realm, he was willing to barter light refreshment—very light refreshment indeed—in the shape of small biscuits or popular magazines. A slim girl porter, far too weak for her task, dragged a trunk from the van for a vigorous indispensable, who stood by with sixpence in his hand. A sailor kissed a rosy-cheeked woman with moist heartiness. . . . A taxi-driver, outside the station, took a sudden and violent dislike to a horse-cabby, casting loud aspersions on the latter's respectability, and hinting at a doubtful pedigree; to which the other replied simultaneously, his remarks being quite unintelligible, but apparently giving himself the greatest personal satisfaction. Down the road a street-piano burst forth into 'The Lost Chord.'

'Pippa,' said the airman, opening the door, 'we have arrived. The Prince with the Golden Key welcomes you to London.'

'*Mon Dieu*,' said that young person, 'what a noise!'

Chambers's Journal
SEVENTH SERIES

THE LINK.

A TALE OF ADEN.

By R. A. ADAIR.

It stretches—ten dreary miles of low-lying sand, flanked on either side by the blue deeps of the Indian Ocean; bounded here by huge heaps of salt, tent-shaped, looking, in the early and all too brief twilight, like the ghostly encampment of some phantom army, hedged in there by a lazy windmill, or again by some gently rising, scarcely perceptible dune—it stretches from Aden on the one side to Sheik-Othman on the other, a link between civilisation and barbarism.

I.

STAFF-SERGEANT JACK DORLEY, R.E., finished off his shandy with a long draught, sat deeper into his long chair, and with a sigh of contentment stretched his legs on to the veranda-rail.

'Well, that's that,' he remarked drowsily.

'Busy day, staff?' asked the R.A. sergeant sitting next him.

'Not particularly,' said Dorley; 'but I'll be at it all to-morrow. Have to find a fault somewhere between here and Sheikh.'

'Wish I had the job,' said the gunner enviously. 'Nice gharry, gallon jar o' juice, little to do, and all day to get it done, eh?'

'Hardly! The gharry's all right; but no beer, thanks. Far too hot out there. All right for you to talk—finish parade at ten; but I can tell you it's no joke fagging out in those sands between eleven and three. You're much better off here, sonny.'

'When do you start?'

'Oh, about nine, I think,' said Dorley.

'Nine! Poor, hard-worked staff! I'm for Morbut at five-thirty. How about that? And it's ten now, so here's off. Good-night, staff!'

The gunner struggled out of his chair, and left the veranda.

'Decently cool now,' said the schoolmaster, appearing from behind a magazine; 'quite a treat after to-day's heat.'

'Yes,' said Dorley, 'this veranda's practically always cool; we certainly get what breeze there is going.'

They were seated on the veranda of the R.A. sergeants' mess, perched up on the low *khuds* overlooking the primitive links that Aden boasts of. To their left front rose Fort Tarshyne, rugged and frowning, twinkling with a hundred lights from the officers' bungalows. A young moon lightened the sea into a shimmering mass, and made the rocks of Little Aden—far across the gulf—just visible. Brilliantly lighted, looking to those on shore like some blazing cheap jeweller's shop in far-off London, a German East African crept out of the harbour towards the open sea. Away to the right, straggling off from the more prominent little Aden rocks, the low-lying isthmus was just visible.

The schoolmaster indicated the latter with his pipe. 'Your job lies out that way, I believe. What exactly is it?'

'Still after information, Mr Bryce?' said Dorley with a laugh. 'Well, it isn't very exciting. Part of my work is to keep intact the phone line between here and Sheikh. We get plenty of faults reported. Sometimes it's a flaw in the line, sometimes—near Sheikh—a tree gets mixed up with the line, and at times even the line is cut.'

'Cut—by whom?'

'Oh, some fanatical Arab, I suppose, thinking to destroy British prestige with a jack-knife. It's a bit tougher than that, though—eh?'

'Slightly,' said the schoolmaster; 'but aren't the wires worth bagging altogether? They're copper, I believe.'

'Not now. We removed all the copper long ago. A new line didn't last a week. The present stuff is not worth the risk of taking.'

'Still, to me, fresh from home,' mused the schoolmaster, 'it's very strange to think we here are so near the verge of barbarism. Here in Aden we have civilisation, barracks, schools, links, big guns—all the things that spell British; while out there, half-a-dozen miles off, is—well, primitiveness, if I can use the word. It always seems to me that the isthmus is just a link—a link, and not a long or a strong one at that—between civilisation here and barbarism there. . . . And what if it broke?'

'Not much fear of that,' said Dorley. 'It's not so weak as one might think.'

'Still,' answered Bryce, 'it *might* break one day—stronger links have. Just supposing the Arabs did decide on a sudden raid—quick and with no warning—what then?'

'Oh, we'd be quite O.K., I'm sure. The news would be phoned over from Sheikh in a jiffy, and your Arab levy wouldn't get a quarter of a mile on the link—as you style it.'

'But you base your defence on the warning

 [*All Rights Reserved.*]

from Sheikh. Supposing it wasn't given? Native police have been bribed or murdered before to-day, you know.'

Dorley openly yawned. 'Bit pessimistic, aren't you?' he said, sitting up. 'Try a peg; it 'll help to get you out of the blues.—Boy'——

II.

Dorley was tired, sick, and cross. He lay stretched out under the trees in the Government garden at Sheikh-Othman, enjoying the only natural shade to be obtained in or near Aden. The morning had been fagging, and his day's work had produced nothing, for, in spite of frequent tappings, he had failed to locate the fault in the line. Worse still, during the morning a fitful breeze had bowled his topee over the sands, leaving him bareheaded for a full five minutes, and giving him quite a beastly sick headache. The shade in the garden was very pleasant, and the creaking of the wind-driven pumps, together with the gush of the water, was music in his ears.

It was as yet only a little after noon, and he vigorously damned the ill-luck that would make him go off again across the isthmus in the blazing heat instead of waiting till the cool of the evening.

'What was it that schoolmaster chap called the blasted thing?' he mused. '"A link!" And a damned hot un at that. Must have been forged in hell!'

He laughed feebly at his witticism.

'Wish I hadn't got this fat head; it 's just the last straw. Damn that wind! It comes once in a blue moon, and when it does arrive, if if doesn't choke you with a sandstorm it takes your topee. Still, I suppose it 's no use grumbling about it. Duty must be done, me boy; so here goes.'

III.

Three o'clock on a May afternoon on the Isthmus of Aden is not quite so cool as it might be. For the tenth time since leaving Sheikh, Dorley left the friendly shade of his gharry and trudged across to the telephone-wires. An Indian sapper swarmed up the pole and connected up, the while Dorley completed the earth connection. His head was throbbing wearily, making him long for a cool drink and a bed. He called up Sheikh. Yes, they got him all right; no fault here again—must be on the other side.

He looked up at the rattle of the gharry, only to see it careering madly towards Aden.

'Now, where the devil is that blasted fool off to?' he ejaculated wearily.

A call from Sheikh drew his attention again to the phone.

'What 's that?—What?—What 's that?—Hi!'

But the operator at Sheikh, after giving a ghastly scream, strangled almost at birth, was silent.

'My God!' said Dorley. 'Arabs? Surely the man 's mad; or has that damned schoolmaster, with his infernal croaking, something of the prophet in him?'

The sapper up the pole gave a sudden yell and scrambled down, in his desperate frenzied hurry falling the last eight feet. He picked himself up, and without a word made for Aden as fast as his trembling legs would carry him.

Then in the distance, towards Sheikh, Dorley saw them. On they came—in twos at first, then in groups of half-a-dozen, followed by the main mass. Splendidly horsed, they came on apace, spreading across the isthmus as they advanced. There were hundreds in sight already. God only knew their actual strength. Thousands probably.

The foremost halted for a moment, swarmed up the pole, and down again.

'Cutting the wires,' thought Dorley. 'The swines! But I've still got Aden. I 'll do 'em yet.'

As fast as his wearied limbs would allow him, he climbed the pole, and connected with the Aden wire. From here he could see a mass of the Arabs swerve off towards Khor Maxar. Evidently the plans were well considered.

Down again; and now for Aden.

'Are you there? Are you there? Hurry! For God's sake, hurry!'

But Aden was dumb.

'The fault,' he thought—'the fault! Hang it! of course, I 'll never get 'em.'

Over his shoulder he could see the advancing Arabs, now only a mile away.

Again to the phone.

'God—God—that fault! Break it! Clear it!' he raved.

Swift through his mind passed the conversation of the evening before. The link! Yes, the schoolmaster was right. The link was breakable, and was on the verge of snapping.

What was that? Aden calling? Yes, it *was* Aden.

'Arabs!' he gasped. 'Arabs—taken Sheikh—cutting the wires, and coming over the isthmus! D'yer hear? Arabs—Arabs—for Heaven's sake, listen!'

'Steady,' said the cool voice from Aden. 'Keep your hair on, old man, and start again.'

The nearest Arab, now only some eight hundred yards away, dismounted and knelt.

'This is the end,' groaned Dorley, 'and the link will go. Oh, the devil take that fool!'

With a crash, a bullet smashed into the pole some six feet up.

'Good,' grinned Dorley, 'but not good enough.'

Again he addressed the cool voice. 'Listen, you damned fool!' he said, endeavouring to be steady. 'Listen—Arabs have taken Sheikh, sent a party to Khor Maxar, and are coming across the isthmus. Many? Some thousands.

Get to work quickly—what? I'm Dorley of the R.E.'s. Yes, yes, hurry. I'm done. Oh, bad luck!'

'What's up?' said the voice, now rather agitated.

'Hit,' said Dorley—'only in the arm, but they'll get me next time. Get a move on. Ah-h-h!'

Yes, they had him this time. He felt it, hot and cold at once, in him, through him, tearing away body and life in its awful course.

. . . . . .

They found him later, face downwards in the blazing sun, with the gharry wallah and the Indian sapper doing their best to aid him.

The gharry stood by the roadside as he had left it. The wires were intact, Sheikh-Othman, lazy in the afternoon sun, drowsed on as usual. Arabs there were none. The isthmus was deserted.

And Dorley, lying in the sand, with flushed cheeks and open, staring eyes, babbled on about links and Arabs.

. . . . . .

Strange how a touch of the sun *does* affect a man!

A NEW PLATINUM SUBSTITUTE.

By G. Basil Barham, C.E.

THE price of platinum was at one time so low that it was used for many purposes for which other and cheaper metals must be used to-day. Thus, it was once employed for the contacts of electric bells and induction coils. A tiny button of platinum was used in connection with the old form of telephone transmitter, and the early carbon filament lamps had 'leading-in' wires of platinum of fair length and section. As a matter of fact, the old carbon lamps of, say, twenty-five years ago would be worth more to-day for the platinum alone than they cost retail at that time. Platinum rings, bracelets, and chains were comparatively cheap; the metal entered into the composition of fairly low-priced dental sets; and no one could have imagined that a time would come when platinum would be worth six or seven times its weight in gold.

There seems no immediate possibility of the shortage being relieved. Indeed, there is every likelihood of further increases in price. Since the outbreak of war the cost of an ounce of platinum has more than doubled. He would be a bold man who would venture to express the opinion that it has now reached its maximum cost.

As the metal is practically a necessity in many chemical industries, it is not surprising that metallurgists have given much time and thought to seeking an alloy which would possess all, or a large number, of the attributes which render platinum so useful. Many have seemed at times to be on the brink of success, and quite a number of platinum substitutes are now in use, but they all fall short of the pure metal in one or more respects.

It may be that the new alloy which has been discovered by Dr F. A. Fahrenwald may not be suitable for every purpose for which platinum alone could previously be used; but, if so, the purpose has not yet been discovered. And if time shows the truth of the inventor's claims, a number of industries will be saved from the necessity of raising their prices to the point of practically extinguishing their trade.

The bulk of the platinum used before the war went in dental sets, and of this only a comparatively small amount is recoverable. Jewellers used about the same amount, and the balance was utilised by chemical and electrical engineers and by scientific instrument makers, and for scientific purposes generally.

It has been pointed out that a substitute for platinum must resist temperatures up to 1300 or 1400 degrees centigrade; it must be unaffected by mineral acids or alkalies, either fused or in solution; and must not oxidise at any temperature up to and including its melting-point (1775 degrees centigrade). Further, it must be malleable, ductile, and sufficiently strong to resist stresses tending to change its form while in use. Jewellers would add that it must be as white as platinum, but Dr Fahrenwald says that platinum is valued in jewellery solely because it is so expensive.

By a process of elimination Dr Fahrenwald found that the only elements suitable for making an alloy which would take the place of platinum were palladium and gold. Iridium and rhodium might be used were it not for their rarity, costliness, and refractoriness; and silver had to be omitted because it is readily attacked by acids, and its melting-point is too low. His experiments finally resulted in a series of alloys consisting of platinum, gold, and palladium, which he calls *rhotanium*, distinguishing the different kinds as 5, A, A5, B, C, and D. These are from 60 to 90 per cent. gold. In the alloys for electrical use there is a minute quantity of rhodium, and in those for purposes other than chemical there is also a small quantity of silver.

An elaborate series of tests was made in the University of Michigan Chemical Laboratories, the report of which shows that for use with hydrochloric acid, hydrofluoric acid, dilute nitric acid, concentrated sulphuric acid, and many powerful alkalies, the alloys are better than pure platinum. They cannot be used with hot concentrated nitric acid or as anodes in electro-

lytic work, but serve well as cathodes in such work.

Rhotanium is practically white, can be rolled into sheets, drawn into wires, welds as readily as iron, weighs only half as much as platinum, does not oxidise, and below 1300 degrees centigrade is less volatile than platinum.

It has already been used by dentists for pins, baked into porcelain teeth, and as foil for other purposes. It serves well for contact terminals in automatic electric devices, telephones, switchboards, certain kinds of magnetos, &c. For jewellery it is better than platinum, because it is harder, stronger, takes a finer finish, does not tarnish or corrode, and in colour is practically identical.

THE SEARCHERS.

CHAPTER XXXVI.

SUCH was the strange, sad record of wasted power and the searing consciousness thereof; courage and resource sapped and perverted by the insidious poison of self-pity and the corrosion of revenge; and the end—the glissade to the abyss. There were glimpses of finer issues, but the thought of the colonel's fate and 'The Searcher's' black dissimulation dried up the springs of pity.

Tony had taken the notebook-leaves. '"As a man sows,"' he said. 'He tells us that his mind once gave way. It is charitable to suppose that it never again became normal. An *idée fixe* grew from an obsession to paranoia—and he became a thing without a soul. Better dead!' There was a long silence as he slowly turned over the leaves. 'Aphorisms on the brink of death are rare,' he went on with unwonted gravity. 'He writes: "The Devil . . . keeps his appointments." But there is an older and a surer saying, Neil—"Them that honour Me I will honour." . . . Let us go home.'

Tired though we were, the return journey would have been set about at once, but when we looked up to the saddle of the Pass the ground was blanketed by the white fleece of a summer mist—not an uncommon weather caprice on a hot, windless day in the Larig. Malcolm and Duncan prophesied that it would clear in a couple of hours, but it was late in the evening ere it lifted and we turned our faces towards the Glen.

By the time we had breasted the slope up to the col, darkness hovered over the Pass, silent shadows gathering for their nightly tryst. The last red spark of the dying sun flickered and dipped out of sight behind far western hills, its afterglow short-lived in the sombre fastnesses around us. Colour and outline were lost as the sun lowered. Muich Dhui's deep red was the last to surrender, and then Night—stars acclaiming her—scaled the mountains.

The descent now became easier as the Pass widened. Soon we struck a path in the heather through the foothills, where the soft turf underfoot instead of the everlasting granite, the neighbourhood of friendly trees after the relentless moraines, and the dewy scent of the woods—myrrh and frankincense—growing stronger at every step, brought, to one of us at least, solace and an exaltation of the spirit. The kindly host of stars paled as the early June dawn began to stir, unveiling a delicate vista of pine-woods slipping from sable to green pavilions; the land breaking to the valley; a link of the distant river; and then—welcome sight—a score of white specks, the little homesteads asleep in the peace of the Glen. Another couple of hours through the forest, and the old house of The Bield, bathed in the clean radiance of the morning, saluted us with kindling eyes. The old casket had at last come to its rightful owner's door.

. . . . . .

From the Running Target Mine of bleak memory to the experts' report on the jewels was an Arabian Nights' transition. A cynic might arrive at their approximate value by pondering on the number of my hitherto unsuspected well-wishers who have expressed the hope that my sudden wealth may not be a source of unhappiness. I shall risk it.

Tony cherishes the Leopard's Eye, which I presented to him as a souvenir of those hectic days. It is a meagre recognition of his services, and it was only when I convinced him that I regarded it with an unconquerable aversion that he accepted it. To my fancy, its velvet depths change too suddenly to a predatory glower, and in its wonderful line is the challenge of a mocking spirit of Evil, imprisoned and unrepentant. Truth to tell, gems in themselves offer no attraction to me, and very soon, when the rest of them are put up at Christie's, the fall of the hammer will rejoice the august Order of the Highest Bidders.

Exeunt 'The Searchers.' The evil brotherhood has not been heard of since, and Tony tells me the authorities are confident that it exists no more.

Benedetto, *alias* This, That, and the Other, was laid by the heels a few weeks afterwards when he was stepping off the steamer at Ostend. He got a well-earned term of penal servitude for his share in the Italian Bank-Note Forgery; and as the smooth old villain is nearly seventy, it is extremely probable that the rest of his days

will be passed in company with his *bête noire*—hard and regular work.

Tireless and nerveless as ever, Tony continues his beloved and adventurous work. He promises to be a striking success, and has no enemies, other than his natural foes who love darkness rather than light. One of these days, with his permission, I may chronicle a few of his doings.

He runs north to the Glen now and then, and many a good day he and I have together on the moor and in the forest. Our friendship apart, he is a thrice welcome guest. He is a prince of story-tellers, and the Laird's Room, where the old casket has the place of honour, often sees my friends and myself chained round the fire until the small hours, listening to his tales of tight corners. He has figured in many exciting experiences, but I doubt if he recalls any of them with as keen a savour as the one that wrought to its end amidst the mountains, on the day when 'The Searcher' stepped into the hush of the Chanter Corrie.

THE END.

'THE PEARL OF THE PACIFIC.'

By W. Scott Lorrie.

THE steamer is besieged by a hundred boats, all gaudily painted. Standing in his *chalupa*, the bronze-faced *fletero* picks you out among the passengers wandering about the deck, and raising his hands melodramatically, fires at you some incomprehensible words which you take to be an offer to pull you ashore. Competition is running high, and his efforts to secure your patronage interest you as expressions of the human striving for a livelihood. Luck, naturally, does not always fall his way, and disappointment oftentimes runs at par with his prospects at their brightest. You have not intimated that you are going to engage him, but he rushes up the companion-way and makes for where you are. You say no; that you are a transit passenger, or that you have already made arrangements with somebody else. Disappointment has its effect on him, and his eyes sparkle under their jet-black lashes, revealing his bad temper. He walks away in a huff, and mumbles something that it is probably to your benefit to ignore.

As usual, a crowd on the pier awaits the arrival of the steamer at Valparaiso, which is often referred to as 'The Pearl of the Pacific.' A hundred yards away is the monument erected to the memory of Arturo Prat, the greatest of Chilian naval heroes, who is seen half-enveloped in the flag of his country. A large square faces the pier, across whose eastern extremity you walk to the custom-house, while the governor's palace catches the eye, nestling at the foot of a house-clad hill in the background. The people, the fine modern buildings, the busy thoroughfares, the dazzling sunshine, and the turquoise sky suggest that the place must be as good as any on earth, and your admiration deepens as you see more of it. It is no use trying to picture beforehand what the place is like, for you will be fated to discover that the reality is as far out of keeping with the preconceived notion as can well be. I had pictured Valparaiso to be a centre of Machiavellian revolutionaries; of half-civilised Araucanians, ever on the alert to take in a foreigner; of muddy streets, unpaved side-walks, and inadequate buildings. I was mistaken, though, for the city is in every respect as up-to-date as it can well be, ranking among the finest in existence.

Built on some thirty hills—each of which has a name of its own—Valparaiso is one of the most curious and uniquely formed cities in the world. On the fashionable hills of Alegre and Concepcion dwell the British and the German residents, who apparently live very happily and comfortably, so little regard do they have for the outer world. Both colonies have their own churches, large clubrooms and concert-halls, and schools and hospitals that do honour to the city.

There is no sign of slowness on the part of the people to take full advantage of the benefits of modern civilisation in all its phases. The climate is delightful, healthful, and sometimes even exhilarating, and the inhabitants are hospitable and pleasant to speak to. Saying this reminds me of a member of the editorial staff of a well-known London magazine, who said that Valparaiso was one of the filthiest and most insalubrious holes on earth, absolutely unfit for any European to live in. It is a pity that he had no personal experience of the place he so readily disparaged!

If those thirty house-clad hills could only speak, what tales they could tell of the days of long ago, when they frowned down on the pirates and buccaneers, and finally on the warriors of Philip II., whose last efforts to maintain the Spanish bureaucratic methods enforced in the colonies failed, thanks to the stubborn determination of the makers of their independence!

In the fifteenth century, when Valparaiso was sacked by Drake, Hawkins, and Van Noort, there were not enough houses to accommodate comfortably the two or three hundred inhabitants. Since that time, however, the city has grown prosperous and wealthy, although its people have experienced many a disastrous set-back.

In 1814 a fight took place, a few hundred yards from that part of the shore now occupied by the principal railway station, between the British vessels *Phœbe* and *Cherub* and the American *Essex*. The *Essex* had been despatched under the command of Commodore David Porter, who had received orders to do as much harm as possible to British merchantmen in the Pacific. The British Government ordered the frigate *Phœbe* and the corvette *Cherub* (which happened to be in Callao), under Commodore James Hillyard, to set out in search of the *Essex*, and capture or destroy her. She was at length found at anchor in Valparaiso. A terrific fight was the result. After several hours' hard fighting, the *Essex* was overpowered and sunk. When British and American tourists visit Valparaiso they never forget that the place was the scene of a naval action of which they are justly proud; nor do they ever fail to pay a visit to the graves of those who lost their lives on that memorable day. So it happened with me. I felt overcome by curiosity to see those graves and read on the marble slabs the inscriptions that commemorate the dead.

The Protestant cemetery is perched on one of the hills in the centre of the city. Access to it is gained from a street bearing an English name—Cumming. As chance would have it, the day I chose for my visit was the 2nd of November (All-Souls' Day). Now, it is customary in Roman Catholic states that every one on this day should visit the graves of the dead. That is why a procession of people in deep mourning filled the street almost all the way from the *plaza*, at the foot of the hill, to the Catholic cemetery, adjoining the Protestant one.

It was all so very interesting that before branching off towards the Protestant cemetery I decided to have a look at the other burying-ground, now so full of life and colour. The church bells crowned the silence of the morning with doleful cadences. They throbbed and lulled, broke out in one general and harmonious peal, then sank gradually as the hour to cease approached. In the little chapel in the middle of the cemetery a service was being held, and a murmur of prayer and hushed voices hung round the temple and filtered beyond the gravestones. In that small burying-ground there prevailed the utmost respect for those wrapped in eternal rest. Every one had a look of sorrow in his face; every one felt bound by the traditional duty of attending on that day.

There are many fine tombs and mausoleums in the Roman Catholic cemetery that tell of its being the resting-place of some of the city's greatest and best children, the last home of many illustrious men and women who were born to no titles, but achieved fame and fortune by their own energy and their own genius. At the foot of one of the graves a young widow and her child were shedding tears. They had laid carefully under the gray marble cross a dainty wreath of violets, and another of mixed flowers. None of the tombs showed signs of neglect. I cannot hope to convey in written words the surging emotions I felt as my mind absorbed such vivid and painful sights.

In the eighteenth century Valparaiso had grown to such importance that it could help the patriots in the definitive overthrow of Spanish rule. In 1817 there poured into the town the fugitives of the battle of Chacabuco, at whose head was General Maroto, who had ordered the destruction of all the villages lying between Santiago and Valparaiso. On 13th February 1817 several thousand defeated Spanish soldiers and settlers entered the place, followed by a no less numerous lot of leading immigrants, wealthy families, necessitous employees attached to the Spanish administration service, and innumerable harlots, of the sort that generally followed the Spanish armies through South America. These panic-stricken people gathered on the shore and implored the commanders of the Spanish vessels in the bay to admit them on board, and thus save them from the hot pursuit of the Chilian armies.

In the meantime the Spanish soldiers gave themselves up to looting and pillaging the houses that were nearest to the sea. They set many of them on fire, and the two or three thousand inhabitants felt their hearts sink within them, and prayed that the liberators might come soon to deliver them from the wrath and fury of the depredators. Of the four thousand odd Spanish soldiers, only about one-half were able to get away in the royal fleet, that set sail the instant the patriots' guns opened fire from the hill-tops. With no great difficulty the town was captured, and the Spanish soldiers who could not embark were taken prisoners. The flag of the victorious patriots, who had thus definitely established the cause of independence, waved above the great fortress that stood where the Plaza Echaurren is to-day.

In November 1822 Valparaiso and an extensive part of the coast began to be convulsed by a succession of shocks, the first of which was of great severity. The heavings of the earth were quite perceptible to the eye. The sea rose and fell to a great extent in the harbour, and ships appeared as if they were first rapidly forced through the water, and then struck on the ground. The town was completely overthrown. In some parts the earth opened, and discharged water mixed with sand, which gathered in heaps three or four feet high. At the promontory of Quintero fissures were formed in the solid granite parallel to each other and to former similar rents. It is said that sounds like those produced by the escape of steam accompanied this earthquake, which was felt throughout a distance of one

thousand two hundred miles along the coast, a portion whereof was permanently raised to a height varying from two to four feet.

In October 1829 the city was again severely shaken, and many houses were thrown down, with much loss of life. Other violent earthquakes were felt in 1835 and 1851. In 1866 the place was bombarded by a Spanish fleet, and the damage done was enormous. This was the last attempt of the fierce, reckless revellers of Spain to maintain their power and dominion in this part of the world. For forty years Valparaiso knew of no further trouble of any magnitude, except the mad acts of the overthrowers of President Balmaceda in 1891, until once more, on 16th August 1906, a calamitous earthquake struck the city. It was a rainy night, and the church clock opposite the Plaza Victoria would have struck eight in another five minutes. Soon the air was filled with the confused murmur of voices, that groaned and sank, that came in hoarse gusts and then subsided to a sullen hum, a murmur, caught up every now and then into a single prayer, which was flung wildly into the evening sky, and was followed by a general clamour, as if all the voices strove together, thrust each other aside, and trampled to be free. There was an onrush of voices pouring round the ruined houses, an interminable succession of voices—a multitude was praying for pardon and protection from the ire of Nature.

Rip Van Winkle, after his long sleep in the Catskills, could scarcely have been more astonished at the changed aspect of his native village than I was at the wonderful improvements that nine years had worked in Valparaiso. The destroyed city has been rebuilt. But there are still one or two nooks that serve as sad remembrancers of the terrible event of 1906.

There are in Valparaiso quite a number of places of interest to the foreigner: public buildings, parks, theatres, hotels, monuments, pretty suburban localities and house-studded hills and ravines, where the foreign residents seem to rival each other in the spectacular upkeep of their garden homes. There is the splendid arch-like monument presented to the city by the British residents on the occasion of the one hundredth anniversary of the first struggle for the cause of independence, 18th September 1810. It is situated a little way down the Avenida Brazil. Every one knows it; every one recognises that Arco de los Ingleses running across the avenue.

Valparaiso lies between two particularly interesting suburbs, Viña del Mar and Playa Ancha. One is the home of the *élite;* the other is what might be called an extensive park, whose hillsides are studded with small cottages. Here the air and the climate are bracing and exhilarating. There is a large oval in the centre of the park, where football and tennis are the chief pastimes on holidays, and whence flowerbeds and tree-lined avenues lead down to a good lighthouse, propped on a hill at just the point where it breaks on its descent toward the sea. Near by are the fortifications of Yerbas Buenas and Punta de los Angeles.

Viña del Mar cannot be spoken of in too high terms. It is a small but beautiful town. The most striking object which it can show is its racecourse, ranking among the finest in the world. At any of the racecourses in England one will often meet some old fopdoodle who knows more about this or that particular racecourse than all the turf-masters put together. So it is at Viña del Mar, where I happened to hear many an interesting yarn about the place in its different periods of development.

A magnificent thoroughfare is that fashionable Avenida de la Libertad, full of palatial residences and pretty gardens, that speak eloquently of the progress of the country and the enterprise of its people. Driving down that avenue, one is reminded of some beautiful summer-resort in Europe—a Jean-les-Pins of the Riviera, for example. The bathing-place of Miramar stands at the south-western extremity of Viña del Mar. Hundreds of seats and numerous summer-houses are to be found along the promenade, where cheerful bathers make the best of an afternoon plunge, and mirthful little folks play on the sands, defiant of the northern breeze, which is strong and chill.

There is a house built out over the sea, with the waves splashing against it, and looking for all the world like the bow of an ocean liner furrowing its way through the billows of the angry deep. In the interior there are many habitués, seated at small tables, and outside a distinguished crowd of people roam about.

STOLEN GUESTS.

CHAPTER IV.—THE CURE.

MEANWHILE Miss Marion Smith had been doing her best to give the police authorities a worrying time. She inundated their offices with hourly messages demanding why they had not discovered the whereabouts of General Cockburn Davidson. Had she been his wife she could not have been more insistent. She hardly ever mentioned her nephew, Jack Wright; her concern was for his superior officer. For her relative she was bottling up the greatest scolding of her life.

'He has led the poor general away into some

mischief,' she muttered in anger. 'One would have thought that a man of the general's age would not have allowed himself to be guided about by a mere boy.' She forgot that she herself had been making use of that same youngster to bring the distinguished man within her reach, the unsafest place of all!

At last a telegram reached Auchinbreck that brought a ray of hope. The detective department was waking up. They believed they had got a clue. General Cockburn Davidson was known to have gone north to Inverness, and was doubtless now in the neighbourhood of the Highland capital.

Miss Marion hastily consulted time-tables. She determined to go in search of the lost pair herself.

'Those blundering police have taken days to discover this,' she said to her niece. 'I will give them a lesson in their own business. If the general is near Inverness I will ferret him out, and bring the pair of them here. They have made me the laughing-stock of the parish, and they will just have to come and put things right.'

So Miss Marion started north, and her train in due course brought her into Perth station. There the first person she met on the platform was her cousin Mary, looking very distracted and at sea.

'You here, Mary! Why, I have not seen you for years. You have become a perfect hermit. Are you on the outlook for another situation? For, if so, I fear I cannot give you any reference after what happened.' Miss Marion meant this as her little joke, but it struck a new terror into the heart of the timid runaway.

Poor Miss Mary had lost all her nerve, and her old disease had come back with redoubled vehemence, as if in revenge for her attempt to throw it off. She shuddered at the very sight of her cousin.

'No; I am going to London—for a change,' she gasped.

'By yourself, as usual. Really, Mary, you are living a useless life all alone. As soon as I get my present business off my hands I must come and root you out. I suppose in your journey from Inverness you have not seen anything of a general, have you, with a jackanapes of a young lieutenant accompanying him?'

'Do you mean—Jack?'

'I refer to General Cockburn Davidson, a friend of mine, who ought to have been staying with me at the present moment if he had not gone mysteriously amissing.'

'Oh!' exclaimed Miss Mary suddenly, with a new terror in her voice.

The north mail had just come in, and was emptying its passengers, and there, towering above the crowd, was the soldierly figure of the general, with Jack Wright beside him. In front of them a porter was carrying two portmanteaus, which Jack had insisted on packing at the last moment and taking with them. On each the name of its owner was painted, and it was this that caught Miss Marion's eye.

'Why, I believe,' she exclaimed, 'here is a clue right off. These bags must belong to the missing officers, and I am certain that must be the general and my nephew.'

Leaving her cousin without another word, Miss Marion accosted the general.

'Ah, I have found you at last,' she said playfully. 'You naughty man. What a lot of trouble you have caused me! But that is just the way with bachelors; they never think.'

'Pardon me, madam,' said the general, saluting; 'but you have the advantage of me.'

'You are General Cockburn Davidson?' said Miss Marion, a little more stiffly.

'Yes, that is my name.'

'And there is that young scamp of a nephew, Lieutenant Wright, behind you. I am sure it is all his fault.'

'And your name, may I ask?'

'I am Miss Smith of Auchinbreck, where you ought to be now.'

'We have just come from there,' replied the general, who had not yet grasped the distinction in sound of the two names, 'and we are searching for our hostess, Miss Smith; but you are certainly not she.'

'Indeed! Do I not know my own identity? Now, I see what's wrong. It must be shell-shock. Poor fellows, they have lost their memories!' The latter words she had mumbled to herself.

'Jack Wright, I am your aunt, Miss Smith,' she added, addressing the younger officer.

'Oh no—but I wish you would tell us where she is,' he replied.

Miss Mary, with beating heart, had dodged behind a big pillar, and, like a hunted animal, was glancing everywhere for a more secure hiding-place. For the moment she was out of sight. She was trembling in every limb.

'Well, you are a pair of fools,' blurted out Miss Marion, fast losing her temper; 'and to think that you have been trekking about the country like this for a whole week, and yet the detective department has failed to find you!'

'You seem deeply interested in our movements,' said the general icily, as he tried to force his way past. 'We wish to catch the London train.'

'You will do nothing of the kind,' she replied indignantly. 'You will come home with me.—Jack, you are my sister's own son, and I expect better behaviour of you than that.'

But she got no further. There was a sudden unexpected interruption. The general had actually pushed rudely past her, and started running down the platform. Miss Mary, like many a hunted creature, had done a foolish thing in her fear. She thought she might dart across the platform and through the archway unseen. She felt that she must do something,

so she risked it, and at once was spotted by her pursuers. It was the maddest thing to do. Had she simply remained where she was, and moved round the pillar, keeping it between herself and the general, she might have avoided his eye, and escaped detection. Now she realised too late that she had been recognised, and this gave wings to her feet. She bolted through the archway, not knowing where she was going, but seeking in desperation for some place to hide.

A train bound for Dundee was just moving off from the platform, and the door of a first-class carriage happened to be open. Without a thought except that of escape, Miss Mary jumped in, and threw herself into the farthest seat, as much out of sight as possible. But the general had just seen her action with the corner of his eye, as he bounded through the archway, and he made a spurt after the train, regardless of the shouts of porters. Giving one who tried to bar his way a rough shove to the side, he jumped on to the boards of the carriage, and opened the door of the compartment where poor Miss Mary was cowering.

He was breathless himself and could not speak, but he felt triumphant that he had succeeded. After what had happened, he was determined not to let her out of his sight again.

Suddenly a face appeared at the window, and a voice said, 'Tickets, please.'

'I have no ticket,' gasped poor Miss Mary.

'Will you give me your names, then?' said the persistent official.

'I am General Cockburn Davidson. Now get off and leave us alone,' replied the officer testily.

'Excuse me, sir, but you are the gentleman we have all been warned to be on the look-out for. Where are you going to?'

'Auchinbruich, *viâ* Aberdeen and Inverness.'

The general took command of the situation. He saw that Miss Mary was exhausted, that the one place she needed most was home, and he decided that he would pilot her back safely.

The man let go his hold of the window and dropped on to the platform as the train gathered speed, and the two were left alone.

'Can you forgive me, Miss Smith, for the way I have chased you?' began the general, with greater nervousness than he had ever manifested before in his life. 'I was afraid that if I let you out of my sight I should never find you again. Will you let me take you back to your own pretty Highland home, which looks so deserted without its mistress? And I wonder if, in that delightful Highland hospitality of yours, you would let me stay with you—for ever?'

The shock of his question, whose force lay in his glance and tones, gave Miss Mary's shyness its *coup de grâce*. The frightened look fled from her face, as she softly answered, 'My home is yours—now and always.'

Meanwhile, on a Perth platform, a young Australian subaltern was getting the scolding of his life from an irate, long-lost aunt.

THE END.

ST JAMES'S PARK.

By E. Beresford Chancellor, M.A., F.R.Hist.S.

WHAT Hyde Park is to the world of fashion to-day, that was St James's Park to our forebears in the seventeenth and eighteenth centuries—a place to lounge and gossip in; a place where the last 'toast' flaunted her beauty, or the fine gentleman *par excellence* flourished his clouded cane or toyed with his amber-headed snuff-box. To-day St James's Park is a pleasant spot of greenery, but it is little more. The only loiterers there are the happy children who, on summer afternoons, crowd the grass; or those of maturer age who may be seen feeding the ducks (like Charles II.), or wondering at the gulls. The place has been changed out of all knowledge. The Mall, once so umbrageous (to use a favourite eighteenth-century word), is now become a roadway so wide that only the greatly daring risk their lives by crossing it. Where the Merry Monarch once strolled with Rochester and Sedley, or conversed with Mistress Eleanor Gwynn or the sedate Evelyn, or where, later, those beautiful goddesses the Gunnings drew crowds of admirers, so that George II. once gave them a military escort to ward off the inquisitive, motors rush screaming up and down, and stately processions pass between the Palace and the hurrying world at Charing Cross.

Indeed, St James's Park has, in this way, kept up with its various periods of existence in quite a remarkable manner; rough and ready in the days of the Tudors, it was gay and picturesque in those of the Stuarts and the early Georges, as now it is active and business-like in our own Georgian era.

Its history, like that of every square yard in London, is full of interest. As an enclosed piece of ground, it came into existence under Henry VIII., who, when he obtained the land hereabouts from the Abbey of Westminster in 1531, and erected St James's Palace on part of it, built a wall round that portion which remained. He seems, however, to have done little more; and though even this was a vast improvement in a place which at a very early period had been but a marshy piece of ground, it was not very much; and centuries before Henry became possessed of the land this 'Slough of Despond,' as it was termed, was in a sufficiently sound

state to afford accommodation for an annual fair which was first held in St James's Fields in the reign of Edward I. The proceeds of this fair were allocated to the Leper Hospital, which then stood—having been founded 'long before the time of any man's memory,' according to Stow—on the site of the present St James's Palace.

During the days of the Tudors the Park was reserved for the royal family and the royal household, and in it, at its western end, was that Rosamund's Pond, once described by Warburton as 'long consecrated to disastrous love and elegiac poetry,' and filled up in the year of grace 1770, whose origin and name have baffled the diligent researches of antiquaries. In those days the Park was really such, consisting of grass land, with trees studded about it and deer wandering amongst them. Nor was there much alteration under James I.; for, although the salary of its keeper was doubled, and certain improvements, such as the bringing of water from Hyde Park to feed Rosamund's Pond, were made, the place remained in practically the same uncultivated state as it had been under the Tudors; and, besides, gravel was dug here, haystacks stood in various parts, and the menagerie of those animals of which the king was so fond was situated within it. What is now the Horse Guards Parade was then an enclosed tilt-yard where Henry, Prince of Wales, used to disport himself, and where those martial displays in which he excelled were given on the occasion of the visits of illustrious foreigners; and at that once rural spot (now so altered) where the cross used to stand, close to Spring Gardens, were formerly some trees which Henry and his brother Charles had planted with their own hands. At this time, and for many years after, the Park was not open to the general public, only such privileged persons as belonged to the Court being permitted to use it. In the time of the Commonwealth, however, it appears that the owners of certain houses on the Westminster side had a prescriptive right of entry, apparently from the fact that their premises abutted immediately on the royal enclosure. One of these was no less a person than Milton, who resided in what was then known as Petty France, later to be metamorphosed into York Street. Another famous man who was fond of wandering about the Park was the Lord Protector himself, what time he was living in Whitehall and thinking of assuming the royal title.

But St James's Park first sprang into fame in the time of Charles II. Charles loved to loiter about it, feeding his ducks or talking to his friends. The place is indeed sentient of his easy-going personality. If ghosts walk, the Mall must often see the gaunt, dark-visaged monarch strolling up and down it, or pacing it with the long strides which he so often affected. It was Charles who remade the Park, and brought it into fashion. The Merry Monarch was supine enough over the serious matters of State, but in the formation of a garden or the construction of an aviary he expended infinite pains. Fond of emulating the ways of Louis XIV., he commissioned the famous French architect and landscape-gardener Lenôtre to lay out St James's Park on the same lines as the grounds of Versailles. The result was a veritable transformation in certain particulars. But Lenôtre was luckily a man of taste as well as a genius; and, recognising the rustic simplicity of the place, he persuaded the king to allow much of it to remain as it was. What was done in the way of alterations was the construction of the river or canal which is to-day, in its less formal outlines, one of the most beautiful features of the place. Just at the south-west end of this canal was the so-called Rosamund's Pond, which remained till it was filled up in 1770. Another improvement made by Charles was the formation of a Physic Garden, of which Dr Morison (who is said by some to have largely advised the king in the alterations here) was made custodian; and yet another, the planting of a belt of trees round Rosamund's Pond. This spot was on a slight elevation, and became in time a favourite place for lovers' meetings, as may be seen in the many allusions to it in the plays of contemporary dramatists.

But perhaps the most memorable change made was the formation of the Mall, which was begun soon after the Restoration, and was laid out in order that the game of pall-mall, formerly played in the street of that name, might be indulged in with greater security and comfort. Pepys, who kept his eyes open to all the changes that were going on in London at this period, has various references to the work then proceeding in St James's Park. On 16th September 1660 we find him loitering in the Park and seeing 'how far they had proceeded in the Pell Mell and in making a river through the Park.' Again, on 11th October, he observes, 'Several engines at work to draw up water,' which was intended, of course, to feed the new canal—although this scheme did not prove very successful. In the August of the following year the diarist sees 'a great variety of fowle' there—the birds, in fact, which the king was so fond of feeding; and in the following month he is still astonished at the 'brave alterations' in the place. Pepys naturally felt particular interest in the making of the pall-mall ground, and on 15th May he had some 'discourse' with the keeper, whom he found sweeping it, and who told him 'of what the earth is mixed that do floor the Mall, and that over all there is cockle-shells powdered, and spread to keep it fast; which, however, in dry weather, turns to dust and deads the ball.' At another time the diarist visits the Physic Garden, and sees orange-trees there for the first time; anon he is diverted by observing people 'skaiting' there, a relaxation which was then a

novelty in this country; and yet again he, with Lord Brouncker, visits the 'new buildings . . . they being the place for the priest and fryers.'

Evelyn also noted the 'sliders on the new canal;' but his interest was naturally chiefly concerned with the aviary, and he specifies the various kinds of birds and animals which were then collected at this spot. He also saw a wrestling match which took place before the king in the Park, when 'many greate sums were betted.' The match was between the western and the northern men; and the former came off victorious.

Innumerable as are the references to St James's Park in contemporary literature, one of the most interesting is that given by Rugge, dated September 1661, which runs as follows: 'This month the road that was formerly used for all coaches and carts and horses from Charing Cross to St James's by St James's Park wall and the backside of Pall Mall, is now altered, by reason a new Pall Mall is made for the use of his Majesty in St James's Park by the wall, and the dust from coaches was very troublesome to the players at mall. The new road was railed on both sides five-foot distance the whole field length, also in the Park at the hither end of the new river cut there (the length of the Park) a brass statue set up upon a mound of stone, and the Park made even level to the bridge, taken down, and the great ditches filled up with the earth that was digged down; the rising ground and the trees cut down, and the roots taken away, and grass seed sowed to make pleasant walking, and trees planted in walks.'

The statue mentioned by Rugge is, of course, that of the Gladiator, executed by Hubert Le Sœur, which once stood on the Horse Guards Parade, but is now at Windsor. An interesting eighteenth-century print, given in Pennant's *History of London*, shows this statue and the spot it occupied, just at the east end of the ornamental water. By this print, too, a good idea may be gained of what the Horse Guards and the adjoining buildings looked like before the former was rebuilt by Kent and Vardy in 1751–53. The temporary galleries which were erected for the convenience of the spectators of reviews gave the place a rather untidy and ramshackle appearance, very different from its present solemn classicism. On the south may be seen the circular roof of the famous Cockpit, about the position of which so much controversy took place a few years ago.

Although the Park was much affected by Charles II. and his companions, its heyday as a fashionable lounge was during the eighteenth century. Innumerable prints show it thronged with the gaily dressed *beau monde* of that picturesque period, and its various promenades had then specific names, such as the Green Walk, between the Park wall and the Mall or where the roadway used to run before the present avenue was formed; the Close Walk, sometimes called the Jacobite Walk, at the west end of Rosamund's Pond; the Long Lime Walk, &c.; and these names are to be found in contemporary literature, where all kinds of amusing and interesting references to the Park as a lounge, a place of assignation, a nocturnal resort are frequent. The place enjoyed also the privilege of 'sanctuary,' where a man was out of the reach of bailiffs and duns, and where to draw a sword was regarded as a serious offence. 'I must not draw in the Park,' says Bluff in Congreve's *Old Bachelor;* while we know that Booth (in Fielding's *Amelia*) was accustomed to walk in the Park in security from his creditors.

It was when looking from the windows of St James's Palace over the Park that George I. made his famous remark. 'This is a strange country,' said he. 'The first morning after my arrival at St James's I looked out of the window and saw a Park with walls, canal, &c., which they told me were mine. The next day Lord Chetwynd, the ranger of *my* Park, sent me a fine brace of carp out of *my* canal; and I was told I must give five guineas to Lord Chetwynd's servant for bringing me *my own* carp, out of *my own* canal, in *my own* Park.' And it was *à propos* of this royal domain that George's daughter-in-law, Caroline of Anspach, once suggested to Sir Robert Walpole the possibility of closing it to the public, and asked what the cost would be, to be answered in the memorable words, 'Only three *crowns*, your Majesty.'

Kip's 'Bird's-eye View of London' gives an excellent representation of the outlines of the Park during this period; though the view prefixed to Lord Lansdowne's works, published in 1732, Hogarth's picture of Rosamund's Pond with surroundings, dated 1740, and Malton's later view showing Buckingham House, the picturesque red-brick predecessor of the present dingy structure, give a still better idea of the place as a resort of fashion during the days of the Georges.

The alterations which have been made in our own time have been so drastic that, except for the ornamental water, whose outlines, too, have been changed, in this case for the better, it is difficult to reconstruct the Park in our mind's eye as it was even in the time of George III. How much more impossible to bring back to our mental vision its appearance in those earlier days when it was a more or less uncultivated waste, and when its frequenters were not the *haut ton* of the period, but the miserable lepers from the hospital which preceded its palace!

St James's Park has seen many strange, and not a few stirring, sights. One of the earliest of these was in 1539, when Henry VIII. reviewed that great muster of the London Militia, which Hall, in his *Chronicle*, describes with such particularity, when no fewer than fifteen thousand men, 'beside whifflers and other waiters,' marched round the Park, so that 'the king himselfe

[might] see the people of the Citie muster in a convenient nombre.'

Another notable gathering here took place in 1560, when Elizabeth kept her Maundy in St James's Palace, and gave away much of her superfluous clothing to various poor women whose feet she washed, what time two thousand poor people were assembled in the Park, and each received twopence, a sum equivalent to twice as many shillings of our currency. One wonders whether the queen, on this occasion, called to mind the scheme for killing her sister Mary, which Bacon tells us was to have been effected 'by a burning glasse, when shee walked in St James's Park, from the leads of the house'?

Did, too, the Merry Monarch, as he sauntered here, remember—how could he fail to?—that wintry morning—30th January 1649—when the White King took his last walk from St James's Palace to the scaffold at Whitehall? That memory seems to haunt the place to the exclusion of all others: the snow-covered ground; the silent soldiery; the erect central figure, covered with its velvet cloak on which the Garter shined so idly; the sad, sad face which looked on these desolate trees for the last time. Or did the careless, loitering king remember (if he ever knew) that it was here that Cromwell once sounded Whitelocke on the subject of the very sovereignty that had been snatched from his father's grasp? 'What if a man should take on him to be king?' asked the Lord Protector. Ay, what indeed? Did not the terrible storm that raged when the presumptuous man lay a-dying, and uprooted so many 'immemorial elms' in the Park itself, give a belated answer?

As I have before said, Charles II.'s memory will always be closely identified with this spot; more so, indeed, than with any other in London. Charles with his poodles and his courtiers about him; Charles playing pall-mall; Charles suggesting the subject of 'The Medal' to Dryden, or in deep converse with Hobbes, or chatting with 'Nelly,' while Evelyn stood by and wondered; Charles in a hundred guises seems to dominate this place of many memories. And then at a later day—the day of Anne and George I. and George II.—when Swift walked here to make himself thin, and Prior to put on flesh; when the Duke of Wharton was seized by the guards for singing in the very teeth of royalty, as it were, the Jacobite ballad, 'The king shall have his own again;' when Bolingbroke is said to have once, in a fit of intoxication, run naked through the sacred precincts. In those times when the Clarindas and Belindas swept along the gravelled paths, and the Sir Plumes or the Sir Foppling Flutters strutted by their side; when great ladies were attended by their court of obsequious beaux and followed by their black page-boy—Pompey you're sure his name was; when the Montagues and the Bellendens were only less mobbed than the Gunnings and the Rutlands and Devonshires of a later day, then was the moment of the Park's apotheosis; and now when motors rush hooting up and down that road which was once threatened with the name of Processional Avenue, now we must close our eyes and think and think indeed before we can call back to memory those gay, thoughtless ones who once made the place like a kaleidoscope, but who are now

> Cold, cold as those that lived and loved
> A thousand years ago.

THE AIRY PRINCE.

PART IV.

IX.

IT was nearing the middle of the afternoon when the airman succeeded, after some difficulty, in piloting his little companion across Piccadilly Circus to Regent Street. It is something to be noticed in that most cosmopolitan of districts, but more than one turned to watch the solemn officer of the formidable stride and the French girl, whose wealth of hair and length of dress (barely revealing her ankles) made her seem a vignette from some past century novel.

It had been, for her, a day of wonders.

From her lonely little world, peopled with make-believe inhabitants, she had been transported through the air to the centre of reality. London, the 'Baghdad of the West,' huge, monotonous, garish, beautiful—what term is there in language that could not be applied to that great gathering of human souls?—London sprawled before her gaze in a yellow sunlight which played such tricks with its tired buildings that age-old stone looked bright and cheerful, and the very dust seemed like the coating of frost when a thaw succeeds a freezing night.

Before her eyes the pageant of passions passed in endless array. Poverty and hypocrisy rubbed shoulders with ostentation, greed, and lust. Streets, crowded with a suffocating similarity of stodgy dwelling-places, gave way to parks, fragrant with the atmosphere of romance. Vice stalked unashamed through the thronged streets, and dull, tired faces, leaving monotony in their trail, passed their next of kin without a glance, those to whom discouragement had come as some incurable disease. Sinister, sensuous eyes looked into hers, and children pure in mind as snowflakes laughed as they walked beside their nurses.

For the sun was in the heavens—and the same warmth that brings the beauty of a

narcissus into being gives life to the noisome, crawling things that feed on decay.

London's costume drama was at its height; uniformed men and girls paraded in their thousands. There were loose-limbed Colonials, slouchily-smart British Tommies, amazingly serious Americans; bus-girls, land-girls, girls on motor-cycles, and girls driving ambulances; graceful French officers, swarthy Italians, impassive Japanese, and ruddy-faced British sailors seeking a day's diversion from the sentry-go of the sea.

From the great, throbbing city a babel of voices rose, like the sound from a gigantic mart; hurrying, restless vehicles worried their way through the maze of traffic; Youth with its carelessness of years elbowed Age, waiting with weakening tread the call of the Reaper to whom all men's lives are but sands that run their brief course. Over the whole city brooded the Past.

Take all the comedies of the centuries; gather the tragedies of history; piece them together with all the fancies of a madman's brain—and what could they offer in the play of human emotions that would compare with one hour of London's life?

They had gone a little way down Regent Street when an exclamation of delight escaped from the girl.

'*Tiens!*' She caught the airman by the arm. 'Papa Joffre!'

A one-legged man with outstretched cap was seated on the pavement, and beside him were five coloured drawings vaguely suggesting men of the times.

'But he is wonderful,' cried the girl. 'See—it is Papa Joffre himself! Monsieur, you will give him a little present?'

The airman presented the art-exhibiter with half-a-crown, receiving a gin-and-watery blessing in return, as they strolled on their way.

'She's the fust one,' muttered the cripple, preparing to close business for the day, 'as 'as recognised that there dial of Juff's this last four month. It were a rotten drawink and no mistike. Blime! I'll give that cove this 'arf-crown to draw me a picter of this 'ere General Fush as what is getting hisself talked abaht.'

He saw a shadow on the pavement and held out his cap. A Jewish rabbi, with sallow brow and spiritual face, passed without a glance, his flowing robes oddly reminiscent of the Levite in that Past to which the age of London is mere immaturity.

The wanderers turned into Pall Mall, and, traversing it, reached the Strand, where the meeting of human currents forms a whirlpool. Threading their way with difficulty, he felt the restraining hand on his arm, as he had done two hundred times that day. The girl had stopped opposite a hollow-eyed old woman offering violets, from her seat on a box, to the thousands who cared as little for her flowers as for her.

Once more he produced the inevitable coin, and again received a blessing, as trembling, unlovely fingers clutched it. He was about to turn away, when something almost attractive in the wrinkled face held his attention. The woman had looked searchingly at the girl, then into his eyes, and, touched by sudden sympathy, there was a faded echo of comeliness in her features that came and went, like a glow caused by a breath of air on ashes that seemed dead.

'What is it, mother?' he asked, holding the girl's arm. 'Business bad?'

'Yes—yes,' answered the woman in a low, weak voice; 'but it's her I'm thinking of. Take care of her, laddie, won't you?'

The girl, unable to understand them, leaned over and smiled into the wrinkled face. With a little air of embarrassment Pippa picked half-a-dozen violets from her cluster, holding them out to the woman, who took them with strangely twitching features, just as an encircling current of the Strand caught them in its grip and carried them away.

Although they had rested at noon in a quiet hostelry in Oxford Street, near that part of the Park where the delightful statue of Peter Pan pleads for belief in fairies, it was obvious that the strain of countless impressions was beginning to bring fatigue to his charge. Accordingly the airman paused in the doorway of a theatre and drew her away from the traffic's turmoil.

'It is three-thirty,' he said, 'and there is a performance inside.'

Her eyes, which still held their tenderness for the woman of the flowers, sparkled happily.

'That is delightful, monsieur. Is it a play as I read in my books?'

'Alas, Pippa! there are no more plays—only revues.'

'But there is music?'

'There is an orchestra.'

'It will be droll, monsieur?'

'I doubt it, little one; but we shall see.'

Purchasing tickets from a lordly being in a cage, they entered the theatre, where a huge audience was rocking with laughter at the three hundred and sixteenth performance of *Oh Aunt!* They took their seats, just in time to hear the best of a scene between two comedians who, lest the subtlety of their wit be lost, were talking at the top of their lung-power, pulling chairs from underneath one another, colliding frequently, and every now and then, to emphasise some point, kicking each other.

Several minutes passed, and wonderingly the French girl gazed at the pair, while the melancholy of her escort's face reached an intensity that threatened tears.

'Monsieur.'

He inclined his face towards hers.

'Monsieur—they are'—— She did not complete the sentence, but her shoulders conveyed her meaning.

He smiled sadly. 'They are,' he said.

She sighed sympathetically. 'Poor gentlemen!' she murmured.

After that the comedians sang a duet, the words of which dealt with marital infidelity, that screamingly funny subject on which the stage of to-day builds its humorous efforts. Once the verse ended with an innuendo so crude that a gathering of navvies might have resented it.

There was a laugh and a gasp from the audience, then wild applause; the song could not go on for the riot of appreciation. One of the comedians (who had sung it only three hundred and fifteen times) tried to commence the next verse, but was suddenly overcome with laughter himself. The guffaws became a barrage; then, as the other singer turned abruptly about, his shoulders heaving convulsively, the din grew to drum-fire and was deafening. How richly humorous! It was really too much! People held their sides and gasped for breath.—'Have you seen *Oh Aunt?* My dear, it is *too* killing for words.'

Up in the gallery one man sat with an unsmiling face. He was a wounded Tommy who had been blown from a ditch to the top of a barn, and from the barn to another ditch. He had had his fill of slapstick comedy.

When the song was over there were shrieks of forced, girlish laughter, and nearly forty young women in various stages of deshabille rushed on the stage, exhibiting to a critical audience the charms and the defects of their forty individual forms. The producer had been both daring and sparing. He was a second-rate burlesque manager in New York, but London, that great haven for American mediocrity, recognised his genius and gave him a chance. He knew the value of a chorus, and how to get the best out of them—oh, he knew!

'Monsieur.'

The officer turned slowly and looked at the girl beside him. Her face was flushed and her eyes stared at the ground.

'Yes, little one?'

'Please—take me away.'

Without questioning her further, he reached for his cap, and amid the wondering glances of the people around, they left the theatre. He paused in the foyer and put on his gloves.

'I am sorry, Pippa,' he said gravely.

Her hand stole soothingly into his arm, and both of them, unknown to each other, experienced a feeling that he was the younger of the two. After all, every woman is a potential mother, and men are only boys grown serious; so she comforted him with the touch of her hand, and—perhaps it was the natural contraction in putting on the glove—his arm pressed hers tight to his side.

And though he was a man, he understood. It is not precept or preaching that teaches it. Modesty in a girl is instinctive; and the little lady from the mill-house had known no other teacher than instinct.

Outside the theatre an attendant was changing the performance number of *Oh Aunt!* from 316 to 317.

X.

Twenty minutes later, in the large tea-rooms of a fashionable hotel just off the Strand, there was a murmur of interest as a flying-officer, quizzically dejected of countenance, entered with a young lady, who glanced shyly about, and whose fingers held his, timidly but confidingly.

He secured a table, and ordered tea from a pleasant waitress. This accomplished, he said something to his companion, who was sitting bolt-upright, keeping a steady gaze on her hands crossed on her lap. Smiling a little, she slowly raised her face and looked into his. A young Canadian subaltern, seated at a table with a woman whose overpowdered, meaningless beauty was only too eloquent, stopped in some remark he was making. Something in the French girl's face had sent his mind, smitten with loneliness, speeding across the Atlantic to a home whence a mother and a sister had sent the finest thing they had across the seas.

Near them, two girls, fresh of face, tittered and posed, challenging the eyes of every man who entered, with a brazen immodesty strangely at variance with their appearance of decent breeding. At a farther table a young woman, with a beauty that was marred by too hard a mouth, sat with her mother and listened to that woman's urging that she should marry a wealthy Jew who had asked for her hand. Was it not her duty to herself and to her mother? Besides, even if that young fellow did come back uncrippled from the trenches—which was unlikely—he would have to begin all over again. Alone, a good-looking artist, discharged from the army with wounds, sat with an insouciant, mocking eye, searching for types and adventure. Around him women of all ages, some of them with men, smoked, while their chatter mixed discordantly with the orchestra playing some negroid ragtime piece, and with the sound of rattling tea-cups.

'Your Majesty,' said the miller's niece, relapsing into her former style of address, 'there is so much I cannot understand.'

'Such as what, youngster?'

'These ladies here. Some are so pretty and so nice. Others are pretty and'—— Again she shrugged her shoulders as only a French woman can. 'I am so young, it is true—but see that lady there.'

'With the young Canadian—yes?'

'Somehow, monsieur, she frightens me. I did not know that women ever looked that way—like Louis when he catches a mouse.'

'The simile is very apt, Pippa.'

'But then'—her brows puckered with a first endeavour to harness language to her psychology—'you can see that nice girl there, so fair and pink.'

'I prefer them dark,' said he seriously; 'but what of her?'

The expounder of philosophy breathed deeply, but stuck to her task.

'I think,' she said, 'that the fair girl is nice, but this one is . . .' (shrug) . . . 'Then why, monsieur, does the nice one try to look just like the other?—*Regardez-moi ça*—see her now.'

He poured out the tea, which had just arrived.

'Shall I tell you a story?' he asked.

She sighed happily. 'Tell me a true story,' she said with that insistence of the young on making all things believable.

He sipped his tea and frowned meditatively.

'Not long ago, my dear, there lived a stupid king.'

'Your father?'

'In any one but you, Pippa, that would be pert. No, he was not my father.'

'I wonder if Louis'—— she began, but he checked her with a portentous frown.

'Once,' he began again, 'there lived a stupid king named Convention.'

'What a silly name!'

'Pippa!' he admonished her with a warning finger.

She tried to look serious, but ended by laughing mischievously.

'There was a stupid king with a silly name?' she said encouragingly.

'This king,' he said, 'was very wise in some things, and often kind, but his courtiers were a poor lot—Hypocrisy, Snobbery, Good and Bad Form, and a lot of others. Now the king used to favour the men among his subjects.'

'You mean, he liked men?'

'Yes.'

'So do I,' she said in an outburst of frankness. 'They are so droll.'

He poured some fresh tea into the cups.

'This King Convention,' he said, after a thoughtful pause, 'said that men could do a lot of things that women could not, which made the women very angry. Now the king had a jester named Shaw.'

'What is a jester?'

'A man who makes jokes that people may laugh.'

'Why do they laugh at jokes?'

'Well, in England—especially on the stage—it is from the pleasure of meeting old friends. As a race, we are rather sentimental about our jests, and don't take kindly to new ones.'

She sipped some tea, holding the cup in both hands, but with considerable daintiness.

'Tell me an English joke,' she said.

He stroked his faded little moustache.

'The House of Lords,' he ventured, after some thought.

'*Hé!* Is that funny?'

'Very.'

'I do not laugh. Tell me another.'

He broke a corner off a piece of toast.

'One of the richest bits of humour in England,' he said, 'is the idea that children born into wealthy or titled families are superior clay to their fellows.'

Pippa thought tremendously.

'I think, monsieur, I know why you look so sad. It is because of what you have to laugh at in your country. . . . But please go on and tell me what happened to—how say you it?—the jester.'

'Ah yes. Well, G. B. Shaw'——

'What is this—G. B.?'

'Those are his names—Gor' Blime Shaw.'

Pippa sighed. It was very difficult to become interested in people of such strange nomenclature.

'What did he, then, this Gor Shaw?' she asked, feeling that the story must end sometime.

'Well, as a matter of fact, he was rather a poor jester, because his only joke was to stand on his head. At first every one laughed; but after a while they thought that it was his natural position, and paid no attention to him. It was really pretty hard on the poor chap, because he was too old to learn any new tricks, and he used to become dizzy from being upside-down so much. Finally he grew furious at the king for not laughing, and urged all the women who did not like Convention to murder him. When the war came along, they saw their chance. The men went away, and the real women of England were too busy helping them to bother about anything else. You see, Pippa, in our country we have the noisy, chattering, selfish women who do good by limelight and find their reward in the illustrated journals. But there are also those, the unrecognised and unthanked ones, who share others' griefs, but suffer alone. It is the unseen, unheard women of Britain who are really wonderful.'

The girl said nothing, but her face, so suggestive of colour in its elusive change of expression, softened to a tender mood that left her eyes very dark and sombre, and her lips curved slightly into a smile that was full of sympathy.

The young Canadian subaltern looked directly at her and compressed his lower lip with his teeth.

'What's the matter, dearie?' croaked the woman beside him; but he returned no answer.

The two tittering girls stopped their staccato giggling for a moment, then resumed with a steadfastness of purpose that somewhat robbed the effect of spontaneity. The young woman with the over-firm mouth took in the tableau of the airman and his little charge, and turned to her mother with some sarcastic comment that was strangely belied by the look of hunger in her eyes. The artist, still with his air of graceful insouciance, sat with half-closed eyelids and visualised Pippa as a subject for canvas. 'What a Psyché she would make!' he muttered. The orchestra was just going to play, when the leader, who had been idly gazing at the throng of guests, made a gesture of dissent.

'We shall not do "Oh that Opium Rag,"' he said. 'You see that girl there, with the dark

curls and the sweet little face? For her let us play Mendelssohn's "Spring Song."'

Quite unaware of their interested audience, the flying-man and his companion continued their excursion into the realm of fables, while untouched toast and half-emptied cups stood by in neglected array.

'That is practically all the story,' he said. 'When the war came on, they murdered poor old Convention.'

'Oh!'

'Slaughtered him,' he said gloomily; 'though all his bad courtiers escaped. For a long time it was feared that the king's son, Courtesy, and his niece, Charm (who were very much in love with each other), had also been done to death, but there are rumours that they have been seen in remote parts of England. So, Pippa, that is why these young women look and act alike. They are the murderers of Convention.'

But she was not listening to him. She was silently enjoying, for the first time, the fragrance of Mendelssohn's Melody of Spring, which found immediate response in her nature, so attuned to the delicate things of life. It had a somewhat contrary effect on the others, whose conversation, which had begun to lag, took on fresh impetus with the sound of the orchestra.

'Tell me,' she whispered, vastly puzzled, 'why do they talk so loud when there is music?'

He shook his head. 'I don't know,' he answered. 'It is said that music soothes the savage breast—it certainly loosens the civilised tongue.'

The charming setting to the happiness of Spring-time, written by a composer who really never grew up, came to an end, and in sheer delight the French girl clapped her hands twice. The leader acknowledged the compliment by bowing. She did not know that it was for her alone he had chosen it.

The airman examined his watch. 'Little one,' he said, 'I am afraid our day is nearly over. In half-an-hour we must catch a train back to "The Plough and Crown," where we shall have dinner and a little rest. At eight o'clock two friends of mine from the aerodrome here will bring the machine—you understand that taking young ladies from France to England has not yet been officially authorised by the Air Ministry. As soon as the stars are out we shall start for home.'

They rose to go.

She smiled shyly at the orchestra, and once more the leader bowed. With the daintiest of gestures she raised her hand and waved to him; then, feeling for her protector's arm, she started for the door, her eyes timidly glancing about her from beneath sheltering, downcast eyelashes. Without the least embarrassment, the tanned airman with the strangely light moustache and eyebrows walked beside her, experiencing an indefinable sense of possession that proved most agreeable.

The artist toyed with an unlit cigarette. 'With such a model,' he muttered, 'if I could only indicate that swift rhythm of expression—I should be great.'

The tittering girls kept up their chatter. They had long since learned that nothing stifles thought like meaningless conversation—and they were afraid their thoughts might be unpleasant.

The young woman with the over-firm mouth drew back as the airman and his companion passed her table, but her eyes clung to the French girl's face as though its winsomeness and purity held the answer to her troubles. Swift as imagination itself, her mind leaped to France, picturing a young fellow who, if he did come back unmaimed, would have to begin all over again.

'Mother,' she said, with hot resentment in her voice, 'I am entitled to my own life. I have seen too many tragedies in material marriages to dread one of love.'

'You are a fool,' said the other; and because she was the stronger of the two, she prevailed.

The woman who looked as Louis did when he caught a mouse turned on the Canadian boy, who had followed Pippa with a far-away, dreamy stare.

'What's the matter, dearie?' she queried, with the tedious endearment of her class.

He brought himself from the reverie that had strangely blended the French girl's face with the faces of two other women across the sea; then he looked into his companion's with its leering comeliness. With a quick, decisive movement he rose to his feet, and, feeling for his pocket-book, placed a pound-note on the table.

'Pay for what we've had,' he said, his jaw stiffening, but his voice shaking oddly.

'What! aren't I going to see you again?'

He was going to speak, but changed his mind, and, turning on his heel, strode from the place, his spurs jingling with each step . . . and there was something in his face that made people keep silent as he passed.

TANTALLON.

HIGH o'er the cliffs that skirt the Northern Sea
Its hoary head the Douglas stronghold rears.
Sea-girt save on the west, its site appears
Of strength impregnable. Those walls must be
Full twelve feet thick. What mighty man was he
Who planned this wondrous pile, designed its strength,
Imagined first, constructed, saw at length
Its form rise splendid in its majesty,
Then passed? His name unknown, his work yet stands
To testify that labour of men's hands
May last a thousand years or more: yet see—
Those ivy-mantled battlements confess,
Those turrets decked with wallflowers sweet express,
God's work continues—man's is vanity.

THE HEART OF THINGS.

By Henry Leach.

London, *Yesterday.*

PEOPLE who play with figures pretend there is a certain suggestiveness, something akin to occultism or magic, in the figures of the year, as reckoned by the era in which at present we so nervously and doubtfully live. Such as recall in any detail the distant days of 1914, and the odd speculations in which many indulged at an excited but hopeful period, may remember that, with an accommodating ingenuity, some of their friends took the figures of the year, sorted them, multiplied, subtracted, divided, and then fortified them with an admixture of other dates that specially concerned William Hohenzollern and his party, and, lo! from this apparent confusion of arithmetic there suddenly emerged a wonderful and inspiriting sign that was as the fair promise of happy fortune. There were variations according to the reckoners; but in the main the token was that in that year, or in the year following, he who was Kaiser would fall, his empire would crumble, and free Britain would be the more free, and in her pride and glory would rejoice exceedingly. You will recall that the greater the complexity of these calculations, the more subtractions and divisions were performed, the more ominous was the sign when it loomed through the arithmetical mists. This seemed right and natural. Though a peace—and, as some consider, a not very perfect peace—was deferred until 1919, one has scarcely a doubt but that some, at least, of those who thus handled the figure magic, who dipped into the occult of a special calculus, may find that 1919 is the most agreeable or adaptable year to their signs, and that once again the hidden forces are justified of the portents they so subtly deliver. But now, in the matter of mere figures and their looks, does not 1919 appear to be of a more special significance, to hold within it more, than any year of recent occurrence? Look upon it, and turn its parts about. See the rhythm, the symmetry, of 1 9 repeated—the first of the numerals and the last. Is there not here a touch of that mystery that hangs upon the recurring decimal and the nth power, which, by their unendingness, their infinity, seem to have acquaintance with eternity? We know our old friend x, with his attendants, the faithful y and the occasional z, to be something of a pious fraud, a humbug, with his squares and his cubes, in his assumption of mysteries the most profound, for he is amenable to the simple rules, is solved in the manner of mere materialism, and indeed is as if prepared for us by our masters behind a screen. But it is different with such characters as this strange 1919, which provokes some of the wonder, the sense of a special sign from Time, that was experienced when stray and helpless mortals were delivered to the awesome 1899 (the first two figures made another 9!), with its grim suggestion of a great finality, and direct from this experience to the scarcely smaller shock of 1900, with the responsibility of a new beginning, of possible perils, of fateful discoveries, of disturbing evolutions, that might lie ahead. The most susceptible were conscious of a certain spiritual sensation that seemed somehow to have brought them to a new and more intimate touch with sublime and mighty forces. Time is the most mysterious and fateful of all the seeming unrealities. Let peoples try to meddle with its order or arrangement in any way, and they have a sense of attempted interference with tremendous forces. Was there no peculiar sensation at the dawn of a war summer in putting the hands of the clock on an hour? The heavens were not affected by this trick, but mankind had a certain unstated apprehension. War economies were well enough—but the planets, the orbits, the sun, eternity! However, the timid still live, and the sun still shines upon them. Sometimes one may comprehend the desperate daring of the French revolutionists, the sensation that was experienced of their grappling with the inner forces of life and forces beyond them, by a simple contemplation of the new calendar they prepared soon after setting up their republic in September 1792, abandoning the Christian way of reckoning with a great defiance. It is nothing but a custom, a simple piece of arbitrariness, but to us the years and the months we reckon by do indeed appear to have a peculiar connection with creation. How if it were now Fructidor or Vendémiaire? When those revolutionaries, mad in their reforming zeal, reconstructed their months and weeks, they seemed to be doing an even more desperate thing than cutting off the heads of Louis and his queen. Monarchs were merely mortal and

 [*All Rights Reserved.*]

subject to human weaknesses; but Time was different, and the men who abandoned the seven days week, extending it to ten days, and counting three such weeks to the month, had the appearance of challenging the highest powers. It was like an attempted interference with Time.

* * *

But in this matter of 1919 it is Time itself making signs and murmuring of immensities. Besides the repetition of its couplets, there is the omen that each couplet, with its components of first digit and last, sums up to the significant arithmetical ten, which is the factor of mighty formations of the decimal order. It is because of such contemplations that some whimsical persons, uneasy upon the circumstances of the time, and feeling within them those spiritual movements or disturbances inadequately named superstitions, sometimes with an effort at intensive reason and enlightenment turn attention to the skies, and vainly consider the immensities there. In this mood they might recall some of the indefinite and ineffectual musings upon this matter of M. Anatole France, whose sceptic spirit has experienced its deepest vibrations as he has looked from a window on starry nights. Every time we wonder at the immensity of the heavens, says he, we must wonder at the same time at our own littleness, since the grandeur of the universe depends on it. Not perhaps M. France, but suffering peoples would suggest that statesmen who regard themselves as instruments of the greater destinies should, before exercising ministerial office at Westminster, in Paris, Washington, Rome, or some other capital, be ordained to spend, let us say, a hundred nights in contemplative solitude on an open moor, or perhaps on a balcony near Greenwich, with impressive explanations by the observers there. One conceives that in no ideal state of society and government would men be permitted to exercise authority and influence without, by such a period of humiliation and wonderment, having been brought to an understanding of their own exceeding smallness, and of the need for sincerity in all effort if it shall avail. Here they could perceive what a peddling thing is a premier in relation to time and space, and if not too stupid they might shape their effort accordingly. 'Time and space,' says M. France, 'do not exist. Matter no longer exists. What we name as such is exactly what we do not know, the obstacle against which our senses break.' Drawn by such thoughts, beginning with speculations upon the mysteries of years, and the signs about them, as in 1919, men and women may drift out upon fearsome depths of wonder. Better edge away from them, and look upon some more material signs delivered by what may be called fate or coincidence to this year in which the greatest peace of a planet, as they say, has been made. Whether it is the design of the higher forces toying with simple mortals and their tiny affairs, or whether it is chance (if such there is), it is at least a curious, almost a sensational, thing that this year of peacemaking is marked so significantly with what we call centenaries—marked as no other year in our time. There are more centenaries of consequence, and, as we might say, the quality is higher, than usual. But these emblems of the past are not given merely for the decoration of the calendar of peace year; however one tries to evade the fancy, there seems in their very character another sign, a warning from Time. The morals are pointed and grim enough; one at least that must be indicated is a strangely ironical reproach against the people of these days. These are not the moments when we would have, as one might say, the ghost of Queen Victoria to pace before us, reminding us of stupidities in her age and later. But here people are now turning from war to peace, and in leisure spared from struggles with controls and with the coarser materialisms exerted by Governments, they may think upon the worth of the arts and the conquests of peace, and upon the fatal instinct which at times asserts itself in peoples, turning them to mutual slaughter. The 'Arts of Peace,' 'Peace hath her victories'—old tags for smug and often hypocritical quotation now!

* * *

If this is the greatest, most notable, and most significant of all peace years, and if the 'arts of peace' are thus unctuously to be patronised and exalted, and if it is to be the habit to look back along old times and see what those arts produced that may call for some remembrance now, one must be impressed by the grand procession of the centenaries that we behold this year. The centenary itself is a purely arbitrary mark in the tables of time, but it has justifications, and in this country affords the first opportunity for careful examination of human work—which may endure and which may not; what stands for real progress, the spiritual refinement of the human race, and what is simply neutral or relapse. Every philosopher sees that time, with its immensity, will blot out from all record and remembrance such a war as we have endured: it will be unknown to the living things upon the earth, while the good works of the mind and the soul, having had long influence upon the spiritual exertion of mankind, will still be not without effect. It cannot yet be seen by all, but the peace-workers in the higher spheres, labouring for human refinement, are of more account in time and space than mere statesmen and war-mongers. Strange then, perhaps, that here in this peace year such a gallery of these purifiers should be presented in centenaries. Ruskin leads the way; Lowell comes quickly in his company; then there is Da Vinci, recalling a great renaissance; in May appear Julia Ward

Howe and Whitman to impress by repetition the significance of the American note in the Lowell theme of February. In high summer there are Kingsley and Addison in purity and splendour; deep in the autumn George Eliot in her intensity. Here and there upon this centenarian subject odd variations are made. In Britain we have, as it may be said, a special and almost exclusive attachment to the pure centenary, the marking of the exact hundred years for celebration, though a certain freedom is exercised in the matter of dating either from birth or from death. Good reasons favour reckoning from the beginning. People discourse and moralise upon centenaries in France, but they have another time of remembrance to which they are attached, the cinquantenaire, the completion of fifty years after the passing of the subject. The great figures of the past are thus considered, criticised, estimated, and, it may be, admired, from the same standpoint of time. And it comes about in this year of peacemaking that while Britain has several of the most impressive centenaries to consider, the French have two of their cinquantenaires of special consequence—those of Lamartine and Berlioz, besides the centenary of Offenbach. In our own music there is the centenary of Brinley Richards (1819–85), the Welsh composer. In British art there are those of W. P. Frith, R.A. (1819–1909), who painted the famous 'Ramsgate Sands,' the 'Railway Station,' and other pictures of a special style; of John Boydell (1719–1804), the print-seller who became Lord Mayor of London, and whose 'Shakespeare Gallery,' to which Romney, Fuseli, West, Angelica Kauffmann, and Sir Joshua Reynolds contributed, was a remarkable production; of Nicholas Hilliard (1537–1619), the Elizabethan limner, a Devonian and the first great English painter of miniatures; and James Gandy (1619–89), who takes position as one of the first English portrait-painters. If we pass from such classes and take in pioneers and exponents of other forms of work and progress, fine figures for reflection are then presented. There are Sir Francis M'Clintock (1819–1907), Arctic explorer, and Sir Joseph Bazalgette (1819–90), an engineer who made that Thames Embankment which, in days that even still young Londoners may recall, was the most tranquil and majestic walk in town before the tram-cars came to ruin it, a peaceful promenade with a graceful curve beside the river, just beyond the clatter and din of the Strand. And very particularly, and of great significance in these times of straining finance, there was Sir Thomas Gresham (1519–79), the eminent financier, who started what were the first paper-mills of their kind in England, established the Royal Exchange, and from the depths of his financial experience and perception impressed upon the statesmen of his time, harassed by the exigencies of war, the principles that England should be self-containing, that there should be as little borrowing as possible from overseas, and that good credit for English trade should be firmly maintained. Sir Thomas was one of the great men of the City, a splendid human reality at a time when its romance, to judge by the story of Whittington, was brighter than it is to-day.

* * *

There are two other centenaries falling for celebration now which challenge most particular reflection. It was a hundred years on 19th August since the life of James Watt, inventor of the modern condensing steam-engine, was closed, and the occasion is being marked by a splendid further endowment by subscription of the engineering department of Glasgow University. It was not only an invention of the utmost consequence in itself, but it seemed to be the beginning of that new era of tremendous mechanical and scientific development which has pushed the world along so fast since then. And another centenary to make a pair with it, though it be of an event and not of a person, is that of the first crossing of the Atlantic by a steamship. The French have noted the occurrence of this centenary, but it is curious that one has seen scarcely a reference to it in our own country, although the recent first passage of this ocean by airmen gives such extraordinary point to it, making a quite astonishing coincidence. The ship was built by the firm of Crocker & Fickett, of Corlears Hook, New York, and was intended for a projected Baltic trade. The *Savannah*, as she was called, was a craft of three hundred and eighty-nine tons, and, steam-power being then, as it was conceived, no very dependable thing for long-distance navigation, she was built for both steam and sails. When the latter were being employed the two paddle-wheels that were worked by the single-cylinder steam-engine were unshipped and hauled on deck. This operation, it is stated, could be carried out in twenty minutes. Steam-driven ships were beginning to be used on American coastal work, but this passage of the Atlantic appeared then a gigantic and risky enterprise. However, leaving Savannah under command of Captain Rogers on (or about) 26th May 1819, the *Savannah* reached Liverpool on 20th June. For some parts of the passage she went along by steam; but Captain Rogers, faced with rough weather and then with shortage of fuel, hauled the paddle-wheels aboard, replacing them in due course when the craft neared the coast of Ireland. We are told that the captain of a British naval division in St George's Channel, seeing this curious thing coming up with her belchings of smoke, believed that she was a ship on fire, and sent two boats to her assistance. The error being discovered, he visited her himself; and subsequently there was a true and appropriate

festival in her honour at Liverpool. Afterwards the *Savannah* went on to the Baltic, and the Emperor Alexander of Russia, visiting her, made gifts to the captain. But trade then did not seem to flourish in those parts, and in the same year the ship returned to her America. Though her voyage had been a good success, her engine was taken from her when she reached home again, and she spent the rest of her ocean days as a sailing-ship on coastal work, being at last wrecked near Long Island in 1822.

* * *

In this account we have touched with slight detail upon the first and the most conspicuous of the non-human centenaries (as they might be called) falling in 1919. There is another kind upon which a note may be made before passing to some unordered reflections upon great figures of the past which by the flight of time are presented for consideration in this particular year. The other non-human centenaries referred to are those of books, famous and dear to readers of present times and past, and specially dear to many of us in the remembrance of our early reading, with its matchless freshness, joy, and wonderment. There is *The Bride of Lammermoor*. It was in 1819, in circumstances of severe physical pain, that Scott wrote this book, which marked a turn in his career, where he struck forth among new scenes, worked with fresh materials, and produced a novel which has been declared to sum up the finest qualities of his romances. Some of it was dictated to William Laidlaw, whose 'exclamations of surprise and delight did not promote despatch,' and who was consequently made to relinquish the office of amanuensis, being an anxiety and a worry, when John Ballantyne was accessible. Hogg said that he had seen Scott's shirt 'burned to an izel' by hot applications to his body, such were his hard physical necessities then, and people in the garden at Abbotsford heard him shriek in agony. Laidlaw appealed to him to cease his literary work, yet he insisted that that could only be when he was 'in the woollen.' Scott himself declared that had he not had the strength of many horses he could not have fought his way through such a trial. His piper reminded him of one of the traditional cures of the Highland country-side, a thing of elves and spells. Twelve burns flowing southwards were to be found, and from each stream a stone was to be taken, the master to sleep upon the twelve, when he would be made well again. But Scott assured him that for the true spell the stones should be wrapped in the petticoat of a widow who desired no new husband for her consolation. Perhaps any other petticoat would have served, but the piper's sentiment and the spirit of a spell must be considered, and the main thing was that cold hard stones should be a little prepared for bed companionship. But despite the spells, that great tragedy might never have come to its completion had Scott not been under the influence of laudanum most of the time, and in that state performed his work. It was necessary to him in the circumstances of his pain; it gave him, besides the soothing, a peculiar change, and we are asked to believe that when the story, printed by James Ballantyne, was delivered to the author in the summer of 1819 he remembered nothing of it, could not recall the characters. The book was a triumph, a masterpiece, but it brought Scott sorrows with his exultations. He mourned poor Lucy; he was bitterly self-condemning for having killed her; yet what option had he? 'Of all the murders I ever committed in that way,' he said, 'and few men have been guilty of more of them, there is none that went to my heart so much as that of the poor Bride of Lammermoor. But it could not be helped; it was all true.' . . . That was one hundred years ago.

THE AIRY PRINCE.

PART V.

XI.

IT lacked two hours of midnight when an aeroplane crossed the Channel.

With his hands automatically guiding the rudder and his eyes keeping incessant watch on his compass and the pulsating lights of landing-points, showing like lighthouses at sea, the Black Cat brought all his conscious mind to bear on the events of the day.

In the whim of the moment, when the rain was on the roof, he had suggested this adventure to the little girl of the lonely mill-house; and for one day London had been hers. He had carried out his plan. Her countless comments, some childish, some strangely mature, were evidence enough of her enjoyment. Then why, he questioned, was he experiencing a dull feeling of depression, as the shadows beneath showed that, once more, they were over France? To-morrow he would have the zest of battle; again he would lead his squadron in the greatest sport of the ages. . . . Then why this heaviness of spirit?

His mind relapsed into a musing mood that got him no further in his introspective analysis; and his eyes, which had always been a reliable pair, commenced playing odd tricks with him. Though in the day-time he was used to seeing the earth and the horizon, and thus establishing

his estimate of distance, he was relying that night almost entirely on his sense of equilibrium, glancing only occasionally at the instruments which would tell him if he were not flying level.

It was the compass that first surprised him.

He was studying its sensitive needle when he noted with some astonishment that the dial had taken on the addition of two dark and most expressive eyes, which proceeded to surround themselves with the delicate features of a girl's face, possessed of a brow that was spiritually white, and dark hair that melted into the blackness of the night.

He shook his head and sought a light on the ground, which, after the manner of 'Winking Willies,' was showing long and short flashes like Morse. To his amazement, the light became a smile, which gradually developed into a most alluring female face. If he had been in possession of his usual sense of the humorous, he would have recalled that Lewis Carroll's cat appeared to Alice in much the same way; but his mind and body were both in the clouds, a realm where cats and humour are uninvited guests.

He next tried a star, which underwent the same evolution. Even the moon was not proof against the phenomenon. Once he half-closed his eyes, but that was worse than ever. Everywhere he looked, there was the same face—smiling, pouting, coquetting, sympathising, commiserating.

He tried whistling, but it offered no relief.

Behind him, nearly asleep, Pippa sat with closed eyes. To her the solution was much more simple. All day she had had her Prince by her side, her arm in his, her fingers locked with his. Therefore she was happy; also, she was tired.

Not having any tiresome masculine mental gyrations to perform in discovering a truth that was so easily apparent, she accepted the situation with sentimental nonchalance, and falling asleep, dreamed that the statue of Peter Pan in the Park had changed to that of the Airy Prince (who, she thought, was ever so much more handsome), and that she was sitting on the grass admiring him, while rabbits played about his feet. She was awakened from this delightful dream by a sensation similar to that of falling off a ladder in one's sleep; but such is the penalty of those who travel at night by air.

And, applying the laws of logic to the case, when a young gentleman sees dark eyes and curved lips in a compass, and a young maiden dreams that the citizens of London have erected a monument to a young gentleman with a long face and glow-worm eyebrows, it is reasonable to suppose that they have fallen in love with each other.

But strange things happen in the month of April.

XII.

She had just fallen asleep for the second time, when the cessation of the engines woke her, and a few moments later they had descended in a field adjoining his aerodrome.

He jumped from the pilot's seat and lifted her out. 'Quick, Pippa,' he said. 'They 'll be here in a few minutes for the machine. I had to land here because that light was my only guide. Do you see that heavy tree over there by the road? Wait beside it until I return with a motor-cycle. Hurry, youngster; they 're coming.'

She did as he bade her, and took refuge in the shadow of a huge tree, just as men's voices told her the mechanics had come. The rolling of distant guns, like thunder echoing through cavernous depths, travelled on the wings of the wind, and left her heart fluttering from a sudden contraction of pain. For one day, in the restful meadows of England and in the fascination of the unmarred City of Adventure, she had forgotten France's agony. With the thought came a sudden bitterness.

Ten minutes later she heard him coming with a motor-cycle, to which a side-car was attached. She took her seat in the car, and he fastened the rubber cover over her knees. Then he opened the throttle, and they sped through the night towards her home.

It was just twenty minutes to twelve when they reached the mill. Hurrying across the foot-bridge which spanned the chute, she entered the cottage and lit the lamp.

'Louis!' she cried. 'Louis!'

That patient feline awoke from slumber and stretched in the most blasé manner; but his little mistress, gathering him in her arms, pressed her cheek against his head, asking a dozen questions at once, to which he deigned no reply other than blinking into space and licking his chops, as though the ways of women were beyond him, but 'twere best to let them have their own way.

The airman followed her in. . . . The prevaricating clock continued its dilatory march of time. Marshal Joffre was, if anything, more paternal than before, and the geranium-coloured table-cover lent its unsubtle glow to the scene.

'Good-bye, Pippa,' he said.

The girl stood motionless, and there was a quick stab in her heart. She had known that this moment would come, but had kept her thoughts from it . . . and now . . . he was going. . . . Once more she would have only her little world of make-believe. She released the cat from her arms and turned her eyes away.

'You have been very kind, monsieur,' she said.

He fingered his helmet absent-mindedly. 'Did you enjoy it?' he asked aimlessly.

'It was wonderful,' she said quietly, still looking into distance; 'I have seen so much. This morning I was just a little girl, but now'——

His fingers ceased turning the helmet, and he frowned at it intently. 'We do not grow old

with years, but by moments,' he said. 'For a long time one is a child; then there comes an instant of suffering, or of love—and one is no longer a child. That is all.'

She slowly sank into a chair by the table, and, folding her hands, appeared engrossed in the table-cover. 'Your Majesty,' she said, 'do you remember the poor lady with the violets?'

'Yes, Pippa.'

'What did she say to you?'

He smiled awkwardly. 'It—it is rather hard to explain, little one. She told me to—to take care of you.'

'Why did she say that?' she asked, without removing her eyes for a moment from the table.

'Well—perhaps you do not know this—but men are often very unkind to women.'

'I know, monsieur. Simon Barit, he often beats his wife.'

He sat down on a chair opposite her. 'There are many more ways of being cruel than that,' he said. 'Sometimes a kiss, or the gift of a flower, is worse than a blow. Often, Pippa, men play with women's hearts as—well, as Louis does with a spool.'

A shadow fell on her face. 'I think I understand, monsieur. That poor lady was afraid I should fall in love with you, but that you would not love me.'

'That is partly what she meant.'

Pippa rose and walked to the window. 'To-night I think,' she said, after a minute's silence, 'that women have the most sorrow in life.'

'They do, little one.'

'But also the most joy, monsieur.'

He rested his chin on his hand, but said nothing.

'All to-day,' resumed the girl, 'when men seemed happiest it was because they were with women. Also, when they looked most cruel—you perhaps know what I mean—there were women there too with the faces that frightened me. And all those lovely children playing in the Park—always they seemed so merry because their mothers were near them. But, also, you remember the poor soldier in the chair?—no legs and but one arm. His face was so sad until once the lady with him—a nurse, you said—spoke to him, and he looked at her and smiled. It was lovely, monsieur. I think I wept a little.'

He made no comment, but his left hand ran slow arpeggios on the table. From the window she could see the water of the chute, all silvery in the moonlight.

'So to-night, monsieur,' she went on, 'I am not the same as this morning. Then I thought that we who are women are the happiest; but now I think, in the real world, it is we who give pleasure or unhappiness. Perhaps, monsieur'—she turned around and faced him—'perhaps a woman finds joy only when she gives it to others.'

He looked at her, and his eyebrows were raised in wonder. When he had said we grow old by moments, was it more than just a well-turned phrase?

She returned to her chair by the table.

'When Louis and I are alone,' she murmured, 'I shall not dream the same as before. Then we had only young people, brave and handsome, but now I shall pretend that there are many old and sad ones, who perhaps will be glad if I am with them. And'——

'Pippa, my dear'—he looked into her eyes that met his without timidity, and there was a pleading note in his voice—'you may be lonely here, but you saw to-day how many discouraged, unhappy people there are—how much sickness and unkindness there is. Keep to your little world here with its Fairy Princes and the music of the wind. It is better, Pippa. . . . Perhaps it is even more real than the other.'

She smiled, patiently, and, for the second time that day, felt a motherly pity for his youthfulness.

'Your Majesty,' she said, 'in my book, *The Fairy Prince*, the girl sings a song about love, and she asks her mother, "*Est-ce plaisir, est-ce tourment?*" I know now that it is both. Ah! I think it is too wonderful to be a woman; for some day, perhaps yes, perhaps no, I shall have my own children and a husband and friends. And sometimes, when my husband, he is much discouraged if the mill makes no money, though he work so hard, or if my children are perhaps sick and cry—then it is I who smile and say, "*Mes enfants*"—for he, too, will be only a big child—"*mes enfants*, can you see the sunshine? Do you hear the birds? Can you smell these flowers?—So!" *Et alors*—perhaps they smile too. So I sing a pretty song and say to my husband, "*Courage, mon ami!* Have you not your little wife?" And after that we are all happy. . . . And now, that is why I think it is so wonderful to be a woman.'

The clock hiccoughed, and struck eight.

The airman looked at his watch. 'By Jove, it is midnight!' he said. 'Pippa, our day is over'——

Tears sprang to her eyes, and her hands groped for his. 'But no, monsieur,' she cried, 'you must not go. It will be so lonely.'

He leaned over and covered her little hands with his large, tanned ones. 'It will be lonely for me as well,' he said.

'But you will come back, your Majesty? Perhaps—next Easter?'

He gently stroked her hand. 'On my honour,' he said, 'I will come on the Tuesday at dawn. You will be there?'

He released her hands as she slowly rose and crossed once more to the window.

'At daybreak,' she said very quietly, gazing at the steely brilliance of the running water, 'I will watch from the hill. And if you do not

come, though I shall weep a little, I shall say, "He is fighting, and could not leave for little Pippa. Next year he will come."'

'And supposing, little one, he does not come the next year either?'

She leaned her arm against the window-pane and rested her cheek on it. 'I shall watch again at dawn, monsieur'—the words were spoken very slowly,—'and I shall say, "He is not coming. . . . He has gone to be with his brothers who went out into the sunlight, smiling so bravely"'——

Her words ended in a half-sob, and she pressed her face with both hands.

'But every Easter,' she said, her voice very soft and trembling, 'on the Tuesday, I will watch the dawn from the hill, and perhaps, monsieur, you will see me.'

He stood motionless for a moment, slowly reached for her leather coat and helmet, and placed them over his arm. 'Good-bye, Pippa,' he said, and he held out his hands.

Timidly, and with cheeks that went all white, then crimson, she came towards him and raised her face for him to kiss. For a moment he held her in his arms, which quivered oddly. . . . Then, stooping, he gently kissed her—not on the upturned, trembling lips, but on the cheek, just beside her mouth.

Without a word he released her from his arms, flung the door open, and went out into the night.

Motionless, with the burning memory of his hot lips upon her cheek, she stood until the sound of his footsteps was lost in the song of the chute. Slowly her hands dropped to her side and she sank into the chair by the table. The cat looked up from the task of licking his paws, and sprang upon her lap.

'Louis!' she cried, smothering him in an embrace that threatened to snuff out his nine lives prematurely, while tears from her eyes fell glistening on his fur. 'Louis!'

THE END.

THE EPISODE OF RAVENSHEUGH TOLL

By Sir JAMES BALFOUR PAUL, C.V.O., LL.D.

I.

IT was in the gloaming of a fine, calm autumn evening—to be more precise, on Sunday, October 6, 1760—that Peter Kerr, the keeper of Ravensheugh Toll-Bar (about two miles to the east of Musselburgh, just where the road to Haddington branches off from that along the coast), was leaning over his gate, enjoying the Sabbath calm, and at peace with the world in general. On a seat at the door of the toll-house sat his buxom wife, Helen Halliday, resting quietly, as it behoved her to do owing to the interesting condition of health in which she then was. Her sister Anne was staying with her, having been summoned from her Dumfriesshire home to be with Helen at her approaching confinement. Earlier in the day Peter and his sister-in-law had toiled up the hill to Inveresk Kirk to hear the handsome minister, Alexander Carlyle, who had just got his D.D. degree from King's College, Aberdeen, and who was to be married on the Monday of the following week. From within the toll-house proceeded sounds which to the attentive and practised listener proclaimed that some evening meal was in course of preparation by the little maid, Isobel Maclean, whom the couple could well afford to employ, as toll-keeping was a lucrative calling in those days.

The scene was idyllic; there was an air of perfect peace over it all. The clean stubble-fields round about showed that the crops had been gathered in; the trees were just beginning to assume their autumn tints; the rooks were slowly winging their way to roost in the Pinkie woods. Far to the east a faint glow illumined the sky, indicating that the coal fire on the Isle of May had just been lit. Inchkeith was at that period lightless. The only sound heard was the gentle lapping of the wavelets on the adjacent shore.

Suddenly from afar off, up the Haddington road, came the noise of jingling bits and clanking swords, with the tramp of horses' feet, while at intervals snatches of bacchanalian song rent the still air. Peter cocked an ear.

'That'll be thae draigons frae Haddintoun, I'm thinkin',' he called to his wife. 'I houp the maut's no abune the meal the nicht. They're a thirsty lot, thae sodjers, and I'm telt they were neither to haud nor to bind at the "George" in Haddintoun the week afore last when Sandy Purdie, honest man, wudna gie them ony mair drink. A randy lot!' he concluded, as he turned to look up the road, where he could just see the riders coming into sight. On they came, shouting, singing, and occasionally cursing. Before they pass the toll-bar, let us see who they were.

There were not many of them—only five officers altogether. They belonged to the 18th Light Dragoons (the number has been changed since), and very gay they looked in their red coats with white facings, white waistcoats and breeches, and the badge of the regiment—a death's head with the words 'Or Glory' below—on their tall grenadier hats. The regiment had been raised only the previous year, chiefly through the exertions of their present com-

mander, Lieutenant-Colonel Hale, who now rode at the head of the party. A Hertfordshire man himself, he had got his recruits mostly from his native county. He had seen a good deal of soldiering, as a young man had been in the 47th Foot, and was with Sir John Cope in the '45. Later he had distinguished himself in the war in America, and had had the honour of being the bearer to this country of the despatches announcing the victory at Quebec in 1759. His major, John Blaquiere, was the son of a London merchant of French extraction. He was now about thirty-eight years old, with many years still before him. Their companions call for no special remarks. Captain Sam Birch had not been at the feast with his brother-officers—he had picked them up on the road—though this does not imply that he had not been indulging in potations elsewhere. The two youngsters, the noisiest and most obstreperous of the party, were Lieutenant Joseph Hall or Hale, perhaps a younger brother of the colonel, and Cornet George Birch, a brother, maybe, of the captain.

As they approached the toll it was evident that the whole party were decidedly drunk. What really happened we do not know; at the trial, to which reference will in due time be made, the 'panels' pleaded guilty, so that no evidence was led. There is reason, however, to suppose that as the first of the party passed through the gate Peter demanded his toll dues, on the ground, doubtless, that though the officers were in uniform, they were not on duty. This was roughly refused, probably with many oaths and objurgations, which so set Peter's Border blood aflame that he incontinently closed his gate on those who had not yet got through. And then the row began. Peter got a cutting whip laid across his head, was ridden down by a horse which was shoved against him, and lay bleeding on the ground. His faithful spouse now rushed to his rescue with tongue and nails.

'Hoo daur ye, ye drunken limmers, use my gude-man sae? Ye 've felled him near deid, and I 'll hae ye a''——

But her sentence was never finished. Down came the butt-end of a whip upon her shoulders, and again and again were the blows repeated, till the poor woman shouted, 'Murder! Murder!' Her cries reached some cottages inhabited by workmen at a neighbouring pottery. Two of them, with their wives, ran up to see the fray, but prudence forbade their taking an active part in it at first. The toll gate having by this time been opened in some fashion, the roistering party proceeded on their way, and the cottagers hastened to give first aid to the unfortunate toll-keeper and his wife.

II.

But, alas! the battle was not yet ended. After they had gone on about a quarter of a mile, some fresh idea seemed to strike through the muzzy brains of the soldiers, and they stopped, swaying in their saddles.

Quoth the colonel to the major, 'Stap my vitals, Jack! now I come to think on 't, that lousy Scotsman at the bar called me a cheating rascal. I knocked him down for trying to swindle me—the boot 's on the other leg, I think. Let 's go back and baste him again. We cannot in honour retire after such an insult.'

The proposition was received with drunken clamour, and with cries of 'Revenge! Revenge!' the whole party galloped back to the toll-bar.

'Gude's sake!' cried Mrs Mason, one of the neighbours' wives who had come to the assistance of the Kerrs, 'there 's thae mischancy pock-puddin's o' officers rattlin' doun the road again, and they 're a' as fou as pipers. Intae the hoose wi' ye a'.'

She had hardly uttered the words when the enemy was upon them. Charles Turner and William Mason and their spouses made a bolt for safety and reached the toll-house, into which they rushed along with Isobel Maclean, the servant-girl. The bold dragoons halted, and dismounted as best they could. They first rushed at poor Peter, who, though dazed and shaken, had managed to regain his feet. They seized him and dragged him along westwards with many oaths and imprecations. He resisted stoutly, which exasperated them so much that, crying out, 'Knock him down! Damn him for a lousy Scot!' they drew their pistols from their holsters and battered the unfortunate toll-keeper on the head with the stocks of their weapons till he fell to the ground, covered with wounds and blood. Next turning their attention to his wife, without more ado they knocked her down also—an easy victory. They then commenced to pull their victims' bodies about, adding the vilest insult to physical injury.

Anne Halliday, Mrs Kerr's sister, who had till now remained somewhat in the background, seeing her sister so dragged about, and knowing the condition in which she was, rushed to her rescue. But what could one frail woman, however brave, do against such opponents? One blow from a pistol-stock disabled an arm at once, and it hung useless by her side. She could only mingle her cries of pain and terror with those of the other victims.

The dragoons now turned their attention to the toll-house. They knocked in the door, which had been bolted against them, and entered the house, demanding that the men there should be given up to them, though it does not appear that they had taken any part in the fray. Charles and William, honest men, stood by the fire, trying to make themselves as inconspicuous as possible; but their wives were more assertive, and boldly stood up in defence of their good-men.

The issue was at no time in doubt. The

attacking party consisted of five soldiers, reckless and armed; against them were two peaceful country louts, their wives, and the toll-house servant. But a lively 'scrap' ensued. The officers raged and stormed, and dealt indiscriminate blows with the butt-ends of their pistols, one of which was broken in the scuffle. The women tore and scratched to the best of their ability. If their husbands afforded them any aid, it was to no purpose. The floor was soon strewn with prostrate bodies, most of them with severe wounds and streaming with blood. Then Mrs Kerr, supported by her sister, tottered up to the door. The sight of her seemed to inflame the passion of the infuriated officers to a still higher degree. They caught hold of her, turned her round and round till she was ready to drop again, and ultimately pulled almost every stitch of clothing off her. Then, and not till then, it seemed to strike the least drunk of the party that it was time to go.

'Well, my brave bucks, we had better be off. If we stay here much longer, 'fore Gad! we shall have all the county down on us. We have taught these cattle a lesson they will remember, and they will not insult His Majesty's troops with impunity again.'

They then staggered to their horses, clambered on to their saddles as best they could, and were soon in full retreat towards Musselburgh, where their quarters were.

The condition of the victims was pitiable. Peter Kerr had his head laid open; his wife lay unconscious and motionless; Anne Halliday had a fractured arm; the party in the toll-house itself were all suffering more or less from contusions and wounds. They administered what aid they could to the toll-keeper and his wife, and Charles Turner, the least battered of the company, was despatched to Musselburgh for surgical assistance. When it did arrive, some two hours later, the doctor shook his head, expatiated on the gravity of the condition of the two most seriously maltreated of the patients, and finally said that he could not be answerable for the consequences unless additional surgical skill was procured with as little delay as possible.

By this time the news of the attack had spread. A friendly neighbour offered the use of his light cart to drive to Edinburgh for young Professor Monro, who had succeeded his father in the Chair of Anatomy the year before. Whether the professor got to Ravensheugh that night or next morning history relates not, but it was many weeks ere Peter and his wife were able to crawl about again, and to collect the toll dues at the gate.

III.

The next morning dawned on several splitting heads and hazy memories in the quarters of the 18th Light Dragoons in Musselburgh. The culprits were fully aware that something pretty dreadful had happened the night before. A broken pistol, of which only the barrel remained, testified to the occurrence of a serious fight. In the course of the forenoon, by dint of cautious inquiry through their servants, it was ascertained that rumour alleged that Mrs Kerr was dead, and that Peter was irretrievably injured. Visions of a court-martial, if not of an ordinary criminal trial, rose up before the gallant five, and the prospect looked so black that four of them took to flight at once, leaving the colonel alone to bear the consequences as best he could. Where they went or how long they stayed away we know not; but, as we shall see, the fugitives were back again before many weeks elapsed.

It was not long before the authorities took the matter up. On October 13 an advertisement appeared in the *Caledonian Mercury* and the *Edinburgh Courant* calling a meeting of the Road Trustees of Haddington (in whose jurisdiction the toll was) for the 17th of that month 'upon affairs of the greatest consequence to the country.' At the meeting, which was attended by fifteen members, under the presidency of Lord Coalstoun, it was stated that precognitions had already been taken from the assaulted persons, and the meeting, after considering fully the circumstances of the 'attrocious ryot' which had taken place, recommended their preses to communicate with Mr Thomas Miller, the Lord Advocate, desiring his lordship to raise a process against the officers, and to conjoin the names of the trustees in the indictment along with those of the private prosecutors. The meeting also undertook that the expenses of the prosecution should be paid out of the money belonging to the turnpike, and appointed a committee to carry out its decisions.

IV.

The next act in the drama opens in the High Court of Justiciary on January 26, 1761. The five officers are in the dock, guarded by two grizzled warriors of the Town Guard, with Lochaber axes in their hands and enormous cocked hats on their heads. The prisoners, or panels, as they were legally termed, look, it is but justice to say, thoroughly ashamed of themselves, and appear very different from the swaggering roisterers of the memorable October evening. The cry of 'Court!' brings the assembled audience—and it is a large and distinguished one—to its feet, and there enter, preceded by the mace, the judges who are to try the case. There are six of them, headed by the Justice-Clerk, Sir Charles Erskine of Tinwald.

The Justice-Clerk was a very old man, being at this time upwards of eighty years of age, but his intellect was as clear as ever. He was far

removed from the popular conception of an old-time Scottish judge. Grave, courteous, and suave in demeanour, he was what a modern girl would call 'an old dear,' and spoke with a grace and a purity of speech that contrasted with the broad Doric of some of his brethren. But the remainder of the judges did no discredit to the Scottish Bench, being without exception men of family and learning. There were Sir Gilbert Elliot of Minto, who was soon to succeed Erskine as Justice-Clerk; Alexander Fraser of Strichen, who sat on the Bench for nearly half-a-century; William Grant of Prestongrange, a fine specimen of the upright judge; Alexander Boswell of Auchinleck, better known, perhaps, as the father of the biographer of Johnson than for anything else; and Andrew Pringle of Alemoor, whose strong and jovial countenance looks down on us to this day from the walls of the Parliament House.

The judges having taken their seats on the Bench, the trial was begun by the indictment being read over by the Clerk of the Court. It was, as usual in those days, rather a lengthy and involved document, but it had the merit of stating the principal facts of the case, which otherwise we should not have known. It narrated how crimes of assault were severely punishable, especially when committed on persons holding public offices, and at the door of their dwelling-house where they were stationed on duty; it was an additional aggravation when such crimes were committed by officers in the king's army, and not only so, 'but on a Sunday or Lord's Day, set apart by the laws of the land for the exercise of the duties of religion,' and under cloud of night. 'Yet true it is and of verity,' the indictment proceeded, that the prisoners committed this assault under the circumstances which have been already given in detail.

The reading of the document finished, the Lord Justice-Clerk, leaning over his desk and looking rather overwhelmed by his ermine robe, said in mellifluous accents, 'Prisoners at the Bar, you have heard the charge read over to you. What say you—are you guilty or not guilty?' No direct answer was given, but Lieutenant-Colonel Hale, fumbling for a moment in his pocket, drew forth a sheet of paper, which he handed to the Clerk.

The gist of the document was that the prisoners pleaded guilty, one and all, but explained, in mitigation of their proceedings, that they had all been drinking on the night on which the affair occurred; that they thought the toll-keeper had insulted them, and that they were sorry they had resented it in such a way; that they were willing to give any reasonable satisfaction to the gentlemen of the county (meaning the Road Trustees); and that they were ready to make any reparation to the prosecutors (the toll-keeper and his wife) and to the laws of their country that the Court should think proper.

All that was frank enough, and what might have been expected of persons in their position. The only drawback to it, from the point of view of a latter-day chronicler, is that it rendered unnecessary any evidence being led in the case, so we are deprived of that detail which would have come out had witnesses been examined.

In our day, under the circumstances of a plea of guilty having been tendered, nothing more would have required to be done, and sentence would have been immediately pronounced. But at that time it was requisite that a jury should be empanelled and should return a formal verdict in accordance with the plea. Accordingly a jury was called from those who had been summoned to be in attendance for the purpose. It consisted of ten county lairds, an Edinburgh merchant, and a wright, Sir Robert Myreton of Gogar being appointed Chancellor. They took their seats in the box, and, after a brief direction from the presiding judge, returned a verdict of 'Guilty' on the prisoners' own confession. There was a short conference among the judges, and the Justice-Clerk then announced that they would consider what sentence would be pronounced, and that the Court would adjourn for two days.

On Wednesday, January 28, then, the same assemblage convened to hear the result of the deliberations of the Bench. The Justice-Clerk, speaking in clear and measured tones, addressed the prisoners and expatiated on the enormity of the offence, especially when committed by persons in their position, and sentenced them to pay two hundred and six pounds fourteen shillings for the expenses of the trial and the costs of medical attendance on the sufferers, and also to pay the sum of two hundred pounds as damages to Peter Kerr and his wife. In addition to this, each panel was fined five pounds for the assault.

V.

But there was a sequel to the affair which was even more serious to the culprits than their trial, as it promised to affect their professional career. The old Duke of Argyll, who in Sir Robert Walpole's day had been the principal agent of the Government in Scottish affairs, as such ruling Scotland with much ability and prudence, brought the matter of the Ravensheugh riot under the notice of George III. It must have been among the last official acts of Argyll's life, as he died in April 1761. The effect was instantaneous. The young king was much incensed, and commanded the Secretary of War to write to Lord George Beauclerc, then commanding the forces in Scotland, to the effect that he was highly displeased at the conduct of the officers in question, but as they had already satisfied the law of the country by their submission to

the sentence of the Court of Justiciary, he did not think fit to bring them to a second trial by way of court-martial. Beauclerc was, however, directed to reprimand them, in the king's name, in the strongest terms, for their breach of military discipline as well as of civil duties, and to recommend them in future to regain, by a prudent and inoffensive demeanour, the good opinion and confidence of their fellow-citizens as the surest means of restoring themselves to the favour of His Majesty, who was always particularly offended when the public peace was disturbed and the laws insulted by those whom he had honoured with his commission for the protection of both.

No time was lost in carrying out this order. On March 19 those troops of the regiment which were quartered at Musselburgh were paraded, and Lord George Beauclerc and his staff having arrived, the five officers concerned were called to the front and addressed by the Commander-in-Chief very much in the terms of the communication above mentioned. He concluded with a recommendation to both officers and men of the regiment to continue to cultivate the good understanding and harmony with the gentlemen of the country which had happily hitherto subsisted between them and the military.

It was probably with chastened feelings that the officers heard these words of grave rebuke from the Commander-in-Chief, especially as they saw themselves surrounded by a jeering crowd of civilian spectators. When Lord George and his staff wheeled about their horses and returned to Edinburgh without partaking of the hospitality of the regiment, the offenders went back to their quarters in a rather downcast frame of mind.

VI.

But if they flattered themselves that now at last the affair was over and done with, they were considerably mistaken.

There was still another, and a very curious, sequel to the case, which had, as might be expected, created considerable interest and excitement in the county. There appeared shortly after the trial a squib, skit, pasquil, pamphlet, or whatever it may be called, of four quarto pages, setting forth what purported to be a true version of the affair from the officers' point of view. Like many of its tribe in that day, it is of rather ponderous and elephantine humour, but its extreme rarity may be an excuse for describing it somewhat in detail. It is entitled 'The surprising and heroic Atchievement at Ravensheugh Toll, to rescue from the Jaws of Oblivion or vague Tradition, and to hand down to Posterity, unsullied by the noxious Blasts of Envy or Malice, an Atchievement more perilous and more tremendous than the most renowned of the peerless Knight of La Mancha, is the disinterested Motive of ushering into the World the following impartial Narrative.'

It then proceeds to describe how the officers were returning 'to their Cantonment at Musleburgh,' and how the toll-bar had been seized upon that very day by a party of French, 'who, with the Policy and craft characteristic of their nation, disguised themselves in the Habits of Women, all except the Commandant, who assumed the Dress and Character of the Toll Keeper.' The narrative goes on to tell how toll duty had been asked from those in the rear of the party after some had been allowed to pass unchallenged. 'Enraged at this insolent Demand,' it continues, 'and beginning to suspect they were enemies, those brave Gentlemen, disdaining further Parley, attacked the subtle foe with Whip in Hand, applying that Instrument Butt and Lash with such happy success upon the Body of the supposed Toll-gatherer and him who passed for his Wife, that in a Twinkling they laid them bloody at their Feat. On the alarm created by this, more petticoated Frenchmen making their appearance, they judged it prudent to make an orderly retreat and rejoin the main Body. This they effected without loss, the Enemy not daring to pursue them.'

After describing a council of war which was held, the tale goes on: 'The Council unanimously resolved to attack the Enemy in their Intrenchments without loss of time. The two Field officers, after making an excellent Disposition of their Forces, endeavoured to rouse their Troops to martial deeds by all the Powers of Persuasion,—they beseeched, they exhorted, they enjoined, they commanded them to behave like Men, like Soldiers, like Britons. Then this little tho' intrepid Army marched in Battle Array, headed by their C.....l and M...r, which last acted as Brigadier for the time and was particularly zealous for the Service, riding through the Ranks, Sword in Hand, and, lest their martial Spirit should flag before they reached the Enemy, often repeating the Word *Revenge* with great vociferation and calling to them to advance with Briskness. They advanced, they charged the Foe, and after much Carnage and Bloodshed they gained a complete Victory, all their Enemies being grievously wounded and some of them left for dead on the spot. This great Battle was fought and won without a single Man being lost, or one Drop of Blood being spilt on our side: which was very extraordinary, as we were not greatly superior in Numbers to the Enemy.'

The ingenuous author then goes on to observe that 'though these Facts are strongly attested, yet a Report still prevails that those Frenchmen in Petticoats were really women, and that the one disguised in the Toll-Keeper's Garb was in Fact the Toll-gatherer appointed by the Trustees for the Turnpike Roads. The Improbability,

nay the utter Impossibility, of this Account will appear from the following reasons:—First, it is agreed, that none but Cowards, Dastards, and Poltroons would beat Women: now everybody knows how much the Reverse of that is the character of Soldiers, more especially that of officers, and still more that of Field Officers, therefore the Story must be in so far false. Again it is well known that the British Army is kept up for the protection of the Laws and the civil Authority, and for the Defence of our Lives, Liberties and Properties: ergo, no Gentlemen of the Army would be concerned in any the smallest Violation of the public Peace, far less in assaulting civil officers in the Execution of their Duty. These two reasons are sufficient to convince any considerate impartial Person that the common Report concerning this Affair is entirely a Fable.'

Having rubbed all this in with a somewhat heavy hand, the author, after a peroration with which we need not weary the reader, adds a postscript to the following effect: 'An invidious Report has arisen, that the Persons who prepared this Atchievement were not Officers but Women in Officers' Cloaths. The Public may be assured it is entirely groundless. There are always some People ready to detract from the Merit of Soldiers.'

VII.

Such was the episode of Ravensheugh Toll. It is a curious commentary on the manners and customs of the age. But it must be stated that such outrages were very exceptional; the two and three bottle men generally got mellow, rather than uproarious and quarrelsome. Drinking was, in many quarters of both ability and respectability, considered a virtue rather than a vice—an opinion echoed on the Bench itself by one of the most noted judges of the time, who, when trying a man for stabbing a friend after supper, would not listen to the plea that there was no malice in the matter, the prisoner being drunk. 'Good God, my laards,' exclaimed the judge with fervency, 'if he will do this when he is drunk, what will he not do when he is sober?'

No doubt the satirical pamphlet was chuckled over by the community at large, and did not tend to increase the popularity of the regiment at Musselburgh. It is to the credit of the authorities, however, that they took a serious view of the matter; and their action did good. What became of the younger members of the party we do not know, but Colonel Hale died Governor of Limerick in 1806. The major had an excellent career. He was in 1772 appointed principal secretary to the Lord Lieutenant of Ireland, the Earl of Harcourt, whose secretary he had been when ambassador in Paris. Two years later he got the Order of the Bath, and he was created a baronet in 1774. He is described as 'a gourmet with social and convivial tastes,' and Horace Walpole calls him a 'frank, good-humoured, but weak and conceited man.' Other writers have not such a high opinion of him, but he must have been, on the whole, popular, and for his support of the Union he was raised to the Irish peerage in 1800.

THE MONTH: SCIENCE AND ARTS.

A LARGE CINEMA-FILM FACTORY.

BY the time this note appears in print, what is believed to be the largest cinema-film factory in existence will have begun operations in New York. The unique feature of this establishment, in addition to its mere size, is the housing of all departments connected with the production of films under one roof. The building forms a complete city block, with a ground area of four acres. In the basement is a steam plant capable of generating five hundred horse-power for distribution in the form of electric current all over the building. On the first and second floors are housed the largest film-printing plant in the world, with a capacity, according to the *Scientific American*, of three million feet a week; an experimental department in which chemists and photographers can try new apparatus and improvements; and the administration offices, where some sixty-three branches dotted about the globe are controlled. Most of the upper floor is given over to the filming of plays, and so large is the space available that one hundred scenes can be in course of production at one and the same time. The roof is in a single span without supporting columns, so that the floor is unobstructed. Under it, in addition to the stage space, are twenty dark rooms, shops for wood-carvers and carpenters, a restaurant, and dressing-rooms for one thousand artistes, with bathrooms, gymnasium, library, and greenroom. There are twelve small theatres in which plays can be filmed, and thirty-five fireproof and waterproof vaults for the safe storage of prints and negatives. Air-freshening and heating apparatus is included in the equipment, which will supply fresh air of the same temperature all the year round. Naturally the building has been made as fire-resisting as possible, but to allow of the rapid exit of the five thousand persons employed, an inclined roadway leading to the street from each floor is provided, the width being sufficient to eliminate any risk of a jam during an alarm of fire.

ROLLING STEEL RAILWAY WHEELS.

As is well known to railway experts, and is realised to some extent by passengers, carriage and truck wheels form a most important part of the equipment of every train. As enormous numbers are required, it is only natural that efforts should have been made to turn them out by automatic machinery at the lowest possible cost. A great many wheels are now made of forged steel in one piece, and until recently these were produced from blanks stamped from huge slabs of steel by enormous punches and dies. This process has been lately superseded to some extent by colossal rotary shears which cut off the blanks from round bars. The bars, varying in diameter from eleven to twenty inches, according to the size of the wheels required, are rolled from steel ingots, and the blanks are sheared off when the bars are at a bright-yellow heat. The shears take the form of two steel discs, of which the peripheries have a spiral contour. These discs are mounted at such a distance apart that when their larger sides are turned towards each other they come together, while their smaller sides have just space enough between them for the thickest bar to be sheared. The bar is mounted on a roller which revolves it in a clockwise direction, while the disc-shears are driven the opposite way by a powerful electric motor. As the shears revolve they bite into the bar from opposite sides until, in about eight seconds, they meet in the middle and the blank is sheared off. The blanks are afterwards heated and rolled between revolving dies, which squeeze and shape them into wheels of the required diameter. The dies are forced together by a hydraulic plunger with a pressure of three million pounds, while the electric motor which rotates them is capable of developing two thousand horse-power. According to an article by Mr E. F. Cone in the *Scientific American*, the bearings for the dies which have to withstand this enormous pressure are believed to be the largest in the world. Only twenty seconds are occupied in the wheel-forming process, which completely finishes each wheel except for the cutting off of a fin round the periphery and the punching of a hole in the middle, these operations being effected by separate machines. The apparatus for producing wheels by this system is of colossal proportions, the shears being thirty-six feet long, and the shearing-machine having a width of eighteen feet and a height of nearly fourteen feet. The complete equipment is about one hundred and thirteen feet in length, and weighs three hundred and eighty tons.

A PILLION-SADDLE FOR MOTOR-CYCLES.

In spite of an agitation set in motion by the Watch Committee of a well-known district council to have pillion-riding on motor-cycles made illegal, this practice has come to stay, and is being catered for in the devices mentioned in this note, and in other similar appliances. When pillion-riding on motor-cycles first came into vogue the rear passenger was content to maintain a precarious and uncomfortable seat on the luggage-carrier. Recently pillion-saddles have been introduced, one ingenious example being described below. This appliance, known as the 'Tan-Sad' (short for tandem saddle), consists of a rectangular steel frame which can be attached to any motor-cycle luggage-carrier. Above this frame is a similar one, supported on three springs at each end. The actual seat consists of a bowed or dish-shaped piece of thin steel plate fitted across the upper frame and secured to it at each end. The resilience of the plate itself, together with that of the springs, ensures a minimum of vibration. A cushion is, however, also provided, which can be fixed on quickly by means of grips. Without further support the upper frame would cant over too much on the springs, but this is prevented by a U-shaped link pivoted to one end of the lower frame and to the middle of the upper frame. A further refinement of the saddle proper provides for the middle spring at each end being quickly taken out for light or medium weights. A number of accessories for various purposes are made to accompany this saddle, one of the most obviously serviceable being a pair of foot-rests for a rider sitting astride. For one riding sideways provision is made in the shape of a collapsible back-rest and a special form of foot-rest. Other devices include a tool-bag carrier, grips for a petrol-can, and a handle, all of which are attachable in a few seconds.

HUGE VACUUM CLEANER FOR EMPTYING DUST-BINS.

The present method of emptying dust-bins by filling galvanised containers and discharging their contents into dust-carts in the streets and roads of our towns can scarcely be deemed ideal, as the dust, which may contain disease-germs, is blown on to the clothes and into the faces of passers-by. Until recently, however, no attempts have been made to improve this dirty and dangerous system of collecting dust; but a plan is now being tried in New York that bids fair to eliminate the objectionable features. The new method works on the principle of the vacuum cleaner, the contents of the dust-bin being drawn up through a huge suction-nozzle and deposited in the dust-cart. Mounted on a five-ton chassis, the cart takes the form of a large box-van, the vacuum-producing apparatus consisting of a rotary exhaust-fan, driven by the motor which propels the vehicle. The van having been placed as near to the dust-bin as possible, a telescopic suction-pipe with a vacuum nozzle at the end of it is extended to the dust-bin, the exhaust-fan is started, and the refuse is

rapidly drawn up through the pipe and into the van. Some shovelling of the ashes to the lower end of the tube is necessary, but otherwise no manual labour is involved, and, of course, no dust can escape either at the dust-bin or in the street. Moreover, the operation is carried out much more quickly than by the old method.

A SAFE PETROL STORAGE-TANK.

As most of us know, petrol is much lighter than water, and will not mix with it. These features are taken advantage of in the Bywater petrol storage-tank, in which motor-spirit is stored above a layer of water. When empty of petrol, the tank, which is closed at the top, automatically fills up with water, the bottom of it being in communication with a water-cistern having the usual ball-cock on the supply-pipe. This cistern is mounted high up, and in the pipe leading to the bottom of the tank, at a point just above the tank-top, is a valve which can be set either to open a drain-pipe and cut off the connection to the cistern or *vice versâ*. From the top of the tank a stand-pipe rises to a point just above the cistern, where it is fitted with a spigot. The equipment is completed by a branch, provided with a stop-cock, from the stand-pipe, this branch turning up into a wide funnel which serves as a filler for the petrol and is provided with the usual fine gauze strainer. When the tank is to be filled, the valve is set to open the drain and cut off the water, while the stop-cock in the branch is opened. Petrol is then poured into the funnel and displaces the water, which runs out through the drain. Once the tank is filled, the stop-cock is shut off, and the valve is set to close the drain and turn on the water from the cistern. The tank is now ready for supply purposes, petrol being forced out through the stand-pipe and the spigot by the water from the cistern, which keeps running in at the bottom as the spirit is drawn off from the top. Two outstanding advantages accrue from this system, one being that the tank is full of liquid at all times and contains no vapour liable to escape and explode; the other that dirt in the petrol falls to the bottom of the tank, leaving clean petrol to be drawn off from the top. In the ordinary storage-tank the vent-pipe is always a source of danger, while the petrol, which is drawn off from the bottom of the tank, is apt to be mixed with sediment. Finally, the supply is always under pressure without pumping in the Bywater tank, and may be run to a car through metallic hose. It is interesting to note that the petrol-tanks in R34 were filled from huge storage-tanks in the ground, arranged on the Bywater system.

KILLING MICROBES BY PRESSURE.

Although the sterilisation of liquids by high pressures can hardly have a wide field of application in industry or medicine, the investigations in this direction lately carried out at the West Virginia University Experimental Station by Professor B. H. Hite and his associates, Professor N. J. Giddings and Professor Charles E. Weakley, junior, are of considerable interest. Very high pressures, ranging up to forty-five tons to the square inch, are used, and special cylinders of enormous strength are required to withstand the bursting-strains. This will be readily appreciated when it is remembered that the above-mentioned pressure is more than double that in the breech of a fifteen-inch gun just after the charge has been fired. The cylinder used in the experiments consisted of a block of steel with a hole through it measuring slightly over five-eighths of an inch in diameter. The bottom end of the hole was closed by a steel plug, while a steel plunger was inserted at the top. It would have been impossible to make such a plunger tight by any known form of packing if actually in contact with the liquid; the latter was, therefore, sealed up in a thin lead tube. Pressure was applied by an Olsen testing-machine, such as is ordinarily used for testing bars of steel and other metals. It was found that no micro-organisms can withstand a pressure of one hundred thousand pounds to the square inch, while 'most bacteria,' says the *Scientific American*, 'including those responsible for typhoid, tuberculosis, and diphtheria,' are killed in three minutes by a pressure of seventy-five thousand pounds. As might be expected, the time of exposure to the pressure has an important bearing upon the results obtained, longer exposures being required with lower pressures. Temperature also affects the destructive power of high pressures, this being enhanced by increasing the temperature. For sterilising the media employed in the culture of bacteria a pressure of one hundred thousand pounds to the square inch is applied at temperatures of from forty to forty-five degrees centigrade.

TELEPHONING BY SUNLIGHT.

One would scarcely suppose it possible to transmit the vibrations of the human voice by rays of light; yet this has been done experimentally at University College, London, in response to a request by the Admiralty Board of Invention and Research, and Dr A. O. Rankine recently read a paper before the Physical Society of London on the apparatus used and the results obtained. Telephoning by light is based upon the fact that the conductivity of an electric-battery cell of which one plate is selenium varies with the amount of light thrown upon it. No difficulty is experienced in projecting a beam of light over considerable distances; in fact, this has been done extensively in signalling by sunlight with mirrors known as heliographs. It only remains, therefore, to devise some system whereby the intensity of the beam of light to

be projected can be varied in accordance with the varying vibrations of the human voice when a person is speaking. This having been accomplished, the varying intensity of the light thrown upon the selenium cell may be caused to vary the amount of electricity passing to a telephone receiver, as is done when a telephone transmitter is spoken into. Sunlight was generally used in the experiments, but light from an arc lamp was also found to be effective. The light was focused by a lens on to a small concave mirror, but before passing to the lens it was split up into bands by a grid with spaces one-tenth of an inch wide between the bars. When telephoning by light, the operator speaks into a horn terminating in a vibrating diaphragm, but instead of the vibrations being transmitted to a needle, as in a phonograph, they are reproduced in the mirror, which gives off a number of vibrating bands of light. These bands are projected on to another mirror fitted with a grid similar to that already mentioned, whence they are reflected on to the selenium cell at the receiving station. If no one is speaking into the horn of the transmitter, and the mirror, therefore, is still, the bands of light reflected from it exactly fit between the bars of the grid on the second mirror, and the maximum amount of light is transmitted. When a person is speaking into the horn, the mirror is caused to vibrate, and the bands of light play across the spaces between the bars, the amount of light reflected to the receiving station thus varying with the intensity of the vibrations. 'A speaking-range of one and a half miles has been easily covered,' says *The Wireless World*, 'while the articulation at the receiver is remarkably good.'

A NEW HAND VACUUM CLEANER.

Most housewives are familiar with the advantages of the electric vacuum cleaner for absorbing the dust from carpets and other articles of furniture. Unfortunately many houses are still without a supply of electricity, and even in those that have a supply the cost of the apparatus places it beyond the reach of the householder of limited means. In these circumstances several hand vacuum cleaners have been invented, the latest patterns being used like a broom. Of these an interesting example, known as the 'British Queen,' has been recently placed on the market. The body of this appliance consists of two parts, an upper cylindrical portion, and a lower conical portion. The top of the former is fitted with a handle; for the bottom of the latter there are provided two suction-nozzles which may be used as circumstances dictate, one eight inches in length, and the other three inches. The cylindrical part of the body really forms the barrel of an air-pump, the piston of which is connected to the handle. The complete contrivance is about the same length as an ordinary carpet-broom, and it is held at the same angle and passed over the carpet in the same way as a broom, except that the nozzle is not lifted on the return-stroke. When this appliance is being worked the handle is held steadily against the waist of the operator by one hand, while the other pushes the cylindrical part of the body down and up, thus passing the nozzle to and fro over the carpet. The moving of the cylindrical part of the body down and up the handle or piston-rod has the same effect as pulling up the piston, a strong suction being created at the nozzle by the inrush of air. The pump is, of course, fitted with the usual valves, and just below the lower or suction valve at the bottom of the cylinder is a closed fibrous bag which acts as a filter. This cone-shaped filter-bag has inside of it a weak spiral spring. On every suction-stroke the filter-cone partially collapses and compresses the spring, the latter pushing it out again with a jerk at the end of each stroke, thus shaking off the dust from the outside of the bag, and causing it to fall into the lower conical portion of the apparatus. This is a most important improvement, and entirely does away with the choking of the dust-bags, which is apt to impair the efficiency of such appliances unless they are frequently cleaned. As already stated, the dust falls into the metal cone above the nozzle, from which a suction-pipe projects up the cone nearly to the filter. The dust, therefore, settles round this pipe, and in no way interferes with the working of the cleaner. When full the cone can be unscrewed and emptied—a much cleaner and quicker operation than emptying a dust-bag. It should be noted also that the screwed parts are of copper to avoid any tendency to rust. Finally, this vacuum cleaner weighs only three and three-quarter pounds, and is, therefore, held and worked with a minimum of effort.

COMBINED CARPET-SWEEPER AND VACUUM CLEANER.

Those who are accustomed to use vacuum cleaners know that there are sometimes found upon carpets certain forms of 'matter in the wrong place' which no amount of air-suction will take up, and it is necessary to have recourse to the carpet-sweeper. On the other hand, the carpet-sweeper will not remove dust below the surface, which can only be drawn out by a vacuum cleaner. What more natural, therefore, than that the two devices should be combined, so that sweeping and cleaning can be carried out as one operation. This combination may be seen in an appliance known as the 'Sweeper-Vac,' in which are embodied both a vacuum cleaner and a rotary carpet-sweeper. The vacuum portion of the apparatus consists of a rectangular box made of three-ply mahogany, which contains the bellows for creating the suction. At the front is a wide nozzle that can be quickly detached for emptying the dust-bag,

while a rubber-covered, fluted roller for working the bellows is provided at the back. Two pairs of bellows are installed in the box, and are operated by cranks at the ends of the roller-spindle. Suction is, therefore, created whether the cleaner is pushed forwards or pulled backwards. In between the roller and the nozzle is a carpet-sweeper of the usual rotary type. This part of the apparatus, however, is not fixed rigidly to the cleaner-box, but floats in guides, so that it accommodates itself to any unevenness of the floor or the carpet. The complete appliance is fitted with a hinged handle, and is used in the same manner as an ordinary carpet-sweeper. One important feature of the apparatus is that means are provided for quickly and easily detaching the sweeper from the cleaner, when the two devices can be used separately, the handle being made to fit either.

UTILISATION OF OLD TIN CANS.

Although the collection and utilisation of old tin cans has now been carried on for many years past, some interesting facts in connection with this industry which are not generally known were recently referred to in *Salvage*, the official journal of the Salvage Club. It should perhaps be explained that the so-called tin of which tin cans are made consists of thin iron plates coated with tin on each side. Plates made wholly of tin are never used; even if suitable for the purpose, they would be much too expensive. According to the above authority, large works for recovering the solder, tin, and iron from old tin cans were established by a German company at several places in this country long before the war, and one hundred and fifty thousand tons of steel plates derived from this source were exported to Germany annually for many years. No difficulty attaches to the process of recovering the solder, which is melted off in special furnaces. The tin is not so easily removed, and various methods have been tried, including the use of acids, chlorine, and caustic alkalis, the tin being afterwards recovered by an electric process similar in principle to electro-plating. After being cleaned, the iron plates are formed into blocks of about one hundredweight each by hydraulic pressure. At first the tin was removed from the plates before they were shipped from this country, but latterly only the solder was recovered here, the tin being removed in Germany by the chlorine process, yielding tetrachloride of tin, which was used in the manufacture of silk.

GAS RING ECONOMISER.

We regret that in the advertisement of the London Household Supply Co., Ltd., which appeared in the July part of *Chambers's Journal*, the illustration block of the Gas Ring Economiser was shown as including the oven. The picture should have shown the top only, the price of which is twelve shillings and sixpence. The price of the article as illustrated is thirty-five shillings.

To Correspondents who wish fuller information regarding new inventions, publications, &c. mentioned here, addresses will be furnished, when possible, provided a stamped and addressed envelope or post-card be sent to the Editor, 339 High Street, Edinburgh.

'BACKSHEESH, SA'B.'

From the Indian's earliest moments,
When the naked, nut-brown child
Hides behind its mother's garments
From monsters strange and wild,
Ere it lisps its cry of 'Khana,'
Which the tiny fingers grab,
Its baby lips are forming
'Backsheesh, sa'b.'

Midst the busy hum and bustle
Of the never-sleeping town,
Where the jungle-wallahs hustle
With the minions of the Crown,
As I cross Chowringhee, flying
From a lustful taxi-cab,
Comes a voice pursuing, crying,
'Backsheesh, sa'b.'

Midst the lonely mountain passes,
As I gaze with bated breath
At the snowcaps towering heavenward,
Like sentinels of death,
In the still and solemn silence
Comes the lisping baby blab
Of a naked child beside me—
'Backsheesh, sa'b.'

When I lie with temples burning,
Aching limbs, and throbbing brain,
And curse the fates that hold me
To the fever-laden plain,
As I toss and turn unheeding,
Every movement like a stab,
Through the window comes a pleading
'Backsheesh, sa'b.'

When at last my toils are over,
My years of exile run,
And I say farewell for ever
To the land of palm and sun,
As I leave these skies of azure
For others drear and drab,
From the shore will float the echo—
'Backsheesh, sa'b.'

W. J. Harris.

*** TO CONTRIBUTORS.

1st. All communications should be addressed to 'The Editor, *Chambers's Journal*, 339 High Street, Edinburgh.'

2nd. For its return in case of ineligibility, postage-stamps should accompany every manuscript.

3rd. To secure their safe return if ineligible, ALL MANUSCRIPTS, whether accompanied by a letter of advice or otherwise, *should have the writer's Name and Address written upon them* IN FULL.

4th. Poetical contributions should invariably be accompanied by a stamped and directed envelope.

Printed and Published by W. & R. Chambers, Limited, London and Edinburgh.

WITHIN TOUCH.

A STORY OF CROMWELLIAN TIMES.

By G. Appleby Terrill.

CHAPTER I.

AS I lay in Pevensey Marsh that afternoon I was the happiest man in all England, as surely as for the past six months I had been the most wretched. My contentment was so great that when I reflected on it I came to believe that the joy of a coward who finds himself in safety after peril must surpass all other human joys. A shameful conclusion—but my dangers had proved intolerable, and now I was in safety, or within touch thereof.

I had not been always craven. My courage was good enough in the days when I rode with Langdale's Brigade, and for long after it had sufficed for my duty, which was to serve the King as best I might in the land from which they who slew his father had driven him; but at length the Lord Protector, by setting a price on my head, had sapped me.

From an ordinary 'Malignant' under suspicion, I became a fugitive worth a long chase, which was quickly up, and so close on my heels that though I was not actually beaten out of cover to run for it, I yet got little comfort from the friendly roofs or night shadows which hid me, since every sudden hoof-beat or tramp of jack-boots fell on my ears as a certain summons to prison-cell and execution. Soon England itself appeared to me but a vast prison wherein I might lurk for a little space, but out of which I could not escape. I dreaded even to sleep, for fear my life should pay for that sleep; and never did I go to my bed without wishing heartily that I could change it for a resting-place that my fevered mind loved to imagine—a patch of sand on some distant isle, round which a great surf towered so that no man might approach. That island, with its promise of untroubled sleep, was a vision of earthly paradise.

Beyond seas! To be beyond seas! To win across to Holland or to France! The yearning became a frenzy with me; I must ship over the Narrows, or soon I should be shrieking aloud in my terror. But, with my friends spied on and myself spied for, the means were hard to come by, and my limbs had taken to tremble and my lips to quiver when I spoke, so overstrained was I, ere a piece of good fortune brought Dirk Telkirk, the honest Dutchman, into the matter.

And now the horrid times were past. Here was I in the waste of Pevensey Marsh with not a living man in sight, nor like to be. Behind me was the ruined chapel of Northeye, Telkirk's landmark, and before me the shingly beach off which his hoy would heave-to when darkness fell. It might well chance that speck of sail yonder was the hoy herself, even now taking her bearings for her run in. In thirty hours, with this fair breeze, I should be in Rotterdam. But why stretch to thirty hours? In four I should be safe aboard. Now, at this moment, I was safe—well, within touch of safety.

The sweetness of that knowledge! Resting on my elbow in perfect enjoyment, and breathing deep in the newness of my relief, I smiled anon over the sea, and anon down at the crimson and yellow water-lily leaves that were spread on the black water of the dike by my side, and again at the cattle ranging about me. It was these same cattle which presently recalled something I had ceased to think upon in the happiness of my situation—how close I had come to the cruellest fate conceivable, capture when I had reached the very edge of the marsh, after creeping and tiptoeing undetected through fifty miles of England. And I shivered far more vehemently at the recollection of the peril than I had at the instant of it.

The curiosity of a young white bull drew him to the place where I had thrown down Leyburn; other of the creatures followed him, and soon there was a group sniffing shyly at the body. Leyburn had come there thus. He was a rebel man that knew my face well, and as I stepped into the rough road which was between me and the marsh (stepped carelessly, perchance, for the first time in my journey, since my troubles seemed ended), I came right against him, resting under a hedge, with his horse tied to a bush. As soon as he saw me he leapt up, crying my name in triumph, and drawing a pistol from his girdle. But I had a snaphaunce pistol lying loose and cocked in my pocket, and before he could lift his I shot desperately at him, and shot him

 [*All Rights Reserved.*]

dead. Then, lest he be found and a hue raised, I put him athwart his horse and brought them both into my retreat, unsaddling and unbridling the beast and sending him to feed among the cattle, that he should not savour of a rider did any chance to sight him.

Yes, I shivered hard; but quickly my calm returned. Providentially I had got through; the dangers were left behind me—left for good and all. The byways of London, the corners of watched manors, might haunt me in my dreams, but I should never go back to them. Go back! I would not turn inland now for a king's ransom, for a king's daughter.

The happiest man in England once more, I lolled, weary and mud-stained, on the sunny grass. I began to day-dream of Holland, and of the simple things which would give me marvellous pleasure—a care-free saunter through Rotterdam streets, a fair lodging which I might enter and leave in the sight of all men. And presently, the price of the lodging being in my mind, I put my hand to an inner pocket that held my money and my letters to the Dutch bankers. All were secure; but what—— Ah, it was the sealed paper which had fallen from Leyburn. There was a look of State about it, and, though sick indeed of State matters, I had pouched it to read at my leisure. Well, here was leisure. I drew it forth. 'To Deputy Major-General Burfield, at Sir H. Ferrers's House, in Hastings.'

Leyburn's fall from my bullet had broken two of the seals; I snapped the third, opened the letter, and read:

'His Highness the Lord Protector.

'By these Commandeth,

'That whereas you hold in custody Beatrix Mary Ruthven, or Rivven, sentenced to be put to death for High Treason, which sentence you were to see carried out on Thursday next coming, being the 15th day of this instant month, *You do now delay* the execution of the same sentence, and deliver the said Beatrix Mary Ruthven, or Rivven, to Captain Leyburn, by whose hands these reach you, that he may forthwith bring the said Beatrix to us in London to be further questioned; and you shall furnish Captain Leyburn with such escort of troopers as he may ask, for the safeguarding of the prisoner on the roads hither. OLIVER CROMWELL.

'Given under our hand this Tuesday the 13th of April, 1658.

'To Deputy Major-General Burfield.'

I put the letter down and looked at the sea again, but I was little disposed to smile now. So, in killing Leyburn, I had killed a woman also. To-day was the 14th; since the reprieve would not now reach Major-General Burfield, Beatrix Mary Ruthven, or Rivven, whoever she might be—and by the words 'high treason' she had wrought bravely in the King's cause—would die to-morrow. I sat up, regretting bitterly that I had discovered the letter. Here was my peace of mind, my hard-won happiness, gone. Because of this ill thing I must carry overseas with me the knowledge that in saving my own life I had sacrificed a captive woman's.

I locked my hands about one knee and tried to reason calmly. That is, I tried to satisfy my conscience. This letter, now, it was not a pardon; it would give Beatrix Mary Ruthven another week of life, perhaps, but no more. And yet it might give more. The Protector, maybe, would find her guilt less than supposed, or a touch of mercy might come to him, for, harsh villain though he was, his love for his daughters inclined him sometimes, so it was said, to pity a woman in distress.

I held my knee tighter. Grant it, then, that the letter shadowed a pardon, I was still free from reproach. I had waylaid it unwittingly, and could I, a fugitive hid in a marsh, see to its delivery? As that question took form I shrank from it, for the answer was, 'Yes—at a deadly risk.'

'No, no!' I breathed desperately, striving to crush that answer; and the bare thought that I might yield to it gave me a paroxysm of fear. No! nothing short of Cromwell's troopers should drag me back from my marsh, now that I had gained it. Leave it of my own free-will? Go again, with my courage all drained, into the dreadful background? I would not go a yard thither! Hazard my life afresh and more perilously than ever before? Miss the hoy to a certainty?—and I within touch of safety! I were mad if I did so.

I felt that I had won and was preserved, but the struggle had shaken me, and so weak and craven was my condition that now a kind of anger filled my heart, and I fell shamefully to raging against her who had been near to tempting me. Let her die, this Beatrix Mary Ruthven, this siren that might have destroyed me; yea, let her die, and me be quit of her! Then I remembered that she was no siren, but a woman who had known such fears as had broken me, and now knew worse, since her last night was at hand. Was ever man more base than I, who stormed on her instead of pitying her? She had no thought to lure me. She was not aware of my existence or my strait. What if she were? What would she urge me? Perchance, 'Give not your life for me.'

These imagined words unrested me. I frowned, biting my lip hard. I would not go for *them!* But presently worse followed, sprung, I suppose, from some music in her names. A scrap of faulty verse, which I had no consciousness of forming, was dancing suddenly in my brain, and it danced there without ceasing:

'If Beatrix Mary Rivven
Unto her death be given,
You shall not be forgiven.'

It was torture, and at last I groaned and clapped my hands to my face. The battle was begun again. For a space I bowed forward and back like a sore-smitten man, moaning, arguing, praying, now for my life, now for the will to hazard it.

This woman was the weaker, infinitely the more pathetic figure, of us twain. I could not take her life! I could not carry such a memory with me to the grave! To hesitate thus to give my life for hers were false to all honour. Yet what mattered dishonour? It could be lived down. I wanted my life, calm days and quiet musings in Holland. In three hours Telkirk would come for me. Three hours! If I were to have a chance of saving her and catching the hoy withal, I must act at once—decide at once. Decide? Madness! My legs were trembling. They would refuse to carry me if I turned from the marsh. Leyburn's horse? I cursed it. I should swoon in the saddle. But I must decide!

And forthwith I decided, and, though my heart beat as if it would wreck itself, I got to my feet at once, picked up the saddle and the bridle, and walked to the horse, a good Spanish chestnut, which had wandered near to me.

Whilst I was fixing the gear on him I determined, and quickly this time, which of two plans I should follow. On the face of it, the simplest and least perilous course would be to ride towards Hastings until I met with some person of trustworthy appearance, whom I should beg to take the letter to Major-General Burfield. But against this was the fact that, to ensure its speedy performance, I must tell him of its life-and-death urgency; whereupon his suspicions would be aroused at my entrusting it to him, and, as like as not, ere my back were well turned, he would show it to some passing soldiery, who, scenting something strange, would come scouring after me.

Also, I had now found more manhood in me than I thought to, and felt a distaste for leaving Beatrix Mary Ruthven a prisoner still confronted with death, when, with a little more risk, I might do the business very handsomely and bring her aboard the hoy.

I settled the item. I would play Captain Leyburn, and trust he was not known in these parts, as I believed it probable.

Time was what I lacked. They might keep me an hour or two hours in Hastings. As fast as I was able, I took off from Leyburn and put upon myself his jack-boots, belt and sword, and spider headpiece, thus assuming a military guise; and I did not neglect to find his pass and transfer it to my own pocket. But in the act of mounting I paused and came down again. I had forgotten the broken seals of the letter. With my penknife I cut away the edges (luckily clear of writing) on which they were. Then I refolded the letter and tied it with a piece of ribbon taken from one of those I carried to the Dutch bankers, so that it might well pass as having been given to me unsealed. In ten minutes I was at a canter along the road whereon I had met Leyburn.

It must have been the weariness of Leyburn's own limbs which caused him to rest, for the horse was quite fresh, evidently from a post-house not many miles back, and though I eased him at the high ground behind the hamlet of Bexile, and once when in doubt of my way, he took me very fast into Hastings. The vigorous ride, with all concealment cast aside, and the knowledge of having some other aim than my own preservation, did me good. I began to play Captain Leyburn with spirit.

'Sir H. Ferrers's house?' I cried two or three times when I was in the chief street, and clattering up to a door which was shown me, I gave a loud, careless order, even before I was dismounted, to a soldier, who had come from the adjoining stable-yard, to hold the chestnut.

'Put me a pillion saddle on this horse, corporal.'

The hall door was open, and two troopers and a man-servant were eyeing me from the threshold.

'Take my name to Major-General Burfield,' I said to the footman as I walked up the steps; 'Captain Leyburn, from his Highness.'

He waited to bid me into the hall and to be seated, and went. So the major-general was at home, I thought; fortune was kind to me. But I was to be disappointed.

A young man with a quill pen in his hand descended the stairs and gave me a slight bow. 'Major-General Burfield is out at present, sir. I am his secretary. Can I be of service to you?'

'I fear not, sir,' I said, standing up, 'unless you can deliver to me a prisoner.'

'I fear not, sir,' he answered, smiling.

'I would you were able,' I said in a friendly tone of jest, 'for I must instantly take the road again. I am from the Lord Protector, who enjoined me to make the greatest speed. How soon will the major-general return?'

'He should not be away above an hour.'

'An hour!' I exclaimed blankly. I put my hand on the young man's sleeve. 'You would oblige me much, sir, if you could tell me where to find him, or send him word of my being here.' Then, fearing that my manner had been too anxious, I added with a rueful laugh, 'As it is, I shall be forced to ride through most of the night to repair lost time.'

'Ill luck that,' he answered, 'both for you and the prisoner. Is it the maid, by chance?'

I nodded.

His face lighted up. 'I like thee for that news,' he said heartily. 'I confess to have thought overmuch of to-morrow—not that I should have been *there*. Yes, I will set them searching for the major-general, and come you to the library and drink a cup of wine, for I must go back to my writing.'

I had fasted all day, and so enjoyed the sack and fruit-cake he set before me, but the victual did nothing to allay my impatience, and presently I was fidgeting in a way that must sorely have distracted the young man from his penmanship. I moved about and looked at the pictures on the walls, returning several times to one which, strangely enough, was a scene in Holland—a church and a quiet market-place. How thoroughly I wished I were one of the figures therein, going peacefully to worship!

This delay at the outset was affecting my new-found courage, which threatened to desert me. Again and again I foresaw two incidents—detection, or success, but the hoy sailing without me. A full hour had gone by, and the secretary was on the point of sending out fresh messengers, when the library door was opened, and there entered a short, thin man, with a pale, disagreeable face and a white moustache, wearing a buff military coat and broad hat.

'The major-general,' whispered the secretary swiftly to me, and he got up, saying, 'Captain Leyburn, sir, ridden post from his Highness.'

The major-general nodded gruffly, sat down and leaned back in the secretary's chair, pushed his hat from his brow, and held out his hand. I gave him the letter.

He twitched off the ribbon in a manner which betokened no taste for my handiwork. 'Sealing-wax scarce at Westminster?' he asked, spreading open the paper and not looking up.

'It was writ and given me in haste, sir,' I answered steadily, seizing the chance to lay stress on my hurry.

He read. 'Very well,' he said at the end, but plainly disapproving. Then he raised his eyes to me testily. 'But where is the haste? I have been twice sought out and told that you were here and not a moment to spare.'

'Does not his Highness explain it in the letter, sir?' I asked, as if surprised. 'He bade me most straitly use the greatest speed, and I was delayed at the last post.'

He shook his head. 'What troopers do you want?'

I was prepared for this question. 'By your leave, sir,' I answered, 'I want none. I requisitioned two at Lewes, who are waiting for me beyond the town here.'

He picked up a pen and commenced to write. 'So you want the prisoner forthwith? But it will be dark soon. Do you ride through the night?'

'Through a great part of it, sir.'

He folded a paper, sealed it with emphasis, and gave it to the secretary. Then he waved me to sit down, for I had stood since his entrance.

'I have ordered her to be fetched from the jail,' he said as the secretary left us, and then he began to converse with a certain grumpy courtesy.

I would fain have asked how long the prisoner would be, but I deemed it wiser to curb my desire, and, in fact, to make no mention of her, and we talked of the common news of the day, and I was hard beset to conceal that I knew less of it than he.

The light was fading, and he had put a taper to the candles on the table, and I was preparing to give up all hope of the hoy, when a medley of footsteps told us that those we expected were come.

A CHAPTER FROM A JOURNALIST'S DIARY.

By Sir Henry Lucy.

THE PASSING OF GLADSTONE.

May 20, 1898.

In Mr Gladstone's long and noble life there has been nothing finer than his passing away. It might all have been so different—a great career marred by months or years of fretful senility. To speak of infinitely lesser men, we know how much better it had been for the fame of Lord Brougham and Earl Russell if they had died some years earlier than the stroke befell. Up to the last, like some noble oak that goes down in the night before its prime is past, Gladstone was at his best, only in physical strength falling short of the majesty of his normal height. The patience with which he bore extreme suffering was fresh testimony to the nobility of his character. To him it was a new experience to suffer pain, to have a habitual condition of bounding health hampered by physical infirmity. That made the visitation harder to bear, more heroic the patience with which it was suffered. In his paroxysms of pain his prevailing thought was of those watching by his bedside, above all for the faithful companion of his toilsome, often stormy, career.

'Don't say anything to Mrs Gladstone,' was his whispered entreaty to the doctors and the nurses when he was smitten with exceeding anguish.

Save for the local affection that undermined his strength, there was, apparently, no reason why he should not have lived on for another ten years. His marvellous powers of recuperation were proved in this last struggle with death. More than once during the week it has seemed that the end was within touch of the enfeebled hands lying on the coverlet, if indeed the end had not come. After a while he rallied.

Next to the deathbed scene within the room at Hawarden Castle, there is nothing more beautifully pathetic than the multitude outside watching and waiting for news. The throng included the peoples of the civilised world. It is no exaggeration to say that within the last century no man has done more for his fellowmen than has the statesman now lying in everlasting rest. It is fitting that mankind should stand with hushed voice and tear-dimmed eyes round his deathbed. Through a long period of his public life Gladstone was the object of the bitterest personal animosity. At home he has had his windows broken. At his club threat was made to throw him out of the window. In the House of Commons he has stood with silent dignity, watching a mob of English gentlemen howling at him behind the closed glass doors of the division lobby. When he lay dying all animus passed away.

FRED BURNABY.

August 3.

Major Stuart Wortley, who is going out to Khartum with Kitchener, tells me something I was proud to hear of the ever-lamented friend whose acquaintance, prelude to a long and affectionate intimacy, I, oddly enough, made in a balloon. The major says that but for Fred Burnaby the column attacked at Abu Klea would have been overwhelmed and destroyed, even as was the ill-fated army of Hicks Pasha. Burnaby rode with the column without being in any position of command. He was on his way to join Headquarters. Soon after the start his military instinct and keen eye discerned fatal weakness in the formation of the troop. By his advice this was altered, with the consequence that when the attack of the Mahdi's horde became imminent, the British and Egyptian troops fell into formation of the square, and were able, after a prolonged and desperate struggle, to beat off their assailants.

It was out of an opening in the corner of the square that Burnaby rode to the help of the wounded private, 'sitting his horse as quietly,' Stuart Wortley says, 'as if he were riding on parade.'

AMERICAN AMBASSADORS.

September 8.

Colonel John Hay has just had time to make himself at home in London when comes the American President with the, for us, abhorred summons of withdrawal to nominally a higher, actually a less well-paid, post. It is noteworthy, when we come to recall recent appointments, that the United States should have such an apparently illimitable and only slightly varied collection of delightful personages to send to represent her at the Court of St James's. We all remember Lowell, whom it seemed impossible to replace. Yet after him came Mr Phelps, a man of quite distinct character and associations, not one whit less successful in the personal aspects of his mission. Perhaps it may be admitted that Mr Lincoln, who succeeded, did not do anything to add to his father's renown as a companion and a conversationalist. Mr Bayard was attractive in many ways, including his personal looks.

Handicapped by deafness, Bayard sometimes succeeded in carrying the infirmity off only too well. There is a story related, perhaps invented, about him at a country-house which is at least characteristic of his manner. At the dinner-table some one told a tale that vastly amused the company, none more, to all appearances, than the American Minister, whose handsome face beamed with laughter.

'Capital!' he said. 'That reminds me of a story perhaps not so good, certainly'—this with a gracious bend of his head to the raconteur—'not so well told, but perhaps you will allow me to repeat it.'

Forthwith he started, and, to the consternation of the company, he began to recite the very story they had just applauded. Seated at the other end of the table, he had not caught the drift of the first man's narrative. Happily it was a polite, well-bred audience, and it was not till his Excellency had finished that the laughter that choked them was allowed to burst forth. Bayard probably thought he had never before told that particular story to so appreciative an audience.

Colonel Hay has the national gift for telling a good story, and indulges in the accomplishment without the drawback that unhappily attends the efforts of his predecessor. He is also equal to the fame of his nationality as an after-dinner speaker. As a conversationalist in the ordinary give and take of a bright dinner-party he is delightful. For his years—well, he is only sixty—he is a marvellously young-looking man, alert, with the bloom of thirty on his cheeks and ready laughter in his eyes.

'I am more sorry to leave England than you can imagine,' he wrote to me on the eve of his departure. 'There were so many interesting things to do, so many charming people I wanted to see more of. I would like to leave an astral body here, cavorting about in agreeable irresponsibility, while the earthly frame went definitely home to work. I have not seen enough of you. But for what I have seen I am thankful, and should be sorry to think we should not meet again. . . I am always faithfully yours, JOHN HAY.'

SPOONERISMS.

September 30.

Young Cambridge is just now hugely delighted with the latest story about a well-known don. This gentleman has a curious habit of, by a slip of the tongue, involuntarily making up a sort of portmanteau or kaleidoscopic word. It

is accomplished by means of mixing up syllables of words succeeding each other in a sentence. His best-known, and perhaps most perfect, success happened in church. Entering one Sunday morning a little late, he found a stranger in his pew.

'I beg your pardon, sir,' he said, breathlessly leaning over the interloper, 'but you are occupewing my pie.'

'Occupying my pew' was, of course, what in a calmer moment he would have said.

His latest is almost, if not quite, as good. There was talk in the company where he found himself as to what tradesmen were most fully employed by the college.

'Do you still get your groceries from Bloxland?' one of the men asked the don.

'No,' he said artlessly. 'I did for many years, but now I steal at the doors.'

It was only after a moment of shocked silence the company realised that what the reverend gentleman meant was that he dealt at the stores.

'You have,' he recently said to an idle youth, 'tasted two whole worms, and you had better go down.' 'Wasted two whole terms' was what he had at heart to say. Preaching one Sunday, he made a touching allusion to 'the Shoving Leopard.' Through what remained of the sermon the college was intent on wondering what this might mean. It is easy enough when you have the cue. "Loving Shepherd" was the phrase written in the manuscript of the sermon. Two other examples of this rare talent are drawn from the social circle. Seated at luncheon one day, and invited to make his choice from the pastry displayed, the don, after looking round, said, 'Thank you; I will take some of that stink puff.' Fortunately he was pointing to coloured blanc-mange, which he meant to describe as 'pink stuff.'

A worse thing happened in a drawing-room full of ladies. The don, standing full of content by the early winter fire, said, spreading out his hands with gesture of benediction, 'There is something exceedingly pleasant in the bloody rays of a cheerful fire.' This certainly sounded shocking. It being Cambridge company, the ladies rapidly translated the startling phrase into 'ruddy blaze.'

There is too much reason to fear that Satan finds idle hands at Cambridge work to do in inventing some of these ingenious transformations. They nevertheless have a foundation in a quaint, ingrained habit.

KITCHENER.

October 15.

Lord Edward Cecil, just home from the Nile, is full of praises of the Sirdar. He served on his staff as aide-de-camp, rode in his suite when he entered Omdurman, and accompanied him on the expedition to Fashoda. He describes the personal labour and endurance of Kitchener through the campaign as something marvellous. Kitchener overlooked everything, seemed to be ubiquitous, and was simply tireless. On the night before the battle of Omdurman he got only three hours' sleep, taking it wrapped in his cloak on the desert sand, having previously dined and supped on bread and water. He was the first man to enter Omdurman, riding forward regardless of the sniping going on from every corner and many huts. Remonstrated with by his staff for needlessly incurring this danger, he answered, 'Well, well! they are very bad shots.' What the Sirdar is prouder of even than his complete victory is the fact that he has achieved it at an expenditure less by three hundred thousand pounds than the War Office estimate. That is the result of careful planning, and of patient personal supervision of details. The campaign will cost a trifle over a million sterling, which the Sirdar's staff complacently compare with the eight millions spent on Lord Wolseley's earlier endeavour.

Lord Edward's description of the discovery of Major Marchand at Fashoda is particularly interesting. He confirms all that has been said of the hopeless condition of the French force. Marchand was encamped on a swampy bank, lacking food and clothes. He seems to have made a most favourable impression upon the Sirdar and his staff. Lord Edward describes him as a man of charming manners, with a cool intrepidity that made light of his perilous position.

The only difficulty met with was the action of one of Marchand's officers, who, in spite of long privation, had succeeded in preserving constitutional plumpness. 'The fat Frenchman,' as Lord Edward describes him, was so overcome with joy at the sight of the deliverers that, in the effusion of gratitude, he insisted upon embracing the Sirdar, with intent to kiss him on both cheeks in French fashion. Beaten off in that quarter, he turned upon Lord Edward, who, with the greatest difficulty, evaded his attentions. It is evident from the testimony of this eye-witness that if the Sirdar had delayed by forty-eight hours his appearance on the scene there would have been no Fashoda question. The dervishes, slowly closing in on the hapless and helpless little force under the command of Major Marchand, would have crushed them out of existence.

THE DUCHESS OF TECK.

October 23.

The widespread lamentation when news of the sudden death of the Duchess of Teck was flashed upon London testifies far more than usual in analogous circumstances to the goodness of the woman rather than to the fallen estate of the royal princess. Few members of the Royal Family were more popular than the smiling, buxom, motherly-looking lady whose unheroic

life had been rounded off with a touch of something like tragedy. The duchess had her part in the royal procession on the last Jubilee Day. But her great occasion was on the marriage of her daughter to the heir to the Crown of England. On the former occasion she sat amongst ordinary princes and princesses in the cortège. On the wedding-day she rode in a glass coach facing the Queen, and with a heartiness that amused Her Majesty only less than it delighted the crowd, she took to herself and beamingly acknowledged the thunderous acclaim that greeted and followed the royal coach. It was a bright summer day of the kind not too often seen in London. Nowhere in the wedding procession, or among the multitude looking on, did the sun find brighter reflection than on the irradiated countenance of the happy mother of the bride.

Whilst the duchess was on terms of camaraderie with the man and the woman in the street, she was most loved by those who lived nearest to her. During her life the pathway to and from White Lodge, Richmond, was not always of primrose dalliance. For a while, as is well known, the household found it convenient to retire to more economical quarters on the Continent till a temporary storm of vulgar impecuniosity blew over. Of late years time and circumstance mellowed under the sun of York. The duchess lived happily in her park-girt home, chiefly occupying herself in doing good. I have chanced to see her in many circumstances amid public and private surroundings. Never was she more estimable or more admirable than when bustling round among the bales of miscellaneous tributes gathered in by her on behalf of the London Needlework Guild. This is an institution wisely designed and admirably administered for the distribution of articles of clothing among the class in straitened circumstances who prefer to suffer the pangs of poverty rather than to clamour for charity. The Duchess of Teck was the life and soul of the Guild, giving up to it through the year as much personal attention and actual work as, devoted to wage-earning, would have comfortably maintained her.

Members and associates of the Guild undertook either to prepare annually or to purchase for presentation two articles of useful clothing, which, being forwarded to a centre of administration, were carefully distributed among deserving cases personally known to agents of the Guild. I remember the amused astonishment with which, before leaving White Lodge on my first visit, I found myself enrolled as an associate of the Needlework Guild, pledged to send a yearly tribute. I am ashamed to say that this year the engagement slipped my memory. Nothing, in whatever minute detail, escaped the notice of the president of the Guild. Last week I received the following notification: 'Will you kindly send your work and that of your associates to Her Royal Highness, Princess Mary, Duchess of Teck, White Lodge, Richmond Park, Surrey, not later than 27th October?'

Before day broke on the morning of the 27th, Princess Mary, Duchess of Teck, had gone to her long home.

GLADSTONE'S WILL.

November 19.

According to the terms of his will, the personal presents received by Mr Gladstone were distributed among his family. With the possible exception of Prince Bismarck, there was no man upon whom the public showered more tokens of personal affection and admiration. He rarely visited any centre of manufacture without the workpeople combining to give him some specimen of their craft. Not only from home quarters, but from the remotest parts of the world, came tokens of popular esteem. Naturally, his passion for woodcutting brought him the tribute of innumerable axes. The first thing that struck a visitor to Hawarden whilst Gladstone was still in residence was the axes that stood in the hall. On the occasion of the golden wedding miniature axes wrought in gold largely figured. Of earlier date is a pencil-case in silver, which used to be on Gladstone's desk, reserved for his labours in literature. Shaped as an axe, it served as a pencil-case, on the blade being engraved the legend, 'For axeing questions.'

On his golden wedding Edward, Prince of Wales, always a faithful friend whether in sunshine or in storm, sent him a double inkstand in solid gold. The Shah was another contributor to this personal treasure-trove. Other things one remembers seeing lying about the tables were an album handsomely bound, containing the names of more or less obscure Italian students, grateful for Gladstone's labours on behalf of Italy, and a large silver cylinder containing tapestry, the gift of natives of India, to whom his name and his personality were something sacred.

FORECAST OF KAISER WILLIAM'S DESTINY.

November 21.

In spite of his vanity and self-confidence, which habitually reach the pitch of patronising the Deity, the German Emperor is said to be a slave to superstitious fears. There is one tradition about the House of Hohenzollern which particularly disturbs the Imperial mind. It is that three emperors of the House would reign in a single year; that the third would have six sons, and would encompass not only the destruction of his dynasty, but the ruin of the Empire. What on the face of it is the most audacious prediction—three emperors in succession within the limits of twelve months—has already been fulfilled. The present emperor, William II., came to the throne in the year both his grandfather and his father died. The second part of the prediction has also come true

—in 1890 the Kaiser's sixth son was born. For the rest, apart from prophecy, the Kaiser is just the man to bring about the fulfilment of the third prediction.* If his meddlesomeness abroad does not result in foreign war, his tyranny at home is well calculated to arm the Socialism against which he wars. Anyhow, the dark saying is extremely curious, especially since it has just claims to remote antiquity.

TWO PARLIAMENTARY BUSTS.

November 30.

A movement, set on foot in parliamentary circles, to raise funds in order to place a bust of Gladstone in his old college at Eton, threatens to prove a fiasco. The proposal was that members of either House who had been at Eton should subscribe a guinea in order to commission a sculptor to do the bust. As not more than one hundred and fifty pounds was required for this purpose, and as there are in the two Houses of Parliament between four and five hundred old Etonians, it seems, to begin with, that the only trouble the committee would have would be an embarrassment of riches. The duty of secretary and treasurer was gracefully undertaken by Mr Ian Malcolm, a young Conservative member. After more than two months' hard labour, Mr Malcolm tells me he has not succeeded in raising more than eighty pounds, little more than one-half the necessary funds.

The hopelessness of the situation as viewed by him is indicated by the fact that he has retired from pursuit of the coy guineas, and the running has now been taken up by some of the masters at Eton. It was a happy thought to perpetuate in the schoolhouse the memory of Eton's most famous and most brilliant boy. It is not easy to account for the failure, which can scarcely be due to any lingering feeling of political animosity. Possibly it is all due to agricultural depression and the decay of rent.

A parallel movement to do honour to another famous Parliament man has been more successful. Contemporaneously with the floating of the subscription to place a bust of Mr Gladstone in Eton College, there was started a scheme for adding a bust of Lord Randolph Churchill to the possessions of the House of Commons. The area of subscription was limited to men who, whether in the House of Commons to-day or not, had at some time the privilege of sitting in the same Parliament with him. The invitation was responded to with encouraging spirit and unanimity. Amongst the subscribers are Mr Asquith, Mr Arthur Balfour, Sir William Harcourt, Sir Michael Hicks-Beach, Sir Henry Drummond Wolff, and Sir John Gorst. Even Lord Cross, whom Lord Randolph in his impatient way couldn't abear, has come forward with his forgiving guinea. Mr Storey, who has just finished a life-size statue of Lord Randolph designed for Blenheim, will do the bust, for which a position has been assigned in the passage leading out of the central lobby. Lord Randolph will have for close companion a bust of W. H. Smith, upon whom he, of his infinite scorn, once conferred an alleged partnership in the drapery firm of Marshall & Snelgrove.

THE CITY OF DREADFUL SILENCE.

By FREDERICK TILSLEY, Author of *Cheerio.*

I.

'A THIN, damp mist is descending upon the gaunt ruin that is Ypres. Apart from an occasional military policeman, steel helmeted like ourselves, the place seems deserted, for those whose fate it is to garrison the Dead City live in strange, hidden places. A light flickering amongst the indescribable wreckage, a dark figure appearing for a moment in some ruined doorway and then disappearing like a shadow, mingling so quickly and completely with a multitude of other shadows that one is inclined to doubt one's eyesight, are the only clues to their whereabouts. The crash and boom of a British battery, speaking at regular intervals of fifteen minutes somewhere in front and to the right of the town, are the only sounds that break the silence. One naturally associates Ypres with guns and shells and noise, but on a quiet day the thing that strikes the new-comer most is the silence, for it is the dreadful, *waiting* silence of suspense. I suppose there is nothing so impressive and oppressive as the silence of a dead city. There is so much to die in a city, and Ypres is death's monument.' . . .

From which it will be seen that Private Newsome had literary ambitions.

With a sigh of satisfaction he permitted his box-respirator, which he had been using as a rest for his notebook, to slip back to his side. The book he closed with a certain affection. It contained many notes similar to the above, first impressions of Arras, Béthune, Péronne, Bapaume, all jotted down on the spot in neat shorthand. Private Newsome was tall and thin; he had the eyes of a dreamer and the mouth of a humorist.

'The City of Dreadful Silence,' he murmured, glancing about him. 'Ypres will always be that to me: The City of Dreadful Silence.' With the notebook still in his hand, he waved to his companion, who had gone on a little in front, and was now standing before the wrecked Water Tower, eyeing it contemplatively. Bennett was a short, thick-set youth, with keen, gray eyes, a short, thick nose, and a good chin. He turned

* He has done so.

his head slowly as Newsome came hurrying through the treacly mud.

'What a mess! What a devil of a mess!' he said with intense disgust.

Private Newsome gesticulated with his notebook.

'Most wonderful place in the world,' he declared enthusiastically. 'And to think I might never have seen it! The very thought puts the wind up me. I sha'n't forget this day, if I live to be a hundred.'

The other smiled. It was a smile made up of equal parts of good-natured contempt and affection. The two had very little in common, a fact which probably accounted for the firmness of their friendship—they had nothing much to quarrel about.

'You seem to like this mess,' said Bennett grimly. 'I admit that it is tremendously impressive, an artist's dream; but where you see the birthplace of a hundred ballads I see the burial-ground of a city's prosperity. Where you see picturesque ruin I see splendid buildings wantonly and brutally destroyed. You are keenly appreciative of this ghastly, waiting silence. I long for all the pleasant and unpleasant sounds of a busy town. You see only Ypres-as-it-is. I can't help thinking of Ypres-as-it-was.'

'Um-m, yes,' murmured Newsome, who was using his pencil again. He had heard his friend's remarks, but had not caught their meaning. 'I dare say you are right,' he added warmly.

'I have noticed another thing about Ypres. No man seems able to speak in his normal voice. That, like his facial expression, is subdued. There is something more than a mere lowering of the voice. When I first noticed the change I spoke a trifle louder. This made my friend jump, but my tone did not sound normal to me. I think Bennett notices this peculiarity without being able to place it.' . . .

'I'd give something to hear a barrel-organ now,' said Bennett suddenly, and there was deep longing in his voice.

Newsome uttered a horror-stricken gasp, and nearly dropped his notebook.

'Yes, a barrel-organ,' repeated Bennett firmly; 'played by a greasy but friendly foreigner, with ear-rings, and a castle or two in his own country.'

'A clown at a funeral.'

'Monkey and all,' snapped Bennett, almost angrily. 'This place gets on my nerves. From the point of view of poetry and pictures and all that sort of thing, Ypres is the artistic goods; but I'm practical myself, and when I think of the past of this rubbish-heap I feel more fed up with the war than ever.'

'Ypres's past is trivial when compared with the tremendous possibilities of its future. If this "rubbish-heap," as you call it, is used with care and imagination in the years to come, it may be the means of preventing the world from ever again being plunged to the neck in blood. Ypres is the best argument against "blood and iron" culture this side Hades. They ought to preserve the place exactly as it is. Governments on the verge of war ought to be forced to make the actual declaration here. There would be no war then. All the Von Thingummys in Germany wouldn't make war seem glorious with Ypres as a background to their pompous drivelling.'

'If, instead of rebuilding'——

'To rebuild Ypres would be a crime,' interrupted Newsome.

'I expected you to say that,' said the other, 'and I'm not sure that I don't agree with you. But if you are going to use the place as an example, why leave it to future generations? Why not start immediately and dump a few of the more objectionable types of pacifists here? Take, for instance, the microbe who insists that we started the war, and dexterously placed the blame on the shoulders of the poor Germans.'

Newsome grinned thoughtfully.

'And suppose those elderly warriors who insist with such persistent cheerfulness that there must be wars after this one—"they are so good for a country, you know"—were forced to leave their comfortable offices and edit their gummy rags from Ypres, I wonder if they would wield their deadly fountain-pens with such a fine vigour.'

II.

As they passed the prison a silence fell between the two friends. Newsome broke it as a gun-team trotted past with a subdued clatter.

'Those who ride through the streets of Ypres ride on the very edge of Eternity, with Death for saddle-mate,' he said, with a consciously graceful wave of the hand. 'Did you notice the look on their faces?'

'Yes; even the horses seem to have caught it,' answered Bennett quietly.

There was a deafening crash as the British battery spoke again. Bennett shuddered involuntarily.

'What a beastly hole!' he said. 'Let's go and see the Cloth Hall, as arranged, and then get out of it. I don't think I'm a more than average coward, and I've been in some pretty rough places, but I can't get used to Ypres, somehow. One seems to be waiting for something tremendous and evil to happen, and expecting it every next moment. A shell or two would be almost a relief.'

'We'll come again, if possible, and try to get here earlier next time.'

'We shall probably be here on business next time, worse luck.'

'I hope so,' said Newsome. 'We might as well fight here as anywhere else, and I'd like to examine the place at my leisure.'

'I'd rather go to the pictures,' answered Bennett, with a short laugh.

'Pictures!' exclaimed Newsome contemptuously. 'You make me tired. Here in the

centre of this wonderful city you have the nerve to talk about pictures! With the real thing staring you in the face, you long to be seated in front of a blotchy screen, watching a long-haired second lieutenant, dressed all wrong, leading a gang of bandy-legged supers to victory, and marrying the colonel's gum-chewing daughter as a reward! Pah!'

'Right first time,' answered Bennett calmly. 'That's just what I do want.'

Newsome mastered his indignation with an effort.

'It's quite evident,' he said quietly, 'that Ypres affects people in different ways. Look at me, for instance. I realise now, for the first time, what a very small part I am playing in this great struggle. I thought I realised it before, but I didn't. Whether I lived through the war, or whether I was killed, seemed to me at one time to be a matter of some importance; but it isn't. What right have I to worry about my little life, or boast about my sacrifice, when whole cities are being wiped out? I now know exactly, for the first time, my own importance in the scheme of things. The knowledge isn't very flattering, but it helps one to face the possibilities of a violent death with an easier mind. Yes, Ypres has helped me to a certain peace of mind.'

'That must be a very comfortable feeling to take over the top with one,' said Bennett. 'I wish I could cultivate it.'

'There are times when a man's patriotism gets thin in the middle and frayed at the edges—when he is as wet as the rest of Flanders, as hungry as the heroine of one of your picture-dramas, and as fed up as you. Here in Ypres he realises that the State has the right to demand even more of him if he could give it.'

'What worms we are!' murmured Bennett with sarcasm.

'Ypres has made me realise the insignificance of my part in the greatest struggle in history, but it has also made me feel prouder of that part than ever I did before, and I don't mind admitting that I regarded myself as a pretty considerable young man the first time I donned khaki.'

'So did I,' answered Bennett. 'But now my tastes have changed, and my ambitions are all in the direction of blue suits, low shoes, straw hats, and earthenware crockery. Ypres has made me long for home, half-holidays, girls without fringe, and—er—picture-theatres, as I never longed before. I do *not* want to die. I want to live to a senile old age, and be a nuisance to everybody.'

'I, too, want to live—we all do—but even if we were killed to-night, look how we *have* lived! This war is easily the biggest thing that ever happened, and we have had our little part in it. It's only when you get next to death that you begin really to live. A boy of nineteen who is killed out here has, in some ways, seen a lot more life than his grandfather. That's why the old men envy us. Pile the agony on as you will, you won't kill the old man's longing to be out here. He may not say anything, out of consideration for you—he may even manage to convince himself that he is glad to be out of it, but his face betrays him.'

'I dare say there's a lot in what you say, but this way of living, or whatever you call it, gets a bit too hot for me at times, and then my youthful slumbers are disturbed by hammock-haunted dreams, and I wish I had been born a jelly-fish or something like that. Jelly-fish don't live at the double.'

'Jelly-fish don't live at all. Neither did you before the war—nor I, for that matter. Take a sample week of your pre-war days—any week will do—they were all the same. You went to business at exactly the same time each morning, and finished at exactly the same time each evening'——

'I was late occasionally, and sometimes we worked overtime.'

'Yes, at exactly the same season every year. When you returned from business you changed into a sports-coat and flannel trousers, and went playing tennis, or cricket, or golf, or something of that sort, and secretly despised yourself and your tame sports because you had been reading Jack London. If it rained you would curse the miserable English climate for half-an-hour or so, and take some girl or other to a theatre or a music-hall. Saturday afternoon—more tennis, or cricket, or golf. In the evening the same theatre or music-hall, and possibly the same girl. If that's'——

'Don't,' interrupted Bennett; 'I can't bear any more. I do believe you've been reading that old diary of mine—either that, or I talk in my sleep.'

'And,' continued Newsome, 'you were not satisfied. You sat in picture-theatres and wondered why on earth you weren't a gold-miner, or a bushranger, or a sailor, instead of a commonplace young Briton who had never been farther from home than the Isle of Man. Oh yes, you did! Don't tell me! And in your meaner moments you were even inclined to blame your parents for it. And the girl who was with you felt the same about it too. She sat by your side and wondered why you couldn't be a cow-boy with a hat three yards wide and astrakhan trousers. But now, when you go on leave and drop into your favourite picture-theatre, the wealthy munition-worker in the next row of seats will eye *you* enviously, and come to the conclusion that his spats and fashionable trench-coat—they all wear trench-coats, I believe—have lost their smart appearance. The girl who is with him will keep looking at you covertly with wistful eyes, until she catches the triumphant glance of the girl who is with you, *and then*'——

'There is the Cloth Hall, if I'm not very much

mistaken,' said Bennett suddenly. 'We'll just have a look round, and then clear out of Ypres. The mist is thickening, and it will be quite dark soon. Motor-wagons are none too plentiful about here just at present. We don't want to have to walk all the way back to Poperinghe in the dark.'

They stood for a moment looking at the most famous ruin in Ypres, and then Newsome led the way across the road. There was just enough light left for him to make the following notes:

'We are in the Cloth Hall—if it is possible to be *in* a place which possesses but the meagrest relics of roof and wall. Bennett is searching for souvenirs, bits of marble, &c., but has not found anything yet. The Cloth Hall is like the rest of the buildings here, shattered almost beyond recognition. A few battered pillars with bits of roof and wall are still standing, but that is all. In the quietness of this place I find that Ypres is not dead. The tortured soul of the place is alive and crying for vengeance. Each brick and stone seems to have had a shell to itself; every roof and wall has long since been shattered; but *Ypres is not dead.* As the mist grows more dense, and the coming night deepens the shadows, one is conscious of a persistent undercurrent of sound. The silence becomes clamorous with a spirit of vivid anger and pain; Ypres is not dead, but dying. I think Ypres will die the day peace is declared, and then it will be a very dead city indeed.' . . .

III.

A month later Private Newsome went on leave. He was very fortunate in the matter of trains and rest-camps and a boat, and he arrived home early in the evening. In spite of the U-boats, there was quite a palatable meal waiting for him. He rather liked the war-bread, and the tea tasted like tea. He gave his mother and sisters a carefully camouflaged account of his adventures at the front, and heard in return thrilling stories of margarine and meat queues. He was given in whispers the true and authentic account of the quarter of a pound of real butter which his youngest sister had obtained by glaringly false pretences. That young lady had shown a masterly cunning and deceit of which he had never dreamed her capable. After he had mastered certain instructions with regard to the Food Controller, he sent them into raptures by producing Flemish lace which might—or might not—have been the real thing.

When all the other souvenirs had been inspected, and there seemed nothing else to discuss for the moment, his eldest sister asked him what use he intended to make of the evening, which was still young. Perhaps he was tired after his long journey, and would prefer to remain at home. Or possibly—here her eyes sparkled, and she smiled mischievously—there was some one, some—er—friend, whom he would like to see without needless delay. This was an old joke of hers, and at one time it used to irritate him. Now he leaned back in his chair, smiled indulgently, and considered the question in silence. His glance shifted from his sister's face to his mother's, and then to the various well-remembered articles of furniture, pictures, and photographs about him.

At that same moment the sky over Ypres was alive with searchlights, and a company of British infantry, marching with respirators at the 'alert,' was passing the Cloth Hall. On the faces of the men was stamped the indefinable Ypres look. Bombs began to thud in the distance, and suddenly the sky was flooded with a red glow against the fiery background, the skeleton of 'The City of Dreadful Silence' stood out gaunt, and black, and ominous. . . . But Private Newsome was at home, surrounded by the old, familiar faces and things. The clock was ticking on the mantelpiece, and the cat was curled up on the hearthrug at his feet. Newsome stretched luxuriously and yawned. He was at home. . . .

'I'll tell you what,' he said. 'Let's go to the pictures.' . . .

BIRD-LIFE IN THE CANADIAN BUSH AND SOMETHING OF HUNTING

By Herbert T. Grant.

A STRIKING feature of the Canadian bush is its lack of bird-life, and it is one all the more noticeable to those fresh from the medley of song and the lively comings and goings of birds which afford so much pleasure in these islands. One can travel for days through the vast extent of forest ranging from the Great Lakes and the St Lawrence to Hudson Bay without sight or sound of any of the feathered tribe. This enormous stretch of bush, unbroken (save for lakes and beaver meadows), where the pioneer's axe has not yet encroached, accounts, I take it, for the bird scarcity throughout the provinces of Ontario and Quebec.

Even in the settled parts of eastern Canada, however, which would provide feeding-grounds for many times the number of birds that Britain houses, birds are few and far between. Insect-life there is in abundance in the bush, but those pests, mosquitoes, black flies, and the like, usually haunt the windless shelters in their myriads, immune from the birds, ever lovers of free air and sunshine. One of the chief arguments put forward for the protection of our home birds is that they are the most effective antagonists of undesirable insect-life, but wise nature has provided other means to preserve a proper balance in Canada. In the bush insect preys upon

insect rather than bird upon insect, and to the half-crazed pioneer or traveller the gorgeous, darting dragon-fly is a doubly welcome sight, as it skims across the water in relentless pursuit of that bane of existence, the mosquito. In less obvious ways, too, are the insects kept in check. The mosquito puts in an appearance with the first touch of spring, when the rivers are swelling freely north and south, and every twig and leaf and clump of moss is saturated with moisture; and, granted a season with a normal rainfall, it succumbs gradually as the bush dries up before the summer sun. In wet seasons, however, mosquitoes persist, crop succeeding crop after each rainy spell. There are also 'die-hards' of the species, and the luckless prospector, stripping the rocks in search of veins of quartz or calcite late in the autumn, will find them humming about his ears. A scrutiny of the mosquito in the dry weather will reveal the presence of a tiny parasite clinging to its body, which saps the life out of the insect, so that it becomes brittle to the touch.

Dismissing, then, the insect question, let us turn to another source of bird nourishment. In the bush proper there are no games of hide-and-seek with vengeful farmers and alarming scarecrows for possession of the crops, and by the same token no worm for the early bird to catch. This is neither so extraordinary nor so inexplicable as it reads, earthworms here flourishing only in ground that has been cultivated.

The only birds seen in any number are game-birds. First and foremost amongst these is the wild-duck. In some parts with an abundance of lakes it is found in enormous flocks. It takes precedence also on account of its value as a supplement to the monotonous diet which of necessity pertains to the average bushman's lot. Large bags can be got without difficulty where the duck are plentiful; but when they are migrating, the hunting of stragglers in twos and threes, if exciting, is, alas! a decidedly unprofitable sport. No matter how stealthily the canoe-man handles his paddle, it is almost impossible to creep round the point to the backwater in the river or the bay in the lake where they are feeding, to get within gunshot of them. They are off like a flash on the least suspicion, and a canoe provides anything but a satisfactory foundation for snapshooting at a limited target travelling at some seventy miles an hour directly overhead. Wild-duck are splendid eating, and when the luck is with the hunter he is well repaid for many a fruitless expedition. These, with the partridge and its first cousin the ptarmigan, are the only game-birds. Ptarmigan are rarely found so far south as the part I have in view.

The partridge is such an extraordinary bird that it deserves no little mention. The bush partridge, in the first place, is not a partridge at all, but is really a ruffed grouse. It is a welcome addition to the stew-pot, in spite of its flesh being more remarkable for its insipidity than for its gaminess. From the sportsman's point of view the partridge is an absolute joke. No hunter worthy of the name goes out to shoot partridges with a twelve-bore, no matter how urgent the necessity of replenishing his larder may be. A ·22-calibre rifle is the usual weapon; though, in default of this, with the exercise of some caution, a stick will prove serviceable, while to an American base-ball player armed with a stone they are, as the reporters of his prowess on the 'diamond' would phrase it, 'duck-soup.' As with every other kind of game, be it 'fish, flesh, or fowl,' the hunter must know where to look for them. I have discovered by experience that cedar-clumps are the most likely places, particularly in winter, the low-growing, feathery fronds on the cedar-boughs providing excellent shelter from the falling snow and a degree of warmth not procurable elsewhere. For sheer stupidity (or it may be trustfulness) the partridge has no equal up to a certain point. One can approach, without much stealth, to within a few yards of a log on which six or eight of them may be perched, and proceed to pot them off one by one like the celluloid balls at a shooting-gallery. So long as one can continue to put bullets through their heads—in which event they will drop off the log stone-dead—the others will seldom be seriously disturbed. They realise that all is not quite right with their world, and they twist their heads and shuffle their feet; but, as a rule, only the violent flutterings of one of their number which a badly aimed bullet has got through the body will put them to flight. Even then they will fly only a short distance, and can be readily followed; and frequently they content themselves with running along the ground till they find a new perch. When wounded, however, the partridge displays great cunning. I have fired at and hit one, and, having marked the limit of the wounded bird's struggles, have gone on, intent on getting its scared companion. On my returning with my booty my first victim had vanished. If there happens to be a windfall near, a wounded partridge will invariably make for that, and in such case it is practically impossible to retrieve it. In the fall, too, when the dying moss carpeting the low rocky ridges (so marked a feature of the bush of eastern Canada) is rich in tints of yellow, russet, crimson, and gold, I once searched for a badly injured bird, which, unable to move farther, had merged its speckled plumage in the general decay, and, in spite of being all eyes, I discovered it only by accidentally treading on it. Although the partridge is common everywhere in the bush, it is never found in large numbers at a time. About a dozen or so is the most I have seen in a covey, and even this total is infrequent.

An issue of this *Journal* some time ago contained an article on the migration of birds. It

dealt largely with the old belief that swallows hibernate in ponds, and explained away this theory by stating that in all probability examples quoted as proof of this idea had been the victims of a sudden frost, and, falling into the ponds, had been frozen over, but found before life was extinct. It may be of interest to mention that I have found bush partridges on an April morning frozen in a small creek. I know that they were not there late on the previous afternoon, and that then the water in the creek was flowing freely, so that they must have succumbed under these very circumstances during the night.

Of the birds whose usefulness lies along lines more natural than apparent there is also a very limited number—so limited, in fact, that all of them may be remarked on without going to any great length. None of them are songsters, and only one, the woodpecker, adds a bright touch to the neutral colouring of their summer surroundings. As he hangs on the trunk of a decaying tree he looks like some stumpy buccaneer, bedecked in a crimson head-dress, clinging precariously to the mast of his ship. By far the most popular of all the bush birds is the whisky-jack. Smoke-gray in colour, he is a friendly little bird, about the size of a thrush, and he is the only one whose presence is constant, year in, year out. He regularly invites himself to the *al fresco* meals of the bush, and if one lays aside for a minute a piece of bread or biscuit, as likely as not, when one turns to it again, it is in the possession of friend whisky-jack, who will be seen perched on a branch near hand, pecking it with infinite relish. The culprit goes unscathed, for by one of the unwritten laws of the bush whisky-jacks are sacred. They are supposed to house the spirits of departed lumber-jacks, and their cry is mournful enough to warrant this superstition. The robin and the tsic-a-dee appear before the snow has left the ground. The Canadian robin is a large and stolid-looking specimen, lacking altogether the charm of our own cheerful little visitor. The tsic-a-dee is small and restless, and its incessant cry, 'Tsic-a-dee, tsic-a-dee, tsic-a-dee-dee-dee-dee-dee,' gives it its name. Another nonentity is the blackbird. Neither in voice nor in sprightliness does it resemble the blackbird which plays havoc among our berry-bushes, and how it ever came to be known by that name—considering that it is blue in colour—is a mystery. Noblest of all bush birds is the heron, and it is a fine sight to see it winging its way across the tree-tops or rioting in the abundance of frogs in stagnant pools or in muskeg. The loon is another aquatic bird, similar to the wild-duck in appearance. On a windless stretch of river loon have great difficulty in rising, and thrash along the surface in the manner of a hydroplane.

With so little bird-life it is not to be wondered at that birds of prey are rare. Now and again, however, a hawk is visible, ranging high above the forest, and eagles are not unknown.

THE 'COAST' WAY.

By Frank H. Shaw.

'IT is a bit amusing,' said the second officer of the *Maverick*, 'to hear all this talk of industrial unrest. Forty-hours weeks and increased pay are desirable things, and I don't say for one minute that I am out of sympathy with Labour, but sometimes, when I read of this agitation and that, I remember my own average life.

'Being on the West African run isn't all vintage champagne and snooker-pool—which I take to be the modern equivalents of beer and skittles. We take rank as a liner in this packet; and we *are* a liner. We carry passengers and mails, and we try to run to a regular timing. In between whiles we do other things. I'll try to give you an idea of a voyage—just an ordinary voyage. I'll leave out the war-days, when we were targets for odd torpedoes and were reckoned as combatants long before we were granted guns to defend ourselves with. There aren't really very many mines left floating about now, though one's apt to imagine any floating thing sighted to be a mine, especially in the half-light at sunrise or dusk. That's over and done with, and may the Lord of the deeper seas be praised!

'But as it is, life is varied enough. Our outward trip is the pleasant part of an entire voyage. For a few days, after we've made our calls at various ports from Glasgow to Madeira, we're free to rest and recreate ourselves, when we're not standing watch, or seeking for privileged passengers' special baggage, or helping the passengers to enjoy themselves and keeping them from grumbling. Most of our passengers are West Coast men, with hobnailed livers, and they grumble fairly easily; but we know them inside and out, and can generally get up something to keep their minds occupied. It breaks into our watches below, but that's all a part of the game. No, there's nothing much wrong with the outward trip, except that it is too soon over.

'It is on the Coast that the fun begins. There's the heart-breaking, damp heat in the first place; it isn't like the air of an Alpine sanatorium exactly. I've known days—dozens at a stretch—when a man has had to sweat for a clear half-hour before he could summon up energy enough to wind his watch! But one gets used to that; we Britishers are an adaptable

race. Coming from the North in winter-time to torrid heat such as one gets down the Coast isn't nearly so trying as you might think. But once we make our first port, the real fun commences.

'It isn't a proper port, our first stopping-place. It is simply a trading-station up a creek, a typical West Coast creek, with fast-running water the colour of beer, with a smell of crushed marigolds and rotting vegetable matter always polluting the air, with malaria everlastingly hanging about—we reckon to have four or five men down with fever every time we call at Challa-Challa—and mud, mud, and yet more mud. You should get a really good whiff of those mud-flats in dry weather if you want to think the Thames is a pellucid stream for the benefit of pleasure-makers. Your eyes ache with looking at the sun-washed greenery ashore—the greenery that practically overhangs the decks as we push our way up-stream, after bumping over the bar. It's not a sane, healthful green, that; it's vicious in its vividness, and tells of the fluxes, fevers, and what not that are always lurking about its roots. The air reeks of unhealthiness, and the managers of the big factories are always changing—white men can't stick it for long at a stretch. You can see the aridness of the land, spite of the vegetation, in the sun-bleached silvery whiteness of the plank buildings that make up the settlement.

'Once we've tied up to the bank—it's a bit of an art getting your moorings just-so, because we've never any guarantee that the river won't come down in flood any minute and pitch us high and dry on some shifting bank—we begin work. No, as an officer, I don't need to handle the cargo; but many a time I wish I was just a labourer, because labourers don't have to think out a hundred details all at once, tally the stuff correctly to a hair, with four gangs working all at one time in a hold; keep the Krooboys up to their collars, and prevent them pilfering; watch that the cargo to be left behind in the holds isn't broken down so as to render it unsafe when we move out to sea again, in case we run straight into a heavy seaway; arbitrate in a couple of dozen or so quarrels between the niggers themselves, between foremen and labourers, between foremen and foremen; listen to a man's story of his wife's jealous disposition, and another man's description of his umpteenth child's symptoms after eating too much sugar-cane; and so on.

'I'm not grousing, remember; I'm just trying to give you an idea of what we people go through for our money and our keep. And we don't go on strike! We're supposed to belong to a caste that cannot resort to the strike as a weapon; and when we ask decently for increased salaries, our owners express themselves as being hurt. But I've no grouse against the pay; and though frozen turkey gets a bit monotonous after a month, there's always enough to eat, when you're in the mood for eating.

'It gets very hot down there in the holds. The dust flies thickly, and the clatter of the winches, the hiss of steam, the shouts of the Krooboys, the crash of falling cases, and that sort of thing would wear our nerves thin if we allowed ourselves to possess any. Temperature runs somewhere about 120° in the shade, and it isn't a breatheable heat. Sometimes I feel as though my lungs were scorched like a bit of volcanic ash. Krooboys working hard in that temperature aren't over and above pleasant to the senses; and sometimes the heat tries their tempers and they get insolent, and you have to punish them. Then they kick, and throw things, and drop chains on your head, and generally league themselves together to annoy you. Once last trip I caught a nigger breaking open a case of boots. I had him out as quick as you like, and then he went for me with his cargo-hook. I hit him on the shins with a chunk of dunnage wood—no use going for their heads, you know—and the whole holdful of men struck work at once and went on deck; said they wouldn't work another hand's turn. And we running to a given timing! That wouldn't do, of course. We turned the deck-hands to to handle the cargo, after trying persuasions; and I had to sweat twice as hard as any nigger down below, slinging cases and breaking 'em out from their stowage. Never felt so thirsty in my life; but—I've seen too many decent fellows go to the devil through whisky-pegs to seek consolation there, thanks.

'No; the trouble that corresponds to what we used to call "mat-fever" in Burmah—going native—doesn't appeal to me one little bit. And whisky leads that way. I tell you, a fellow's got to keep the tightest kind of hold on his moral helm on that coast, when his conscience and every blessed thing that he learnt at his mother's knee seem to be pouring out in cascades through the pores of his skin. And whisky makes your hands shaky, and you lose your grip of the wheel-spokes if you don't look out.

'But you manage to get the cargo ashore somehow. You get your chop as best you can—and the white enamel of the messroom is so covered with buzzing flies that you can't see a square inch of it. They drop into your soup; you tread on them on the deck. And there are cockroaches, too, and—other things. Jumpy things and those that crawl. The local traders come aboard to chop with us and to get home news. They tell us—by way of cheering us up—that So-and-So died of malaria a week ago, and that Someone Else isn't expected to recover; and they encourage us to hand out cocktails and cheap champagne and Madeira cigars. Good fellows they are, in the main; but they think that we, being sailors, have all the good things of life, and oughtn't to grudge them a smell of them when we make our calls. But the heat

and Africa itself seem to have dried up their sense of humour along with their blood, and they are generally ghoulish in their talk, or else Rabelaisian.' The second officer drummed with his heels against the drawers beneath his bunk.

'You hear some almighty funny yarns down there—about white men forsaking the straight and narrow road. Some of them seem too wildly impossible to be true, but—I've seen with my own eyes. If I had the gift I'd write a book about Africa that would startle a few arm-chair critics.

'But when you hear the same kind of yarn in every river, with only local variations, you get a bit tired of it after a few years, and you discuss anything by way of a change. Then, when the messroom gets too hot to be endurable, you go out on deck and swelter beneath the awning, and look at the river and the jungle, and, if you're lucky, at the hills beyond, and the marigold scent fills your brain like opium-smoke; and you wish to God some good fairy would come along and maroon you on a clean, healthy iceberg beyond the Arctic Circle. Your tobacco gets tasteless, and your digestion goes all wrong in spots; your liver swells up towards the back of your neck, and yellow specks dance in front of your eyes. But you have to turn to again at the appointed time, and you have to work. Once the cargo's out, we start getting fresh cargo in—palm-oil, as likely as not—at Challa-Challa it's sure to be—and we officers have to see that it's properly brought aboard and tallied and stowed. Each officer's responsible for his own hold. The noise gets pretty hefty about this time. The bank is probably something like seventy or eighty yards away from the ship's side, with deep water around. You have to heave the oil-casks from ashore, through the water and up the side; and if you stave a single one you might as well throw up the sponge, because palm-oil is valuable stuff.

'We work Lodge this fashion. You reeve the end of a new coil of four-inch stuff through the derrick-gin, in place of the ordinary cargo-wire, and you have a length of stray line hitched to the hooks. The Kroos drag the hooks ashore and clamp 'em to a cask's chine, and you go ahead with the winch—that leaks all over the shop and suffocates you with steam—and the Kroos yell and dance in the water at the edge of the river. The big fat casks come storming across, smash against the side, and you think every stave is coming apart; they climb up and rush aboard; and having seen one safely over the hatch, you have to nip below like a bromley-kite and see to its stowing. That's a heart-breaking job if you like. Oil-casks don't handle like trifles, and the Krooboy is thick in the head in more ways than one; it's generally easier to do the job yourself than try to explain how it should be done. Then you go up on deck again, and if you're lucky enough to dodge a dose of sunstroke or heat-apoplexy, you carry on as before, without intervals.

'And the night comes down, bringing no sense of coolth—only a more breathless heat, indeed; and the thousands of stinks waken to life; and in the little lulls you hear the alligators splashing and snapping; and the women in the huts ashore start singing Methody hymns; and you pick up a distant droning sound that is hardly a sound, and you know the "bush telegraph" (that will tell the natives of the interior the precise colour of hair of the latest recruit to Africa) is at work, and will go on all night. Our work goes on day and night; because when it's too dark to work by natural light we rig up electric mushrooms—in old-time ships we use naphtha flares—and the smashing and the clatter and the shouting go on just the same as before. Talk about your six-hours day! And if we didn't do it there'd be thousands who would jump at the chance. But it's pretty to see the reflections on the water, all the same. And when you get used to the crooning wail of the singing ashore, it works a sort of fascination on you; it fits in, somehow, because it's the real voice of Africa, and it speaks of wonderment and enchantment and the hidden things of life.

'Perhaps we get finished at midnight. Then, if the skipper knows the place well, he makes for open water one-time,* so that he'll be at his next port by daylight, in order to start work without leaving the owners' capital lying idle. They don't know the sort of service they get, bless you! They take it for granted. We're their paid servants; but we are a bit more than that. We're sailormen who take a sort of sneaking pride in tackling a job thoroughly, and turning it up neatly at the end. If we just gave our pound of flesh, some shipowners would open their eyes pretty wide.

'Being second of the ship, if we do put to sea, I keep the middle watch, engines going slow and the leadsmen busy. There aren't any shore lights to guide us, of course, so we just keep the ship outside seven fathom and inside twelve, and when the water shoals or deepens, we waken up and alter helm a bit; and we keep a lookout for small stuff in the way of country boats or coasting-steamers as best we can. But it's a lot better to be at sea than up those stinking rivers for a middle watch, let me tell you. Ever tried to sleep in a stuffy cabin, with never a breath of pure air to cheer you? Your electric fan drones away like Jimmy-oh, but it brings no freshness with it; just circulates the old stale air over and over again. And the mosquitoes come out in hundreds of millions, and the fleas and other vermin get busy, and you toss from side to side with your brain growing as big as a filled balloon in your head, and the tiny noises that you wouldn't notice at other times get magnified out of all proportion, and

* Coast parlance for 'at once.'

you sweat like a pig at every pore; and you remember every symptom of malaria, and feel sure you've got 'em all. Oh, it's some Purgatory, I can assure you.

'But it is better in open water, though only a bit better. And then, at daylight, you cross another bar, and the old horrid marigold and sun-heated mud smell hits you in the face; and almost before you're aware it is day the sun has the weight of a steam-hammer, stunning you.

'It is probably a river like the other one, and the day's programme starts all over again. It's like being in a room with a gramophone that has only one record and that's playing all the time! Sometimes, by way of a change, you take the shore-gang in hand, and rouse the Krooboys about ashore, instead of aboard; and you get palm-oil to the eyes, and the flies stick to you and drive you half-mad. And the trader invites you to lunch, and presses square-face gin and beans cooked in oil on you, and tells you that you're no end of a lucky chap not to be tied down to one spot all your life, as he is.

'Oh, I could go on for a week without a rest, just as our life on the Coast goes on: working sixteen hours a day when we're not working twenty, doing the same thing over and over again, day in, day out; sick to the heart's core of the sight of your shipmates, your nerves on edge from the time you open your eyes until you close them again; with the mate finding fault with you because the skipper's found fault with him—and you've no appeal except to pass it on to some subordinate of your own. And then you get to your final port, and think you're going to have a bit of an easy; but the boilers start to leak, or something like that, and there's no electric light, only smoke, stenchful oil-lamps, and no fans—no conveniences of any sort; or you find the homeward ship of your own line has had an engine-room breakdown, and you've to take her cargo and make a quick turn-round; and there you are, at it again.

'To say nothing of deck-passengers—yes, and saloon-passengers, who will insist on banging away at the saloon piano till all's blue, though that piano butts clean up against your bulkhead and the rattle of it makes you grind your teeth and curse the man who first invented such an abomination! The deck-passengers generally start a riot just as you're going off into your beauty-sleep, and you're lucky if you haven't to turn out with a hatch-batten to act as arbitrator. I've seen a dozen family feuds start, reach a climax, and be settled during one night at sea.

'And then, when you've endured all this for a month or two, you go off home. You are in a hurry, and the engineers push the old tub along for all she's worth; and with your blood thinned like water, you run almost in a day from that heat into Atlantic cold. It bites through to the marrow—worse than whaling off Spitsbergen. And you hit a Biscay snorter—a real one, from the north-east, say, with a smirr of snow and sleet in it. And the big graybacks come pouring aboard as if they were professional mountebanks out to give you your money's worth; and the ship's decks are clean swept, and the messroom is washed out; the alleyways are knee-deep in water; and you've to fight all you know to humour the ship and keep her afloat, because a packet that's built to navigate West Coast rivers isn't apt to make the best kind of sea-boat in heavy weather.

'But you know what a Biscay snorter is like, so there's no need to pile on the agony. You get through it somehow, and get into narrow waters, where the watches are doubled up, and you keep a strict watch and watch—four hours on, four hours off, no matter whether it snows or blows, or fogs or clears—until you see the old Rock Light ahead, and know that it's over for one more trip—only to start again in another week's time or so; and so *ad infinitum*.'

The second officer reached for the tobacco-jar and stuffed his pipe thoughtfully.

'It's a funny thing, though,' he added. 'I tried a change; went over to the —— Line—the "kid-glove" line. Across the western ocean in six days, with the bridge stiff with officers; ten days in New York, and nothing much to do; six days back—a feather-pillow existence. But I couldn't stick it; I just couldn't. Funny how Africa calls! One voyage filled me to the brim. I changed over as soon as I could. After all, a man shouldn't quarrel with his bread-and-butter, and—I like it really. The work's got to be done, so why shouldn't I do it? But sometimes, when I hear about these chaps I helped to feed when otherwise they'd have starved, well'——

THE WESTERN MEN.

THE men of the North are stern and shrewd;
The Eastern men are strong;
The Midland men toil hard and late
To roll the world along;
The Southland men are kind and slow
As their placid vales and streams;
But, oh! it's the men of the West Country
Who are the Dreamers of Dreams.

They read the runes of the changing year
On the heath and fern-clad hills;
They learn the lore of the Other Things
In the pools of the peat-brown rills.
Their eyes are turned to the sunset glow,
And through its golden bars
They see the land of the 'What-may-be,'
And the glint of its guiding stars.

The west wind sings in their trancèd ears
The song of the Far Beyond;
The sea's breath lures their souls to sail
On the tracks no man hath conned;
So they seek adventure, not knowing why
They follow those shifting gleams,
For that is the weird of the Western men,
Who are the Dreamers of Dreams.

KASSA-WA-WA, THE SONGSTER.

By H. MORTIMER BATTEN.

I.

KASSA-WA-WA sat on the crest of the rugged ridge, and poured forth her soul to the glory of the sunset. 'Wa-Wa-Wa-a-a-A!' she sang, and, though not exactly melodious, the wavering cadences seemed to express the solitude and the wind-swept grandeur of the foothills.

Each morning and evening since her cubhood days Kassa-Wa-Wa had sung thus, and regularly once a week had found herself in some kind of trouble as a result. Yet she just *had* to sing, as her forefathers had sung before her away back into the dim ages of the past. Other things the coyotes of Lost River had learnt readily enough, but not to cut out that song; and even Kassa, the latest product of her kind, versed in the knowledge of poisoned baits and in the setting of steel traps—even Kassa, who knew to look over the skyline before she appeared in silhouette (a habit acquired through ten generations of persecution), had to resort to her Arab-like devotions at the twilight hours. It was as though a thief who spent his days skulking from justice in the shadowy defiles built for himself a house upon a hill-top, and there returned each night to light the lamps at every window.

This spring evening there came an answering howl, and Kassa pricked her ears and listened. At any ordinary time her song would now have taken on a fierce defiance—'This is my range! You keep away!'—but now, as the answering howl drew nearer, Kassa remained in silhouette and watched.

But the coyote that answered the call was not the first to appear. The big she-wolf, whose mate had fallen by Logan's traps, saw the little coyote on the skyline, and stealthily crept upwind to take Kassa by surprise—as she had done a dozen times before. Kassa, indeed, dwelt in mortal terror of this wolf, who was always lurking and waiting, pouncing out upon the little coyote at the most unexpected moments, and ever ready to tear her limb from limb.

The faintest suggestion of a sound warned Kassa in time, and she slunk behind a boulder, peering over it, only her big ears visible; whereupon the she-wolf charged with a snarl and a chopping of jaws.

Then began one of those tedious wars of exhaustion in which Kassa was an artist. She did not run away, she did not even appear to hurry, yet each mad charge of the wolf, each ugly chop, found the little coyote just out of reach. She was more nimble than the wolf, and here, among the boulders, she could keep on dodging and sliding through the narrow chinks till her aggressor tired of the game.

But this evening the she-wolf did not tire. There were two reasons for this, the first being that early in the contest a snake-like snap from Kassa had laid open her muzzle, and the second that ere long her cubs would be born—a fact which seemed to call forth the last grain of spite in her unusually spiteful disposition. Systematically she drove Kassa to the far end of the rugged ridge, beyond which lay open going, while in vain Kassa dodged and feinted, trying to regain the better cover. Always the wolf cut her off and drove her back; so Kassa, rather than wait till the last, made a dart for the tundra, hoping she would obtain a start over the remaining patch of rough ground.

The she-wolf's growls took on a note of triumph as she bounded in pursuit; 'pitter-pat, pitter-pat,' went Kassa's paws on the sand, sending up little spumes and cyclones, though they seemed hardly to touch earth. Kassa made for each clump of dwarf cactus, side-stepping at the last moment, and hoping her pursuer would fail to notice the wicked, half-buried thorns; but the wolf came on in great mile-eating bounds, and Kassa's heart sank in terror.

Oh, how far away the cañon seemed! Every nerve and muscle she strained for greater speed, but upon her was that paralysing sense of a pursuer swifter than herself. In the very ace of time she threw herself flat, and the wolf's jaws slashed the air within an inch of her neck.

Like a flash Kassa turned, fleeing for dear life back towards the rocky ridge. 'Pitter-pat' went her paws, 'thump-thump' came the she-wolf behind her, and then—oh, horror!—there flashed from a cactus-clump ahead a second wolf, cutting her off from the friendly rocks.

Husky and formidable he looked to Kassa's terrified eyes, barring the direct path with forelegs widely braced, yet as Kassa swerved to dodge him he held his ground, glowering with fangs exposed at the pursuing wolf.

 [*All Rights Reserved.*]

One whiff was enough for Kassa. She knew in the twinkling of an eye that this big, husky brute was a jackal like herself, and so, side by side for the first time, they faced the common foe.

The she-wolf pulled up short in a cloud of dust, regarding them red-eyed and sullenly. Then, with rumbling growls, she recalled an appointment away down the cañon, and the jackals, with waving tails, brought up the rear, yapping their mockery.

Kassa looked at her deliverer with shining eyes; then she bit him. It was not a serious hurt, for his coat was long and thick, bearing the black gloss of the greater altitudes, where the air is rarefied and the nights are bitter cold. He had come from the Buttes away in the west—come in the very nick of time; and now he stood stock-still, wagging his tail from side to side, and waiting, evidently, for Kassa to bite him again.

II.

When Kassa stole off towards the ridge, Butte followed. She sat at length on the skyline, looking absently into space, and pretended she had forgotten him, though his yawns were loud enough to carry fifty yards. He came fawning up to her, and at length dared to lick her nose, at which she fairly wailed with disgust. Finally she got up and trotted off, while Butte followed with an unwarranted air of triumph.

He followed till they reached the ridge overlooking Logan's cabin, with its streak of foreign smoke rising straight skywards—doubtless some kind of trap! At this they howled in unison, which surely was a step in the right direction, for the song seemed somehow to bring them closer together; and when at last Kassa rose and trotted away, her nips had lost their keen edge, and her yaps of disapproval were less impatient.

Oh that fateful howling! It told Wolver Logan that there were still jackal bounties to be drawn along this range; otherwise he would have packed out with the first springtime floods, and Kassa and Butte would have lost the most terrible, though not the most terrifying, of their foes. As a matter of fact, Kassa had derived a good deal of amusement that winter at Logan's expense. She was a wise little jackal for one of last year's cubs, for she sprang from wise parents, and time and again she had watched Logan make his sets, only her two pointed ears visible above the ridge, and when he was gone she had sallied forth and scattered dirt upon them, leaving the sign which other jackals read and knew to mean 'beware.' But Logan knew his business, and sadly had he reduced the number of wolves and jackals along his range.

That golden evening the trapper, had he used his glasses, might have seen two coyotes seated side by side under a boulder overlooking his cabin—a coy little vixen and a big, prim, husky male—so close together that they seemed to be propping each other up. They watched with the keenest interest while Logan tidied his hut preparatory to his long jaunt to the city to buy fresh stores, and somehow the jackals knew that he was shortly packing out. At dawn they were back at the same place, watching Logan load his pack-horse with a huge pile of pelts; then, as he rode slowly off, leaving the cabin shuttered and barred, they escorted him respectfully to the prairie-edge, where they howled a doleful farewell.

That evening there was no suspicious smoke rising from the cabin chimney-pipe, and, glancing round for Butte to follow, Kassa stole up to investigate. Butte was wary and shy, but when he reached Logan's garbage-heap his confidence returned. He puzzled long and painfully over the anatomy of an empty milk-tin, while Kassa was exploring the mysteries of an ancient larigan. They scattered the garbage far and wide, strewed it to the very threshold, whereupon Kassa began sniffing under the door. The first sniff brought a delightful suggestion of seasoning bacon, also a dash of molasses. Kassa began to gnaw, and very soon splinters of wood littered the threshold. She gnawed and tore till her jaws were tired; then Butte took her place, and in less than an hour they had engineered an entrance—difficult, but nevertheless sufficient.

Kassa wormed in, while Butte mounted guard without. The bacon was suspended from the roof, and Kassa's first leap brought down a rickety shelf loaded with tins of paint, musquash 'charm,' a bottle of whisky, a box of nails, and all manner of oddments. The whole lot lay in an unsavoury concoction on the floor. When she had analysed each and every article, Kassa's confidence returned. She leapt again at the bacon, obtained a good hold, and hung on. Then she swung, jerking, worrying, till one suspending loop gave way and the side hung perilously by one corner. Another mighty snatch brought it down, and Kassa struggled to the door with her prize.

Try as they would, Butte tugging and worrying without, Kassa manœuvring within, that obstinate side of bacon refused to exit by the way Kassa had entered—probably because it was at least a foot too wide, so that in the end the two jackals were compelled to feast on the spot, which they did whole-heartedly.

Thoroughly satisfied and confident now, they fell to exploring. The flour-bag was upset, and though its contents interested them little from an epicurean point of view, it occurred to Kassa that this was good stuff to roll in, so she rolled. Butte also rolled, and that explains why a tipsy half-breed, crossing the range that night, saw two white jackals trotting together across the ridge, and got the fright of his life.

Next evening Kassa and Butte returned to finish the bacon, but the first whiff, on their nearing the door, told them that another visitor had been there. In truth, a prowling, old, dry valley skunk had strolled into the cabin that

very afternoon, and finding himself surrounded by such a harvest of plenty, had decided to settle. Kassa and Butte snarled threateningly at him through the jagged hole, at which the old skunk settled all doubt as to the question of ownership by letting off his musk-gun.

Whoever might have wanted the hut hitherto would certainly have no use for it hereafter. The skunk had stamped his brand of ownership, which silenced all argument and left him in undisputed possession. Kassa and Butte hurried away, rolling in the sand and sneezing to get the horrible stench out of their nostrils.

III.

When Logan came back and found the brown-and-white freebooter in possession, he swore an awful oath, then shot the skunk with his pistol. Thereafter he held a bonfire of all that the hut contained, and finally pulling the cabin to bits, he rebuilt it solemnly, log by log, most of the logs reversed. It never occurred to him that the jackals might have had a hand in the pie. His suspicions ran no farther than milord the skunk, which can scarcely be wondered at, considering to what extent the scent of skunk pervaded his clothing, defiled his body, and saturated his very soul! For weeks after Logan breathed skunk, ate skunk, dreamt skunk—in fact, was enveloped in a material and spiritual atmosphere of skunk.

But he had come back with a new idea for a coyote set, and was anxious to carry it into effect. Thus, a night or two later, Kassa and Butte were greeted by a glorious aroma of dead goat wafting down the breeze, and followed it to its origin. There lay the goat in a sheltered hollow, but as they circled round, sifting every breeze, Kassa uttered a warning growl, for the scent of steel was also wafted to her nostrils. On their drawing still a little nearer, the smells of man and of trap were unmistakable; in fact, Logan had even forgotten to brush out his tracks with the old wolf-tail he carried for that purpose.

The whole thing was the most obvious trap the most blundering novice could have contrived, and Kassa and Butte sat near by in the offing howling their mockery. Had they known, they could have stepped right in and fed, for there was no trap anywhere near, and the warning scent of steel came only from a few old horse-shoes and other oddments Logan had strewed round the carcass.

The next night and the next the two coyotes returned to howl their derision, till at length Logan, at a well-chosen moment, reappeared upon the scene, bringing with him this time five Whitehouse wolf-traps with chains and drags attached. These he set not near the carcass, but on the crests of neighbouring mounds where, the signs told him, the coyotes sat and howled.

That night Kassa and Butte reappeared as usual. They were no longer suspicious of the place, as they knew where the traps were; but scarcely were they within sight of that tempting bait when there was a thud, and Butte was caught.

There was no mistake about it. He was firmly held by one forepaw, and his frantic efforts to escape merely resulted in the appearance from the sand of that great three-pronged anchor to which the trap was chained.

Kassa, horrified and distressed, circled timidly round, and soon located a second trap, which she sprang by scratching earth upon it. She then went to her husband's aid, worrying the trap, the drag, the chain, even biting *him* in her frenzied anxiety. But her efforts were cut short by a thunderous growl almost at her side, and, peering up, she saw, to her horror, the big gray timber wolf!

There the brute stood, head lowered, eyes flaming, and even as Kassa stared the she-wolf came stalking towards her as a cat stalks a mouse.

Butte uttered a desperate snarl and strove madly to free himself; while his little wife, trembling with terror, crouched at his side in deadly preparedness. She might easily have slipped away had she chosen, yet, like the faithful little wife she was, she remained at her mate's side, ready to die with him; for scarcely could it be otherwise.

Well the wolf knew that Butte was trapped, and there was but one thing that restrained her—the scent of steel. But for this she would have rushed in and finished first Kassa, then Butte; as it was, she contented herself with uttering thunderous growls, prowling round stiff-legged, and at times scratching dirt with all fours.

And as she trotted round the two jackals were ever facing her with shining, fearful eyes. Afraid they surely were, yet as surely they meant to fight to a finish. Butte's imprisoned leg was numbed, and he felt little during that dreadful twisting process. He did not even know that the skin about that imprisoned paw, twisted and broken, had become but a loose sheath, ready to strip away if the necessary pull were exerted in the right direction.

The wolf became bolder as the night passed on, and steadily now her circles narrowed. Once she was within reach of Kassa, and delivered a terrible sidelong chop, which the little coyote dodged with a movement too quick to follow.

Again the she-wolf snapped, driving Kassa back, then with a roar mastered her fear of the trap and fell upon Butte. There was a sinister vision of scuffling bodies in a cloud of dust, and Kassa threw herself in. Chop—slash—chop went her jaws!

There was a shudder and a pause, and the three animals shot apart, glaring into each other's eyes, and between them, with jaws erect, stood the empty trap! Butte had twisted himself free—or, rather, he had twisted till the hold of the jaws was weakened, when the full force of the big wolf's charge, the fury of her full weight

thrown upon him, had given that final wrench which he alone could never have mustered.

Yes, little as she had willed it, the she-wolf had freed her intended victim, and realising that full well, she now remembered business elsewhere, and slunk away.

IV.

Butte's injury, though bad enough, was not a permanent disablement. It merely meant that he would become thin, and that for a month or so he would hop on three legs, after which he would quickly resume his normal condition.

But the blood-feud between the jackals and the she-wolf was now complete in its bitterness, for at the back of the jackals' minds was a vague sense that the wolf was in some way associated with Butte's whole encounter with the trap. They were unable to disconnect the two incidents —first, the springing of the trap, and, second, the appearance of the wolf; and the memory of that night was a bad dream in their minds —a dream in which the wolf alone assumed definite shape and being.

Whether the thing that Kassa did was a carefully laid plot, or whether it was merely chance that favoured her, I cannot say, though chance plays a smaller part in the destinies of the wild folk than our lack of generosity usually allows us to concede. Not half-a-mile from the dead goat was a shallow creek, and hung by its head in the undergrowth, about four feet from the water's edge, was a wild-duck. Kassa had many times eyed that duck, but deciding it looked unnatural, she had tried to forget it. She would have defiled it had it been within her reach, so that no other jackal would eat; but now, going one night alone to the place, she sat on the windward side of the duck and howled. The she-wolf heard and came along, knowing that Kassa was alone; but when she arrived Kassa was gone, and there remained only the thing in the trees, imparting seductive aromas to the breeze.

The wolf approached cautiously. This, then, was what the jackals were after! She would see they did not get it. There was no scent of steel, so she leapt, falling back into the shallow water. Tock! The steel jaws of a No. 4 Whitehouse closed upon one of her hindlegs. With a roar she spun round to snap at the awful jaws which rose from the surface, when—tock!—a second pair of jaws closed on her forepaws, pinning her down in a helpless attitude.

Kassa and Butte came down and howled their triumph; then away they went into that shady cañon which was sacred to the wolf.

There is one vengeance in the wild more terrible than all others, for not only is it the most vicious, but, over and above the actual injury done, it conveys mockery and contempt.

In a shallow den deep down in the cañon Kassa and Butte located their enemy's cubs, and had the she-wolf returned that morning she would have found her nest scattered to the four winds, and there, at the den entrance, stark and mangled, she would have found her darlings lying defiled and bespattered with dirt in the twinkling sunlight.

WITHIN TOUCH.

CHAPTER II.

THE secretary showed himself first, and held the door wide. Then there appeared on the threshold only a cornet and a trooper, and for an instant I feared that they had brought no one, and, more, that my trickery was discovered and they were come to seize me. I sank my hand into my pocket, where the snaphaunce lay. But the trooper stood aside and disclosed another form.

I saw a white face, that did not reach to the cornet's shoulder, and a cloak—a cloak hanging so straitly that it could cover but a slight body.

So far, only a sense of duty, or, perhaps it were better said, a fear of being haunted, had carried me along; but the sight of Beatrix Mary Ruthven, or Rivven, in the being, in the midst of her burly enemies and under the shadow of death, took my pity instantly, and I was glad that I had come for her, whatever the cost.

The cornet saluted the major-general from where he stood, and then placed his hand beneath the prisoner's arm. She advanced, moving weakly and as if near to a swoon, and he led her, with some kindness in his manner, to a chair, wherein she sat, and, after drooping her head at first, looked up, her eyes very wide open, at the major-general. The secretary had rightly called her 'maid.' I thought her not above eighteen, and her face very beautiful, with its delicate short nose and perfect mouth and chin, and the lovely clean curve which ran from chin to ear. Pallor and a red flush around the eyes from weeping could little detract from a face so featured.

'Under favour, sir,' said the cornet to the major-general, 'I do not think she can travel to-night.'

'Eh? Wherefore not?' He leaned across the table towards the girl. 'Young mistress, you are in better case than your high crimes deserve. Not so near death but what you may save yourself, I believe, an you speak fair to the Lord Protector. So take that advice to heart, and now rouse you up, for you are to go to London to-night.'

'I am thankful—so thankful,' she said slowly,

'and would fain do your wish, but I—the good tidings have dismayed me.' She breathed hard and sank her head on her hand, and I saw that she was trembling much.

The major-general glanced at me. 'You were best make up your mind to sup with me, Captain Leyburn,' he said. 'As she is, she cannot sit pillion, and, of course, that is your plan?'

'Yes,' I answered; 'and, by your leave, sir, ride she must and soon. I once neglected a command of his Highness, and have no mind to again. If Mistress Ruthven hath no strength to hold my belt, she can be belted to me.'

I spoke firmly, as one who had no intention to be crossed; but hope was dying within me. I saw myself beaten after all by this ill chance. If the major-general deemed the prisoner unfit for riding, he could, as my senior officer, take it upon himself to retain her, and answer to Cromwell for doing so. But, fortunately in the circumstances, he was not a man of merciful nature.

'Belt her to you?' he said. 'Yes, it could be done.' He eyed me with pleasure. 'You are like me, sir; you yield not readily to obstacles.'

'No, sir,' I said with relief, and I was little surprised that on looking towards the prisoner I found her gazing over her finger-tips at me in shrinking apprehension. My words had been very harsh, and my face, with its lack of shaving, and with, I suspected, many an earth-stain, though the common mark of one riding post, might well discomfort her.

I walked up to her chair, intent to reassure her somewhat by a question as to how she did; howbeit, the major-general mistook my action for impatience.

'Now, mistress,' he said, 'Captain Leyburn awaits you. Stand up.'

As if his words had shot her, she fell across an arm of the chair.

'Um! she will beat you, sir,' he said, rising impatiently.

'Not if I may have the tending of her,' I answered, raising her a little and holding her so that her head leaned right forward. 'Pour some water into that dish,' I added to the secretary.

I raised her head to cast some of the water in her face, and then let it fall forward again, soaking my palm continually and pressing it to her brow; and when I thought her senses returning I set her back, and taking a cup of water from the secretary, who stood by to assist me, won her into drinking some.

'You are better?' I asked.

She replied, 'Yes,' but faintly, with closing eyes.

I set her forward again, wetting my hand and holding her brow as before, and gazed down upon her brown hair, and felt the pitiful throb of her temple against my fingers. In troth, I was hard put to to know how I could get her away. I determined on a risk.

'Some wine or spirits,' I said to the secretary.

He went first to the bottle I had drunk from, and finding it empty, hurried out of the room, as I had expected. The major-general and the cornet were talking on the far side of the table.

I bent my lips to her ear. 'Come, come,' I said softly, as if to chide her. 'Come,' I whispered; then, lower still and rapidly, 'For your life's sake and mine, come now. I am a King's man, trying to save you.'

I felt her start in my hands, and soon could tell by the great drawing of her breath and the straining of her little form that she was striving with all her will to recover herself; and, knowing what encouragement can do, I said to her ever and anon, 'You are better; I see that you are better.'

And gradually she became so, and when the secretary returned was able with her own hand to lift a beaker of strong waters to her lips, whereof, at my urging, she drank a fair quantity.

'A tender leech!' said the major-general, who for some minutes past had been studying me with, I feared, a hint of suspicion in his thoughts.

'What would you?' I answered, laughing. 'His Highness will not be tender of me for delay. And, with your permission, sir, she does well enough to be put on horse. The fresh air in her face'——

I broke off, for I could perceive his doubt growing. Then I recalled Leyburn's pass, which contained no such description of the bearer as would betray me. That might lend a little more weight and get me through yet.

'If you will be pleased to endorse my pass, sir, with sanction to carry the prisoner'—— And I held it out carelessly.

He took it and glanced over it, and his face became more assured; and then, to my great relief, he sat down and wrote across it.

'Get you gone, then, Captain Leyburn,' he said, giving it back to me; 'and my humble services to his Highness.'

The maid, whose pretty, narrow hands had been busied with pulling the hood of her cloak over her hair, stood up at his words. She wisely showed no trace of eagerness, but, fixing her eyes on me, waited as if in miserable indifference. Yet a faint colouring of excitement had stolen to her cheeks.

I saluted the major-general and turned to the door without more ado; and, the secretary leading the way, she and the cornet and I went down and out to my horse, which the corporal held ready, having obediently girt on a pillion.

Into this the cornet lifted her, so soon as I was mounted, and I felt her fingers in my belt.

'You are strong enough to hold on?' I asked.

'Yes,' said she behind me.

Then 'Good-night and good thanks to you, sirs,' I said, and, giving the corporal a silver piece, started atrot down the street, ready to shout for joy at my success, but to despair for

another reason. By now it was almost fully dark.

As yet I had scarce learnt the sound of my companion's voice, so mute had she been from her first coming into the library. But ere we had gone many yards she spoke quickly across my shoulder.

'Sir, sir, what you whispered was true? You are saving me? You are a true man?'

'True enough man, mistress,' I answered, 'as the rebels yonder would have proved on my body had they guessed my name; and at present you are safe from them.' I eased the chestnut down to a walk. 'We will talk here and quickly,' I said; 'for, once out of the town, we must gallop hard, and shall have no breath for speech.'

I told her in few words of my hunted condition and the manner of my coming to her aid. 'And now, Mistress Ruthven,' I ended by saying, 'I still may catch the hoy, and you were far best out of England—nay, you cannot think to remain. Will you trust to me and to Telkirk, an old, honourable man, and cross with us to Holland, whence you can write to your family?'

Instead of answering my question at once, she slipped one of her hands from my belt and laid it on my arm, and leaned forward so that her breath was on my cheek.

'Thank you, thank you, for my life,' she said, 'which henceforth, under God, I owe to you. You had barely saved your own, yet you straightway perilled it again for me. I know not how to tell you my gratitude—and I think you the bravest, noblest man that is in England.'

The edge of her hood, with a tress of hair lying across it, as I could feel, touched my neck. It sent a thrill through me, and my heart gave a great beat. I found myself drawing a long breath and realising what gladness a certain maid may instantly bring upon a man. But I could not let her words pass.

'You must not name me brave,' I said, 'unless you would shame me. Call me rather the "Great Coward of Pevensey Marsh," for that is my fitting style. I clung to my marsh, and long declared I would not leave go though you died of my cravenness. Knew you ever such a cur?'

Her fingers tightened about my sleeve. 'Brave, brave!' she murmured. 'How you durst have come forth I know not! Could I have done so? Could I turn back a step now, think you?' (She shivered against me.) 'Not for a king's ransom!'

The very words, those last, that had run in my head not long ago. Indeed, we were a shattered pair! And yet not so; my courage was with me again, and waxing the stronger for knowing of her fear.

'Not for a king's ransom,' she repeated. 'Not to save a life! But I have not answered you. Yes, I will go to Holland with you, and be deeper in your debt for taking me. I have no near kin in England now, since they killed my uncle when they made me prisoner; but my aunt Ruthven is at the French Court, and will receive me.—And tell me not of your worthy Hollander,' she added, almost with reproach. 'I were base, I think, did I not gladly trust myself to you.'

Her confidence in me, though mayhap I expected no less, was pleasant to hear. I twitched our Spaniard into a rapid trot, and her free hand went back to my belt.

'So, now for the hoy,' I said. I spoke gaily, both from a desire to cheer her spirit and from the effect which her presence had on me. But I doubted much that we should find the hoy. At this very minute Telkirk might be putting off in his boat for me. When he discovered that I was not on the beach, he would not wait, but deem me waylaid on my road thither, since I had been given ample time to reach the trysting-place. Howbeit, I noticed, as we came to the outskirts of the town, that night was not so completely fallen as I had thought, but that the darkening was in part from a sea-mist; and, as this circumstance, together with the dying down of the breeze, would make the hoy slower in approaching shore, my hopes revived somewhat.

By galloping the chestnut to his uttermost we might yet win to sea. But this same galloping, now that the time was come for it, was no nice prospect, with the pits and other snares of the road, dangerous enough in broad daylight, now scarcely to be seen if one stared straight down at them. But there was no other course.

'Hold tight, Mistress Ruthven,' I said. 'If we fall, you were best spring out sideways.' And then I gathered the reins shorter and spurred.

(*Continued on page 660.*)

THE NEW TEACHING AT CAMBRIDGE.

THE PERSE SCHOOL.

I.

SHORTLY before the war, the writer travelled from Cambridge to London in company with a well-known American educationist, the brother-in-law of an ex-President of the United States, and this gentleman explained that he had been to Cambridge specially to see and hear Dr Rouse teach Latin and Greek to the boys of the Perse Grammar School, and had been greatly impressed by his visit. A month or two later a friend of the writer, who was removing from London to Cambridge, was congratulated by a London headmaster upon the fact that he would

now be able to send his sons to the Perse School 'to be taught by the great Dr Rouse.' Who is Dr Rouse, and what is the special educational work he is doing at Cambridge that attracts scholars from all over the world, and calls forth the admiration of other headmasters in his own country?

It is now eighteen years since Dr W. H. D. Rouse went to Cambridge as headmaster of the Perse Grammar School, founded in the last year of Shakespeare's life by a bequest of Dr Stephen Perse, and rendered famous by Bishop Jeremy Taylor, 'the Shakespeare of divines,' who was one of its earliest scholars. Dr Rouse had had fifteen years' experience as master in various English public schools, including Rugby, and he was profoundly dissatisfied with the methods of teaching which he found in vogue, particularly in connection with the classics. He went to the Perse School with the firm conviction that the whole existing system would have to be radically altered if any real success was to be attained. It may be said that he carried out the daring experiments for which he has since become famous in educational circles with a boldness worthy of the high cause he had at heart, and the courage and the earnestness shown have been crowned with triumphant success. The Right Honourable H. A. L. Fisher, President of the Board of Education, who recently made a special journey to the school to see the boys at work, stated at the tercentenary celebrations that, with one exception, the Perse was the only school in the country that was receiving the Board of Education grant for valuable experimental work in education.

In passing, it may be mentioned as curious, and at the same time eminently fitting, that this modern pioneer in the teaching of Greek and Latin should have chosen Cambridge as the field for his efforts; for two other pioneers in this sphere have had connections with the university town. One of these, Sir Thomas Elyot, who is best known as author of *The Boke named the Governour*, the first work on education to be printed in the English language, was Member of Parliament for Cambridge and sheriff for Cambridgeshire in Henry VIII.'s reign. The principles he enunciated were a remarkable forecast of Dr Rouse's methods. The child was 'to use the Latin tongue as a familiar language,' and he was not to be detained too long in the tedious grammar. 'Let not the child's fervent desire of learning become extinct by the time he cometh to the most sweet and pleasant reading of old authors.' The child, Elyot went on to explain, was to be treated as an individual, and his originality encouraged and drawn out.

The other Cambridge pioneer was Roger Ascham, tutor and secretary to Queen Elizabeth, whose book on classical education, *The Scholemaster*, was published in 1570, two years after his death, and nearly forty years after Elyot's *Governour*. He was fellow and Greek reader at St John's College, Cambridge, and worked with much success to extend the knowledge of Greek at his university, and to improve the method of teaching Latin. Like Elyot, he strove to make Latin a living language, and described his book as 'a plaine and perfite way of teachyng children to understand, write, and speake in the Latin tong.' His plea was one for 'alluring the child to learning by gentleness rather than by force,' and though his actual routine of teaching was different from Dr Rouse's, there is no doubt that in spirit it was akin.

II.

It is extremely difficult in one short article to give any adequate idea of Dr Rouse's system, or to show fully how remarkably it differs both in method and in result from the system that has been enthroned for a couple of centuries or more. Not only are the classics involved, but modern languages also, and the whole range of English literature. Of what other school in England could boys of eleven and twelve be found who sit down in their spare hours at home to read Shakespeare for pleasure—not the plays they are studying in class, but other plays to which they have been attracted by their appreciation of the author? This Perse boys do —a fact within the writer's own knowledge.

It was on account of his teaching of the classics, however, that Dr Rouse first attracted attention to the Perse School. That method of teaching modern languages known generally as the 'direct method,' because in it there is a direct connection between experience and expression, between the idea and the spoken word, has been tested for something like a quarter of a century, and has proved, without doubt, the best method ever devised. It is the plan followed in the teaching of French and German and other modern tongues at the Perse.

But in transferring the direct method, sometimes called the oral or natural method, to the teaching of Greek and Latin, Dr Rouse has struck an entirely new note. 'Can these dry bones live?' might well have been asked after two centuries of the current practice, for the pedagogue had seen to it that Latin and Greek were indeed 'dead languages.' Dr Rouse, however, has given life to the dead; he has made the ancient tongues live once more; he has restored their rhythm and their music, and made the schoolboy appreciate and enjoy them. As he himself says, 'The Romans used Latin, and the Greeks used Greek, to express their daily thought one to another; Cæsar commanded his soldiers in Latin, and Xenophon in Greek; whilst Gaius and Gaia used Latin in the bosom of the family, and all the little Athenian children spoke Greek at their play.' Of course they did, but we had never quite thought of it in that way.

Perhaps the striking contrast between the old

method of teaching and the new can best be shown by taking concrete instances. The writer has a very lively recollection of his introduction to the Latin language in an old London grammar-school of the traditional type. He was seven years of age at the time, and was set to learn by heart what he was told was 'the first declension.' In painful, parrot fashion he repeated *mensa*, a table; *mensae*, of a table; *mensae*, to or for a table; and so on, through six cases, singular and plural. He had not the remotest idea what it all meant, nor did he know or care whether the table in question was a piece of furniture or a set of figures. The natural result was that he took an antipathy to the classics, which he has never been able wholly to overcome.

Now, take a Latin lesson at the Perse School. The class is ready and the master sitting at his desk. '*Surgo*,' says the master, and rises in his place, and the boys at once associate the act of rising with the sound and expression, *surgo* (I rise). The master then beckons to a boy to rise, and says to him, '*Surgis*' (thou risest), and to the rest of the class, pointing to the boy, '*Surgit*' (he rises). Perhaps two boys are next motioned to rise, and the master says to the rest of the class, '*Surgunt*' (they rise). The boys now sit down, and the master, indicating by signs that all the class, including himself, should rise, says, '*Surgimus*' (we rise). Again they sit down, and several boys are motioned to rise, the master saying, '*Surgitis*' (you rise). In this way the whole class has, in a few minutes, learnt the present tense, indicative mood, singular and plural, of the third conjugation verb *surgo*, and not a word of English has been spoken: Latin only has been used, and the boys have learnt in such a way that the lesson will never be effaced. Not only so, but their interest has been keenly aroused and they have had a good deal of amusement.

The lesson is continued. '*Ambulo*' (I walk), says the master, taking a few steps forward; '*revenio*' (I come back); '*sedeo*' (I sit down); and all the changes are rung until of these also the boys have learnt the present indicative. They now know this tense of all the four conjugations of verbs. By the old method the boy drummed away for weeks at the first conjugation only, knowing nothing of the other three, and thus came to have an idea that all other verbs must be irregular. The same thing happens with the five declensions of nouns, which are learnt simultaneously instead of in succession. In all cases the words when learnt are written by the boys on the blackboard.

But the early lessons do not consist of sentences of one word only. Each boy has a Latin name, this wherever possible being his own name Latinised or translated, as *Ricardus*, *Carolus*, *Sartor*, *Lupus*, and so on; and in this way the vocative case is introduced naturally and easily. '*O Carole, surge*' (Charles, rise), says the master, here introducing the imperative. '*Quid facis?*' (What art thou doing?), he asks, and his tone and expression indicate his meaning. So the lesson goes on, to the intense interest of the boys, who almost immediately experience the joy of being able to speak and understand the strange new language.

Successive lessons centre round the schoolroom and furniture and the ordinary actions of daily life, and in a very short time each boy has at his command a fairly good vocabulary which he is able to use fluently and intelligently. To hear a class of boys at the Perse School thus carrying on a lively conversation or discussion in the Latin tongue is indeed a remarkable object-lesson in the value of the new teaching. Think what all this has done. In the first place, it has interested the boy in his Latin lessons, usually the dullest of the school curriculum. It has made Latin as living a language as English or French, and has shown him how to use it fluently and effectively. It has amused him, and has saved valuable time by cutting out altogether the parrot work of committing long lists of words to memory, and by abolishing the labour of translating English *words* into Latin, and *vice versâ*. The idea, that is the action or the object, has been connected up directly with the Latin expression without the intervention of English. Above all, the boy has been taught to some extent to think in Latin. As new words and expressions arise, they are not explained by being translated into English, but are paraphrased by means of Latin words already known. If later on, as in an examination, the boy has to translate from English into Latin, or for the matter of that into any other foreign language, his translation will be strictly idiomatic, because he will be thinking not of the words before him, but of their sense.

Now, all this is obviously the natural method. It is the way we learn our mother-tongue as children. We get to know and use the names of familiar objects by hearing people repeat them many times and seeing them point to them. Words are really sounds, not collections of letters. The printed word represents the sound, and not *vice versâ*, for the spoken language existed long before writing was invented, and there are many races to-day which have a well-developed spoken language, but no system of writing. Written and printed words are lifeless; they must be translated into sounds, either audibly or mentally, before they live; and so by teaching a foreign language first of all as a spoken tongue, we are undoubtedly following the true natural method. And Dr Rouse, by applying this idea to Latin and Greek, has certainly given those ancient languages a happy and glorious resurrection.

III.

From conversation, the boys soon go on to reading and composition. The reading-books used are interesting stories which the boys will

love for their own sakes, long stories for preference, to avoid the tedium of constant repetition; and later they come to the classical masterpieces. In Greek, Homer is a great favourite. They do not translate, but read in the original, which, by this method of teaching, they understand; and cultured visitors and educational experts who hear the Perse boys read Latin and Greek, with the appropriate rhythm and modulation, speak of the new æsthetic pleasure which they experience when listening. Like Ezra, the boys 'read distinctly and give the sense, and cause the hearers to understand.'

When it comes to composition, a story is told in Latin by the master, and the boys have to write it out in the same tongue from memory, paraphrasing it as they like. At a later stage a story is given in *résumé*, and has to be filled in by the boys; and at a later stage still a theme only is given, around which the boys write a story. Of course, this is a very bare outline of the method, and those who wish for fuller details should read the two pamphlets issued by the Board of Education, *The Teaching of Latin at the Perse School, Cambridge*, and *The Teaching of Greek at the Perse School, Cambridge*.

One of the foolish criticisms sometimes levelled at this method is that by it the boys do not learn grammar. As a matter of fact, they learn far more grammar than by the old method, but they learn it in the right order, for, as Herbert Spencer has pointed out, 'grammar was made after language, so ought it to be taught after language.' The Perse boys really learn their grammar with their language, and learn it logically, knowing and understanding the reason for everything.

Another foolish criticism is that to use Latin and Greek for describing daily life degrades the languages that should be associated only with noble literature. 'The answer to this is simple,' says Dr Rouse; 'knowledge of a language must come before taste.'

Greek is taught in the same way as Latin, except that the first few lessons are given to teaching the new script.

In modern languages the Perse School is equally successful, and Frenchmen who hear the boys carry on their discussions entirely in French are astonished at the correctness of the pronunciation. Mr Louis de Glehn, the modern language master at the Perse, has brought the direct method to perfection, and he lays great stress upon the importance of teaching boys in such a way that they shall understand directly what they hear and read, and express directly what is in their minds.

The singing of songs in the foreign languages, and the writing and acting of plays, form an important and delightful part of the teaching of languages, both ancient and modern, at the Perse School. The boys write their own plays, and surprising results have been attained. Many of these are published in the series of Perse Playbooks. One of the remarkable things about the Perse methods is that boys who would be incapable of learning any foreign language at all by the old plan are able to become quite proficient by the new.

The whole thing is really a revolt against the German influence that has so long dominated the educational as well as the military world. Some boys may be terrorised into learning the declensions and the conjugations and translating foolish sentences, but all must of necessity detest the work, and certainly cannot be expected to see that it has even a remote connection with their own life.

IV.

Dr Rouse has found by experiment that the average boy can easily take four languages and learn them thoroughly during his school course. The best age, he holds, to begin the first language, which is French, is ten years. It is more difficult for the child if this is left till eleven or twelve, and extremely so if thirteen is reached before a start is made. On the other hand, if he begins at seven, eight, or nine, nothing is gained, for at fourteen he will know no more than the boy who started at ten. The earlier years are therefore given up to a thorough grounding in English, and at ten the boy begins to learn French by the direct method. The true pronunciation of foreign languages can be attained only if the child starts young, while his ear is susceptible and his vocal organs are pliable. Directly the boys begin to ask questions it is known that their interest is aroused. As already explained, writing only follows the oral lessons, and here the sanity of Dr Rouse's ideas is shown, for he strongly condemns the current system of underlining errors in a written exercise, which simply serves to emphasise them and impress them upon the child's mind. In the early stages it is always easy to correct a spoken error, whereas writing stereotypes the mistakes on the mind, the eye as well as the ear being involved.

The other languages follow at intervals of two years—Latin at twelve, when the child has learnt to express himself in French, Greek at fourteen, and German at sixteen; and it is interesting to know that the greater maturity of the mind, as time goes on, enables the boy to learn the later languages so much more readily that at nineteen he will have practically the same knowledge of all. When the fourth language is begun, the first is dropped except for reading, to keep it fresh. The lessons last from half-an-hour to three-quarters of an hour, care being taken that they should cease before the child shows symptoms of weariness; and there is generally one lesson a day in each language. It is found that double time does not give double results, and with three or four daily lessons in a language less might be learnt

than with one lesson. By this system of teaching the crib is ruled right out of court, for it is useless, and in this sense the Perse methods may be said to have a good moral effect as well as an intellectual advantage.

The teaching of English is carried out on equally sane and natural lines. The boys are given a real love for literature. They act Shakespeare and other classical dramas; and Dr Rouse's idea is that eventually handwork, carpentry, embroidery, and so on, should be linked up with literature and other intellectual studies. Thus, when it was decided to act a certain play, the boys would make the furniture for the stage in their own carpenter's shop, would design, cut out, and make their costumes, embroider these themselves, and so on. It is a great idea, and has already been partially carried out. One of the English masters at the Perse School, Mr Caldwell Cook, has shown in his book, *The Play Way*, what a vast deal can be done in evoking the enthusiasm of boys for all that is highest and best in English literature. He has displayed an absolute genius for true education, by drawing out from the pupils what twenty or thirty years ago would have seemed impossible. The Perse boys write ballads and plays; and they give lectures on all kinds of subjects to their own forms. In this they are subjected to the intelligent criticism of their fellow-scholars, and the absence of self-consciousness is remarkable. Here are some of the subjects, taken at random, on which boys have given ten or fifteen minute lectures with great success: 'Saturn and His Rings,' 'Motor-Buses,' 'How to do Your Hair,' 'Greek Architecture,' 'Flying a Kite,' 'Great Eastern Engines,' 'Aeroplanes,' 'Japan,' 'Turbines,' 'Police Traps,' 'Meccano,' 'Foreign Stamps,' 'Preparations of the Germans.'

The natural assumption is that this kind of thing would make the boys horribly conceited and develop a most offensive form of priggishness. But it does nothing of the kind. They retain all their natural boyishness, taking the lectures as a matter of course; and so far from boasting, they rarely mention the matter to their friends and relations. Take an instance known to the writer, of two brothers who in different years lectured more or less regularly in their forms. One, a youth of fourteen, who was interested in architecture, gave a series of lectures on this subject. A representative from a London daily paper was present one day, and it was known that an article would be published describing the lectures. But the boy never even mentioned this to his people at home, and they were left to discover the article in the paper, and recognised the boy from the description and the photograph.

The other brother, thirteen years of age, had been lecturing some months, on and off, on Great Eastern engines and kindred topics, and was selected with several others to go to lecture at the Ladies' Training College for Secondary Teachers in Cambridge. He never mentioned the matter at home, till his family heard of it quite incidentally from outside. It is clear, therefore, that the whole plan carried out at the Perse is simply a natural development of the boy mind. If it were unnatural it would at once produce the priggishness that is conspicuous by its absence. The co-operation of the boy is secured in his own education, and the keynote of the system is that he is trusted by his masters.

'Is the child happy?' That is the great question that Dr Rouse asks himself, for if not, presuming the health is right, then there must be something wrong with the system of education; and in this his views are confirmed by another educationist, Professor Pillans, who says: 'Where young people are taught as they ought to be, they are quite as happy in school as at play, seldom less delighted, nay, often more, with the well-directed exercise of their mental energies than with that of their muscular powers.' There can be no doubt that Herbert Spencer was right when he pointed out that the intellectual action which the child likes is a healthy one for it, and conversely.

How long will it be before Dr Rouse's methods are adopted in the large public schools? 'Can the Ethiopian change his skin or the leopard his spots?' England has a very great horror of any such heterodox proceeding. She loves to walk in the old paths. The political upheaval of the past five years, however, has, to some extent, awakened her; and we may yet live to see the governing body of Eton or Rugby or Harrow, when the headmastership falls vacant, calling in Dr Rouse to reorganise the whole system of education and make the great public schools of England a beacon light to the world rather than a byword.

'THE VERY CHRISTIAN SEÑOR.'

By G. Trevor Roller.

PART I.

I.

CAN you imagine a hot, dusty corral, with a white post and rail fence round it, seven feet high; inside, twenty head of whirling, bad-tempered cows, three mounted men, two dismounted, and one bonfire? It was half-past eleven on a hot Mexican day, and a hurry-up order had come to have the cows branded by noon and clear the corral for another bunch of

cattle. A steaming packing-house to windward of the corral wafted various smells ranging from cooking sausage and boiling lard to the dried, decomposed smell of the fertiliser, which made you cough and splutter.

No wonder the cows were bad-tempered, and no wonder the men used language, both Spanish and English, that was anything but refined! For, of the five, four were Mexicans, and the fifth an Englishman, boss of all the live-stock that came to the packing-house.

They were pressed, and these cows, not for killing, but for the pastures — wherefore the branding — were wild as hares, and about as quick movers. And Brennan (the Englishman), dropping the bossing, had jumped on a cattle-pony, and was helping with the roping and the throwing.

His rope would curl out through the dusty shimmering air and settle neatly over a cow's horns, his pony would slither down on its hocks, and the captive cow would pull up with a stagger and a jerk. She would face her captor, rope taut, with a perplexed what-shall-I-do-now expression. A *vaquero* (cowboy) would sidle up, and another rope would uncurl like a snake and land with open loop underneath her. She would ease the strain on her head by a pace or two forward, and, quick as a flash, as her two hindfeet arrived in the loop, it was jerked, catching them just below the hocks. Then started a tug of war between the two mounted men. 'Stretching,' it's called. The *vaquero* with the leg-rope pulls till the hind-limbs are stretched out and the cow falls on her side with a flop and a grunt. He keeps up the strain, as also does the head-rope man. This keeps her still while the brander runs from the bonfire with a hot brand and clamps it on. He hands the brand to his assistant, who rushes back and pops it in the fire; it must be kept hot. It's the half-heated iron that has to be held on for thirty seconds at a time that is cruel, makes the cattle squeal, and marks a bad brand.

He then takes the rope off the horns, standing well in front. The *vaquero* on the leg-rope holds his taut till the brander is well clear and back to the fire—for many a beast will rise and go for the brander if care is not taken. Once the rope is slackened behind, up gets the cow, kicks loose the running-loop, and grumbling at the indignity, presses back into the bunch. The third horseman by this time has another 'head-roped;' and so it goes on.

Brennan, in his few spare seconds, had been watching his brander—a new hand that morning, pressed into branding because he was so short-handed. The boy was doing well, and working harder than Brennan had ever seen a Mexican work. José Cantano was his name—no references—simply said he had worked with cattle all his life. But he was something to look at, tall and lithe, moving with that apparently slow grace of the Indian which is so deceptive, being really most remarkably quick, like the movement of a cat. His large, brown, wistful eyes looked at you in a tired sort of way, and would suddenly twinkle if a kind word was said. 'Yes,' thought Brennan, 'I'll bet he can ride too. And he's a Yacki Indian, or I'm a Dutchman.' Now, the Yackis hail from the north-west of Mexico, and are supposed to be a wild, untamed crowd. Possibly they may be as a whole, but get one apart from his cattle-raiding companions, and he is 'some man' to have working for you.

As Brennan watched he noticed the agility with which the new-comer would place on the brand, strongly and firmly, the quick tug he gave to the running-noose over the horns ere speeding back to the fire. Certainly this man was a 'find,' an old hand at the job, and worth keeping.

His two helpers had a cow down, and José was running up with the brand. Brennan swung his pony round to look for an unbranded cow to rope, when out of the bunch trotted a long-legged, parti-coloured brute, with a nasty, roving eye. Now, there is one thing in cattle-work you must always remember: that as long as they are in a bunch they are more or less docile, but once a beast gets detached from a herd it may turn into the devil incarnate. So Brennan watched the detached cow. She had ambled with head up to a corner of the corral. Brennan got his rope ready, deciding on her for the next victim. But she turned and showed the fresh brand on her flank, and then—head still up—she started to trot towards José, who at that moment was kneeling in front of a struggling cow, trying to loosen the rope, with his back directly to the oncoming would-be murderess.

There was only a second to think, and Brennan thought. 'No chance with the rope. Go for her.' And he went, both spurs in, with a yell. His pony jumped right at the cow, which, caught amidships, fell with all the wind out of her, five feet from José's back. The pony stumbled and staggered over her, and being a cow pony, with a leg or two to spare, arrived on the other side, hocks well under, and turned, ready for round the second. José, having realised the close shave, tugged the rope loose, eyes all the time on the smother of dust that represented the cow, the pony, and Brennan, then sidled to the fence and so round to the fire, and the work went on.

It had merely been an episode. Nobody made comments. A man and a pony had probably saved another man's life by acting practically quicker than thought, but in cattle-land many things happen quickly and no fuss is made about them. 'If you can't get a move on, then better quit.'

The cows were soon branded and turned out into the pasture.

Brennan went away to his matchboard bungalow, and with the help of a bath got rid of the

dust. He was just regaling himself with a long, cool whisky-and-soda when José arrived on his veranda.

José was hot; the dust on his face had turned to caked mud; his shirt was wringing wet, and very, very dirty. Branding and hopping round a bonfire is not all jam.

'Señor,' he said, 'you have saved me from an injury, perhaps from death. I wish to thank you.'

Brennan smiled, and patted him on the shoulder.

'Nonsense!' he replied. 'I did the only obvious thing. It's an old stunt, and the first thing I thought of doing.'

'Then, señor,' said José, looking Brennan straight in the eyes, 'your thoughts must be as quick as those of a frightened deer, and your action was most Christian in saving me.'

His slim, dusty hand went out; Brennan shook it, drew him—still holding his hand—into his little sitting-room, and sat him down. Then for the first time in his life José had a 'Scotch' and soda. He didn't like it, but he was thirsty, and it was iced. He swallowed it, and expressed a wish that he might continue to work for the señor; the señor said, 'Most certainly;' and José packed off to stake out a claim in the peon quarters, while Brennan settled down to his office-work.

II.

Next day hard work and far afield was the order. Brennan, as they drove and cut cattle in the broiling sun, watched José, now mounted on a bad-tempered, cow-hocked cattle pony, swing right and left, turning a refractory steer here, darting to head a break in the bunch there; sitting like a centaur and getting good work out of the bad-tempered one, a thing that none of Brennan's *vaqueros* had ever been able to do before. 'I was right about his riding,' thought Brennan.

On the way home he picked José out, and asked him many questions.

'Where did you learn your cow-punching?'

'In the northern country, señor.'

'Did you start very young?'

José smiled a slow smile. 'All my life, señor, I have ridden behind herds. Even before I could walk I would ride on my mother's back behind the cattle in the big drives, day after day, across the deserts, praying to the saints the while for water. Then we would reach the foothills, and the alkali would give place to grass, the cactus to the sage brush. Here we would rest a while, and my mother would teach me all the songs the cattle love best—the songs that soothe them when they are storm-herding, the song that urges them when they are weary. Ah! many things like that my mother taught me, señor.'

'And your mother,' asked Brennan—'is she alive?' As he asked the question he glanced at José, who turned in his saddle and looked at him with a face unutterably sad.

'Alas!' he said, 'she still lives, but for her life can only mean a living death. She is blind, señor, and so deaf she cannot even hear her son's strong voice—she who would listen to and hear his very sleeping whispers when he was a baby. The smallpox took this all from her. It came when—after she nursed me.'

'You had it, but you are not marked,' said Brennan.

'Nō, señor; my mother nursed me too well,' he said quietly. 'And now she does not know me. Surely the blessed saints should see that life is no longer for her.'

'So you have come south to find a fortune, so that she may be comfortable?' asked Brennan cheerfully.

'Yes, señor.'

'Then work hard and you will find it.'

'*Gracias*, señor,' said José gravely.

They swung on along the dusty road for home, entered the big compound, and started to unsaddle, when from out of the shade of the stable veranda came two policemen and a sergeant.

Brennan looked at them without surprise, but with annoyance. It was no unusual thing for one of his *vaqueros* to be arrested. Arrests are common enough in Mexico—some little debt in the town, some brawl in a drinking *tienda*. It was annoying, because it meant he would be short-handed to-morrow.

The sergeant came up to him. 'Have you one José Cantano here? I wish to arrest him,' he said.

'What for?' asked Brennan.

'I am not at liberty to say, señor; but it is for an affair that happened far from here,' said the sergeant.

'Well, he is over there, with his back to you, watering his horse,' said Brennan.

The police turned, and spreading out, approached the all-unconscious *vaquero*. They produced ponderous revolvers and advanced cautiously.

'It appears,' thought Brennan, 'that Mr José has a reputation, and that it has followed him south.'

The sergeant, in the centre, halted. José stood by his horse, still with his back to the proceedings. The saddle and the blanket lay on the ground. The bridle was off. José held the end of the *riata*, or halter, in his left hand; his right hand was on his pony's withers.

'José Cantano, I arrest you,' said the sergeant in a fierce and awe-inspiring voice. He evidently did not like the job.

José glanced over his right shoulder and straight down the barrel of a revolver. Quick as a flash his right foot flew up and caught the sergeant's hand. The pistol rose in the air

and exploded. Next second he was on the startled pony's back and heading straight for the second policeman, who fired wildly, then fell over himself in avoiding the whirlwind of dust, pony, and José. Policeman number three took a shot. Brennan heard a yelp behind him, saw a man clap his hand to his thigh, and sit abruptly in the dust. José was now making straight for the compound gates, when from the timekeeper's lodge rushed a fourth policeman and—slammed the gates.

José wheeled the pony in its own length and galloped for the far end. The compound was high, with wire atop. José was cornered; he must surrender, unless he put up a fight, for he was armed. In a flash Brennan made up his mind that this must not occur. He mounted his pony, and, with a word to the sergeant, cantered over to José.

José swung his pony round, and his hand dropped to his holster.

'You'll gain nothing by shooting me,' said Brennan, smiling. José's hand was placed in a less aggressive position. 'Now, what's all this about?' Brennan went on.

'They tried to arrest me, señor,' said the aggrieved José.

'That was quite apparent,' agreed Brennan; 'but why? What for?'

'Because, señor, I made a mistake. I set out to kill a man, and I failed—I only half-killed him.'

'Well, that's better. Things won't go so badly with you, seeing you did not kill him.'

'Had I succeeded, señor,' sighed José regretfully, 'all would have been well. He was a man much hated; those that saw would not have told; I should have been shielded. But no, señor, he is alive, and is at the bottom of all this trouble.'

'Well, you're cornered now, José. It's a bullet for certain if you don't surrender; and if you do, and go quietly, I'll see the authorities and do all I can. There are ways and means; you know that. I may be able to bail you out. I will do so if, when I hear your story, I think you deserve it.'

'When you hear my story, señor, you will want to bail me out, because you are very Christian,' said José.

'Then come on with me, and be polite to the police. Every bit helps; and you have, to say the least of it, somewhat ruffled them.'

José dismounted, undid his belt, and handed his revolver to Brennan. 'Keep it for me, please, señor,' he said.

Brennan strapped it round his own waist, and led his prisoner back to the sergeant, who was murmuring something about a 'tiger' and a 'he-cat' and 'one without shame.' Brennan sized things up. He bowed politely to the police.

'Señors,' he said, 'you have had a hot and dusty walk here. There has been a misunderstanding between you and this man which has led to violent exertion. You have a hot and dusty walk back. Please do me the honour to partake of some light refreshment before you set out.' Then, in English, to a youngster who had come out of one of the offices, he went on: 'Bobby, take the minions of the law and gin them up. Don't make 'em drunk, but send 'em out smiling, you know!'

'Right-o!' grinned the youth called Bobby, and led the way. The sergeant demurred. The policemen licked their lips. Brennan opened an office door of the veranda.

'I will take the prisoner in here,' he said. 'He wishes to make a statement. A policeman can be left outside. I will be responsible for him. Do me the favour, señors, to refresh yourselves.'

It was quite out of order, of course, but it was hot and dusty, and, after all, a little refreshment would be very pleasant; so they went off to be put in a good humour by the excellent Bobby.

III.

Brennan led the way into the office, closed the door, and demanded the tale of José's woes.

It was short and somewhat sad. José had worked for a rich *hacendero*, or ranch-owner, up north, one Ignatio Masbate, a much-hated landlord. José lived on an acre or so of land belonging to this man, in an adobe hut. Here his mother lived also, very deaf, very blind, and very feeble. The rent was deducted from José's wage, and this left him with only enough to buy food and supplies to keep himself and his mother alive. These supplies had to be bought at Don Ignatio's store, so one might almost say that Don Ignatio achieved the impossible—eating his cake, yet keeping it.

One fatal day José was told to rope a certain pony close by his master. José was the best roper on the ranch, and did so promptly. He was then told to throw it, and with a clever trick José snaked a loop on the near hind, pulled taut, and over rolled the pony. Ignatio applauded him; but on their approaching, the pony was found to have fallen on a boulder and broken a leg. Then the pony suddenly changed from a thirty-dollar cattle-hustler to a very valuable animal. José was a careless dog; he should pay for the pony. His rent was raised, his wage reduced. A few days after he had words with Don Ignatio, which resulted in a further raising and reduction. José stood it for a week, then went and informed Ignatio that he must leave and find work elsewhere, as his mother was starving. Ignatio put it quite plainly that he could not do this, as he was bound to his master by a debt for the pony—he must work that off. He could give up the hovel (house, Ignatio called it), and live and eat in the peon compound.

'But my mother?' asked José.

Don Ignatio consigned her to a place that, as José tritely put it, would be fuller for his—Ignatio's—fat presence when he came to die.

José lost his temper. Ignatio lost his, also his common-sense, for he struck José; and it's a stupid thing to do, to strike a Yacki Indian. They have a wonderful memory for that sort of thing. This seemed to calm José, and he went. Next day he transported his mother to a village where he found some good sisters in a convent who promised to care for her if José would send money from time to time. Then José left his mother, and returned to the ranch, saddled his pony, his own property, given him two years before by an American ranch-owner, and went to work. Towards midday he met Don Ignatio, also mounted. José had his rope out, and was driving an old cow that had strayed from her proper pasture. Don Ignatio pulled up and grinned, a nasty sneering grin. José threw his rope with the rapidity for which he was famous, and the noose clipped round Ignatio's fat body like a vice. José galloped downhill with his end of the rope snubbed down on the horn of his saddle. Ignatio bumped from his horse to the ground. At about the sixth bump he became unconscious. The rope was a good one, but the strain was enormous, and it parted after some two hundred yards. José kept going all that afternoon and part of the night, making south. The inert mass he had left behind he supposed dead. What he had done was done, as he put it, 'in the light of the noonday sun for all to see.' But he had many friends, Ignatio none. Nobody would know anything. At the same time, he was going to make himself scarce.

'But, alas!' he finished, 'how could one bump the life out of so much fat? He [Ignatio] awoke in a week, and set men to track me. To-day he has caused this trouble. It means the *carcel*, I suppose, or perhaps death. *Quien sabe?*'

'Nonsense!' laughed Brennan. 'I will see the *Jefe Politico* [Chief Magistrate] to-morrow, and try if I can't work things for you.'

So José went off to the neighbouring town, in the centre of a well-refreshed and happy escort, who reported him as a most docile and obliging prisoner when they reached the *carcel*.

(Continued on page 665.)

THE INDUSTRIAL VALUE OF 'RESIDUAL FIBRES' ON COTTON-SEED.

FEW of us in this country realise that cotton is, botanically speaking, the *fruit* of a plant, a fleecy mass containing a number of seeds, in the outer covering of which innumerable cotton fibres are rooted. The mass of cotton fibres and seeds is picked out by hand from the containing envelope (or 'boll'), and is termed 'seed-cotton.' The seed-cotton is then passed through a machine called a 'gin,' which pulls—or saws—off the longer fibres suitable for spinning. The residue of the 'seed-cotton' after being 'ginned' is known as 'cotton-seed.' About 95 per cent. of the 12,000,000 tons or so of the cotton-seed produced in the world annually is of the 'woolly' variety—that is to say, is covered with short cotton fibres, which adhere very tenaciously to the surface of the shell of the seed. The remaining 5 per cent. consists in the main of Egyptian cotton-seed, which is devoid of these short fibres, and hence is commonly termed 'bald' seed.

As far back as the year 1783 the Royal Society of Arts offered its gold medal and a premium to any one who would produce a reasonable quantity of oil from cotton-seed, it being realised even then that the seed contained a valuable oil, and that the residue of the seed, after extraction of the oil, constituted an excellent food for cattle. The offer was renewed for six consecutive years, but no one qualified for the medal or the premium, and it was only during the first two decades of the nineteenth century that any attempt was made, on a practical scale, to extract oil from the cotton-seed. At first the progress of this industry was slow. The literally phenomenal expansion of the manufacture of cotton-seed oil and feeding-cake in the United States dates from about 1860 to 1870. Up to that period enormous heaps of rotting cotton-seed were familiar sights in the neighbourhood of the ginneries, and legislation had to be introduced, on sanitary grounds, to compel the planter to burn, or otherwise dispose of, the cotton-seed resulting from the ginning of the seed-cotton.

In 1860 there were seven cotton-seed-oil mills in the United States, and in 1870 there were twenty-six. By 1910 the number had increased to eight hundred and ten. In 1874 about 35,000 tons of cotton-seed were crushed in the United States, representing about 5 per cent. of that year's crop; in 1910 the quantity crushed was over 4,000,000 tons, representing about 80 per cent. of the seed produced in that year. During the years 1911 to 1915 the proportion of cotton-seed crushed for oil and cake in the United States was nearly 90 per cent. of that grown, and the value of the cotton-seed products of the cotton states to-day is said to be greater than that of their combined crops of wheat, oats, and hay.

During the last five years between 5,000,000 and 6,000,000 tons of cotton-seed were produced per annum in the United States, and the value of the cotton-seed crop in 1917 was between £60,000,000 and £70,000,000.

The discoveries made during the past fifty years relating to the thousand and one uses to which the products of the cotton-seed can be put, and the employment of these products and of the by-products resulting from the milling of cotton-seed in hundreds of industries to-day, were recently referred to by Mr J. W. Pearson, chairman of the British Oil and Cake Mills, Limited, as constituting one of the most marvellous romances of commercial history.

In addition to some 900,000 tons of oil and about 2,000,000 tons of cattle feeding-cake now yielded by an average cotton-seed crop in the United States, there are furnished about 2,100,000 tons, consisting of the shell of the seed, on the outer surface of which are found the short residual fibres remaining after the longer fibres required for the spinning of cotton goods have been removed by appropriate machinery.

The proportion by weight of the shell of the seed to the residual cotton fibres is roughly as 3 is to 1, so that about 525,000 tons, or something over 10 per cent., of the original weight of the ginned cotton-seed in the United States (that is, the seed from which fibres long enough for spinning have been gathered) consists of these short residual cotton fibres, which, until some six years ago, constituted the only portion of the cotton-seed that was not properly turned to account.

Scientific men have for many years recognised that these short cotton fibres could be very usefully employed in many industries, but the difficulty was to separate them from the shell of the seed in which they grow. It is stated that hundreds of thousands of pounds were spent by firms and individuals on both sides of the Atlantic in the vain endeavour to construct a machine for recovering the short fibres in a commercially utilisable condition, and the credit for solving this difficult problem must be given to British enterprise, because the first commercially successful machine was worked out by a British engineer. The first plant of machinery for recovering these fibres on a commercial scale was installed in Europe by British capital and initiative, and in 1913 a factory was erected in the United States, entirely by private British enterprise and with British capital, which furnished, up to the outbreak of war, over 2000 tons of these residual fibres to papermakers in Great Britain, and has since supplied upwards of 6000 tons to the Du Pont de Nemours Powder Company of America for the manufacture of explosives.

The dislocation of shipping conditions brought about by the war made it impossible commercially to develop this industry in Great Britain during the last four years, but the material has been subjected to examination by expert analytical chemists and other authorities in England, and to trial on a manufacturing scale. It has been pronounced suitable for the manufacture of nitro-cellulose powders by our Government authorities, and artificial silk has been produced from it by the well-known makers of this article, Messrs Courtaulds, Limited, of Coventry. Mr C. F. Cross, F.R.S., one of the leading authorities on cellulose, has independently examined into its suitability for the production of cellulose acetate, which played so important a part in the construction of aeroplanes during the war, and he states that in this respect these short fibres fulfil the most exacting requirements.

The solution of the problem of detaching the residual fibres from the shell of the cotton-seed has turned a waste product into a cheap raw material for many industries in which the valuable long-staple cotton fibres were hitherto employed, thus achieving a twofold economic advantage—the utilisation of a waste product and the liberation of long-fibred cotton for the purpose for which it is becoming needed with increasing urgency—that is, the maintenance of Lancashire's spinning industry, the manufactured products of which amount in value to about £110,000,000 per annum, or, roughly, one-fifth of the value of our total exports.

The indirect benefits attending the utilisation of these residual fibres are, however, as great as, if not perhaps greater than, the direct benefits.

India is generally considered to be the second largest cotton-producing country in the world, with an annual cotton-crop of some 4,000,000 bales, and a concomitant production of some 2,000,000 tons of cotton-seed. For several reasons (of which space forbids an exposition) India has not hitherto grown the types of cotton needed by Lancashire in anything like the measure required, and for many years our British spinning industry has been dependent for nearly 80 per cent. of its raw material upon the United States, a condition of affairs at the best unsound, but now a grave menace to the life of the industry, owing to the fact that of recent years the United States have been spinning increasing quantities of their cotton in their own mills. While the *quantity* of cotton produced in the United States during the past ten years has fluctuated between 12,000,000 and 16,000,000 bales (of which Lancashire needs from 3,000,000 to 3,500,000), the proportion absorbed by American spinning-mills has risen during the last fifteen years (according to the recently published report of the Indian Cotton Committee appointed in October 1917) from about 33 per cent. (about which figure it had stood for some forty years) to nearly 60 per cent.

Professor John A. Todd, the well-known authority on cotton economics, tells us that the world's requirements call for a progressive increase of 1,000,000 bales of cotton per annum, which will be cumulative, and he gives cogent reasons for the view that 'it is to India that we must turn as the only hope for relief in the way and to the extent which the cotton industry requires so urgently.' It is, therefore, gratifying to note that the report just referred to gives evidence that during the last few years the cultivation of

the American type of cotton in India has made good progress. But if the 1,000,000 extra bales so urgently required are produced, there will likewise be produced some 500,000 extra tons of cotton-seed. Let us suppose that this is done in India. There is at present no scientific cotton-seed milling industry in that country, and large quantities of Indian cotton-seed are exported to British crushing-mills. Now, the Indian cotton-seed retains a goodly quantity of residual fibres. The presence of these fibres not only renders the seed a bad traveller, but is a serious disadvantage in the manufacture of oil and feeding-cake on the British system; hence such seed fetches a relatively low price.

The advent of these new seed-defibrating machines, however, puts a different complexion upon matters. By being defibrated in India before shipment, the seed would be improved from all points of view. It would occupy less space on board ship, thus saving expense in freight (ocean freight being charged according to volume occupied); the risk of fire from 'heating' would be reduced to a minimum, thus commanding lower insurance rates; and the defibrated seed would sell in British markets at a considerably higher price, thus yielding the shipper a larger profit. But this is not the end of the benefits. The material removed in improving the seed is itself a merchantable commodity, the value of which in the manufacture of high-grade papers, explosives, &c. has already been proved and established, and India is notoriously short of such papermaking material. The aggregate additional net revenue derivable from these sources is stated to amount, in the case of certain varieties of cotton-seed, to as much as one-tenth of the value realised for the cotton concomitantly produced, which, in so highly competitive a market as that for cotton, is exceedingly important.

The general subject of the industrial value of these short cotton fibres was dealt with in a lecture recently given by Mr Ed. C. de Segundo, A.M.Inst.C.E., at the Royal Society of Arts. At the conclusion of the lecture one of his cotton-seed defibrating machines was shown in operation, removing from cotton-seed the residual fibres not economically recoverable by any saw-linting mechanism; and in the course of an interesting discussion which ensued, Professor Todd drew attention to the importance of the successful industrial utilisation of these residual fibres. He pointed out that 'there were many countries in the world in which cotton could satisfactorily be grown; but the question was whether it could be made to pay in competition with other crops. One of the factors in that question was the by-products that could be realised, and he thought the by-products obtained from cotton by means of the lecturer's machine might just turn the scale in many cases in favour of cotton. The importance of these by-products could hardly be exaggerated. The use of fibrous cellulose for artificial silkmaking was one of the great possibilities of the future. There was practically no limit to the possibilities of artificial silk, and the lecturer had produced an excellent raw material.'

The commercial development of this industry in Great Britain has been delayed owing to the war, but arrangements are now in progress for the establishment of a cotton-seed defibrating plant on a large scale at a seed-crushing mill in England. The engineer and manager of this mill estimates that an additional revenue of at least £2, 10s. per ton of seed crushed can be earned by treating certain of the woolly varieties of cotton-seed in this machine prior to crushing them for oil and feeding-cake.

During four and a half years of war the resources of science and industry were applied to the destruction of human life and property on a scale and in a manner unparalleled in the history of civilisation. It will be years, perhaps generations, before humanity recovers from this cosmic upheaval, during which a gigantic inflation of credit has been unavoidably caused. Recovery can be effected only by increased production and by scrupulous attention to efficiency and economy in all departments of trade and industry. The provision of a cheap raw material, by turning to account these hitherto neglected residual cotton fibres, is, therefore, a factor in imperial economics which we cannot afford to neglect.

THE VILLAGE WAR-MEMORIAL.

BEYOND the sound of city's rush and roar,
A little hamlet led its peaceful life:
Its lusty manhood roamed its meadows o'er
In happy ignorance of the coming strife.

Where are they now, those hardy sons of toil,
Who left their homesteads for their country's sake?
Sleeping awhile beneath a foreign soil,
Until the Great Reveille sounds 'Awake!'

No more shall they their fruitful acres plough,
Or tend the lush, green pastures o' the vale;
No more at eve frequent 'The Barley Mow'
For cheery gossip o'er a glass of ale.

Their teeming flocks they ne'er again will fold,
That grazed at will upon the breezy hills;
Or call the cattle from the trackless wold,
To stall them safe from winter's cruel chills.

Nothing *seems* changed. There stands the village green,
Whereon in boyhood they were wont to play;
The little church still nestles in the dene
Where in their tender years they learned to pray.

And yet, beside the parting of the ways,
A simple cross of stone now rears its head,
Crowned by the sculptor with immortal bays,
In honour of the noble spirits fled.

And oft, when day is fading into night,
The sorrowing peasants to the shrine repair,
And, resting in the gloaming's mellow light,
For those they've lost send up a silent prayer.

THE KEEPER OF THE JEWEL-HOUSE.

By Major-General Sir GEORGE YOUNGHUSBAND, K.C.M.G., K.C.I.E., C.B.

I.

THE Keeper of the Jewel-House holds one of the oldest offices under the Crown. In very ancient days, when the regal emblems were few in number and of no great value, the king generally carried them about amongst his other impedimenta when he moved from place to place. Moreover, this was necessary, as the king constantly wore his crown and bore his sceptre, in order that his regal dignity might at all times be impressed on the people.

Even in battle the king wore his crown; he led his troops in person, and the crown round his helmet shone from afar to encourage his followers and throw dismay into the ranks of his enemies. For not only would the king be there, but around him, assuredly, would be gathered his doughtiest warriors. (At the battle of Agincourt Henry V. wore his crown, and in single combat with the Duc d'Alençon a portion of it was chipped off. We may also recall that at the battle of Bosworth Richard III. had his crown on, and retained it till at last he fell, overwhelmed by his enemies. Secreted in a hawthorn-bush, it was there found by the victor, who was crowned on the battlefield as Henry VII. That was probably the last occasion on which an English king wore his crown in battle.)

As the centuries succeeded each other the regalia increased in value and quantity, so that it became inconvenient and unsafe for the king always to carry his treasure with him. Thus it came about that the monarch looked for some safe place where the crown-jewels might be stored when not in use. Edward the Confessor, who had great faith in the sanctity and the safety of the Church, entrusted the guardianship of the regalia to the abbot and monks of Westminster Abbey. This was in or about the year 1042. Thus the abbot of Westminster became the first custodian of the jewels, and the treasure-house at Westminster, which still exists, the first jewel-house.

There the regalia remained for the most part, for nearly two centuries, through the reigns of many monarchs. Soon after Henry III. came to the throne, however, an unhappy occurrence took place. Under the shadow of its sanctity, Westminster Abbey had proved safe enough from outside marauders, but amongst the monks was one who, inured to the phantom guard, achieved the simple task of unlocking the door and removing some of the king's treasure. These items he sold, but fortunately he was caught before he had taken any of the older and more valuable portions of the regalia.

Henry III., who was a practical monarch, came to the conclusion after this experience that perhaps in this sinful world a fortress guarded by soldiers was a safer place in which to store the regal emblems than the holiest church. He therefore removed the treasure to the Tower of London, the strongest fortress in England, heavily armed and guarded. He also appointed the first official Keeper of the Regalia in 1216, a little more than seven hundred years ago. The name of this first Keeper has not been left on record, but a few years later, in 1230, we find that the Bishop of Carlisle held the office. It is not, however, likely that the bishop sat in the Tower and kept personal watch and ward over the crown and the jewels. More probably, as was the custom in those days, he drew the emoluments and delegated an assistant-keeper to do the watching for him. We know, for instance, that Thomas Cromwell, Earl of Essex, who was Keeper of the Regalia in the reign of Henry VIII., held other and higher offices at the same time. The Marquis of Winchester, too, who as Keeper handed the crown-jewels to the unfortunate Lady Jane Grey, held another appointment simultaneously.

II.

When the regalia first came to the Tower of London they were probably placed in the White Tower, that being the central keep and the strongest place. And the most likely spot in the White Tower seems to be the little chamber which opens off the crypt of St John's Chapel, a chamber which was until lately erroneously marked 'Sir Walter Raleigh's Cell.' Here the treasure would have the double safeguard of sanctuary and soldiery.

But as time went on and the regalia further increased in number and quality, a special Jewel-House was built outside the White Tower, adjacent to its south face. This Jewel-House is

 [*All Rights Reserved.*]

shown in the plan of the Tower made in 1597 during the reign of Queen Elizabeth. But though there was a Jewel-House and a Keeper of the Regalia, the crown and the other jewels frequently made their appearance outside the Tower, and sometimes under rather distressing circumstances. Even Henry III., who first placed them there, towards the end of his reign took crown and jewels to France, and there, with the assistance of another sovereign, Margaret, Queen of France, pawned them to a syndicate of French merchants. They were, however, redeemed and brought back to England for the coronation of Edward I.

In the reign of Edward III. the crown-jewels were pawned to some merchants in Flanders, to meet the expenses of a prolonged war. Richard II. again pawned them to a merchant of London, named John Philipot, for £10,000; whilst Henry V. similarly pledged them to the Mayor and Corporation of London for 10,000 marks. Henry VI., in his turn, pawned the regalia on several occasions. Possibly it was these experiences of the misty past which caused a law to be enacted that the King of England may not take his crown out of England. That law is still in force, so that when George V. went to the East to be crowned Emperor of India, it was found that the Coronation crown could not go with His Majesty. A new crown had, therefore, to be made, which may be seen amongst others in the Jewel-House at the Tower of London.

Thus, though the jewels went through strange adventures, they returned safely to the Keeper, and when James I., in his own handwriting, made out the list of the royal treasure, it was both rich and numerous. But, alas! only a few years later the old and priceless regalia came to an untimely end. Charles I. made deep inroads on it, taking most of the plate in order that it might be melted down to meet the costs of the war he was waging against the Parliamentary forces. After that unhappy monarch had met his doom at Whitehall, all crowns and other emblems of royalty were ordered by Parliament to be broken up and totally destroyed. This order was carried out literally. Few items escaped, but amongst these were the Black Prince's ruby, now in the state-crown of George V.; some pearl ear-rings belonging to Queen Elizabeth, which are also in the same crown; and Queen Elizabeth's gold salt-cellar. Amongst the priceless treasures thus wantonly destroyed was King Alfred the Great's crown, made of gold wire and set with jewels.

On the Restoration a completely new set of royal emblems had to be made for Charles II., and these form the nucleus of the crown-jewels of the present day.

III.

Under the Commonwealth, though there were now no jewels to guard, Sir Henry Mildmay seems to have retained the office of Keeper of the Regalia, or, as he was then styled, the Master and Treasurer of the Jewel-House. During some reigns this officer was called the Keeper of the Regalia or the Keeper of the Crown-Jewels, and again in others, as at the present time, the Keeper of the Jewel-House.

The Keeper of the Jewel-House is in a curious, perhaps unique, position in that by ancient warrant 'he hath no superior officer.' He takes no orders from anybody except from the king personally, or those conveyed to him from the king through the Lord Chamberlain. And this right is confirmed to him to this day in that his warrant of appointment reads that all the rights and privileges of his office as enjoyed by his predecessors are to be his. The origin of this distinction is not difficult to trace, for in old and less regular days without this safeguard it would have been open to any officer superior in rank to the Keeper to order him to hand over all, or portions of, the regalia. Even at the present day, but for this safeguard, a military officer, who, under pain of death, has to obey the orders of those senior to him in the army, might find himself in a precarious position—between the devil and the deep sea, so to speak.

The precedence of the Keeper of the Jewel-House was laid down in the days of Charles I. He was to have precedence after privy councillors and before all judges, and as that position has never been abrogated, whilst all warrants to this day confer the privileges held by predecessors, that is still his right. The robes of the Keeper are like those of a baron, but with a crown embroidered on the left shoulder. In ancient days he ranked as a baron and had a seat at the barons' table at the coronation of a king. He was also frequently made a privy councillor, and if not already of higher rank, was made a knight-bachelor, and ranked senior to all the knights-bachelor of England.

Amongst the Keeper's emoluments and perquisites in early days were many curious items. Though his regular salary was only fifty pounds a year, the deficit was bountifully made up. Thus, he had apartments set aside for him in all the king's palaces as well as at the Tower of London. He was entitled to a table of fourteen double dishes per diem served from the king's kitchen, with wines, beers, &c., as seemed good to him. Out of the king's gift-money at the New Year the Keeper of the Regalia received £300. He calculated also on getting another £300 in presents from foreign ambassadors. The king's goldsmiths gave the Keeper twenty pounds in gold every time he signed a bill, doubtless as a gentle suggestion that he should not examine it too carefully. One way and another this fortunate officer could count on an annual income, pay and perquisites combined, of about £6500 of our money.

The Keeper of the Regalia in the days of the

Tudors had his responsibility for the king's crown curiously emphasised. He was, in fact, never allowed to let it out of his sight—from the moment it left the strong guard of the Tower till it returned again—when it was taken out for the king to wear on State occasions, such as the opening of Parliament. The orders went so far as to enjoin that the Keeper should with his own hands place the crown on the king's head, and after the occasion should himself take it off and convey it to the Tower. Even during the whole time the king was wearing the crown the Keeper was ordered not to let it out of his sight; and to enable him to perform this duty he followed the king into the House of Lords, and, together with Black Rod, stood at a corner of the Woolsack during the ceremony. That, never having been abrogated, is still the duty of the Keeper of the Jewel-House. Sir Gilbert Talbot in 1680 made a complaint that, as he naturally arrived late, having to follow the king, certain unmannerly persons, members of the House of Commons and the like, had pushed their way into his place at the corner of the Woolsack, and he bitterly decried this abuse of his privilege.

IV.

Evidently in the easy-going days of Charles II. the strict guard on the Jewel-House, then removed to the Martin Tower,* was greatly relaxed, for when Colonel Blood made his bold attempt to steal the crown the sole custodian was the assistant-keeper, an old man over seventy years of age, named Talbot Edwards. The Keeper himself, the same Sir Gilbert Talbot above mentioned, preferred to live at the Palace at Whitehall.

Besides the Bishop of Carlisle, the Earl of Essex, and the Marquis of Winchester, many celebrated persons have been Keepers of the Jewel-House. Amongst these may be mentioned the Honourable James Brudenell in 1716; Charles Townshend, Lord Lynn, in 1730; William Neville, Lord Abergavenny, in 1739; John Campbell, Lord Glenorchie, in 1745; Sir Richard Lyttleton in 1756; and Henry Vane, Earl of Darlington, 1763–82. On the death of Lord Darlington the office was for some years unfilled, the Lord Chamberlain assuming the duties, and doubtless taking the salary in addition to his own.

The office was re-established, however, early in the nineteenth century in the person of Lieutenant-Colonel Charles Wyndham, who rode in the historic charge of the Scots Greys at the battle of Waterloo, and who, it is said, appears in Lady Butler's famous picture of that event called 'Scotland for Ever.' Colonel Wyndham's appointment formed a precedent, and since then none but old officers of distinguished war service have been entrusted with the custody of the crown-jewels. There is something appropriate in this sentiment, which had its origin with Queen Victoria, in whose generous heart was always a soft corner for the old soldier. Amongst Colonel Wyndham's successors have been many distinguished officers of high rank, known, by name at any rate, to the present generation—Lieutenant-General George Dean-Pitt, Lieutenant-General Sir Michael Biddulph, Lieutenant-General Sir Frederick Middleton, General Sir Hugh Gough, Lieutenant-General Sir Robert Low, and General Sir Arthur Wynne.

The Keeper of the Jewel-House is no longer allowed to live where he pleases, nor does he follow the king when he moves from one palace to another. He now has an official residence in the Tower of London, over the Traitor's Gate, known as St Thomas's Tower, thus named after Thomas à Becket. The Jewel-House is in the Wakefield Tower, which stands within a few yards, the two towers being connected by a bridge much resembling the Bridge of Sighs. The duties of the Keeper are not onerous, but they are responsible and exacting. For instance, he must be present in the Tower at certain hours of the day, and he must sleep in the Tower. He may not proceed on leave, even for a few days, without receiving the king's permission, through the Lord Chamberlain. By special arrangement with the Constable of the Tower, the Major of the Tower answers for the Keeper in his absence.

Formerly the office of Keeper of the Jewel-House was bestowed by the king on the Keeper for life. But this has now very rightly been altered, for it became apparent that officers in their extreme old age were not physically capable of sustaining the responsibilities and the duties of the office. The pay of the Keeper has greatly varied throughout the ages. Of old, as we have seen, in pay and perquisites that fortunate individual made about £6500 a year of our money; besides which he had free board and lodging at the king's expense. In 1680, however, Sir Gilbert Talbot made complaint to Charles II. that he had received no pay or perquisites for twenty years, and sent in a bill for what he deemed due to him. Whether this debt was discharged is not related, but probably so (at any rate in part), for Sir Gilbert remained on as Keeper for eleven more years. For the past century the pay of the Keeper has been fixed at £300 per annum, with a free residence in the Tower of London. This he draws in addition to his military pension. The Keeper has nothing to do with the Tower of London beyond residing in it, though he naturally conforms to the rules and regulations which apply to all who live within a fortress. The Tower of London is administered by the Constable, the Lieutenant, and the Major, whilst the troops in garrison, usually a battalion of the Guards, are commanded by their commanding officer; but the Keeper of the Jewel-House, who 'hath no superior officer,' is neither above nor below any of these.

* One of the lesser towers in the Tower of London.

WITHIN TOUCH.

CHAPTER III.

FEW rides can have been wilder than that one of ours. Ere we had well started, the maid, to prevent herself being cast out of the pillion, was forced to work her hands along each side of my belt and grip it in front of me, bracing herself with her arms around my body and her breast against my back, so beset were we by jolts, swerves, and stumbles—stumbles which were harrowing uncertainties—to the tune of the Spaniard's desperately striking hoofs and heavy snorts.

She was admirably brave in such a case. I felt her gasps, but she did not let me hear them, and never thought to speak a word of caution. As for me, I resigned myself to catastrophe at any stride. With jaw hardened and muscles tense, I took it for granted that I was about to be launched headlong.

Yet I rode with a certain caution, for what it was worth. The night was not so thick but I could see something of how the road before me lay. I could make out its dark face, gleaming here and there with wet, twenty yards ahead, and perceive when it began to rise or fall. Cruel though the practice was, I drove on hardest when we were going uphill, and thus could afford to hang a little on a downward slope, where full career must have proved fatal.

In such wise, marvellously escaping an actual fall, we made speed towards the marsh, only twice losing time, when I stopped in doubt of the proper road—but decided aright. Our fortune held so good that we met not a single soldier, nor heard a voice accost us save occasionally a rustic shout, which reviled us from a hedge whither the crier had hastily sprung; and presently we had gone by the lights of Bexile, plain enough, and I was facing a fresh difficulty —how to distinguish the spot where we must enter the marsh, just behind Northeye Chapel, which I could not hope to see from the road.

I ceased to goad our Spaniard, dead-beat by now, and spoke of my quandary when I thought we were near the place. Mistress Ruthven and I strained our eyes, but in vain. Her counsel was to go seaward forthwith, yet I hesitated to do that. There was a path to the chapel and a track beyond to the beach, could I but discover them. Both were long gone out of use, desolate relics (or I had not lain so near), but they were of great import to us, for they avoided the dikes and pools. To venture by any other way in this gloom would be to struggle through water and mud at every second pace, and possibly to drown. I pricked on a little, until I was sure I had come far enough, but there was no trace of path. So I drew rein and dismounted.

'We must grope for it, mistress,' I said, holding up my hands to her, 'and we were safer to trust our feet.'

She put her hands on my shoulders and came down in my arms, and the holding of her light body for a second, with her face so close to mine that I could see her smile and the brightness of her eyes, was a talisman that drove all annoyance from me. I led the staggering horse off the road and let him go, after loosing his band, hoping that he would find a kind master, if not claimed by the post-house, for he had served us very well; and then I touched her wrist.

'Will you hold my hand?' I said. 'You are like to need it.'

'And you to need mine,' she said with a little laugh, peering before her; 'for all equally may stumble here. I hope I shall have strength to hold you up.' With a turn her palm came warmly into mine (we were both gloveless), and her fingers clung. 'Is this mud or a rush-bed?' she asked, making a careful step.

We moved on for perhaps a hundred paces; then the gleam of water stopped us. It was a dike. I might have jumped, but there was no such remedy for her.

'To the right or the left?' she queried.

I led her to the left for another hundred paces, only to be stopped by a second dike at right angles to the first.

'So it should have been the right,' she said, still cheerily. 'Come, we must hasten;' and, gripping my hand tighter, she took me at a run back over the firm ground. 'How long will the hoy wait?' she panted after a while.

Before I could reply she drove against me, crying out warningly, and we were sinking into thin mud, dropping as if through water. A terrible fear that our heads would follow our legs under flashed through me as I clutched her by the waist; and, indeed, not until the slime was pouring over the tops of my jack-boots did I feel a solider footing beneath. I was able to maintain my balance, and, lifting her clear, I got us both to firm ground again; but the outcome of the misadventure was that her lightness of spirit was all gone, not because she stood soaked and shoeless, but because we seemed cut off from the sea. I believed I heard a sob from her.

'Nay, nay, we are not beat yet,' I said whilst pulling off and emptying my boots. 'Let us go straight for the sea. I will carry you over the dikes.'

'Can you?' she asked, hope reviving in her voice.

'Yes; I saw this afternoon that the water was not above three feet deep in any of them, and the beds looked not too soft to bear one.'

I would have picked her up there and then and carried her all the way to save her feet, but she forbade me, saying she would take no hurt of the grass. We climbed side by side down to the water-level of the first dike, and I lowered myself into it, and found that I stood quite steady when about waist-deep. Taking her upon my shoulder, I made a big stride and lodged her safe against the other bank, where she must needs pause and bid me clasp her hand to help myself up, which I did readily, though, being afraid to bear on so slight a thing, I had greater trouble to extricate myself than I should have had without her aid.

For a score of minutes, in which we crossed three more dikes, we seemed to make good progress. Then a swamp turned us from our true course, and an accident followed, for the bed of the next dike we essayed proved treacherous, failing me at the very time I was lifting her. We struck the water with a great splash and dived completely under; and I pity her to this hour in thinking what her sensations must have been as she fell from the grayness about her into the blackness which smothered her with an icy shock. My own feelings were bad enough, for I knew not what quagmire might be under us. Howbeit, I gained my legs momentarily, clasping her with one arm, and made a swirling leap at the farther bank, clutching a bunch of rushes thereon before I could fall again, and scrambling forth.

I put her on her feet, yet still held her anxiously.

'Can you forgive my blundering?' I asked.

'What need to ask forgiveness of an accident?' she said, looking up at me. 'And should I not forgive you anything, who have saved my life? Oh! I am the one that must beg forgiveness; I have brought you to a sorry pass. I believe we are lost. I believe we shall never find the hoy. Oh, you have thrown away your life for me—I know it! And I, what shall I do? I dare not go back!'

Her voice rose and then failed her, and she began to cry bitterly. I strove hard to speak her some comfort, and presently she took my arm gently from about her and sought my hand, and, heavy with water and heavy in heart, we fared on again.

The mist had now increased, and several times we doubted that we were keeping straight for the sea, and stopped to listen for the sound of its breaking, which was fallen so gentle as scarcely to be heard, and no great guide, since it stretched so far on either hand. And for a while I was depressed with a strange dread—a dread that we should come upon Leyburn's body. I suppose that my overwrought state made me ill-inclined to see it, for it would really have been of good use, telling me of our whereabouts.

An hour must have passed since our last ducking, when suddenly she shook my hand in excitement. 'Look!' she said, pointing, with her finger close to my face. 'A house.'

I stared, and saw the mist dark and solid a little to one side of us, and my heart bounded for joy.

'A house,' she repeated.

'Ay,' I said, 'and, by God's grace, His House. It is Northeye Chapel, that we have so long sought.'

I drew her forward eagerly, blessing her eyes over and over again as we went, and quickly we were on the path.

It was stony beneath its grass, and without more hesitation I picked her up, and made seaward with running strides. But I had somewhat overrated my strength, I found. The prolonged sufferings of my mind must have told upon me, and several times I was forced to stand and recover breath, feeling my legs very weak and a strange pulsing all over me. And it was during one of these halts that we heard distinctly a man's voice give a shout far behind us.

'Ah!' she cried in my ear, and clung hard to me. 'What does it mean?'

'I know not,' I said; nor did we ever learn. But it gave us a bad fright and drove me to frantic efforts.

Some fifty yards from the white mounds of pebbles which marked the beginning of the beach, and were just to be seen at the distance, I was exhausted, and set her down, listening the while for a repetition of the shout. It did not come.

But presently, as we walked on, my foot struck some shingle, making a sharply rattling cascade—and the sound, it seemed, betrayed us to an ambush. There was a hoarse cough at our very feet; forms which had been lying unperceived scrambled to rise; the shingle all about us poured and crashed beneath scampering steps.

Mistress Ruthven screamed loudly and without disguise, and small blame to her. I heard my own voice as I whipped out the snaphaunce, which I had reloaded lately from some dry powder that was in my tinder-box, and then I changed my tone to an exclamation of relief.

'Sheep,' I said.

She sighed deeply and hung upon my arm, her head fallen against me.

'Sheep?' she said, speaking very low. 'I thought it was death. But soon it will be death, will it not? We cannot escape. Nay, I cannot move farther.'

'The hoy,' I said, trying to encourage her.

She shook her head mutely, hopelessly.

Somehow I found strength to pick her up again, and to carry her across the shingle almost to the water's edge. There I lowered her down until she lay, and I dropped beside her, as despairing as she, for there was no sight of boat or man, no sound of oar or voice.

The hoy had gone. What chance of safety now for me—for her? None! We were finished

with life, we two drenched, exhausted figures, sunken down here—finished, except for a few days or hours of weary evasion.

But ere long I sat up; I must think. The hoy had gone; let all thoughts of it go too. What of the future? Was it worth pondering upon? Should I rouse myself to plan, or yield to the apathy I felt settling upon me? Had I been alone I should have lain down again dully, abandoning consideration as a torment and useless. But this little form by me! Beatrix Mary Ruthven, prone on her face now, with her brow pressed on her arms. Could I let her suffer anguish of disappointment, perchance *die* of grief for want of cheering words, when there might yet be a chance in a thousand of my saving her from our enemies, when Cromwell still might spare her, since the rescue had been no device of her contriving? No, in troth, not if there were any manhood left in me. Dreadful as a turning-back into England was to me, I must paint such in bright colours for her.

I stood up and touched her shoulder. 'Since the hoy is gone, Mistress Ruthven, we must arrange matters anew,' I said cheerfully, 'and keep ourselves secure and comfortable until Telkirk is again ready to help us.'

She raised herself a little—shivering, by the sound of her voice. 'Secure—where?' she said.

I turned and faced inland. 'With one or another of my friends.'

'No!' she cried. 'No, no! I cannot go back. I will not leave the shore. To see soldiers, to see towns—prisons, would send me mad. I will *not* go back. I will lurk in the marsh, if I die of cold and want. Better die peacefully here than in a cell or on scaffold boards.'

I lifted her and held her hand as before, she weeping again piteously.

'Walk,' I said. 'You are cold. And now, listen. What matter a few more weeks in England? Honestly, I think you have little to fear. Even if you be taken, the Protector will give you your life. But you shall not be taken. Presently, when dawn comes, we will find the horse and be once more Captain Leyburn and his prisoner. As such I can safely carry you whither I list for days to come, and that shall be to a certain faithful house where you shall find friends, sisters and a mother, and' (I chafed her hand) 'bright fires to sit by and a bright supper-table too, where the talk shall be of Telkirk hasting back to fetch you away.'

Thus I spoke, and at great length, showing even how she might walk abroad without fear by practising some change of her appearance, until to my delight she began to turn brave, and to be as confident as I made pretence to be, though her confidence, as she let me see, hung upon a condition.

'It is very wonderful,' she said, 'how you have heartened me. There seems scarce any danger in what we have agreed upon, and I shall be of good courage now, so long as you are by me; but otherwise'—— Both her hands gripped mine tightly. 'Oh, go not from me, go not out of call, till we be safe in Holland, or I am lost! Surely lost!'

I enfolded the pleading hands. 'Till Holland,' I said; 'and there I shall not go far from you, unless you bid me.'

She looked at me earnestly as she drew her hands from mine. 'I shall not bid you,' she said. 'You—you shall see me into France an you like. And now,' she added quickly, 'what are we to do till daylight?'

I thought of the shout we had heard, and balanced its suggestion of danger against the cold of the night and our wetness.

'A fire inside the chapel walls,' I answered. 'The sacrilege will be forgiven us in our poor circumstances.'

I felt against my pocket to make sure that I had put back the tinder-box after recharging the snaphaunce—and, just as before it had been her eyes, now it was her ears, for, 'I can hear a boat rowing!' she exclaimed.

I held my breath, held it long, and was on the point of telling her she was deceived, when a faint *oup-oup, oup-oup*, caught me from out at sea. Darting my hands to my mouth, I shouted over the water.

'They have answered,' she cried, whilst my own voice echoed deafeningly in my ears. 'There!'

And this time I heard a weak and distant 'All right—coming.' That calm reply banished doubt. The boat was the hoy's. 'Telkirk,' I said to her.

For the moment following neither she nor I stirred or spoke, nor, I believe, thought it strange we did not. Each guessed the prayer of thanks filling the other's soul. And then we went joyfully to the edge of the sea, and after a little space I called again: 'Captain Telkirk!'

'Ay, ay,' came the old man's voice. 'Is dat Mr Simpson?'

'It is, captain, and well pleased to hear you. I feared to have missed you.'

'Oh, de fog and calm make us very late. But no matter now. Dere vill be vint at dawn.'

The yellow blur of a lantern, which some one had lifted, showed, and soon we could make out the boat's hull and the figures in her.

'Vat—eh? Two?' exclaimed Telkirk.

'Yes, an extra voyager, by your good leave, I said.

'A luty! Is de laty in de same box?'

'Ay,' I answered; 'and a desperate box it has been. You will not refuse her?'

'No, certainly. I dake her vit pleasure. Ah, de vater shallow hereabouts.'

'No need to run aground,' I said; 'we will come out to you.' I turned to my companion and put my arm round the slim waist that necessity had made me so free of. 'For the

last time,' I said, meaning that I should have no occasion after this to carry her.

'Yes,' she answered softly. She let her hand rest on the arm about her, as if she thought I referred only to that. 'Yes,' she said, 'for the last time, of course. I have liked to feel it in danger, but I shall not want it in safety—on our Franceward road.'

Her voice seemed scarce in accord with her words. I paused in the act of stooping to lift her, and my face was scarce an inch from hers. I read her eyes. Then quickly she looked aside, with plain intimation. She had shown me a promise, but I must expect no more as yet.

So I kept my gaze on the boat as I waded out, nor seemed to think of what I bore, yet all the while I was telling myself that, dear as my life had been to me when I carried it, as the saying is, in my hands, it was become infinitely more precious now that I carried it in my arms—which I knew full well I was doing.

THE END.

SPITTING-SNAKES AND SNAKE-POISON.

By H. A. Bryden.

WE in Europe are fortunate indeed in being almost completely free from the terror of those poisonous snakes which in tropical countries are a very real and constant danger to human life. European vipers, of which there are various species, do certainly exist; but they are, compared with their tropical relatives, not very formidable, and deaths from their bite are few and far between. In Asia, Africa, and other continents it is a very different story, and deaths from snake-bite, especially among natives, are to be numbered annually by thousands.

Certain serpents, especially among the African species, have the faculty not only of inflicting a deadly wound by a lightning-stroke of the perforated fangs through which the poison is forced, but of ejecting their poison for some considerable distance in the direction of the person or animal to whose near presence they object. When the eyes, which are nearly always aimed at, are thus struck by the poison emitted, the consequences are painful and even serious. Blindness for several days, often a week or more, is certain to follow; while, if the poison should happen to come in contact with a wound or a cut, and so become mingled with the circulating blood, death even may ensue. Among the species which are known to indulge commonly in this unpleasant habit are the African cobra (*Naja haje*) and the ring-hals of South Africa (*Sepedon hæmachates*). Dogs, oxen, horses, and mules are often temporarily blinded in this manner. In searching for a snake in the wall of a stone kraal, or enclosure, I have seen a native herd struck fairly in the eyes by a thin, practically invisible, stream of poison, which hit him at a distance of at least six feet. The man was in great pain, and suffered for a long time. The eyes were bathed in warm milk-and-water; they became terribly red and inflamed, and the Kaffir did not recover the use of them for more than a week. In severe cases the inflammation may become chronic. One very careful investigator of South African snakes and their poisons, Mr Eugène Marais, has expressed his belief that if sufficient of the fluid reached the eye 'death would inevitably result, since the virus is rapidly and completely absorbed by the conjunctiva.' Usually in the process of ejection the poison is spread over a wide surface, and only a small quantity reaches the eye. Mr Lyster Jameson, in some investigations of spitting-snakes, counted no fewer than one hundred and fifty minute drops on a pane of thick glass, from the spray of one of these discharges. How the discharge is effected is not yet clear, but one theory, possibly a correct one, is that it is done by a sudden blast of air expelled from the *rima glottis*. 'This orifice lies well behind the fangs, and during excitement snakes inflate and deflate their lungs with great vigour.'

The venom is frequently spurted a considerable distance. As already stated, I have been witness to its effect at six feet range; but cases have been observed and recorded where men and dogs have been hit by ejected poison at twice that distance. In such cases the spitting-snake was the ring-hals.

Scientists and naturalists long expressed doubt as to the capacity of serpents for thus ejecting poison. Yet the old Dutch settlers at the Cape, no doubt warned and educated on the subject by Hottentots and Kaffirs, soon laid hold of the fact. They labelled the cobra much more than a hundred years ago *spuug-slang*, 'spitting-snake;' and they have long been aware, too, of the similar capacity of the other serpent that I have mentioned, which they call, from the yellow band round its neck, ring-hals. The ring-hals is also often referred to by them as a *spuug-slang*.

Even now it is not, apparently, recognised by closet naturalists that certain of the Indian snakes display at times this same characteristic of spurting their poison to considerable distances, and thus crippling their opponents, if, as so often happens, they are struck in the eyes. The Indian cobra and Russell's viper have both been observed to display this habit, as has the saw-scaled viper. Moreover, Audubon remarked many years ago that he saw a rattlesnake in a wire cage strike at the bars, and poison was sent several feet towards him. This, however, may

have happened involuntarily, merely from the force of the blow, and not, as in the African and the Indian snakes, by the voluntary action of the enraged reptile.

Notwithstanding the labours and researches of European scientists during the last century, no really reliable antidote or serum has been brought to light in aid of human beings against the deadly effects of a bite from a dangerous poisonous snake. Owing to the fact that most white men who move abroad in districts where these reptiles abound wear thick boots, and very often strong gaiters, they are much less exposed to the danger of snake-bite than natives. Yet there are many instances where Englishmen have lost their lives from this cause. In the year following the Zulu War Colonel Montgomery, while shooting amid some long grass, was bitten by a black mamba through his riding-breeches, just below and behind the knee. In spite of the fact that medical aid was available an hour or so after the infliction of the bite, the unfortunate officer was dead within four hours. The writer once saw a Boer who had been bitten by a puff-adder, and had had the great good fortune to escape with his life. He had been struck in the shoulder at night, the reptile having no doubt crept to him for warmth. Two facts may have contributed to his almost miraculous recovery, one being that it was the cold season, when the venom of serpents is not nearly so plentiful or so virulent as in hot weather. The other was the fact that, providentially, he was struck through his clothing, and in consequence some portion of the virus may have failed to reach the wound. It is worthy of note, also, that the puff-adder's method of injecting its poison is neither so rapid nor so fatally certain as with other snakes—cobras, for instance, which deal a lightning-like stroke, and yet manage to inflict a fatal wound. In the case of the puff-adder there are three distinct motions. First there is the stroke by which the fangs are fixed in the flesh or the skin of the victim. These fangs are extraordinarily curved, and the first action seems to be merely to hold and retain the object of the blow. Instantly the reptile closes its lower jaw, and the fangs are pressed home deep into the flesh. Then follows the pressure upon the poison-gland and the injection of the full, lethal dose into the blood of the victim. There have been a good many instances in South Africa where the persons struck, after being hooked by the curved fangs of the puff-adder, have shaken the deadly creature off before it could inject a full dose of poison, and so escaped a horrible death. This may possibly have happened with the Boer I saw; for it is undoubted that no human being struck and fairly dosed with poison by a puff-adder ever escapes with his life. The Boer in question had a very narrow escape. He was terribly ill for months, and even at the time I saw him the flesh of his shoulder was sloughing badly and was very offensive.

Innumerable professed antidotes against snake-poison have been announced during the last century. In 1878 Professor Pedler, in the *Proceedings* of the Royal Society, made the following vigorous assertion: 'Experiments without number have been made with a view to discover an antidote for snake virus; but although many so-called remedies have been reported, it has been found, on closer examination, that none of them has been of the slightest efficacy in modifying the action of the poison, or in any way tending to save human life.' It is true that Dr Calmette, of the Pasteur Institute, who has long been engaged with the terrible mysteries of snake-poison, has prepared an antidote in the shape of a serum obtained from the blood of immunised animals. This serum seems to form a true antidote, but unfortunately it does not keep, and is, therefore, useless in foreign countries.

In the *Pioneer Mail* for November 1905 an extended account was given of some experiments by Mr Greengrass of the North Arcot District, Madras, who stated that he had arrived at the conclusion that acetic acid, even in the dilute form of ordinary vinegar, is a very reliable and important remedy, and that it can be used effectively even as long as an hour and a half after the insertion of the poison. He recorded twenty-nine cases of cobra-bites which had been cured where this treatment had been followed, only one of his tests being a failure, due to the fact that the vinegar was merely rubbed into the bites, instead of an incision being made so as to apply the acid to the poison which had been injected. Mr Greengrass's instructions are that if the wound is on a limb, which is usually the case, a ligature should be at once applied over the bite, and as much blood as possible squeezed out. The vinegar should then be injected or poured in. It is fourteen years since this announcement was made; but we have not heard that this remedy has been adopted with success in other parts of India, and it is to be feared that snake-poison still remains without a real antidote.

French scientists, who have given much labour and thought to this subject, have made certain important discoveries in recent years, which may yet lead the way to some method of giving immunity against this frightful danger. A few years ago Dr Calmette, who has already been mentioned, stated that he knew of only three mammals which are immune against snake-bite, these being the hedgehog, the pig, and the mongoose. The alleged immunity of the last-named animal was disputed by the late Dr W. T. Blandford in the *Fauna of British India;* but recent research seems to have justified the ancient Indian tradition that this courageous little animal is in truth completely immune against the poison of serpents. In 1909 Dr Billard, a professor at the School of Medicine

at Clermont-Ferrand, was able to announce, after repeated experiments, that the Continental garden dormouse (*Myoxus nitella*) known in France as the *lérot*, a somewhat larger species than our British dormouse, was to be added to the small list of immune animals. Not only has Dr Billard proved that the French dormouse is immune against normally fatal doses of viper-poison, but it seems clear also that its blood, when injected into other animals, acts as a powerful anti-venom. Later investigations of this distinguished professor demonstrate that the badger and the domesticated cat are to be included amongst the mammals which cannot be killed by snake-poison; and Dr Billard hazards the belief that some of the great *Felidæ*, such as lions, tigers, and leopards, may be found to share the same immunity. In some experiments with birds, Dr Billard has found the raven to show remarkable immunity against large doses of viper-poison. A domesticated duck exhibited great resistive powers, and recovered in half-an-hour after being bitten by a large viper. This experiment was tried a second time, when the bird again recovered. Owls, apparently of the tawny species, also displayed no ill effects, except slight local swelling, after being bitten by vipers.

These experiments indicate that scientists are still busily at work endeavouring to find their way to an antidote against the venom of the most deadly creatures in the world. Whether they will eventually succeed future years must determine. At present tropical poisonous snakes remain complete masters of the situation, confident in their terrible power of inflicting death, sudden, horrific, and certain, wherever they fairly plant their blow.

THE VERY CHRISTIAN SEÑOR.

PART II.

IV.

NEXT evening happened a wonderful dinner-party *à deux* in the best—in fact, the only—hotel in the neighbouring town, the 'San Carlos.' Soup, lobster (tinned), salad, stuffed chilli, wild-duck, *dulce* (a sort of conserve), washed down with Lacrima Christi, coffee, and liqueur brandy. The gourmets who partook of this repast were the *Jefe Politico* and Brennan. Brennan paid.

When the coffee and cognac had penetrated the coldest cockles of the heart, Brennan broached the subject of José.

The *Jefe Politico* was interested, even amused. He knew the whole case; also knew Don Ignatio, and apparently had no use for the gentleman.

'Bumpity-bump, señor,' he laughed, 'over rocks and sand. They say he shaved off much of his fat. A good boy, this José, but in great trouble. Ah yes, it will mean ten years or more; unless'——

Brennan filled his guest's glass. 'Unless?' he asked.

'Unless I could arrange,' went on the *Jefe*. 'You see, if you would care to go *confianza* [bail] for this man, I could manage. Lately I have had information of a certain man that the Republic has been wanting badly. I could place my hand on him to-morrow. It would be quite easy for me to say the information came from this protégé of yours. This service would remit his sentence, and, of course, with a *confianza* from you, he would be a free man inside a week. Ah yes, señor, it might be arranged.'

The long and the short of it was that an arrangement was made; and that night, when Brennan counted over his wad of notes, he murmured to himself, 'Yes, there are ways and means—principally means.'

In a week's time, after complicated formalities, José was released. His gratitude knew no bounds. Brennan became his god on earth. Twice he had saved him—and why? The question worried José so much that he asked Brennan right out the reason for his kindness.

'Because,' said Brennan, 'I like you. You are made of the stuff one can trust, and I want one man about me that I can have perfect confidence in. I am going now on a long trek, and I intend to take you with me. I shall be carrying large sums of money and buying cattle all along the Balsas River. I do not want every *ladrone* and bad man in the district to know that I carry money. I am banking on your gratitude not to talk, and to defend—with me—this money. I have been let down and robbed by a *mozo* [guide] before, because he talked. Do you understand?'

'Perfectly, señor,' said José, and no more. No protestations of fidelity, no long-winded speech, for which Brennan liked him the more.

V.

The long trek started, and as the days went by Brennan and José became more than master and man; they became friends. Day after day they would ride across the sierras, dipping down to the scrub-oak belt, then up again to the pines, and higher yet to the barren lands, where the cold caught them at night, so that they would huddle over the camp-fire smoking, one cigarettes, the other a pipe. Then on again, and down perhaps to the hot country plain, where no blankets were needed and the fire was allowed to die. A hard life, but a glorious one! Both hard men, used

to taking the hot or the cold, the rough or the smooth, as it came their way.

Passing through villages José was wonderful. He could get chickens and eggs at absurd prices, because he never seemed to possess much money. As for his master, he would cheerfully lie about him, making him out to be a very poor man roaming to the coast in a vain prospect for copper. Also, José cared for him like a mother. Once Brennan mentioned that in England tea before rising was a delightful luxury. Always after that, and at whatever hour the Englishman was astir, José was before him with a tin mug of tea, or, failing that, of chocolate.

Brennan looked into the half-tamed mind and found much good. This man who could neither read nor write, whose value of life and death was placed on so low a plane, whose ideas of personal property were so hazy that all property not actually guarded belonged to him—this man had a code of his own. And the code seemed to be that the master to whom he owed his freedom must be served to the utmost ounce of his ability; Brennan must never want; he should never have to ask for a thing twice. Everything must be achieved for him, if it meant pulling down mountains in the achievement.

One day José asked his master if he was anxious to return home to England.

'Yes, some day,' said Brennan. 'Some day in the vague to-morrow I should like to go back to see it all again, if only to sit on a good horse and ride a good line behind a good pack of hounds. But I'm content here with free, open-air life, and I don't want to change it for a long while yet. But supposing I made quite a bit of money, then I should feel it my duty to go back, and back I'd go.'

This last worried José not a little, and deep down in his Indian heart he hoped fervently that Brennan never would make that 'bit of money,' which would break up their friendship for ever.

VI.

Months went by, and Brennan amicably severed his connection with the big cattle company, and started in to deal on his own. José remained with him; they were inseparable.

Brennan was making his way rapidly—each month saw an improvement in his balance sheet—until at last he told José that if he did well on his next big deal he would leave Mexico and go home. José's spirits fell to zero. But Brennan never noticed it—he was busy on his last big deal. He had bought two thousand head of cattle up the Santiago River at an absurdly low price. He knew he could sell again to his old company at nearly double, and all parties pleased. Certainly he had to get them delivered and driven through a bad bit of country. He could afford to lose a few, but he would superintend the drive himself.

The first part of the drive was bad—bad as it could be; but they managed it with practically no loss in spite of the fact that the cattle were wild. They then got into more open country, not so hilly, with no timber. The cattle had settled down to a steady six to eight miles a day, grazing when possible, and even staying, if the grass was exceptional, from twenty-four to forty-eight hours in one spot. The cattle looked well, and Brennan saw his trip home within appreciable distance. And then the blow fell.

At the end of a grassless day's trek they came on a long *barranca*, or gully, with sides like the sides of a house, running east and west. Here Brennan decided to camp. It needed only two men to hold the cattle—one at the opening, and the other down the *barranca*. There was no getting up the sides, so two men at a time on two-hour shifts could hold the herd through the night. The cattle seemed quiet, but Brennan took a watch. About ten o'clock he turned in. All was well. José was to come on an hour or so before dawn, and take up his beat down the *barranca*. The camp was at the other end, at the opening.

José went on shift, stumbling down the dried water-course, which here and there held small pools fed by springs. He watered his pony, then mounted and relieved the watching *vaquero*.

José took a long sniff. The air was dead-still and very hot. He lit a cigarette. After the match went out it seemed oppressively dark. Most of the cattle had been lying down when José came on watch, but now by the sounds in the darkness they were rising and moving with that shuffling, vague meandering of restless cattle. José rode slowly up and down from one *barranca* wall to the other, crooning one of those interminable songs common to the muleteer and the *vaquero* of Mexico: a song full of love, adventure, hate, and life and death—the words most disturbing, but the tune most soothing.

Now and then he would stop in his singing and listen. There would be a quick scramble of hoofs over the stony ground, a clash of horns, and out of the darkness a disconcerted bellow. Then more trampling and nervous snuffling. 'Storm-herding,' thought José as he glanced at the sky above. Not a star was to be seen, and occasionally he felt chill little eddies of draught come dancing down the *barranca*, making the dry leaves on the ground rustle and swirl. A faint gray light suffused the east. José pulled his woollen blanket closer round him, and sat still on his pony, thinking. The storm-herding that so often leads up to a stampede, and yet not always. The storm would come with the dawn, and break its fury overhead. The cattle would get their tails towards the wind and stand like old work-oxen once the storm broke. But it was now, during this waiting for the unknown, that danger was near. Such a little might start them. The sudden barking of a dog, and off they would go, and nothing would

stop them till they galloped their hoofs to the bone. It would be best, perhaps, to loosen them up; to ride away, calling them to follow, starting the day's drive at once; get them loosened and doing a definite thing; then, when the storm broke, to hang up and wait till it was over.

José went on with his song. Suddenly he made up his mind not to loosen them up, but to chance things, and wait for the storm.

VII.

It was growing lighter. Gray forms would loom up before him, stand for a moment stiff-legged, then wheel sharply and crowd back into the herd. Then, before José realised it, the cattle began to 'mill.' Those on the outside started to trot, shambling along, heads up, trying all they knew to press into the centre, all moving the same way, the whole herd like an enormous horizontal fly-wheel, circling faster and faster. Soon it would break at one point and pour away in a wedge which nothing could stop. José jammed his pony up to the herd, trying to beat against the stream, to loosen out a few head down the *barranca*, to break them up before the real panic seized them. His rope laboured like a flail over the tossing heads; his curses and shouts rang out.

Brennan tumbled out of his tent just in time to see them break, to see his great bunch of cattle burst like a dam and fill the *barranca* from wall to wall with a chaos of galloping hoofs, with a dim shape but twenty yards in front—José riding in the half-light, riding for his life with all the odds against him. Brennan knew the end of it. The *barranca* was cross-cut a mile farther on by a dry water-course, and to enter it meant a drop of ten or fifteen feet. A right-angle turn to the left and the trail sloped down to the river-bed, easy driving with cattle going slow and well strung out; but as they were now, at the pace they were going, there could be no turning. They would flow over that drop like water over a fall. Brennan knew this road, José did not; and José was in front, galloping, galloping, as hard as Heaven would let him, to certain death. There was nothing to do but wait, no possible way of reaching him, no possible chance of letting him know he must swing to the left. It was misty down there—he would never see the drop.

But José did see it—when only a few yards off. He heaved himself back in the saddle in an endeavour to stop the pony. Stopping, however, meant being beaten to death by the flying crazed hoofs behind. The pony sat on his hocks and slid on and on, his impetus gradually giving way to the friction of his four hoofs. Suddenly, with a stagger, he dropped like a plummet down on the boulders below, to lie, an inert mass, with José pinned by the leg under him. Then the cattle flowed over them like a cascade into the shambles beneath.

VIII.

Brennan was kept hard at work that morning. José was practically dug out from a tangle of dead and dying steers. He was quite unconscious, and was carried in a blanket slung between two horses to the nearest railroad depot, then shipped to a hospital in Guadalajara. The injured cattle had to be destroyed; great skinning-work had to be done, a few dollars saved on the hides. Then, having shipped the uninjured beasts, Brennan ran down to Guadalajara to see José.

He saw the poor *vaquero*, also heard his wild, delirious ravings, and learnt much from them.

'Will he live?' he asked the doctor.

'Ah, certainly he will live,' answered the kindly Mexican medico who had the case in hand. 'He is much broken up, and has concussion, but a wonderful constitution. He will be fit for work in a few months. Luckily he fell under the bank, or he would have been more crushed. He worries a lot about you, and yet he does not wish to see you. In his delirium you appear to be his friend, and yet he fears you. I do not understand.'

'I think I do,' said Brennan.

Brennan had to get back to Mexico City, but daily there he received a bulletin with regard to José. At last a letter arrived to say that José was 'conscious and doing well;' there was absolutely no fear for him. Only, he seemed very worried over something, and appeared to dread a meeting with his master; it was quite inexplicable. Also, worry kept him from eating.

Whereupon Brennan sat down in the British club and wrote the following letter to José:

'*AMIGO* [FRIEND],—Don't worry. No cattleman with your knowledge and experience would have let the cattle go that night. I realised that, and it worried me; I thought you had gone mad. I saw you, heard you, when you were delirious, and grasped your point of view. You thought that if these cattle were destroyed, if I lost money over them, it would prevent me from going to England. That (my going to England, I mean) seemed the end of our friendship, and on that dark, stormy morning you decided to break me to keep me. All this I have learned from your raving. It was wrong of you, but *you* all over; it was psychologically (a word you won't understand) correct. But, you silly one, didn't you understand I was coming back to Mexico? No! you didn't. Well, let this relieve you. I had the cattle insured, and although I have not made as much as I might, I have made enough to go home on. I shall be back in three months, when I want you to manage a ranch I am buying. José, stupid one! I forgive you; but in the next storm-herding, loosen them out, and soothe them with a song, as your mother taught you. I send some dollars for you and for that same mother.—Your *amigo* and master.'

José heard the letter read, and at the close sighed a great sigh, and smiled at the old doctor. 'Señor doctor,' said he, 'now I have no more worries. My master understands. But, then, I always said he was very Christian.' After a pause, during which he snuggled down comfortably, 'Doctor,' the patient went on, 'I do not know how it is, but I feel suddenly terribly hungry.'

THE END.

VEGETABLES AS CURATIVE AGENTS.

NATURE, that stern mistress who metes out justice so impartially, exacts a full measure of payment from those who transgress her laws, but at the same time extends a gracious helping hand to all who endeavour to live in harmony with her.

This is a truism especially applicable to diseased conditions of the human body. Nature provides, in the form of vegetables, remedies which are easily grown and which are essential to the maintenance of health, as well as being valuable allies in the fight against disease.

In this connection that true disciple of nature, the late Count Tolstoi, is said to have remarked as follows, pointing to his vegetable-garden: 'There is my medicine-chest. It contains all the remedies that a man requires. The only thing necessary is to know what to eat for the ailment that troubles you, and once you know that, you will never hear the bells of your doctor's droshky outside your door.'

Ill-health may be caused by the lack of certain organic salts which are supplied by vegetables, or it may be caused by an over-supply of acids in the blood and the tissues that will be neutralised by the alkaline juices of raw vegetables. By their influence on the body these juices will, through time, even neutralise the chemical poisons of the brain caused by auto-intoxication.

Cabbage is one of the vegetables most frequently seen on the tables of the rich and the poor alike, but it is usually in a cooked form, a condition which does not give the best results to the consumer, as in many cases a great portion of the organic salts in the cabbage is lost in the water during the process of boiling. This applies to most vegetables which can be eaten raw, but are generally cooked. For this reason it is advisable to save the water in which the vegetables have been boiled, and use it for making soup and gravy, inasmuch as it contains from 20 to 30 per cent. of the most nutritious and valuable part of the vegetable.

Cabbage largely contains sodium, and is, therefore, a powerful aid to digestion. The best results are obtained when it is eaten raw, and preferably young and tender. In America 'slaw' or raw cabbage cut into ribbony slices, soaked in vinegar, is served in all first-class restaurants as a salad. Some people will not eat cabbage unless it is raw. A Jewish acquaintance of the writer, a literary worker in Salt Lake City, Utah, invariably followed this custom, even to the extent of nightly making his supper off raw young cabbage and Brazil nuts! This, however, is probably carrying the cult of raw-cabbage eating to extremes.

Sauer-kraut, a form of pickled cabbage much relished by Germans, is an insult to the stomach, because it is practically putrescent when it is eaten, and the cellulose, or woody fibre of the vegetable, is hardened and rendered indigestible by the action of the vinegar.

Many people never eat cucumbers, possibly because they believe in following the advice of a learned doctor who said that 'cucumbers should be skinned, cut into slices, salted, soaked in vinegar, and then thrown into the dust-bin'! This is somewhat drastic advice, as cucumber, when eaten slowly and in small portions without salt or vinegar, is not only easily digested, but is also very nutritious. While engaged in surveying and constructional work on a new railroad being built in Nevada a few years ago, the writer observed particularly the noon meal of the Italian labourers employed at the laborious work of handling heavy rails and sleepers. It consisted entirely of big slices of bread and a large cucumber! These men were all brawny, powerful fellows with clear skins, tanned to a deep mahogany hue. Cucumber-juice is a 'beautifier' of ancient origin, and, when applied to the skin, is said to have a stimulating and cleansing effect on the pores. The real reason why some people consider cucumber harmful to them is probably because they eat too much at a time, and season it with salt and vinegar, causing diarrhœa in consequence.

Tomatoes for a long time were looked upon with suspicion, but of recent years their true value has been discovered, and they are appreciated accordingly. People inclined to be 'liverish' would be quickly and agreeably surprised at the beneficial effect on their liver and skin if they were able to include in their daily dietary, preferably at breakfast, a hearty dish of raw tomatoes, free of condiments of any kind. It is said by an American doctor that 'slices of tomato, if rubbed briskly on the cheeks, will quickly remove freckles of long standing, stains, and burns; also, its mild acid and cathartic juices help to overcome the causes of obesity.'

Lettuce is a most indispensable and appetising vegetable, and should be on all household tables when procurable, as it is a blood-cleanser and a stomach-regulator of a very high order. It cools

the blood—that is, actually lowers the temperature of the vital fluid when rich and heating foods have caused feverishness. Vinegar should not be used on this vegetable when it is made up as a salad, as vinegar is a preservative that tends to interfere with the digestion of foods. Lemon-juice and olive-oil are quite sufficient dressings for lettuce. There is a harmless natural narcotic in lettuce which induces sleep, if the vegetable is eaten prior to going to bed, and its regular use has been known to cure insomnia and night nervousness.

A 'sour stomach' will be quickly sweetened by a diet of young raw carrots. This vegetable has established itself firmly in the dietary of those who seek beauty and health. Regularly used, it tones the system, imparts vigour to the nerves, and brings the bloom of the rose to the cheeks. The following combination makes a very palatable dish: a selection of choice nuts and raisins and young raw carrots grated into fine particles, the whole thoroughly mixed by stirring.

'Parsley is a broom that sweeps the stomach' is a much-quoted proverb used by that nation of natural cooks—the French. Parsley is a great corrective of the stomach and a destroyer of a bad breath. Onion-eaters should chew a little parsley after eating their favourite in its raw state, and they will find the smell of the onions to be much lessened. Parsley also stimulates the flow of gastric-juice.

Spinach contains in great quantity iron salts, which are easily assimilated. It is, therefore, a natural tonic of the greatest importance. Anæmic people will find that better results are obtained from eating foods which have iron salts in abundance than by using iron in mineral form purchased at a druggist's shop, as the stomach does not readily take up iron in this form and absorb it into the blood.

Asparagus, as is well known, has a marked effect on the kidneys, both in a functional and a remedial form.

Potatoes are essentially a fattening food. This is especially true of the sweet-potato, which contains sugar, in addition to the starch so prominent in ordinary potatoes. A good many thin people are unable to digest the common kind, but seem to increase their weight by using the sweet-potato in their daily dietary.

Celery is a nervine and a soporific of great value. Eaten after severe mental exertion, it restores the molecular balance of the nerves. Celery should be eaten raw if the greatest benefit is desired.

Radishes are particularly rich in phosphorus and iron, which organic salts feed depleted nerves and overcome brain-fag. Well-masticated radishes are easily digested, and provide the elements used up by muscular and mental labour. It is best to eat them without salt, as then the flavour of the natural salts they contain will be properly appreciated.

Raw leeks and onions contain iron salts in abundance, and are marked stomachics. They have excellent cleansing properties as well, and are healing to the lungs and the bronchial tubes.

Garlic, because of its strong flavour, is not in great favour in this country. The Latin races believe in its cleansing and stomachic properties so much that it is used, in some form or other, at all meals.

Beetroots and parsnips are generators of vitality, and possess fattening qualities.

Dandelion greens are a positive tonic because of the iron salts they contain. They also cleanse the liver.

Water-cress is a blood-cleanser, and is very useful in ridding the blood of the impurities that cause malaria, typhoid, and smallpox fevers.

WANTED—A PRISONER.

WITH hundreds of Germans just in front of you, to get a prisoner—just one—would seem (and unfortunately did to some) an easy task. You just go and fetch one—a sort of 'Nuts in May' game. A requisition for a prisoner is put through the various headquarters to the battalion, and an unlucky 'one pip' detailed to 'fetch 'em away.'

Corps to Division: 'Hullo, Black! is that you? White speaking.—Anything doing? No; very quiet. How about some prisoners, old man?—Might as well. Yes, certainly.—Coming up to-night?—Good! Cheerio!'

Division to Brigade: 'Black speaking. The general says you had better get identification of the enemy on your front. How about it? Can you arrange for a raid? Just a small one—no artillery.—Good man! Right-o!'

Brigade to Battalion H.Q.: 'That the adjutant? Brigade speaking. Look here; you've got to get a prisoner.—Yes, to-night.—*What!* But you must. And send 'em down here just as soon as you get 'em.—What! No, no; it's very urgent. *Corps* are asking for it—must have information to-night. . . .—All right, sir. Good-bye.'

(The Staff part of obtaining the prisoner ends here.)

Adjutant to C.O.: 'Brigade, sir. Usual thing—prisoner wanted at once.'

C.O. (to himself): 'Damn!!!'

Usually there were set methods employed for these small raids and patrols, which in their frequency became monotonous; but this particular raid was quite out of the ordinary, and presented the 'party' with an unexpected thrill—hence my story.

We were at Lens. The Boche held the east end of the town, and we the west—so that the centre was No Man's Land. The town was in absolute ruins, houses totally destroyed, except in a few instances, and the whole area was a mass of brick, roofs of houses, iron, and general débris.

Our front-line trench ran through streets, gardens, and even houses; garden-fences crossed the trenches, and vegetables were growing all round. Our supply of 'green stuff' was never better. Many patrols went out at night, and came back with sacks of cabbages, &c.—captured, taken unawares—and casualties light!

Our front line was held by a system of 'posts' consisting of a few men, and in some places we occupied houses, or what was left of them. We had one forward position pushed well in front of the others, in a house on the main Lens-Arras road. This was in a row of houses, and the Boche occupied a house on the other side of the road. He didn't show himself very much, however, and our men said they only saw a fat German once or twice through a hole in the wall where the window used to be. It was not a nice piece of line to hold, as one never knew quite what to expect. Among so many houses it was well-nigh impossible to see anything going on, and at night it was *quite* impossible. Several times one of our posts was attacked by a small party of Boches at dawn with a 'flammenwerfer' (liquid fire-thrower), but we usually spotted such moves in time. The Hun had a silly habit of 'pine-appleing' the post to be attacked, always at dawn, for about half-an-hour beforehand, so we knew what was coming, and dealt with it accordingly. Altogether both sides saw very little of each other—so much so that Brigade said, 'We *must* have a prisoner for identification.' A big raid was impossible; the ground-wire, fences, and houses wouldn't allow of it. A small patrol was very difficult—you made an awful noise in the dark, falling over bricks, tins, wire, and rubbish. A Boche listening-post would soon discover you—up would go a 'Very' light, and the place would be alive with machine-guns. You and your patrol would probably be caught crawling on 'all-fours,' like cats on the tiles, and then your difficulties would begin—or perhaps end very suddenly.

A small raid was planned on some old boilers in the station-yard, presumed to be an enemy post. It was going to be very costly to carry out, owing to the difficulties mentioned. We should have many casualties. Was it worth while?

In the meantime a peculiar thing had happened. The corporal in charge of the advance post in the house had discovered a large hole in the cellar wall, covered over by boards and blankets. Being curious and a very 'stout' fellow, he started to investigate, climbed through the hole into the cellar next door, lit a candle, and found a large hole in the floor about five feet deep, and from that a long shallow tunnel sloping downwards. He went down this, and came to a series of rooms and passages; and, as his story ran, after going some distance, he opened a door and saw a room lighted up with a lot of electric lights. This so frightened him that he blew out his candle and made his way back as best he could. The corporal reported that he also saw a clock and heard it *ticking* on a shelf in one of the passages. Coming back very excited, he told his story to his company commander, who told it to the colonel, and so on it went till it reached Brigade. Every one was very excited. Here was our chance, perhaps, to get a prisoner. Of course, the story as it was retold didn't lose anything in dramatic thrills. This place must at least be a German officers' mess, &c.! We had instructions to go after it at once.

As it was going to be a peculiar job, the C.O. thought it a good chance to use the scouts, so I picked four excellent men, absolutely trustworthy and fearless, to assist me in capturing this officers' mess. I told them the thrilling story, and what a magnificent opportunity they had, and they entered into the spirit of the thing with wonderful keenness. As it would be impossible to use rifles, I got revolvers for them, and took them out in the afternoon for a little shooting-practice. The colonel told the general we were having a go at it that night, and Division promised ten days' leave to any one who secured a prisoner. It was impossible to get to this house by day, so we set out from headquarters as it was growing dark, and had about a mile to go in trenches. The colonel came with us. It was a nasty, dark night, and just starting to rain. The colonel left us at company headquarters, as he wanted to warn the company of what was going on, and have them keep a close watch out; so we carried on, and soon reached the front line.

It was raining hard now, and very dark, and walking in the mud and trenches made an awful noise. We were very close to the Boche, and had to be extra careful. Climbing out of the trench, we made for the house, about fifty yards away, falling over things and sliding in the mud. Eventually we reached the house, after much laughing and swearing (one can't help laughing when a fellow, trying to be very quiet, falls over something into a shell-hole, and then says a 'few kind words'). We were challenged by the sentry, and entered. Down in the cellar we found the corporal and his men, and I got him to tell me all he could about his experiences when he explored the place, and what I might expect to find down there. I then worked out my plan of action, first of all taking the precaution to double all the sentries round the house and have others 'standing by,' as I was afraid, if we were discovered down below, the house might be rushed and we should be cut off. We had every-

thing fixed up, when I heard footsteps, and, to my surprise, in walked the colonel! He said he had felt nervous about us, and wanted to know if everything was all right. He couldn't rest at headquarters, so thought he would come up. I assured him everything was quite all right, and he said he would go back.

The tunnel apparently led from the cellar next door underneath the garden and the road to the Boche house opposite. All our work had to be done in the dark, but I took a flash-lamp with me in case we should need it—and we did. We removed our box respirators, wound our puttees round our feet to deaden any noise in walking on the boards, and when all was complete climbed through the hole in the wall into the next-door house. We then helped one another down the hole in the ground, and listened for some minutes at the opening of the tunnel. It was a very shallow entrance, and we were just able to squeeze through; but the tunnel itself was larger, and sloped steeply down under the road to the house opposite. We could hear absolutely nothing, so started to climb through feet foremost and on our backs, there being barely enough room to sit up straight. I examined the roof near the entrance for a spring-gate (one that could be let down from the roof by a wire pulled at the other end of the tunnel), because the Boche might have let us walk into that place, pull a cord, and there you are—or we were! However, there was no sign of anything. The tunnel was all boarded, and we slid down very quietly, but even so we knocked down bits of earth, which went rolling to the bottom, and seemed to make an awful noise. We felt the sides and the roof all the way for 'traps.' I had Sergeant Knox beside the left wall, one man on the right, and I was just behind in the centre, looking after the roof and the floor. I left one man at the top.

It seemed to take ages going down there. Presently the sergeant pulled my arm and whispered to me that there was an opening on the left. We found we were at the bottom. I went ahead, and bumped into something. By feeling about I discovered it was a small table, with pens, ink, paper, and books on it; also some tins. These had evidently been piled up at the entrance, and if knocked over would have made a lovely noise. We carefully removed the obstacles and got busy 'Hun-hunting' (the new parlour pastime for grown-ups). On the right we found some beds let into the wall—bunks; on the left the passage turned, and on going down two steps we came to a door. In front of me I saw more steps, which I went up, to find myself in a back-street, but it was too dark to allow me to see anything. The road had been cleared of débris, and had evidently been used for transport. Some distance away I could hear voices and the unloading of wagons—probably rations.

I brought the man I had left at the top of the tunnel to the bottom, and then started on through the door. It led into a long passage with rows of bunks all along one side, with mattresses and blankets. We moved on slowly, expecting to put our hands on a German at any moment. Suddenly we came to another door, and, passing through, found the passage turned to the right. On the left wall we could feel jugs, pots, and things hanging up, so we were evidently near the kitchen (Sherlock Holmes!). On a table was some food—bread, jam, and tinned stuff. Of course, we all put our hands in the jam, feeling over the table in the dark. We now came to another door, which was to lead into *the* room lighted with electric light (intense excitement!). We opened the door very slowly—no light—crawled in on our hands and knees, and waited for some time, but nothing happened.

Owing to our movements being in the dark, and our having to keep very quiet, it had taken us a long time to go a short distance, but we felt as if we must be miles away from our base. As the place appeared to be deserted, I thought it quite safe to put on my torch-light, so wrapped it up in a khaki handkerchief to give a dim light. We moved on very slowly. Suddenly the sergeant pulled my arm and said, 'Light ahead, sir,' and I saw a small light that seemed to be at the far end of a large room. I put my torch out, and at once concluded that the Boches were on the same game, for the other light vanished also. We moved forward a bit, and as there was nothing doing I tried my light again. I felt my arm tugged. There was that other light again. I at once put mine out and waited. We could hear nothing but Boche machine-guns rattling away and an occasional shell bursting outside.

That light puzzled me, so I started to investigate. It seemed to be about twenty-five feet away. We had a whispered council of war. I was to crawl forward, and they were to kneel up and cover me with their revolvers. If I bumped into any one I was to put my torch-light full on, which would blind him, and the other two would fire. Anyway, we would give whoever it was 'some' scare. The excitement was feverish, and I felt as if I was playing 'blind man's buff,' or rather 'blind man's bluff,' with a revolver in one hand and a torch in the other (I should have had a knife in my teeth to complete it, and a long black cloak). Soon my head touched something, and from the distance a light seemed to come through a hole in a wall. I moved my hand over the wall for this opening, but could only feel something very cold. I couldn't understand it. I put my light on still wrapped in a handkerchief, and on came the other light. I quickly took the handkerchief off and put the light full on, and, to my horror, I saw a man kneeling right in front of me pointing

a revolver! My promising career was about to end. I was so taken aback, I waited for the shot which never came. My enemy looked every bit as surprised as I—and why not? For I was staring fiercely at *myself!* It *was* myself! I was kneeling in front of a large mirror.

All at once the place seemed to be full of light. I turned round and saw a grin on the faces of the others; they had been taken in too. We laughed when we realised the position. We were in a very nice, large room—bed with blankets and feather pillows, wonderful French blue-and-gold chairs (stolen from some château), table, and stove, but *no* electric light. There were, however, a number of mirrors, which explained the electric lights seen by the corporal. When he opened the door his candle had been reflected by several of these. A candle between two mirrors looks like dozens of candles, and in his hurry and nervousness the corporal had fancied he was looking into a brilliantly lighted room.

We now had a good look round, as the occupants seemed to have flown. More steps to the street, and a door which led into a small passage to the left. Feeling much braver now, we decided to investigate further. In the room, evidently at one time an officer's bedroom, we found some clothes which gave us identification, and several interesting articles. Suddenly we heard voices in the passage. Now, had our chance come at last? We quickly moved over to the wall, so as to be behind the door when it opened, and put the light out.

We had not long to wait. After much whispering outside, the door opened slowly. Some one behind was holding a light, which showed the bayonet on the rifle of the front man. More whispering and the door partly closed. My heart was beating now so hard with excitement that I was afraid they would hear it. And what if they happened to be a strong party? Was I asking for trouble? The sergeant, a small fellow, was lying on the floor just where the door would open. After a little louder talking the door opened again—not so much hesitation this time. Bayonet, rifle, and then the man himself appeared. Just as he entered he collapsed on the floor. The sergeant had pulled his legs from under him. I threw myself against the door to close it as Boche number two with the candle was entering. His left arm was jammed in the door, and his own light blinded his vision, so I had him covered before he could move with torch-light and revolver. It all seemed so impossible, it was hard to realise what had happened.

We lost no time in getting away with our prizes, and returned to the tunnel without difficulty with the aid of the light, picking up the men I had stationed to warn us in case of surprise. We had been away an hour and a half. I brought the clock back with me. We climbed the tunnel, got through the hole, and dropped into our cellar post. The first person I saw was the colonel. He had stayed there all the time, and had never moved. He was very anxious to hear our story, and was delighted at the result. We now had a look at *the* clock, and found it had no works in it. And that was the clock the corporal had heard ticking! How we laughed! But I don't wonder at his having heard things. The colonel said he could have sworn he heard revolver-shots and a bomb. He thought we were well in it, and as we were so long he was getting nervous, and was just starting off after us! I wonder how many C.O.'s you would get to do that!

Our prisoners turned out to be a N.C.O. and a man of a near-by post. We took them down to battalion headquarters, where they were well cross-examined and chaffed by cooks and batmen, and from there despatched them with escort to brigade headquarters.

The colonel sent in a full report to Brigade, not forgetting to ask for the leave warrants.

Brigade to Division (very excited): 'We have two prisoners for you. Report following at once.'

Division to Brigade: 'Good! Send 'em along.'

Division to Corps: 'Is that you, White? Black speaking. We got those prisoners for you. They 're on the way down.'

Corps to Division: 'What prisoners? Oh yes, of course. Good man! Splendid! Beastly night, isn't it?'

APOCALYPSE.

I WHO was dumb long barren years
Have found at last a voice to sing,
And all my being breaks in flow'r
As buds at the warm breath of Spring.

'The light that lighteth ev'ry man'
Hath flash'd its glory thro' my soul;
Mine eyes, no longer 'holden,' see
The manuscripts of God unroll.

The fragrance folded in the rose
No longer is a mystery;
I read the lily's pure white soul—
A page of sacred history.

I hear the singing of the stars,
Interpret, too, the sea's strange moods,
And lend an understanding ear
To the vague whispers of the woods.

What magnet draws the earth-born lark
Up singing to the feet of God?
What makes the crocus blaze her way
Thro' the dark portals of the sod?

All this I *know*, since I have learn'd
'Love's the fulfilling of the Law;'
I put the shoes from off my feet,
And kneel on holy ground in awe.

From the dark sepulchre of doubt
An angel-hand has rolled the stone.
'All things are yours,' spake One who knew;
And I have come into my own.

SEVENTH SERIES

THE HEART OF THINGS.

By HENRY LEACH.

LONDON, *Yesterday.*

THE perfect liquid green of trees and shrubs by the banks of lakes in Cumberland and Westmorland, the purest green that Nature, enjoying her favourite colour, has prepared, yields in early days of autumn to golden tints which celebrate achievement of the harvest. The holiday-makers leave Windermere, and Derwentwater, Ullswater, and Coniston, returning to the cities and the old anxiety, the hard problems not only of the public kind, of supply and demand, wages and production, but the inner problems of their hearts and minds, the question as to the good and the meaning of the greatest things, the enormous interrogation of life and the soul. More people than ever before have lived for a while in the country about these lakes, climbed the craggy mountains, tramped through the lonely, lovely places where nestle the secret tarns, and they have some advantage over others when they square themselves to these difficult questions. They may have hurried to such scenes as these in August or September with something of the vulgar curiosity of tourists, often unthinking and even a little stupid; but it is a hopeless heart that leaves the land of Wordsworth and Ruskin without a certain conversion, without a sense of purification and betterment. It is a sweet country, where hope is instilled by beauty into the weary spirits of war-worn men, where they may be led to new beliefs in a goodness and a greatness beyond the crushing materialism of modern times. Little wonder that here the poets lived and worked; Britain could find for them no better place. The many thousands who have delighted in a brief season in these parts, and paid, in the usual manner of visitors, a call at Coniston, contemplated Brantwood, where Ruskin lived, the little museum in the village where are Ruskin relics, and were led by such and other circumstances to thoughts of the man beyond the bare statement of a small guide-book, may have been impressed by a coincidence which upon reflection seems to bear a strange significance. For this year is the centenary of the birth of Ruskin, who in his time set himself out on a great mission for the beautifying of life at a period when, largely as the result of wars, it had fallen through materialism to a sad ugliness and coarseness. The effort, with splendid talent to support it, was one of the finest ever made by any man in the prosecution of such an endeavour for the betterment of life; and now we are confronted with the situation that, great as was Britain's need in this matter in those days, it is at least as great at the present time. Never did a capable and well-meaning people who somehow seem to have lost their way (or are in danger of so doing), and who in their distraction are missing the vision of their ideals, need the guidance and the inspiration of such an apostle of the beauty in life and the world as Britain does to-day. But there is this question, whether if a new Ruskin were to rise among us he would gain a hearing and achieve his effect, for in these times the materialism appears to have fastened harder on the people than before; vulgarity has become more firmly established; confusion and distraction have produced a sense of ennui; and such mountains of printed matter are being thrust upon the people, chiefly political propaganda and sensational news, that it is difficult for the true prophet and preacher, of great sincerity and with an important message, to gain a hearing. He is lost in the confusion. Again, people now are more suspicious of preachers of every class; they have been much misled by the insincerities of politicians. Never was the beauty of life stamped out by authority more than now. Nearly a year after the stoppage of the war national picture-galleries and museums are still in the occupation of Government clerks with typewriters, and the chastest scene in London, as many thought it, the view across the lake towards Whitehall from the bridge in St James's Park, is still suppressed through the emptying of the lake and the erection on the bed thereof of more Government offices and a huge Government restaurant for the exclusive enjoyment of the vast company of the bureaucracy. It is unlikely that for many years such an evidence of the loss of the sense of beauty and fitness, such a sign of surrender to materialism and vulgarity, will be removed. The case would be disheartening if there were not real and impressive signs of an awakening of the people themselves, unassisted by their leaders—really in spite of them—to the better possibilities of their existence, to the exhilaration of the pursuit of ideals. One of the

 [*All Rights Reserved.*]

signs is the very definite improvement that took place in the theatre during the summer; another is the extent to which the spirit of the people was affected by the simple, noble cenotaph that was raised to 'The Glorious Dead' in Whitehall. The daily and nightly pilgrimages of heroes' kindred to this shrine, piling masses of new wreaths continually about its base, higher and higher, a plain and noble sincerity of sentiment the Government had not imagined, are better evidence of a people's soul than the tawdry artificialness of official and belated demonstrations. There is place for a Ruskin then.

* * *

Now those who were by the Lakes and thought upon the centenary, that Ruskin was born a hundred years ago, would likely proceed to some new examination of the circumstances of his life and work, and they would find new studies more apposite to these times, more enlightening or of greater consequence. As we approach the winter season, when men and women form plans for reading, it will occur to them that they could hardly give themselves more delight, more instruction upon things of beauty, or stir up in them more active thoughts upon the possibilities of life in this harassing period, than by a careful study of some of Ruskin's works, his lessons on beauty, the delight and the satisfaction of art, on the one hand, and his arguments upon economic points and problems on the other. There is a fashion now to depreciate this genius, suggesting that he was scarcely so fine as was supposed, that his fame is rightly lessening, that his tricks are stale, that he was careless of his own reputation, that he contradicted himself, and so forth. Men who fought against prevailing ways and customs and challenged the conduct and the character of the arbiters of public manners and taste are always denounced, decried, in after-times when such conditions and circumstances are repeated and intensified. But if Ruskin were really stale, and if his fame would now always decline more and more, the sharp electric kind of appeal that much of his writing makes to-day to some who glance at it for the first time would not be intelligible. Let us, for example, take up, as by a sort of chance, the little volume of (originally) three lectures which has the title of *The Crown of Wild Olive* (1866). These lectures were delivered to different types of communities at Camberwell, Bradford, and Woolwich. There is the first essay or lecture on 'Work,' wherein is treated simply and yet effectively a question, vague and mysterious in its depths, which is troubling our people more than any other now. Almost upon any page of this discourse may be found a thought or two which force consideration and application to the present times and circumstances. Lighting upon such a page by chance, see this: 'The lawful basis of wealth is, that a man who works should be paid the fair value of his work; and that if he does not choose to spend it to-day, he should have free leave to keep it, and spend it to-morrow. Thus, an industrious man working daily, and laying by daily, attains at last the possession of an accumulated sum of wealth, to which he has absolute right. The idle person who will not work, and the wasteful person who lays nothing by, at the end of the same time will be doubly poor—poor in possession and dissolute in moral habit; and he will then naturally covet the money which the other has saved. And if he is then allowed to attack the other, and rob him of his well-earned wealth, there is no more any motive for saving, or any reward for good conduct; and all society is thereupon dissolved, or exists only in systems of rapine. Therefore the first necessity of social life is the clearness of national conscience in enforcing the law—that he should keep who has JUSTLY EARNED.' Then in another place there is this: '. . . But, if, having enough to live upon in the manner befitting his character and rank, he still wants to make more, and to *die* rich, then money is the principal object with him, and it becomes a curse to himself, and generally to those who spend it after him. For you know it *must* be spent some day; the only question is whether the man who makes it shall spend it, or some one else; and generally it is better for the maker to spend it, for he will know best its value and use. This is the law of life. And if a man does not choose thus to spend his money, he must either hoard it or lend it, and the worst thing he can generally do is to lend it; for borrowers are nearly always ill spenders, and it is with lent money that all evil is mainly done, and all unjust war protracted. For observe what the real fact is, respecting loans to foreign military governments, and how strange it is. If your little boy came to you to ask for money to spend in squibs and crackers, you would think twice before you gave it him: and you would have some idea that it was wasted, when you saw it fly off in fireworks, even though he did no mischief with it. But the Russian children, and Austrian children, come to you, borrowing money, not to spend in innocent squibs, but in cartridges and bayonets to attack you in India with, and to keep down all noble life in Italy with, and to murder Polish women and children with; and *that* you will give at once, because they pay you interest for it. Now, in order to pay you that interest they must tax every working peasant in their dominions: and on that work you live. You therefore at once rob the Austrian peasant, assassinate or banish the Polish peasant, and you live on the produce of the theft, and the bribe for the assassination! This is the broad fact—that is the practical meaning of your foreign loans, and of most large interest of money.' . . . But, of course, such thoughts taken from their context and their time should not be applied too closely to

modern matters. It is sometimes a difficulty in quoting from Ruskin that one must either take a passage that seems a little trite, or else the meaning may be misunderstood or the moral misapplied.

* * *

In this same small volume there is a lecture on 'War' (which Ruskin addressed to the students at the Royal Military Academy at Woolwich), one of the main ideas of which was remembered and severely condemned when we were in the depths and utmost anxieties of our latest European war, when we were suffering, but still building great hopes on the many catch-phrases that the politicians let loose—'the war that was to end war.' Alas! we hear less now of the end of war; nor to some does 'the next war' seem quite such an appalling thing to contemplate as it did three years ago, for which one reason is that, apart from the sundry comparatively small wars that are in progress in various places, it appears that it may be far off, and another because the public feelings in such matters are dulled. Three years or so ago there was a turn against Ruskin when this lecture was remembered and quoted from, because he preached that war was good for art, and therefore for the beauty of life. That appeared to be a revolting doctrine to a people who were then suffering the keenest pangs, and from whom all that was good in life day by day seemed to be torn away; but Ruskin had his argument, though one suspects he might have revised his views and thoughts and expressions could he have seen how wars are conducted now, when whole peoples and not small armies are bent to them, and what are the effects. Wars to-day are not as wars in which Egyptians, Greeks, and Romans engaged; their causes, their conduct, and their effects are different. Ruskin's entire work was accomplished under the influence of the Napoleonic wars in that he strove for the recovery of beauty in life when it had disappeared under the ugly commercialism and materialism that had succeeded the drain of those wars in a Britain yearning to be more and more prosperous; but great things, vast and awful conflicts, as those wars appeared, how little they were compared with the long struggles of the last few years! And if in future war there shall be the complete and sudden elimination of large cities by means of poison-gas and bombs, which from our recent experience seems quite likely, it is hard to see how a doctrine can be held that war is good for art, and therefore for beauty, and therefore for life and the soul; nor do we think that Ruskin would so maintain it, for the argument, with modern circumstances attached to it, must lead to the negation that the best thing for civilisation is to end it. He said: 'All healthy men like fighting, and like the sense of danger; all brave women like to hear of their fighting and of their facing danger. This is a fixed instinct in the fine race of them; and I cannot help fancying that fair fight is the best play for them; and that a tournament was a better game than a steeplechase. The time may perhaps come, in France, as well as here, for universal hurdle-races and cricketing: but I do not think universal cricket will bring out the best qualities of the nobles of either country. I use, in such question, the test which I have adopted, of the connection of war with other arts; and I reflect how, as a sculptor, I should feel, if I were asked to design a monument for a dead knight, in Westminster Abbey, with a carving of a bat at one end, and a ball at the other. It may be the remains in me only of savage Gothic prejudice; but I had rather carve it with a shield at one end, and a sword at the other. And this, observe, with no reference whatever to any story of duty done, or cause defended. Assume the knight merely to have ridden out occasionally to fight his neighbour for exercise; assume him even a soldier of fortune, and to have gained his bread, and filled his purse, at the sword's point. Still, I feel as if it were, somehow, grander and worthier in him to have made his bread by sword-play than any other play; I had rather he had made it by thrusting than by batting—*much* rather than by betting. Much rather that he should ride war-horses than back racehorses; and—I say it sternly and deliberately—much rather would I have him slay his neighbour than cheat him. But remember, so far as this may be true, the game of war is only that in which the *full personal power of the human creature* is brought out in management of its weapons.' Before this he had said: '. . . All the pure and noble arts of peace are founded on war; no great art ever yet rose on earth, but among a nation of soldiers. There is no art among a shepherd people, if it remains at peace. There is no art among an agricultural people, if it remains at peace. Commerce is barely consistent with fine art; but cannot produce it. Manufacture not only is unable to produce it, but invariably destroys whatever seeds of it exist. There is no great art possible to a nation but that which is based on battle.' But Ruskin then wrote in peace, when the Napoleonic wars were already distant things, and when the 'blessings of peace' upon which he cast a certain contempt were being overdone in the cultivation of materialism, causing him, the lover of beauty, veritably to loathe machinery, industrialism, and all the productive works and organisations of cities. He himself anticipated enormous developments in war; but if he had seen war and its effects in our time, so soon after his, it is to be doubted if he would have considered it as a great stimulant of art and beauty. All the present indications are that the latest war has had the opposite effect, and though in wars and after them there have always been profiteering scandals, the crop that has arisen since the recent war corresponds fully to it in scale and in ugli-

ness. Ruskin could not have considered this a good thing.

* * *

Thus and otherwise Ruskin provokes criticism and dissent in modern times. As some say that, whatever merit and truth once attached to his views upon questions of political economy the expression of which was one main section of his life work, they have only a minor value now, so say others that his thoughts on art, vigorously and dogmatically expressed as they were, have lost much of such truth as they ever possessed. But then art view, and opinion and standards, are not fixed and constant—far from it; and thought has moved more and more from Ruskin, who, for example, was strongly opposed to the new Impressionist movement, a circumstance well advertised by the famous libel action that Whistler brought against him for what was written in *Fors Clavigera* of his pictures. Much is made of this failure to appreciate the quality of the new Impressionist movement and Whistler's work, but it were well to remember that Ruskin was not alone in this. This year one has seen employed for advertisement purposes on the walls of London and in railway stations reproductions of that famous 'Portrait of my Mother' which is as familiar to the people now as almost any picture. Here is the blunt and vulgar but enormous compliment paid to it of using it thus for advertisement without any explanation, assuming (and correctly) that to the mass of the people it is known and understood. Yet, artistic folk of London, do not forget that when Whistler sent this picture to the exhibition at Burlington House the hanging committee refused it, only one member voting for it, and that Whistler took it then to Paris, where it gained the gold medal at the Salon and was bought by the French Government, who installed it in the Luxembourg, where it still is. Again, Ruskin did not appreciate Rembrandt, and one of the most serious charges against him is that he made a mistake committed by others of not merely failing to appreciate Constable, but scorning him as a third-rate painter—a mistake the more surprising when we remember how Constable makes us feel the emotions and the beauties of English nature as no other did before him, the sunlight upon the trees, breezes sighing amid the leaves, the wonder of skies and gathering clouds. Constable, in another way, made emotions kindle in the breasts of the least artistically sensitive among men and women, as Corot with his morning dews and poetic mists of evening did. Ruskin, the nature-lover, should have been more discerning and more just; his individual judgments were often imperfect; he was inclined to dogmatic stupidity, and was impetuous.

* * *

But those are details, and they matter little now when we contemplate the value of the grand principle of the cultivation of beauty in life, the rescue of existence from the sordidness of mere commerce and materialism. This may be doctrine that is easily overdone; but it is well it should be, for thus some effect may be produced. After the Napoleonic wars Britain was exhausted, and in due season settled down to hard work, from which the beauty of life was banished. This was the early Victorian period. Industry, commerce, inventions, manufactures were developed with a wild enthusiasm, and Britain soon grew rich, but nothing else. Her material prosperity was enormous, but her artistic soul was numb under that flood of materialism. Life contained money, but little more. It was a dull thing without the spiritual joys. It was against this that Ruskin raised his standard, and in the first of the great campaigns of his career fought for the beauty and the enrichment of life in such manner as they had never been fought for before. In prose of superb melody he wrote of art and architecture and matters pertaining to them and to life in a clear, direct, and beautiful style which, with its allusions, fascinated every reader and helped his artistic soul along. Think of the extent to which architecture was degraded in the Victorian times, when buildings were duller things in their plain and untouched ugliness, their ordered blankness, than they had ever been before. That was a time for Ruskin to write: 'Among the first habits that a young architect should learn is that of thinking in shadow, not looking at a design in its miserable liny skeleton; but conceiving it as it will be when the dawn lights it and the dusk leaves it; when its stones will be hot, and its crannies cool; when the lizards will bask on the one, and the birds build on the other. Let him design with the sense of cold and heat upon him; let him cut out the shadows, as men dig wells in unwatered plains; and lead along the lights, as a founder does his hot metal; let him keep the full command of both, and see that he knows how they fall, and where they fade.' Ruskin was led to what some felt to be excesses in his campaign against the rampant materialism, in his praise of the nature beauties that God presented, and his call to man to devote himself to them and achieve a new and higher happiness by them. To him the hills and the vales of England were the 'true temples of God, and their waves and clouds holier than the dew of the baptistery and the incense of the altar.' So when Manchester poached for water among his beloved lakes he would have flung Manchester to the bottom of them had there been room for her there. Manchester, he said, produced no art, no literature, yet would 'steal and sell for a profit the waters of Thirlmere and the clouds of Helvellyn.' He would have destroyed the new town of Edinburgh and the city of New York, the signs everywhere of Industrialism disfiguring Nature. If he was excessive, surely if there is anything more in life than money and the

struggle for it and the most vulgar pleasures, if man has a soul, then in the grand principle Ruskin was gloriously, splendidly right. And if he fought a dragon in his own day, that of materialism, over-belief in industrialism, the creed that nothing matters but money and possessions, is there not such a dragon here again to-day, grown bigger and more repulsive than before? It is true that now we should work for our salvation, and that men and machinery must exert themselves in industrialism as never before; but let it be remembered that heaven and man's salvation are not gained either by politics, capital, or the exertion of the most modern appliances. In one of the periods of agony in the recent war the leader of the people declared in a ringing speech that in the peace-time that was coming—that now has come—nothing would matter except capital and labour and machinery. Would it really be worth the war if there should be nothing of value now but this capital, labour, and machinery? It is for antidote to the doctrines of what is coarse and merely material that we need a Ruskin now, and the centenary comes to emphasise the danger and the need.

THE MINIATURE.

By MARY F. RAPHAEL, Author of *Phœbe Maroon*, *As Chance Would Have It*, &c.

I.

OUTSIDE the old shop stood a smart motor-car.

The street was quiet. Only a straggling company of pigeons busied themselves amongst the venerable cobble-stones. The trams, passing every now and then, sent the birds flying. But they returned as soon as the temporary turmoil had died down and the road was clear again for them to resume their gleaning.

A holland awning protected the goods in the shop window from the rays of the spring sun. Across the front of the awning was painted the word *Antiquités* in large blue letters.

It would indeed have been a pity had the old-rose brocade of those Louis XV. chairs become yet more faded. The strong sunlight might have stolen the colour, too, from the silk embroideries of that wonderful vestment, or from the quaint shawl flung so artlessly, yet artfully, over a corner of the gilt Empire cabinet.

It was the cabinet where part of Monsieur Dumont's priceless collection of miniatures was shown.

In the window there were to be seen, besides, cut-glass girandoles, carved and moulded frames of which the gilding had been mellowed to bronze by that most competent artist Time, Venetian-glass mirrors, old Chinese lacquered chests, *cloisonné* enamel vases, queer porcelain figures. . . . There was, in fine, as Madame Dumont herself would have told you, of everything.

A tall old man alighted from the car and paused for some moments, scanning the objects in the shop window.

He was obviously an aristocrat of the old French school. He carried himself erectly. His white beard and moustache were trimmed. And his tailor evidently gloried in his distinguished bearing.

He adjusted his eyeglasses and examined with interest the miniatures displayed in the cabinet. Presently his attention was claimed by one different from all the rest. It showed a Madonna and Child. The work, broad and skilful, was frankly modern. Its method of treatment contrasted strongly with the stippled technique of the other and older paintings. Contrary to convention, the Madonna was robed in white, and the Child had dark curly hair.

Who had painted that Child? *Parbleu!* he must find out. . . . It was exactly like. . . . It was the *portrait craché!* . . .

The miniature seemed to hold some strange attraction for him. At last he pushed open the shop door, and entered.

Madame Dumont, smiling, portly, good-humoured as always, greeted him from the farther end of the establishment.

'*Bonjour*, Monsieur le Comte. One little moment and I am with you.'

But before he could reply, he became aware of the presence of a third person—another customer to whom she was talking.

A tall, elegant girl. Her face was somehow familiar to him. A fancy, of course, for she was quite a stranger. It was annoying that Madame Dumont was engaged. He had looked in only for a few moments on his way from the station to the château. He could not stay—but——

Suddenly his interest was riveted by some words of Madame Dumont's that he chanced to overhear.

'But yes, madame. It is true what monsieur says. As it is modern work, it strikes a false note here. It is out of harmony with the other miniatures. But, *ma foi!*—what will you? Dumont is in love with it'——

The young lady murmured something which the count did not catch.

'*Enfin*,' went on Madame Dumont, 'pray monsieur to trust my husband yet a little longer, I beg you, madame. He is infallible. I guarantee you that he will not deceive himself.

Never in life, I assure you, Dumont has he badly calculated.' . . .

The good dame hesitated, shrugged plump shoulders eloquently, and glanced towards Monsieur le Comte. There was a pause. . . .

'Very well, Madame Dumont, I shall tell my husband what you say. He will perhaps be willing to leave it with you a little longer—before—before deciding. But of course he likes the miniature. In every case, madame, we thank you very much.' The young lady bowed and left the shop.

The count glanced at her as she went out.

A graceful *tenue*, he thought. A pretty girl, *Sapristi!* Where had he seen that face? Quite recently, too, here in Versailles. . . . It seemed she had been speaking of the miniature which had attracted him. Well, he was resolved she should not have it. He would outbid her, no matter what she offered. He must have it for Rosalie. The child's wide brow, the small, straight nose, the dark hair and eyes, the fat little chin with, already, the suspicion of a cleft in it—the resemblance was really striking!

'It is some time that we have not seen you, Monsieur le Comte,' said the buxom lady of the shop, coming towards him. 'And Madame la Comtesse, she is well, I hope?'

'I thank you. Yes, my wife is well. But—we are getting old, Madame Dumont. We are no longer very gay, we two old people up at the Castle.'

'Ah, the fine Castle of Monsieur le Comte—*certes*, it is so vast! There should be little feet—the grandchildren. See you, Monsieur le Comte, there is nothing as beautiful in one's old age! The grandchildren—it is like the return of spring after winter for elderly folk.'

The old man drew himself up with dignity. '*Eh, mon Dieu*, Madame Dumont, we shall know how to continue to bear it. It is so long since our son is a negligible quantity to us. His heart must be dead to his parents.'

'By pity, Monsieur le Comte, do not say so! Monsieur le Vicomte'——

'*Enfin*, evidently he prefers his art to our company. We heard rumours—a marriage—an impossible person, a model. But one must not believe all one hears. We wrote. He ignores our letters. Well, so much the worse. We are learning to accept the inevitable.'

'But, *voyons*, Monsieur le Comte, probably Monsieur le Vicomte fears'——

'We are his parents, Madame Dumont. Love should chase away fear.' The count lifted his eyebrows and changed the subject. 'You have some new miniatures, madame.'

'There are three fresh ones, Monsieur le Comte. But one of them would not interest you. It is modern. Only two are antiques. One of them is a replica of a wax medallion of the reign of Louis XIII. Dumont says it has great merit. *Tiens*, permit that I fetch it from the window'——

'*Pardon*, madame, but it is not that one I wish to see. It is precisely the modern one which interests me.'

'But . . . Monsieur le Comte . . . and you who are so great a connoisseur,' remonstrated the wily saleswoman.

She was also an old retainer of the count's family. She had been born and bred on the estate. She was devoted to them all, root and branch. And . . . there was a little plot she had in hand—ah, if only the good God would favour it! . . .

'I know well,' said the count, 'that, in comparison with the technique of the old miniaturists, the painting of which I speak is coarse. As a work of art it has certainly less merit. But there is something, all the same, which pleases me. I should like to examine it, madame.'

With a show of reluctance Madame Dumont fetched the Madonna and Child from the cabinet in the window.

'*Voilà*, Monsieur le Comte. It is pretty—pretty as everything; but it is modern, you see.'

The count held the little painting in his thin aristocratic hand. It trembled slightly, that hand—for in truth the likeness was startling, *épatant!* The thing might have been painted thirty-one years ago from his own boy, from Marcel himself. It was strange that he should have come across it. It was almost as if Providence had willed that he should possess it. . . .

And while he studied the miniature, Madame Dumont's shrewd, kindly eyes studied him. *Eh, bon Dieu*, the little plot was ripening. Monsieur le Comte and the young madame—to think these two should have found themselves in the shop together, and quite unconscious of each other, too! Surely, it was the destiny!

'What are you asking for the thing?' inquired the count at length.

'It is for almost nothing, Monsieur le Comte—a mere bagatelle; two hundred and fifty francs, Dumont said. For, see you, though it is modern style, it is good painting. Ah, as to that, yes, for example, I guarantee it you! A bagatelle only. It is the last price, Dumont said, without benefit to us, well understood. For the artist is little known. The price is low because he needs the money.'

'No matter,' replied the count. 'I will take the miniature. A little nothing, a birthday gift to Madame la Comtesse. It is her fête to-morrow.'

'I know it well, Monsieur le Comte. I thank you. Permit that I pack up the painting—so. Assuredly Madame la Comtesse will be pleased. Otherwise, you will bring it me back, quite simply. A thing so pretty, that sells itself always. *Bonjour*, Monsieur le Comte. A thousand thanks.'

II.

Next morning about twelve, just as Madame Dumont had finished her *déjeuner*—it had been *croûte-au-pot*, with an omelette to follow and a little cup of black coffee—she was surprised to see Madame la Comtesse enter the shop.

Madame Dumont came through the glass partition into the showroom. 'My felicitations on the birthday of Madame la Comtesse,' she said. (We must remember that she had been brought up on the estate, and was housemaid at the Castle till she married Dumont.) 'You are not, then, content with the miniature that Monsieur le Comte has chosen? You wish to select something else? But willingly, Madame la Comtesse—anything that you like.'

'Thérèse,' said the countess—such an elegant countess, in her velvet coat and ermine furs, with her pretty shining gray hair showing below the black velvet of her toque—'Thérèse, this miniature . . . how did you come by it?' . . .

The poor lady! Madame Dumont saw at once how greatly she was agitated.

'But of course she had divined something. How will you that she should not have guessed? The women, they are sharp, more sharp than you others—you men,' Madame Dumont assured her husband when she was relating the affair to him afterwards.

'And so then,' she went on, 'I told her. "But yes," I said, "the painting is by your son, by Monsieur le Vicomte. It is a painting of his wife—ah, the sweet little lady!—and of his son—but what a love of a child—*quel amour d'enfant!*—and it is the very spit of them, so to speak."' . . .

'You told her! But what cheek you have, you other women!' said Monsieur Dumont. And he pinched his wife's plump chin.

'Eh, my faith! yes, I told her. It is months, now, that they are here in Versailles, and the thing stretches itself out till it gets on one's nerves. And these poor young ones, they get thinner. They eat *maigre* all the week round, to make the money go far enough. And the old ones, up at the Castle, they get more sad and lonely, month by month. It is nonsense, all that.

'"You have seen him, Thérèse—my grandson?" she asked me. *Parbleu*, Dumont, I assure you—she was jealous! Madame la Comtesse jealous of me!

'"*Certes*, yes, that I have seen him, Madame la Comtesse," I said. "It is the finest child possible. And as to Madame la Vicomtesse—the dearest little lady in the world—and witty—and *spirituelle!* When they come here together, they make us laugh—Dumont and me—but laugh!"

'"Yet they say—I hear—she was a model," the poor lady told me. And I was sharp. *Dame*, yes! I think I showed tact, Dumont. For I said, quite simply, "I know nothing of that, Madame la Comtesse. That does not regard me. All I know is that she is as elegant and *comme-il-faut* as any princess—what do I say?—as even Madame la Comtesse herself." . . .

'And then, figure to yourself, she came out with it. Would I take her to see them? Would I take her then—then, at once? I had to go and put on my bonnet and mantle—*moi*, who had but just eaten my breakfast. And off we went in the auto—ah, *dame*, yes, in the grand auto, Dumont—to the Rue de la Poste.

'When we reached the house she was all pale, poor lady! from emotion. They are on the third, those young ones. Up she went, trembling, in front of me, and I puffing behind, for I had not digested, and, my faith! there is not a bad number of steps, see you.

'And she made me to enter first, and announce her. But what a scene for a play, and how touching! *Moi*, quite frankly, I had the tears in the eyes.'

'I think well,' said Dumont—'you with your heart of stone!' and he patted her fat, rosy cheek.

'Great silly, be silent, then, that I tell you the rest. "My mother!" cried Monsieur le Vicomte, and he embraced her nearly to crush her. And then he led that dear young wife of his to her, and said with a very noble air, "If you love me, my mother, you must also love my wife." And the little cabbage, watching it all!

'I suppose he felt himself abandoned. . . . Anyhow, he ran to the three of them, and, "*Maman*," he cried, "me too! Embrace Paul, too!" His father picked him up and put him in Madame la Comtesse's arms. . . . Ah, it was a pretty scene, I promise you!' . . .

III.

The same evening the car from the Castle passed down again into the town, and halted in front of the house in the Rue de la Poste.

Presently a trio of people came out—a tall young man carrying a child, followed by a graceful girl. The groom fetched wraps and packages. Then the car made its way back to the Castle.

There was a stir in the old place. . . . Lights showed in rooms that had been uninhabited for years. Servants hurried to and fro. And in the great dining-room the table was laid for five. . . .

The count had been absent in Paris all day. He returned to Versailles only half-an-hour before the dinner-hour, so that he was not able to greet the countess until he had dressed and they met in the beautiful drawing-room adjoining the dining-room.

Many counts and viscounts, with their ladies and children, in swords and periwigs, in hoops

and ruffles, in powder, brocade, and patches, looked down on them from the damask-panelled walls.

'*Sapristi!*' said the count, 'you have made great *toilette* to-night, Rosalie.'

'It is in honour of my birthday, Paul.'

'It seems, too, we have guests? I saw five covers laid in the dining-room.'

'Yes. To celebrate the anniversary. I—I thought you would not mind.'

'But no. Certainly not, my dear. Whatever pleases you'—— answered the count. But his brows were raised. He was intrigued—and a little bored.

'I went to Dumont's shop this morning,' said the countess, 'and Madame Dumont presented me to the artist who—who painted the charming miniature you gave me. So I invited him with his wife to dine with us'——

'Ah!' said the count.

'They are—rather an interesting young couple, Paul. I—I hope you will like them.'

'No doubt, *ma chère*. And the fifth guest?'

'They are bringing their small son. You see, they could not leave him quite alone. You are not annoyed?'

'But on the contrary. I shall be interested to see the child.'

'Yes,' murmured his wife, 'a splendid child. And we have so rarely a child here, Paul. I—I think I hear them coming.' . . .

Something unusual in his wife's manner awakened yet more the curiosity of the count.

He drew himself up and took his stand with his back to the great wide hearth, where logs burned, for the spring evening was chilly. Life-sized cherubs, wrought in marble, supported the high mantelpiece. But a real child, a child of flesh and blood—that would indeed be a novelty in the place. . . . The count adjusted his eye-glasses. . . .

And then—the doors opened and the three guests entered.

'Ah!' said the count.

For, straddling across the floor towards him, he saw a small figure. It seemed to come to him from the past of more than thirty years ago . . . It had the same wide brow, dark curls, brown eyes. . . . And behind he caught sight of his son Marcel's face—demanding—entreating . . . and of the face of the graceful girl whom he had noticed at the antiquity-shop—or was it the face of the Madonna in the miniature? . . . Then a light went up in his heart.

'Ah!' he exclaimed again.

'Paul!' begged his wife.

'Here's Paul, *grand'maman*,' answered a confident, childish treble. And the small person ran forward.

The count took a deep breath. 'There seem to be two of the same name,' he said with some formality.

'There cannot be too many after your pattern,' murmured the countess.

'It must be as you decide, *ma chère*.' . . .

'We have—all—decided, have we not? And the little Paul has set the example.'

'Madame la Comtesse is served,' said the butler, announcing dinner.

'Then there is evidently nothing more to be said,' acquiesced the count dryly. But there was a humorous twinkle in his eyes that his wife had not seen there for many a year. 'May I therefore have the honour, *madame ma belle-fille*, of conducting you to table?' And he offered his arm to his daughter-in-law.—'Marcel, escort your mother.—As to Paul, he will no doubt show us the way.' . . .

THE MONTH: SCIENCE AND ARTS.

NEW WASHING-MACHINE FOR THE HOME.

THE cost of having clothes washed at a laundry has now become so great as to be an important item of household expenditure. Any machine, therefore, which enables the 'washing' to be done at home with a minimum of effort will receive a warm welcome from the long-suffering housewife. A washing-machine that has been designed with this object in view is now on the market, and is selling in considerable numbers. It hails from Canada, where many have been in use long enough to reveal any shortcomings, if such were latent in the machine. The wash-tub is made of cypress wood, and is fitted with the usual bands to hold the staves together. It is mounted, at the most convenient height for the average woman, on four maple legs, which are bolted to the bottom and stayed by a wood cross with through tie-bolts. The mechanical washer is carried upon a substantial hinged lid made of wood in two thicknesses, the grain of one being at right angles to that of the other, whereby any tendency to warp is avoided. Movement of the dirty clothes in the tub is effected by the well-known dolly, which is mounted on a square spindle in the centre of the lid. Through the medium of a rack and pinion, the dolly is turned about half a revolution alternately in each direction by a vertical wooden hand-lever. This lever is placed at exactly the right height for operation without stooping, and the force required to work it backwards and forwards is only six ounces each way, as proved by actual tests. We all know how much easier it is to turn a handle when a flywheel is attached, to equalise the force required; the same applies to the movement

of a lever. Furthermore, a light flywheel running at a high speed is equally effective with a heavy one at a low speed. In the Canadian washing-machine lightness is of prime importance, as the mechanism has to be lifted every time the lid is opened. Multiplying-gear has, therefore, been introduced, the lever driving a large gear-wheel through a connecting-rod, which turns a small pinion on the spindle of a light flywheel. All the gearing is of steel, with the teeth cut from solid blanks, while the rotating parts are mounted on ball-bearings. The square spindle of the dolly slides in an outer spindle, and has a knob at the top by means of which it can be released from the clothes before the lid is opened. A strong metal catch clamps down the lid tightly so as to keep in the steam. As is usual in other washing-machines, the sides and the bottom of the tub are corrugated. The tub will hold six full-sized sheets at a time, which the makers claim can be washed in five minutes. A segment of the lid is firmly fixed to support a wringer, which is fitted with the usual rubber-covered rollers and adjustable springs for providing the necessary pressure. Here, again, ball-bearings have been used for the roller spindles, thereby reducing the effort needed to work the handle. The wringer is detachable, and the machine can be bought without it if desired. All metal parts exposed to the wet clothes are galvanised, while the exterior of the mechanism is thickly coated with enamel paint. The main advantages claimed for this washing-machine are reduced effort in an upright position and the confining of the steam inside the tub when washing operations are in progress, thus keeping the water hot for a longer period, and minimising the risk of the operator taking cold.

STERILISING THE SOIL WITH THE AID OF STEAM.

If ground in which delicate and valuable crops are to be grown could be completely sterilised as regards insects and weed germs, better results would naturally be obtained than is the case when part of the nourishment in the soil is absorbed by alien plants and the seedlings are attacked by injurious living organisms. Tobacco-growers in the United States have lately hit on a plan whereby perfect sterilisation is achieved without injuring the soil as a medium of cultivation for seedlings. The plan referred to is the blowing of steam into the ground from a portable boiler. Rectangular pans of metal or wood are constructed and inverted over the seed-beds to be treated. If built of wood, each pan has strips of iron along the edges, which fit close to the ground, and thus prevent the escape of steam. About seventy-two square feet are covered by each pan, and steam under pressure is turned on for half-an-hour, when the pan is lifted by ring-bolts in the corners and moved to the next section. After being steamed, the ground is covered with blankets, to retain the heat as long as possible. According to the *Scientific American*, it has been found that thirty minutes' steaming will heat the upper two inches of soil to from 208 degrees Fahrenheit to boiling-point, while the temperature reaches 170 to 180 degrees at a depth of three or four inches, and 120 degrees at a depth of six inches. Two hours later, however, the soil at the last-named depth is found to be hotter, reaching 160 degrees. If two pans are used alternately, one may be left on each area for half-an-hour after the steam has been turned off, thereby improving the effect. One thousand square feet of soil can be treated with steam at a cost of twenty-five shillings, which would about equal the cost of weeding, and as less fertiliser is needed for sterilised than for unsterilised ground, there is a saving under this head. Although the early growth of the plants in steamed ground is slower than in untreated soil, they come along more quickly in the later stages, and are ready for planting out a fortnight sooner.

CHEAP CONCRETE HOUSES.

Owing to the present high cost of bricks and mortar and of the labour needed for erecting houses therewith, special attention has recently been given to other building materials, various forms of concrete construction having aroused particular interest. This departure from customary practice is much older than many people imagine, concrete cottages with flat roofs having been built by an enterprising Essex manufacturer a great many years ago. Even before the war the possibilities of concrete houses were attracting notice, and examples had been shown in connection with at least one exhibition in London. During the last year or two still greater attention has been directed to concrete houses, which have been built in several localities. Particularly good results have been obtained at Sheffield with a special mixture of clinker or boiler ash and cement, seven parts of the former to one of the latter being used, together with a proportion of sand. The walls are built on the cavity system, which gives greater warmth in winter and is less pervious to heat in summer than the solid construction. Two houses built on this plan, on the estate of a local landowner, have been occupied for about four years. The special concrete is said to cost less by 40 per cent. than the usual mixture of broken brick or stone, cement, and gravel. According to *The Times*, the experiments show that a bungalow with sitting-room, three bedrooms, kitchen, bath-room, &c. can be built for £400, as compared with about £700 for one of bricks and mortar. Moreover, the operation can be carried out in three months by two men working under supervision, and the house can be made habitable in another week. At the time of writing thirty-two houses were being built on this system, of which ten had been sold. The concrete is

moulded, and the buildings are surmounted by roofs of the same material, so painted as to give the appearance of being tiled. No fireplaces are provided, the rooms of each house being warmed from a central heating system.

PAINLESS OPERATIONS WITHOUT UNCONSCIOUSNESS.

For many years, in fact ever since anæsthetics were brought into general use, one of the aims of surgical scientists has been the discovery of some method of operating painlessly without rendering the patient unconscious by inhalations of ether or chloroform. According to the *Sunday Times*, this desideratum is now an accomplished fact, a system based on the use of phenol having been successfully employed by the surgeons at the chief military hospitals in Milan for some thousands of operations, among which were over three hundred on the lungs, performed by Professor Bruschi of Como. The proposed line of incision is marked with phenol (carbolic acid) by dipping a sterilised scalpel into this liquid, and using the back of the point of the scalpel as a marker. After the lapse of a few seconds, the scalpel is again dipped into the phenol, and the tissues are cut with a slow and gentle up-and-down movement similar to that used in sawing. What happens is that a film of phenol is formed on the blade when it is immersed, and this anæsthetises the tissues as they are cut. Frequent dippings are necessary to maintain the film, which is rubbed off by contact with the tissues or washed away by blood.

A NEW GAS-RANGE.

So little has the ordinary gas-cooker altered in form during the last decade that one might well have been excused for assuming that it had reached finality. Even in the best models, however, the degree of efficiency achieved has not been truly commensurate with the amount of gas consumed, and in certain types there has been marked room for improvement. Realising this position, the makers of the 'Eagle' gas-range described below set themselves the task of bringing out a new gas-cooker in which the known drawbacks of existing types should be removed. They had achieved a large measure of success early in 1914, but owing to the war the new appliance has been placed on the market only within the last month or two. One notable instance of wasted heat in ordinary gas-ranges is the loss from the bars at the top which support the cooking-utensils. The jets from the burners actually impinge on these bars, which become very hot and communicate heat to the whole top. In the new range the framework over the rings is of such a pattern that the jets nowhere play upon the bars, which therefore do not become nearly so hot, the heat being brought to bear almost wholly upon the utensil. Then the burners themselves are so designed that they cannot be blocked or extinguished by foods that have boiled over—an improvement which will be appreciated by every woman who cooks by gas. Although the burners are small compared with the usual rings, they have a greater consumption capacity, the object being to shorten the time taken for boiling, thus reducing the loss of heat and enabling the cooking to be done more quickly. Each burner gives a concentrated heat at the centre of the bottom of the utensil, so that flames do not rise up the sides of a saucepan or a kettle. Some of them are of the duplex type, one set of jets above another. The taps for the burners are all arranged at the front of the range instead of at the side, and each tap has a 'full flame' and a 'simmering' position. For each duplex burner a quarter revolution of the tap turns both sets of burners full on; half a revolution shuts off the large burner, but leaves on the simmering burner; and a further movement to the stop reduces the consumption to a 'minimum point' of one and a quarter cubic feet per hour. The grill burner has also received careful attention, with the result that the heat is more evenly distributed, while its efficiency has been much improved when this burner is used for boiling. All burners are fitted with means for varying the supply of air, which enables them to be used with inferior qualities of gas at different pressures; in fact, gas containing only 350 heat units, against the pre-war average of nearly 600, has given satisfactory results. The chief innovation in the oven is a solid bottom-plate with the burner immediately below it, which distributes the heat evenly. Pastry can be browned in any part, and no drip-pan is required. Another novel feature is the oven door, which has hinges at the bottom and opens downwards into a horizontal position, where it forms a convenient temporary rest for dishes or tins. The tap for the oven burner is similar to those for the top burners, in that, after being left full on for heating the oven, the lever can be pushed over against a stop, in which position the tap will pass just enough gas to maintain the correct baking temperature. Although the oven in capacity is not smaller than the ordinary type, its height is not so great, but legs fitted to the bottom of the cooker raise it to a convenient height. The equipment is completed by an enamelled splash-plate at the back, fitted with a wire-mesh plate-rack, and by detachable extension plates at the sides of the top to accommodate vessels temporarily out of use.

DRAWING LOTTERY BOND NUMBERS.

Most of us at one time or another must have wondered how the lucky numbers are drawn for lottery bonds, and whether due precautions are taken against fraud. In connection with the issue of a loan of 1,500,000,000 francs by the City of Paris, 3,125,000 bonds are to be paid off at par over a period of sixty years, and

some of these will be entitled to bonuses, varying in amount according to the order in which their numbers are drawn in a lottery. It has accordingly been necessary, says the *Scientific American*, to devise some method of conducting the drawings which shall be free from every suspicion of fraud or collusion. To effect this there has been constructed a huge globe, mounted on trunnions, and consisting of an iron framework with half-inch-thick glass panels between the bars, so that the contents of the globe may always be fully visible. The only means of access to the interior is a hole less than one inch across, which opens into a short tube. Cartridges containing the numbers of the bonds are put into the globe automatically by an electric device. When this operation is completed, a steel valve at the inner end of the tube is closed by a spring, while an outer brass door, fitted with an American patent lock manipulated by three separate keys, is secured and sealed with the City seals. Before a drawing takes place the numbers are mixed up by revolving the globe, which is effected by electric motors. The globe comes to rest with the hole at the bottom, and the seals having been broken and the outer door unlocked, an electric extractor is inserted. On a button being pressed, the inner valve flies open for an instant and allows one of the cartridges to fall into the extractor. The pressing of a second button causes the cartridge to fall out of the extractor and through a long glass funnel into a thick glass bowl, from which it is taken for the number to be read and recorded with due formality and precautions.

CONCRETE FOR RAILWAY TRUCKS.

Although the use of ferro-concrete has proved a commercial success for lighters and barges sailing in smooth waters, and bids fair to be extended to the construction of ocean-going ships, one would hardly expect, taking into consideration the severe vibration to which they are subjected, to find railway vehicles built of this material. Yet a fifty-ton coal-wagon was built of ferro-concrete early in this year, and put into service on the Illinois Central Railway. Primarily this development was due to the shortage of steel owing to the war, but a company has been organised to continue the construction of railway goods-wagons on the same lines, and designs for various types have been prepared. The body of the first example measures forty-one and a half feet in length outside, and has a width of nine feet eight inches, while the depth is four feet ten inches. The frame is built of steel angles and plates which serve to support the steel reinforcement bars. Wood panels or forms were placed beneath the floor and outside the sides, says *The Engineer*, and the concrete was then shot in place against these panels by a cement gun inside the car. The appliance, which is much used for ferro-concrete structures, sprays the concrete in a sufficiently solid form to enable it to retain its position when projected on to the steel framing and network. The thickness of the sides and the bottom of the wagon is two and one-eighth inches, and the weight of the complete vehicle, with underframe, wheels, and other accessories, is about twenty-four tons. In future wagons, however, it is hoped substantially to reduce this weight, which was due to the unexpected density of the concrete when applied by the cement gun. The concrete used is known as 'Haydite,' and it is made of shale burnt in a kiln with Portland cement. It weighs only 105 pounds to the cubic foot.

FIBRE GRAMOPHONE-NEEDLES IN THE MAKING.

As the fibre gramophone-needle is rapidly displacing its steel forerunner in public favour, it is obvious that enormous numbers must be manufactured, and it is interesting to learn how the bamboo from which such needles are made is converted into the finished product. The poles must be twenty feet in length, and two and a half to three and a half inches in diameter, says the *Scientific American*, while the exterior must be relatively free from flaws. This feature is of great importance, as only the hard outer skin of the bamboo is suitable for the points of the needles. Each pole is sawn into sections one inch long, which are split in halves. These halves are next cut up by special machines into rough blanks for needles at the rate of 125 to 180 a minute, the soft inner part of the bamboo being removed from each blank in the process. The blanks are then filled into perforated containers, and immersed in hot baths containing an oily mixture at a temperature of 340 degrees Fahrenheit, the process being continued intermittently for about forty minutes. Any excess oil which has been taken up is now removed in rotating barrels containing hardwood sawdust from which the finer dust has been screened out. During this operation a certain degree of polish is also given to the blanks. Finally, the needles are inserted into bushings on a machine which cuts each to a point terminating in the hard cortical surface of the bamboo. The pointing-machines are each capable of dealing with 30,000 needles a day.

To Correspondents who wish fuller information regarding new inventions, publications, &c. mentioned here, addresses will be furnished, when possible, provided a stamped and addressed envelope or post-card be sent to the Editor, 339 High Street, Edinburgh.

JOCK'S TERMS.

A TALE OF THE MALTA HOSPITALS.

By ALBERT G. MACKINNON, Author of *Hospital Jock*

CHAPTER I —HIS TASK.

'JOCK, we have a case for you in Ward 10,' said the surgeon cheerily as he drew up at M'Gowan's bed. 'The man is in the dumps, and he will not give us a chance to make him well. Try your hand on him, like a good fellow, and find out what is the matter.'

It was not the first time Jock M'Gowan had been entrusted with such commissions. He had a wonderful way with him, and no probing of the surgeon's knife could go so deep as Jock's artful questions and tactful sympathy. Few secrets could defy his methods.

'Ay, weel, I'll dae my best. I'll find oot what the maitter is, onywey,' he replied in tones of confidence.

'His name is Roderick Macpherson. He has been seriously wounded, and unless you can buck up his spirits a bit, it may go hard with him. He has got something on his mind that is troubling him. His moaning and groaning are caused by mental distress, not physical. You must draw out his worry'——

'Like a poultice,' Jock interrupted with a laugh. 'Weel, I'll get it oot, never fear; an' maybe that'll relieve him.'

'Thank you, Jock,' said the surgeon as he turned away. 'You are working your passage in this hospital. I think we shall have to get you put on to the permanent staff. You are the most useful man in the place.'

Jock smiled. He never seemed to need encouragement, but a word of well-merited praise is always a stimulant. Getting into his invalid's chair, he began to wheel himself through the ward, greeting the various patients with a cheery sally as he passed along. Out into the corridor and the adjoining ward he steered his way, and pulled up at a bed above which hung a Scotch bonnet.

'Hae they been giein' ye caster-oil, mon?' he asked in his quizzical way.

A face that was like a map of Scotland, or, rather, a photo of its mountains on one of those cloudy days when its scenery is a study of shadows, looked up at him from the pillow. Rugged, weather-beaten, darkened by a perpetual frown, it was that of a man with a grievance, or something worse. The heavy eyebrows intensified its sombre aspect, though they did not hide the keen scrutiny of eyes very much alert.

'I hae been dosin' mysel'—wi' carbolic,' was the glum response, though it did not lack just a hint of humour. Macpherson had caught the mood of his questioner.

'Gey strong stuff, that. It'll burn ye, mon,' said Jock, feeling for a clue to the patient's real malady.

'Ay, it does that; but it canna burn a' the rottenness that's in here;' and the wounded man pointed tragically to his heart.

It was evident that Jock had won his confidence.

'Tell me hoo ye got yer wound,' asked Jock.

'Which?'

'Weel, we'll begin wi' the ane in yer leg, an' then ye can tell me aboot the deeper ane in the hairt.'

'There's a connection atween the twa,' began Macpherson. 'It was durin' the attack on the Bulgar lines that I got knocked oot. We had ta'en the third trench, an' then had to retire. A shrapnel burst beside me, an' emptied itsel' intil my legs. The doctor has lost coont o' the bits he has extracted. I lay there unable to move, juist lookin' up at the sky. I watched the day breakin', for oor attack had been at nicht. Never afore had I observed sae intently the sun risin'. I had naethin' else to dae, an', strange to say, I didna feel ony pain, but only a numbness. I cudna move my legs, an' sae I lay on my back. Sune I got mair o' the sun than I wanted. It had the range o' me a' richt, an' it didna miss its mark. My lips got pairched, an' then my tongue began to swell. It felt juist as if I had a piece o' red-hot iron in my mooth. There was only ae thocht in my mind, an' that was water. I thocht o' a' the drinks I had ever drunk. The vision o' the well in my mither's back-gairden cam' afore me. Aince or twice as I dozed aff I imagined mysel' workin' as hard as I cud at the haundle, but the water didna come. I tried to turn ower on my side, but the moment I attempted to move a hundred spikes seemed driven intil my legs, an' sae I had to gie that up. I longed for nicht. I prayed for it, but it looked as if my prayers wud never be answered, an' the sun had forgotten to move on, as it did i' the days o' Joshua. I got tired o' my thochts, but I cudna get awa' frae them. Then at last it began to get cooler, an' never hae I blessed a sunset mair. I didna ken that there was waur in store. For a while I felt cool an' contented. The stars cam' oot, an' it was nicht, an' wi' my heid on the grund I lay gazin' up at them wi' mony a queer fancy in my mind.'

'Ye didna feel feared?' interrupted Jock.

'No at the time,' answered Macpherson. 'But it wasna lang afore I got a start that set my hairt thumpin'. When it was quite dark I

began to see figures movin' aboot i' the nicht. At first I thocht that maybe I was dreamin'; but ane o' them cam' quite close, sae that I cud mak' him oot. They were Bulgars prowlin' aboot like ghouls, robbin' the deid an' wounded. I was lyin' in a hollow, an' sae weel hidden. The mon had his back tae me, an' passed on withoot turnin'. I saw the shadows o' several efter that, an' I heard gasps an' cries, an' kenned fine what they were up tae; sae I kept verra quiet. Then the pain began in my throat an' legs, an' I cudna remain silent ony langer. I gied twa three cries, though my voice didna seem like my ain. I thocht the Bulgars wud hear an' search for me, but I was in that state that I didna care what happened. Weel, I kept up my shouts an' groans every noo an' then. It was gey lonesome, I can tell ye, to feel that there was nane to heed. It wud be i' the sma' 'oors o' the mornin' that I pricked up my ears. I heard an' answerin' ca' frae the direction o' the British lines. It wasna lood, but mair like a whisper, an' had a note o' caution aboot it.'

'It wud pit fresh courage intil ye,' said Jock.

'Ay, I'll never forget the music o' that ca' i' the nicht. Mony's the time I hae heard the human voice in song an' speech, but never did it soond sae welcome as then. I forgot a' aboot the Bulgars, an' shouted back. Nearer an' nearer cam' the answerin' voice. Then a' o' a sudden it ceased, juist when I thocht relief was at haund. I called again an' again, but there was nae response. Then day began to dawn, an' I kent the chance was lost. I dinna like to think o' the awfu' horror o' the next day. The sun was mair peetiless than afore, an' my tongue seemed to burn the inside o' my mooth. I prayed for daith to end my misery. Then as nicht cam' on again, an' darkness gathered roond me, a new fear seized me. I feared then I was gaun to dee, an' a' o' an instant the thocht gripped me that I wasna ready. The sin o' my past rose up afore me. Whiles I think my mind wandered, for I thocht I saw the deid bodies roond me movin' an' crawlin' up tae me, an' their deid eyes lookin' intil mine, an' remindin' me o' a' the evil I had done. I began to realise hoo wicked I had been. Then ae sin stood oot frae the rest.'

'What was that?' asked Jock with intense interest.

'I dinna ken whether I shud tell it tae ye or no, but as I hae gane sae far, I may as weel gang the haill length. I telt a lee aince. It didna seem a big thing at the time, but it had awfu' consequences. It sent as guid a mon as ever breathed to the dogs. It slipped aff my lips a'maist afore I kent. Ye see, I was in love wi' Janet Fraser, an' I was verra jealous o' Sandy M'Gibb, especially as I saw he was takin' her fancy. Ae day she an' I were thegither, an' oor talk turned tae Sandy. "I'm hearin'," I said verra jauntily, "that he's tryin' to break aff wi' that Glesca' girl to marry yer money." She looked at me startled an' innocent like. "Ye maun be mista'en," was a' she said; but her falterin' tone let me see that my words had ta'en effect. "Mista'en!" I lauched. "Weel, ye can read the proof wi' yer ain eyes." I happened to hae a letter in my pocket frae a freen' in Glesca inquirin' aboot Sandy. The de'il aye has a tool ready to pit intil a mon's haund. My freen' wanted to ken aboot Sandy's bank accoont, as he had a bill oot-staundin'. He enclosed Sandy's ain letter, in which there were these words: "I wull settle the accoont shortly, as I am comin' intil some money. Margaret Page threatens me wi' a lawsuit if I break my contract, but I'll tak' my ain wey." "There," I said, showin' her the letter, "you can see for yersel' that what I say is true. Whase money does he speak o' but yours, an' wha is this Miss Page but the girl he's engaged tae?" A' the time I kent it was a lee. Sandy M'Gibb had a sma' saw-mill, an' his letter dealt wi' machinery he was gettin' frae Glesca, an' the second remark aboot Margaret Page was entirely a business ane. It referred to a furnishin'-shop that had aince belanged to a person o' that name, an' since her daith the business had been cairried on as before. I kent this, but it suited my purpose no to explain it at the moment, wi' the result that Janet Fraser believed what I said. She left me in great anger at Sandy, an' by some ill-luck he chose that verra nicht to gang an' ask her to be his wife. What she said I didna hear, but it maun hae been pretty stingin', for the next day he was a changed mon. He selt his saw-mill, an' left the pairish. "Roderick," he said tae me the last time I saw him, "I'm gaun tae the dogs," an' if report be true, he didna tak' lang aboot it.'

'Ay, ye've got summat on yer conscience,' remarked Jock gravely. 'Was the lee ever fund oot?'

'That it was, but ower late to undo the wrang, though no to punish the culprit. Janet made inquiries, an' unbeknown tae me wrote tae my freen' in Glesca; an' when I went in my turn to propose tae her, ye ocht to hae heard her words. I didna wunner then that Sandy had fled, an' when I left her door that nicht I kent there was nae livin' for me in the same pairish. I left tae as sune as I cud, an' I've never been back since. I cudna face her for warlds. I wud raither chairge a hundred Bulgar trenches than gang hame. Weel, I thocht it a' ower that nicht as I lay there, an', mon, my wounds were naethin' tae the pain at my hairt. It maun hae been aboot ane o'clock when I heard a low ca' again, juist as the nicht afore. This time it was nearer me. I tried to answer, but words stuck in my throat, though I managed to mak' some kind o' a soond. Then the ca' cam' nearer still, an' sune I saw a

mon crawlin' alang on his haunds an' knees tae me.

'"Whist! Quiet!" he whispered. "There are Bulgars aboot."

'His words startled me, no because o' what they said, but on accoont o' their accent. Was I dreamin' or wanderin' in my mind? The voice was that o' Sandy M'Gibb, the mon I had been thinkin' aboot, an' that I hadna seen since he had gane tae the dogs.

'"Sandy, is that you?" I gasped.

'"Ay, Roderick, it's me," he answered. "I didna expect to find you here. It mak's me a' the mair gled that I didna turn back. Last nicht I heard yer ca' an' tried to find ye, but had to gang back owin' to a patrol o' Bulgars juist aheid o' me. There are some o' them gaun aboot the nicht, sae we maun be gey carefu'."

'"It's guid o' ye, Sandy, to risk yer life for me as ye hae done," I replied, wi' remorse in my hairt.

'"My life's no muckle worth, Roderick boy," he whispered. "I hae made a bad mess o' it. I touched bottom, an' that's gey far doun. Then the ca' o' King an' country fanned the last spark o' guid left in me. I felt there was ae thing I cud dae wi' my muddled life, an' that was to gie it for ithers. The chaps say I hae been gey reckless wi' it, but then they dinna ken the reason. Ye'll be the fourth mon I'll hae brocht in since oor stunt, an' yet somehoo, mon, it disna ease the conscience."

'"Ye're troubled that wey tae," I said. "Sae am I."

'"Weel, this is no a place to discuss it. I maun get ye back if I can," he replied. "We canna staund up, or we'll be seen. I'll hae to drag ye in, since ye canna dae onythin' wi' yer legs."

'He untied his puttees, made a rope o' them, passed it under my airms, an' then ower his ain shouthers, an', still crawlin', began to haul me alang. I helped as much as I cud wi' my haunds, but the agony o' thae moments beats a'. Every nerve in my body seemed to be a bayonet stickin' intil me; yet it was naethin' tae what I was sufferin' in my hairt. Here was I bein' saved by the mon I had ruined. At last I cud staund it nae langer, an' when he halted to tak' a rest I said, "Sandy, I hae somethin' to tell ye. Ye're heapin' coals o' fire on my heid, an' it's causin' me mair pain than my wounds. I dinna deserve to be saved by you."

'He was gey tired, an' had to listen. Sae I made a clean briest o' my sin, an' telt him a' aboot my lee to Janet Fraser, that had caused her refusal, an' that had started him on the track o' ruin. He said naethin', but I saw his feelin's were workin' hard. I ended by beggin' his forgi'eness, though I acknowledged I had nae richt or claim. Efter I had feenished, it was a lang time afore he spoke. Then he said in a voice as hard as iron, "Ye hae tempted me the nicht mair than I hae ever been tempted afore. I made up my mind to leave ye here to dee like a dog, the vile cratur that ye are; but efter a' I hae risked to get ye in, I'm no gaun to gie up at the last. Sae come alang. I'll save yer life, but dinna ye ever ask me again to forgi'e ye, for I'll no dae it—na, never!"

'Wi' that he started to pull me on, an' then he seemed to hae the strength o' a Samson. He had nae regaird for my wounds, an' though I cried oot for pain, he didna stop. I suppose he was ragin' sae in his mind that he forgot a' else. I believe if the puttees had broken he wud hae left me; but they held, an' sae we reached the trench. He had to staund up there to roll me ower, an' juist at that moment the risin' moon peeped through a cloud an' showed us up, an' next instant a sniper fired an' hit him. We were baith cairried doun the line. The last I heard o' him was that he was daein' weel, an' had been ta'en tae Malta also. Noo it's an awfu' thing to be unforgi'en, an' that's what I'm feelin' the noo.'

Roderick Macpherson ended his tale with a groan of misery that seemed to rise from the very depths of his soul.

'I'm gled ye hae telt me a' this,' said Jock. 'Maybe I'll find Sandy, an' bring him to anither frame o' mind.'

'If ye cud dae that!' said Roderick, as his eyes shone for a moment with joy. Then he shook his head, and added, 'It's nae use. I ken Sandy, an' he said, "Na, never!"'

CHAPTER II.—HIS TACT.

JOCK did not waste time in his search, and next day, to his great delight, he heard that Sandy M'Gibb was a patient in St Paul's Hospital, which was only a short distance from his own. To get a friend to wheel him over in his chair was an easy matter. It was not Jock's nature to do anything by halves, and so he could not rest until he had started on his errand of peace-maker.

He trusted to circumstances to guide him, and to give him an entrance into the hard heart whose lack of forgiveness was killing poor Roderick Macpherson.

'I hear ye're to get the Military Medal,' Jock began tactfully as he drew up at Sandy's bed, 'an', as a brither Scot, I've come to say hoo prood I am. I'm telt that ye brocht in fower wounded men efter that stunt at Saloneek.'

'Ay, ane ower mony,' was the gruff response.

'Dinna say that, mon. I hae seen the last ane ye saved, an' though he is gey bad, the doctors hope to pull him through, an' a better sodger there cudna be. Ye've helped the "man-pooer," as they ca' it. But yer job's no richt done yet, an' I hae nae patience wi' half-feenished wark.'

'Div ye mean that I didna save Roderick Macpherson? Weel, if I didna, I dinna ken wha did or cud. I'll confess that I was verra near leavin' him in No Man's Land, but as I had risked sae muckle to find him, I determined to complete the job.'

'But that's juist what ye havena done,' interrupted Jock with some severity, which made the other open his eyes in wonder.

'Ay, I did that; an' it cost me this wound, worse luck!'

'Ye got him intil the trench, I admit; but that's no a'.'

'Weel, it's for the doctors to dae the rest.'

'Is it?'

Jock had a startling way of putting a question that seemed somehow to undermine all one's reasoning. Sandy certainly was taken aback. He was conscious that some axiom, whose sureness he had never doubted, was suddenly discovered to be rotten.

'If the doctors canna cure, wha can? Tell me that!' he demanded with some warmth, answering, Scot-like, question with question, in his determination to show that he could handle the gun of interrogation as well as his interviewer.

'You can,' answered Jock, unable to restrain a smile, for he had most successfully led the conversation up to the point he desired. He had strategically won the dominating position.

'Me?' was the astonished reply. 'I'm no a doctor.'

'There are some pairts o' us medicines canna reach, but words can; an' Roderick's warst wound lies there. He's deein' o' remorse, an' its only cure is forgi'eness, an' it's only you that can speak the message o' pardon that'll pit new speerit intil him.'

'He can dee, then,' was the uncompromising response from the bed.

'An' the British Airmy'll hae lost a guid sodger a' through you. Mon, if I was a general, I wud mak' ye forgi'e him, or duck yer heid.'

'Ye can dae what ye like; but when I think o' a' my past, an' hoo it was due tae Roderick Macpherson, it's no in me to pardon. I'm no made that wey. Sae ye needna fash yersel' wi' talkin'. I'm no the kind to be got roond wi' palaver.'

Jock looked at the wounded man with some amazement and no little secret admiration. He had met his match. All his persuasive powers had failed. He had sense enough to see that it was useless to persist, that it would only render the other more stubborn in his resistance. So, with a curt 'Good-day,' he wheeled his chair round and out of the ward.

Defeat did not agree with Jock. He could not eat his meals, and he did not talk for thinking. His cheeriness vanished, and the ward felt the chill of its eclipse.

'What's wrong with you, Jock?' asked the nurse in surprise.

'There's naethin' the maitter wi' me but my brains,' was the response, for he was cudgelling them to no purpose, and was angry with himself.

But Jock was lucky. Perhaps his luck consisted in always seizing his chances, and being on the lookout for them. Two days later he was still battling with the problem on his mind, when he overheard scraps of a conversation near him. An R.A.M.C. man who was going to Egypt, and whose boat had called at Malta, had come ashore to see a wounded friend in the next bed to Jock.

He was amusing his listener by giving an account of his voyage and describing his fellow-passengers.

'We have a Scottish nurse, a perfect brick,' he was saying. 'Her name is Janet Fraser, and she does credit to the clan.'

'I wunner if she's frae Loch Darroch, by ony chance?' interrupted Jock.

The visitor looked round at him with curiosity. 'Yes,' he answered, 'that is the parish she comes from. Do you know her?'

'No personally, though I hae been thinkin' a great deal aboot her this last day or twa. Is she mairrit yet?'

'I should think not, or I should not be so interested. I do not know why a girl like that keeps single.'

'I ken,' Jock replied with emphasis; 'an' the reason does her credit. But she'll no remain unmairrit lang noo. In fact, she'll no leave Malta withoot bein' engaged.'

'Well, it will have to be to myself, then,' laughed the visitor. 'The boat leaves to-morrow, and she is not coming ashore, and of the men on board I think I stand the best chance.'

'She maun come ashore at aince. Tell her a life is hingin' i' the balance. Gang an' bring her this meenit. It's maist imperative. Noo, dinna hesitate. She disna ken my name, sae there's nae use sayin' wha sent ye; but tell her that her ain future depends on it, an' the happiness o' three lives. Noo, haste ye.'

There was something very commanding about Jock on occasions, and this was one of them. The visitor felt his mesmeric power, and did what many a nurse and doctor had done before —his bidding.

No sooner had his messenger gone than Jock got into his chair, and calling for a volunteer to wheel him, set off for St Paul's Hospital. He found Sandy M'Gibb in much the same mood as he had left him.

'Weel, Sandy, nae cheerier?' was his salutation. 'I hae got news for ye, though, that'll mak' ye sit up an' brush yer hair. Wha div ye think I am gaun to bring to see ye?'

'No Roderick Macpherson, I hope, for I'll hae nane o' him, sae ye needna trouble.'

'If that 's yer speerit, I hae a guid mind no to bring her.'

'Her? Wha?' asked Sandy with a new suspiciousness in his voice.

'Janet Fraser, of course. She 's here in Malta.'

Sandy's face flushed, the frown passed, and a softness crept into his voice. 'Ay, I wud be richt gled to see her, an' wud be muckle indebted tae ye. Dae ye happen to ken, lad, if she 's mairrit?'

'Na, she 's no mairrit, an' for a verra guid reason.'

'Why?'

'She 'll no tak' them that want her, because she didna get the ane she wanted. She 's been loyal tae ye a' thae years, Sandy, though ye dinna deserve it. Mind ye, it was only her mind that was turned against ye, an' no her hairt.'

'Dae ye think sae, mon?' There were tears now in the wounded man's eyes and a tremor in his voice.

'Ay, I hae nae doots aboot that.'

'Gang an' bring her at ainee. I 'm fair deein' to see her noo,' said Sandy, sitting up in bed and beginning to make himself tidy.

'No sae quick, Sandy. I hae got my terms.'

'Terms?'

'Ye dinna expect me, surely, to dae a' this for naethin', an' tae a grumblin' body at best!'

'What dae ye want, then?' asked the other in surprise.

'That ye 'll write wi' yer ain haund on a piece o' paper that ye forgi'e Roderick Macpherson frae the bottom o' yer hairt for a' the ill he has done ye, an' that ye 'll never bear him a grudge. I 'll no budge a step to get Janet until ye pit that intil my haunds, an' withoot me she canna find ye, for she disna ken ye 're in Malta.'

'Mon, ye hae got me fine,' laughed Sandy. His hardened heart had been burst by the explosive of love, whose power Jock knew only too well.

The message of forgiveness was written, and Jock hurried with it to Roderick Macpherson, who could scarcely believe his eyes as he read it again and again.

'He forgi'es me,' he cried with the exuberance of a new-found relief. 'Mon, Jock, I 'm thinkin' that the next best thing to forgi'ein' is bein' forgi'en.'

When Jock got back to his ward Janet Fraser was there. In simple words he told her the whole tale.

'It was I who did the great wrong in ever doubting Sandy,' she cried. 'Take me to him that I may ask his forgiveness.'

'He 'll gie ye that a' richt,' answered Jock. 'He 's learned the art o' it.'

He took her to her former lover, and then he left them alone. They did not notice him slipping away—they were too busy forgiving each other.

THE RED-HOUSE GARDEN.

WADI GHUZEE, BEFORE GAZA, PALESTINE, SUMMER, 1917.

O'ER ridge and plain calm hung the mist of dust,
Save where it soared amidst the whirlwind gust.
The distance trembled 'neath the noonday glare;
Hot airs hung stagnant in the wadi, where
The transport toiled along.

Above, along the banks, the garden slept,
With yellow-flowering cactus-hedge, where crept
Gray lizards, rattling through the fleshy leaves
And bushes, all entangled with the reeves
Of blue convolvulus.

Aweary of the constant, thundering guns,
I turned old Sandy up the path that runs
Toward the red-tiled house, which ruined lies,
Veranda wrecked, roof gaping to the skies,
A heap of masonry.

I led him through a gap, and carefully
We picked our way between an almond-tree
And snipers' post by sandbagged, loopholed hedge,
With cartridges still littered on its ledge,
Where nigh there lay some graves.

I saw the broken water-wheels, the wells,
The fruit-trees green, though riven by the shells,
Citrons and oranges with whitest flowers,
Vines, olives, fig-trees with their richest dowers,
And limes and towering palms.

The tamarisk and cedar gave their shade,
Whilst in the open places melons strayed.
And yet the garden in its beauty lay
A waste o'ergrown with weeds—I turned away:
Despair was even here.

I wondered why should all this slaughter be;
And then I saw a dark pomegranate-tree,
Aglow with crimson blooms. Some petals fell
Like showers of drops of blood that seemed to tell
Of wounds, and pain, and death.

It seemed as if the very trees did bleed;
But when I closer looked, then I took heed
That whence the flowers had fallen always hung,
Unripe and small because they were so young,
The round pomegranate fruit.

E'en then the fruit swelled with the luscious seeds
That satisfy the thirsty traveller's needs—
I saw the promise, when this war should cease,
Of all this weary land refreshed by peace,
And rich with seeds of life.

This land from tyranny we yet should free;
Not useless then would all this slaughter be.
A random shrapnel's smoke came drifting by;
But hopefully I turned, and horse and I
Walked on toward the sea.

KAVANAGH'S LUCKY BEAN.

By MARY STUART BOYD, Author of *Our Stolen Summer*, *The Fortunate Isles*, &c.

CHAPTER I.—THE LASCAR'S GIFT.

TURNING up the collar of his coat, Dennis Kavanagh trudged homewards through the mud of the Glasgow streets, his soul hag-ridden by sullen dissatisfaction with existence. If fate had nothing better to offer a man than long days filled with arduous labour whose profits others reaped, and nights spent in a dreary lodging, then life, he reasoned, was hardly worth living.

As he passed across the Suspension Bridge, his rain-sodden cap pulled down over his eyes, his hands thrust deep into his pockets, Kavanagh's bitter musings were abruptly broken by a wail of distress. The night was a dark one in late September, and it was not until he was close upon them that Kavanagh realised that the inarticulate cry for help rose from the centre of a group of lads. As he came abreast of them the wail was repeated. Shouldering aside the youths, who had been too busy baiting their victim to notice his approach, Kavanagh found that the object of their interest was an Asiatic, who crouched against the framework of the bridge, his whole attitude abject with terror.

Kavanagh was a powerful man. It was the work of a moment to knock two of the assailants' heads together, and to disperse the others by a threatened onslaught. The bullies scattered and vanished, Kavanagh turned his attention to the creature huddled against the railing. Restraining the oriental's attempt to prostrate himself in gratitude before the muddy boots of his deliverer, Kavanagh helped him to stand up. Then, seeing that the brown face was livid with terror, and that the spare form in the flimsy Eastern garments was still shaking with fear, he said, 'See here, now. Them blackguards is settled with. You've no call to be vexin' yourself. Where would you be wantin' to go? I'll take ye there.'

When, with some difficulty, Kavanagh had gathered that his protégé was a Lascar seaman belonging to a ship that was berthed a little way down the river at the Kingston Dock, he resolved, against his physical inclination—for the night was damp and he was weary—to escort him within sight of it.

Deciding that the shivering Lascar would be the better of inward warmth, Kavanagh took him into a public-house at the corner of Bridge Street, and treated him to a glass of hot rum. It was gratifying to watch the magic wrought by the steaming liquor. Under its influence the man became another being. His limbs ceased to quiver; the warmth of colour returned to his face. He waxed communicative, and Kavanagh found himself listening to a confidential recital from which he vaguely comprehended that the Lascar was urging upon his acceptance something that he evidently considered specially precious—something for which he claimed marvellous powers.

They were seated in a quiet corner of the bar; and, after glancing cautiously about to make certain that his action was unobserved, the Asiatic produced furtively from some secret hiding-place in his flowing raiment an object wrapped in a scrap of oily rag.

'Bring good luck. He give weesh,' he whispered, pressing it into Kavanagh's hand.

'Give *what?* Oh, a *wish!*' cried Kavanagh, amused. 'Faith, then, why don't ye keep the good luck for yourself?'

The Lascar shook his head, and held up one lean finger. 'One man, one weesh,' he said solemnly.

'An' it's one, is it? An' you've had yours? An' if it's a fair question, what might be the nature of the luck it brought yourself?'

But the light had died out of the brown man's face. Shaking his head, he affected not to understand the meaning of his host's question.

'I'll wager it's maybe been something the creature would have been better without,' Kavanagh decided with quick sympathy, and tried to induce his guest to accept a shilling in exchange for his treasure. But the Lascar was resolute in refusing the money. 'Him not for sell. Him give,' he stubbornly reiterated; and a few minutes later Kavanagh bade him good-bye at the entrance to the dock where his ship lay.

The glow induced by the hot spirit had evaporated by the time Kavanagh, after retracing his steps, had reached Apsley Place, and climbed the three long flights of steps leading to his lodging. Opening the front-door with his latch-

 [*All Rights Reserved.*]

key, he let himself in, and entered the room that was his.

He lit the gas, which whistled shrilly when turned up, and his habitation was revealed as a chamber of uninviting aspect. The wall-paper was sad-hued and dingy. The red-and-black table-cover showed traces of long wear, the chiffonier and horse-hair-covered chairs were old-fashioned and clumsy, and the tread of generations of feet had robbed the carpet of its original pattern. Clothes hung on pegs, and the half-open doors of a wall-bed hinted at the place of his repose.

Glancing round with a sensation of disgust, Kavanagh sat down, and had begun unlacing his boots, when the bump of an iron tray on the outside of the door heralded the entrance of his landlady with her lodger's tea. Mrs Knox was a gaunt widow of depressing exterior. Her leading characteristic was a habit of punctuating conversation with laconic and non-committal 'Imphms!' Had she been more happily circumstanced, Mrs Knox would have been esteemed good-looking, for her features were regular, and her spare figure erect. But a long-drawn fight with poverty, and the grievance she cherished against her late spouse, had embittered her, rendering her complexion sallow and her eyes dull; while her strictly antagonistic attitude towards life had the lamentable effect of lowering the mental temperature of those with whom she came in contact.

Mrs Knox's housekeeping might be scrupulously honest, but it robbed living of all its graces. The meal she now brought in was singularly unappetising. Set forth badly on the uncovered tray were a brown tea-pot with a broken spout, the half of an ill cut loaf, and a plate containing a segment of salt butter.

'You're surely late the night? Your tea's been masket a good while,' Mrs Knox remarked in the tone of one who thinks she has a grievance. 'Ay, a good half-hour. Imphm!' Finding her lodger was not in a loquacious mood, she repeated 'Imphm!' tentatively, and departed.

Left in peace, Kavanagh drank his bitter tea and took some bread-and-butter, scarcely knowing what he ate. Then, pushing aside the tray, he resumed his reverie at the point where it had been interrupted by his rescue of the Lascar.

Yes, it seemed indeed a pitiful thing that his years of unremitting toil had brought him so little satisfaction. Yet another winter was beginning without any change for the better in his prospects. He saw before him months wherein he would stumble out in the murk of early morning, to return after nightfall, weary and dispirited. Months of unsavoury meals, of a woefully limited horizon, of distasteful recreations in suffocating halls, of Sundays and infrequent holidays spent in loafing, and smoking, and drinking adulterated liquors. Yet there seemed no way out, he told himself.

As he groped in the pocket of his overcoat for his pipe, his hand encountered the gift that the Lascar had forced upon him. Taking it out, he unrolled the greasy rag. Enclosed was something carefully wrapped in cotton-waste. Peeling that off, Kavanagh found a small substance neatly sewn up in a covering of faded green silk. Beginning now to feel a certain respect for a treasure on whose coverings so much thought had been bestowed, Kavanagh slowly unpicked the stitches with the point of his knife. To his disappointment, the talisman was revealed as a crescent shaped bean about an inch and a half long. Its glistening black surface was girdled by a scarlet band.

From the first Kavanagh had been sceptical regarding the magical properties attributed to the bean, and now that his sympathy for the persecuted Asiatic had subsided, he was almost inclined to ridicule the whole matter. But the man's earnestness had unconsciously impressed him. Something in the curious appearance of the seed attracted his attention, and he fell to dreaming. Suppose this strange gift, to which its former owner had attached such value, really owned the supernatural power ascribed to it of being able to grant him a wish, what form would that wish take?

As he rammed the tobacco into his pipe Kavanagh told himself that he already knew what that wish would be. His one haunting craving was for a life in a new country where there was room to move unjostled, pure air to breathe, and clean earth to till; a land where the work of his hands would enrich himself, and not only his masters. As he mused, his thoughts stole back to his early boyhood's days spent in a remote part of Ireland, where, small and turf-smoked though it might be, their cabin was yet a cosy home; where, though they were not rich, there was always a potato and a sup of milk, or a cup of tea, to spare for those poorer than themselves.

A dark time of trouble had succeeded those happy, care-free days. Hidden discontent had given place to open rebellion, which was followed by stern action on the part of the Government. Dennis remembered how his pacifically inclined father had been arrested by their own fireside, where he was sitting in his shirt-sleeves, and taken off handcuffed to jail, with some other suspects, in an open car on a bitter winter's night.

'An' niver the coat on the bare back of him. An' him the wan that coughed all through the winter. Oh, wirra, wirra! but it was clane murder. An' him the innocent man!' had been his mother's constant moan, until the news came of her husband's death from pneumonia in the county jail. After that she ceased complaint. Dennis recollected coming with his widowed mother to Greenock, where, after seven years of longing for the happiness of which she had been robbed, his mother died.

As he sat by the fireless hearth with the strange bean in his hand, these old memories returned to him with unusual clearness. Dennis remembered, too, how, the night after he had seen his mother's wasted body consigned to the pitiful resting-place which was all he could afford to give her, he had gone, in the bitterness of his grief, and in his desire for revenge, to a secret gathering of one of those societies against which his mother had always cautioned him; and how at the meeting, mere lad as he was, he had taken a vow, signed with his own blood, to be at the call of the society whenever his services, in any capacity, were demanded.

That was now ten years ago. The lad of seventeen was a man of twenty-seven. His ideas had matured and modified. He realised that though undoubtedly Ireland had grievances, of which the most had been made, she also enjoyed many privileges which were totally discounted by the stirrers-up of sedition. Of late, reports of disturbances, murmurings, murders, and informations had troubled him. He was glad that he had so completely severed all connection with Ireland; for, since the night of frenzied grief on which he had ruthlessly signed away his freedom, he had never had the slightest dealings with the little group of embittered men who constituted what was known as the Society of Silent Workers. When, a few nights after his single attendance there, he had revisited the ramshackle building where the meeting had taken place, it was so obviously deserted that Dennis could have doubted that he had ever been inside it, whether the scene in the dimly lit cellar between himself and the five masked men had actually taken place.

Dennis recalled, too, how, later, when the thought of what he had done hung heavy on his heart, and the earnest warnings of his dead mother haunted his mind, he had written a letter to the society asking to be released from his promise, on the plea that he was too young to be held to a pledge that had been given when he was beside himself with sorrow, and 'fair distracted' by the loss of his mother. Stealing up at night, he had pushed the letter in below the shabby door, leaving a corner exposed that he might know whether it had been taken in. When he stole up again the corner of the envelope was not visible, but the meeting-place seemed as abandoned as before. Seven years later, when he left Greenock for better-paid work in Glasgow, Dennis Kavanagh had assured himself that a chapter in his life that he would fain have forgotten had been completely blotted out.

Now, as he sat with the odd-looking bean in his hand, it all came back to him with disquieting reality; but he thrust the memory aside impatiently, and returned to the matter of the moment. He would wish, and give the alleged luck-bringer an opportunity of proving the efficacy its late owner had claimed for it.

'Sure, an' it 's mighty bad taste in him to be a Lascar, an' a fireman at that, when he had a wishin'-bean on him,' Dennis commented with a smile. Then he remembered how the man had tried to impress on him that the bean would grant only one wish to each owner. If he could have but one wish, Kavanagh counselled himself that he must make that wish a tolerably comprehensive one.

'What I 'm wishin' for is a new life in a decent, clean country, where it 'll be my own land that I 'll be workin', an' my own home that I 'll be livin' in, an' where I 'll be a free man, an' not a slave to nobody. Are ye listenin'? D' ye hear me, bean?'

As Dennis spoke, half-playfully addressing the seed that lay on his toil-hardened palm, he started a little, and looked more closely at it; for it seemed to him as though strange signs, like some cryptic writing, had suddenly revealed themselves, clear and vivid, on the scarlet band that encircled the bean, and then, before he had time to note their form, had as swiftly faded away.

When he went to his wall-bed, it was with a pleasant expectation of coming adventure that Kavanagh fell asleep. Something exciting, he felt convinced, was about to happen.

CHAPTER II.—THE SMALL, GRAY MAN.

THE incidents of the previous evening had assured Kavanagh that a change in his circumstances was impending. But when the strident, insistent hooter awoke him as usual in the darkness of the late autumn morning, and he scrambled into his soiled garments and went out into the clammy streets to resume the work that seemed to have neither end nor beginning, going on and on like some endless revolving belt, he felt dismally convinced that nothing ever would occur to alter the existing monotony of his life.

Two important matters, he knew, handicapped him—the lack of education and the want of capital. Even after he had repaid the money he had borrowed to buy comforts for his sick mother, and to defray the expenses of her interment, he had found it impossible to lay by anything worth considering. Seven times he had contrived to put past a little sum, and each time some tragic occurrence or other stern necessity arising among fellow-workers who were less well off than himself had touched his tender heart, and he had impulsively given all that he had. No, while he was surrounded by so much poverty, Dennis knew he would never be a hoarder.

'It 's not in me to save,' he ruefully told himself when, for the seventh time, he found his pockets empty. 'It 's myself that has

known too well what bad trouble is, to be standin' by an' not lendin' a hand when times is hard.'

Kavanagh took his breakfast to the works with him, warming his can of tea at the furnace in the brief space allotted for the morning meal. At noon he returned to his lodging to eat, hastily, a dinner which consisted alternately of stewed steak and potatoes, and minced collops and potatoes, varied on Saturday and Sunday by broth and boiled beef. As the day was Tuesday, a soup-plate of very liquid mince and a bowl of potatoes boiled in their skins awaited him.

As he was peeling the potatoes with a black-handled knife and fork Mrs Knox entered the room, and stood, a gaunt figure in a funereal widow's cap, gazing stolidly at her lodger.

'Imphm!' she said at length, a note of challenge in her voice. 'So ye've had a veesitor for once.'

Dennis nearly choked over a lump of potato. 'A visitor? Is't to see me, you're meanin'?'

'Imphm! A veesitor,' repeated Mrs Knox, nodding her head affirmatively, and awaiting further questioning, as though she regarded the exclusive information she held as something too precious to be lightly parted with. 'Imphm!'

'Who was it?' Dennis was getting impatient.

'He didna say.'

'When was it he would be comin' here?'

'Oh, jist about the back o' breakfast-time.'

'And what might he be wantin' with myself?'

'He didna say, and I didna speir. Imphm!'

'Och, then, woman alive, what in Heaven's name *did* he say?'

'He speired were ye in. And that was jist about all. Imphm! That would be all.'

'An' what was he like?'

'Oh, jist ordinary-lookin'. Imphm! verra ordinary.'

Dennis was naturally a patient man, but had he obeyed the impulse of that moment, he would, without a regret, have throttled the lean, scraggy neck of his maddeningly taciturn hostess. A visitor of any kind was a novelty to the lonely bachelor, and a strain of romance in his nature associated with his lucky bean the guest whose call he had been so unfortunate as to miss.

'An' was that the last word that ever he spoke?' demanded Kavanagh, keeping a tight grip on his self-control.

'Every word—exceptin', maybe, that he'd call back.'

'Faith! an' that's one thing, anyway,' cried Dennis, cheering up.

'And that's maybe him the now,' Mrs Knox added deliberately, as a gentle ring sounded at the door-bell.

A moment later she showed into the room a man whose appearance Dennis felt she had been right in speaking of as 'ordinary.' Had he been asked to describe his unknown visitor, Dennis would have said that he was small, and gray, and quiet-looking. It was only when he spoke that some hint of a resolutely forgotten memory thrilled Dennis, and set his nerves aquiver.

'Dennis Kavanagh?' the stranger said interrogatively.

'That's my name.'

'Who's in this house?'

'Not a livin' soul exceptin' herself.' Dennis's thumb indicated the direction in which Mrs Knox presumably was. 'The other lodgers doesn't come home at dinner-time.'

'Send her out. Tell her to go for beer, or anything,' he added as Dennis hesitated. 'We must speak without being overheard.'

Opening the door abruptly, Dennis had an impression of the skirts of the worthy dame vanishing into the kitchen. Presumably Mrs Knox was reluctant to leave home, for she took an unconscionable time in dressing to go out to fetch the beer Dennis requested. When at length she departed, attired in a beaded cape, a crape bonnet, and black cotton gloves, the small, gray man leant out of the window and watched for her appearance at the street door, before assuring himself, by opening the doors of the other rooms, that the flat had no occupants save themselves, and that they were likely to be undisturbed till her return.

That done, he drew a chair close to that of his host, and in a low, impassive voice revealed the business that had brought him.

'Dennis Kavanagh, you are a member of the Society of Silent Workers.'

'But that was ten years ago, an' in Greenock. How ever did ye find me here?' Dennis asked, a cold perspiration breaking out over him.

'We have never lost sight of you for a day,' the man said quietly. 'But till now we had no need of you. When you voluntarily joined the society, you pledged yourself to perform any task that might be required of you.' . . .

'It was but a lad I was then, an' half-crazed by my poor mother's death,' Dennis broke in. 'I was clean beside myself, so I was, an' when my senses came to me again I wrote an' took back my word.'

The small, gray man waved a deprecatory hand. 'Once a member, always a member, until the society releases you,' he said conclusively. 'Now, I have come to tell you of a service that, successfully carried out, would free you from your pledge.'

'An' what's the nature of that same?' Dennis asked hoarsely.

'If you have followed events in Ireland lately, you will have seen that three men have been executed on evidence sold by an informer. That traitor is at liberty to enjoy his blood-money, while the victims of his treachery are dead and rotting in dishonoured graves. Under the protection of the Government, the traitor is on the

eve of sailing for the Colonies, where he expects to live long and prosper.' . . .

There was a pause. Then the gray man leant over and touched Dennis on the knee. 'That informer may sail, but the Society of Silent Workers has vowed that he shall not reach land alive, and you are the member who has been elected to carry out their decree.'

Kavanagh sat rigid, his eyes fixed upon the man who was thus impassively committing him to cold-blooded murder.

'This is Tuesday. His ship sails from London on Friday, going direct to Auckland. A passage will be taken for you. I shall give you money to get your things for the voyage. Any outfitter will tell you what you require travelling second-class,' the visitor went on, as though nothing was left for Dennis but to obey. 'And here is a weapon.' He laid a neat parcel on the table. 'But you are free to choose your own method. There are many ways possible on a long voyage. Only, I give you a solemn warning that if he lands alive your life won't be worth an hour's purchase. Quigley must never set foot in New Zealand.'

'Quigley!' Dennis had started forward, hot colour flushing cheeks that a moment before had been blanched. 'Not Nathan Quigley what kept the store at Ballymacrana?'

'That's him.' The gray man was watching him closely.

'The scurvy devil! An' it's himself that's the informer, is it? Then he's back at his old tricks again. My poor mother—Heaven rest her soul!—always said it was Nat Quigley that sent my father to his death. So it's Nat Quigley, is it? The dirty blackguard!'

'Well, it's either your life or Quigley's now.' The man spoke quietly, but with finality. 'If Quigley fails to survive the voyage, no matter in what way he meets his death, you'll find yourself the owner of some land in New Zealand, and money to work it; and your membership of the Society of Silent Workers will be instantly cancelled. But if Nathan Quigley steps on to Auckland wharf alive, another member of the society will dispose of Quigley, and you can order your coffin, for'—here he spoke more quietly than ever—'you'll stand in urgent need of it.'

Dennis sat silent. Matters were moving too swiftly for him to grasp.

'You'll find money and a single ticket to London in this pocket-book. Let me see. To-morrow is Wednesday. Get your outfit to-morrow. Have it packed in a steamer-trunk and sent to the Central Station. Take the morning train on Thursday, and when you get to London go to the Remenham Hotel. It's a small place just outside Euston Station. A room will have been taken in your name, and you'll find your passage ticket and further instructions awaiting you there.'

The sound of steps on the stair outside and the click of Mrs Knox's latch-key in the lock warned them of her return. The gray man rose to go. As he also stood up Dennis caught sight of the Lascar's bean lying on the mantelpiece, and a thought flashed to him.

'You'll excuse me for askin',' he said with elaborate courtesy, 'but when might all this have been decided on, in a manner of speakin'?'

'The lot was cast last night—about nine o'clock, to be quite accurate. There were three other members of the Society of Silent Workers who would have served our purpose equally well; so we balloted, and the lot fell to you. By the way, what name would you choose to travel under?'

'I'll stick to my own, by your leave,' Dennis decided with sudden heat.

On re-entering the house, after watching the head of the small, gray man disappear down the stair, he cannoned against Mrs Knox, who carried a tray on which were a jug of beer and two tumblers. She gaped in open-mouthed astonishment at the unexpected departure of the visitor.

'He's never away without the beer, and me that's had all the bother of going for it!' she exclaimed indignantly.

'Faith! an' it's mighty bad taste he has to be leavin' the same,' Dennis agreed; 'but it's yourself that'll have to drink it, I'm thinkin', for it wouldn't suit me at all.'

Dennis returned to his room, where his scarcely touched dinner still stood on the table. He had no stomach for food. As he lifted his pipe from the mantelpiece the lucky bean again attracted his attention. To his surprise, its appearance seemed to have altered. It looked dull now. The once shining black surface was dim. It scarcely resembled the brilliantly striped object he had held in his hand while he wished for—what was it?—a new life in a clean country, and his own land to work on. And this was how he was to get the desire of his heart. A church clock near by had just finished tolling nine, he remembered, when he wished the fatal wish; and the gray man had said that it was only a few minutes after nine that the lot appointing a member of the Society of Silent Workers to cold-blooded and deliberate murder had fallen to him.

Snatching up the bean, with a swift spasm of anger, he threw it on the floor and ground it under the iron heel of his boot, determined to make an end of it. But the bean resisted his strongest effort to crush it. Picking it up and hastening into the kitchen, Dennis thrust it into the hottest part of the fire, and covered it up with the glowing coals.

Mrs Knox, still attired in the rusty-beaded cape and the crape bonnet, was sitting by the table, which was littered with the débris of dinner, sipping a glass of the rejected beer. She watched Kavanagh's action curiously, but without com-

ment. When he had left the house to hasten back to his work, she deliberately poked out the fire, and raked among the embers until she found a crescent-shaped object girdled by a faint red band.

Brushing the powdering of ashes from its surface, she wrapped the bean in a fragment of tissue-paper, and put it carefully away in a large, empty pill-box, which she placed in a drawer of the dresser.

'Imphm!' said Mrs Knox.

(*Continued on page 707.*)

CURIOSITIES OF THE PEERAGE.

By Charles G. Harper.

THERE are few more interesting and entertaining studies than that of the history of the Peerage of Great Britain and Ireland, whether from the purely historical, the genealogical, or the human, personal point of view. It is a subject full of poignant incident and unexpected humour, of surprising eccentricities and contradictions, as well as of somewhat fine-drawn distinctions. For instance, take the co-existence of a Duke of Devonshire and an Earl of Devon, the holders of those titles belonging to the unrelated families of Cavendish and Courtenay. The explanation of the two territorial titles being extant, against all the rules governing such dignities, may be found in the fact that when the title of 'Earl of Devonshire' was created, in 1618 (the earldom was raised to a dukedom in 1694), that of 'Earl of Devon' was assumed to have become extinct in 1556. Not till 1831 was the belated claim made and allowed that in the case of the earldom of Devon the patent of nobility, instead of limiting the succession to heirs *de corpore suo*, included collateral heirs-male. Thus for 275 years the Courtenays of Powderham had been earls, unknown to themselves.

It is the usual practice, but one by no means invariable, for newly created peers to adopt for their titles the names of places in which their properties lie. A notable exception is that of the earldom of Lytton, a peerage originally a barony, created in favour of Sir Edward Bulwer-Lytton, the famous novelist, in 1866. The novelist was 'Baron Lytton'—in which we see an ennobled family name, without territorial application (as in the case of Earl Roberts and other instances). The second Baron Lytton was, in 1880, advanced to the condition of Earl of Lytton (or Litton), in Derbyshire—an extraordinary change when it is pointed out that the family have not, and never have had, any properties in the hamlet of Litton, near Tideswell. Further, except by adoption on the most slender grounds (or none at all), the family name is not properly 'Lytton,' but 'Wiggett.' The history of this ennobled family is, in fact, a curious example, among many which might be adduced, of the assumption of a high-sounding name in place of an ancestral plebeian one. Thus, inquiry into the Lytton genealogy shows that the father of 'Bulwer-Lytton,' the novelist, was one William Wiggett, who in 1756 assumed, instead of his own name, that of 'Bulwer,' which had been his mother's. The novelist, naturally enough, with his romantic temperament, copied the paternal example and added to 'Bulwer' the maiden name of *his* mother, Barbara Lytton, who was daughter of one Richard Lytton, a person whose name had been 'Warburton' before he changed it in 1762, on inheriting Knebworth from his maternal uncle, William Robinson Lytton. This maternal uncle himself had not a drop of the ancient blood of the knightly Lyttons of Knebworth. Coming into possession of their lands as 'William Robinson,' he completed and rounded off the circumstance by taking their name as well.

The ignorance of clerks who drew patents has been responsible for some quaint, abiding errors. Thus, when Henry Bennet, in 1663, was created Viscount Thetford and Earl of Arlington, he had really selected for the superior title the village of Harlington, in Middlesex; but a Cockney clerk wrote the title without the letter 'H,' and so 'Arlington' that notorious member of the Cabal became and remained.

It is sometimes difficult to ascertain which place, among several of identical name, confers a title. It has been suggested that the Earls of Derby are not earls of that county, but of the Hundred of West Derby in Lancashire, in which the greater part of their property is situated. The actual patent does not make the point clear. It has also been suggested that Godmanchester in Huntingdonshire, and not the great city of Manchester in Lancashire, confers a dukedom upon the Mandeville family; but the patent distinctly reads, 'Manchester, co. Lancashire.' Yet, against this, the family lands are in Huntingdonshire, which (since we have already indicated the ignorance of old-time clerks) may only mean that an error was made in imagining '(God)manchester' to refer to the better-known place.

However that may be, it is certain that the Duke of Newcastle takes his title from Newcastle-under-Lyme, and not from Newcastle-on-Tyne. The Earl of Roden, whose title comes from one of the numerous Roding, Rothing, or Roothing villages in Essex, where the old family seat of 'New Hall,' now a farmhouse, is situated, was styled of 'co. Tipperary' for a purpose. No one could conceivably have been ignorant of the

fact that the river Roding and the numerous villages in Essex along its course are not in Ireland. But the peerage was an Irish and not a representative British one, entitling the holder to a seat in Parliament; and so this quaint evasion was resorted to.

On the other hand, numerous older peerages were held by the possession of lands, and passed —not necessarily to heirs in blood—with the properties. These were the baronies and other dignities 'by tenure.' The new owner acquired the title also. In Italy and elsewhere on the Continent, it is said, the purchaser of an estate may still purchase a title of nobility as well. Upon this point rests an ancient bitter exchange of gibes between Henry VIII. and one of his nobles. The king chanced to meet Lord Burgavenny, who was a baron by tenure of the castle and lands of Abergavenny, but had mortgaged them, and was presumably, therefore, not strictly in theory a lord. 'Good-morrow, my Lord of Burgavenny, without Burgavenny,' quoth the king. To which retorted that more witty than discreet noble, 'Good-morrow, my Liege-lord of France, without France.' The peculiar sting of this repartee lay in the fact that English sovereigns, long after they had lost those parts of France they once ruled, continued to quarter the lilies of France upon their royal shields; and so they continued to do until George III. abandoned the hoary pretence. Henry VIII. owned only Calais, which was lost in the reign of his daughter, Queen Mary. It was generally ill jesting with Henry VIII.; and as we do not hear of anything happening to Lord Burgavenny, it is perhaps not unfair to surmise that he thought of this quip afterwards, and put it about that he had dared that furious Tudor to his face. But, indeed, the story may be a vain tale, although it is certainly an old one, having been told by Sir Roger Wilbraham in the reign of Queen Elizabeth.

It is singular to reflect that there are several peerages whose titles confound the identical names of extremely large and very insignificant places. Thus, the Duke of Leeds is duke of a village of that name near Maidstone, in Kent, and not of the great Yorkshire city of Leeds. The Earl of Wilton takes his title from Wilton near Ross, not from Wilton near Salisbury, where the Earls of Pembroke have their seat. Nor does the Earl of Wilton now own Wilton, which was sold to Guy's Hospital more than two centuries ago. Again, the Earl of Bradford is not of that great textile-weaving town, but of a place in Shropshire; and Lord Berwick's title comes not from Berwick-on-Tweed, as might be supposed, but also from Shropshire.

The spelling of the title of Lord Willoughby de Broke hides from general recognition the fact that this ancient barony derives from a little brook. The proper pronunciation is 'Brook.' This peerage has an interesting descent from a Sir John Willoughby who, in the fifteenth century, married Anne Cheney, daughter of Sir Edmund Cheney of Broke, in Wiltshire. Their son, Sir Robert Willoughby, by writ of summons to Parliament, 12th August 1491 (or 1492), became Baron Willoughby de Broke. With the death of this nobleman's son in 1522 the title lapsed into abeyance in default of a male heir, but was regranted to the grandson of the second baron's elder granddaughter, Sir Fulke Greville, who thus, in 1621, became Baron Brooke of Beauchamp Court, Alcester. Fulke's cousin, Robert Greville, succeeded him, and a long line of Brookes followed. The eighth Baron Brooke was promoted Earl Brooke in 1746, and in 1759 was created Earl of Warwick. The present Earl of Warwick is likewise Earl Brooke, and 'Lord Brooke' is the courtesy title of his eldest son and heir. In 1695 the House of Lords recognised the claim to the original barony of Richard Verney (a descendant of the first Lord Brooke's sister), who thereupon became third Baron Willoughby de Broke. The present holder of the barony is Richard Greville Verney, nineteenth Lord Willoughby de Broke. The actual 'Brook' indicated may easily be found, about half a mile south-west of Westbury Station, Wiltshire; and Brook House, the former family seat, is still there, although it is long since any of the Willoughbys or Grevilles owned it. The mansion is now a farmhouse, and the brook runs below it picturesquely in a water-splash. Although much of Brook House has been demolished, and though what remains is largely put to use as barns and cow-bartons, enough is left to show that it must once have been not only a stately residence, but also something of a fortress.

Instances of quaintly perverted place-names in titles include that of Winchelsea, which in the Earl of Winchelsea's patent is 'Winchilsea;' while the extinct earldom of Pomfret perpetuated the local way of pronouncing 'Pontefract.' But no instance can be more amusing than the patent by which John Campbell, the first Earl of Breadalbane, was in 1677 made to figure as a French rather than a Scots peer—'Earl of Brea d'Albane.' He was, however, much more than this, being also Earl of Holland (in Lincolnshire), Viscount of Tay and Paintland, Lord Glenurchy, Benederaloch, Ormelie and Weick; on the whole, rather an intimidating personality, so far as titles went. Beside this glittering galaxy of titles, with queer spellings, the modern one of 'Zetland'—Earldom of the Dundas family in 1838, and Marquessate in 1892—is a simple curiosity. Zetland is a way of spelling 'Shetland.'

The Duke of Argyll is, among other things, 'Lord of the Isles;' but the English peerage has had two or three creations of Baron Lisle, which amounts to much the same thing. Thus, Lord Lisle (pronounced 'Leel,' as in French *l'isle*),

summoned to Parliament by writ in 1299, was referred to in the mingled French and Latin phraseology of those times as 'Johannes de Insula, de Wodeton'—that is to say, 'John of the Island, of Wootton,' the island being the Isle of Wight. It is interesting at this point to note that the French town of Lille, much mentioned in recent times, derives its name also from an island formed by two streams in the midst of what is now the city. On it stood the castle of the ancient seigneurs. 'Lisle thread' takes its name from Lille.

Perhaps the title of 'Albemarle' is the most curious of all. It was assumed by James Monck when created a duke by Charles II. The title became extinct with the death of his son; but in 1696, when William III. desired to honour his fellow-Dutchman, Keppel, by creating him an earl, the recipient of the honour took the title so recently vacant. The reasons for this selection do not emerge. The Keppels remain Earls of Albemarle to this day.

But where is 'Albemarle'? Gazetteers of England do not contain the name; nor, for that matter, do those of any other country. Whence, then, did it come? It derives from France, and is the same in its origin as the French title of the Duc d'Aumale. Aumale is situated in Normandy, and owes its name to the quality of the soil to be found there—a kind of whitish marl. The original Latin form 'Alba marla' became in Old French 'Aubemarle' and 'Albemalle,' and later 'Aumale.'

The title of Clarence, now extinct, last lapsed in the person of Prince Albert Victor, eldest son of Edward VII., who was created Duke of Clarence and Avondale in 1890, and died not long afterwards, 14th January 1892. This once-favourite title for sons or near relatives of royalty was first borne by Lionel, third son of Edward III. It had a curious derivation, coming, in fact, from the 'Honour of Clare,' in Suffolk, belonging to his wife. Earlier owners of those lands were the De Clares, who not only took their personal name from the place, but rose to be Earls of Clare, and in course of time, warring and conquering with the English in Ireland, gave their name to what has ever since been County Clare in that country. To return to the dukedom of Clarence—created for Prince Lionel in 1362, it became extinct on his death six years later. The second holder of the title, Henry IV.'s second son, Thomas, also died without issue. An evil fate befell the next Duke of Clarence, George, brother of Edward IV. In 1478 he was put to death (some say drowned in a butt of Malmsey wine) in the Tower of London, and his titles and estates were forfeited.

The title was revived in 1789 for Prince William, son of George III., who afterwards became William IV. The Duke of Albany, youngest son of Queen Victoria, had among his other titles that of Earl of Clarence. He died untimely in 1884. The 'Clarence' title has, therefore, unhappy associations which are likely to prevent its being revived.

Among curious titles must certainly be reckoned that of Lord Saye and Sele, which sounds like a firm determination to stand by what has been said, even to delivering a duly attested and sealed deed—an irrevocable 'what I have said, I have said,' in fact. But this odd double title has nothing to do with saying and sealing. It was in its origin the Barony by Writ of Say, created in 1313, and extinct or in abeyance by 1399. It was revived in 1447 in favour of a Fiennes of Hurstmonceaux, who took the additional title of 'Sele,' which comes from one of the Seals in Kent—perhaps the village of Seal, near Sevenoaks. The title of 'Say' was assumed by reason of a descent from that family through the new peer's grandmother.

Modern titles are fully as picturesque as the old, full of resonant sound, sometimes, too, a little uncouth. When the Rolls family was ennobled by the conferring of a barony, the recipient chose the title of 'Llangattock,' after one of the twenty or more Llangattock villages in the county of Monmouth, in which 'The Hendre,' the seat of that family, is situated. This title, scarcely a euphonious one, is already extinct. But it was not so bizarre a title as that of 'Magheramorne,' chosen by Sir James M'Garel Hogg when made a peer thirty-two years ago. A pleasant legend was current at that time, which told how the newly coroneted Sir James, attending a reception in London, where he had long been known and respected as Chairman of the Metropolitan Board of Works, was announced by a footman (who either could not remember or could not pronounce the new title) as 'the late Sir James M'Garel Hogg'! The portly new peer, however, made a less ghostly entry than might have been expected from this terrific introduction.

The conventions to be observed in the assumption of titles are sometimes neglected, either accidentally or deliberately. It is hardly credible that two identical dignities should exist concurrently; but the history of the title 'Earl of Leicester' shows us that such indeed has been the case. Thomas William Coke of Holkham—that great 'Coke of Holkham' who was one of the most wonderful agriculturists England has produced—was the son of one Wenman Roberts, afterwards calling himself 'Coke,' whose mother was Anne Coke, sister of Thomas Coke, created Earl of Leicester in 1744. At his death, in 1759, this short-lived creation became extinct. The title was revived in 1784 in an entirely different family—the Townshends. The second Townshend, Earl of Leicester, succeeded in 1811, and also to the superior title of Marquess Townshend, and died in 1855, when that of 'Earl of Leicester' again lapsed.

Meanwhile 'Coke of Holkham' had in 1837,

at the age of eighty-three, been raised to the peerage as 'Viscount Coke and Earl of Leicester of Holkham,' an extraordinary title in itself, but additionally strange because the Townshend earldom was still in being. We have thus the remarkable phenomenon of two 'Earls of Leicester' existing side by side for a period of eighteen years.

SPORTS.

A STORY OF THE WILD.

By F. St Mars, Author of *Snapshots of the Wild, Pinion and Paw*, &c.

I.

'SOFTLY! softly! softly!' the snow seemed to whisper as it fell, as if adjuring the wind to rest and be still.

But the wind would not be still. It tore and gnashed; the only live thing, it seemed, upon 'our blunt, bow-headed, whale-backed downs' that night.

But—ah!

What was that sound between the gusts? A terrier, surely? Yet no terrier ever barked with so guttural an ending, so lonely, so mournful, so utterly, desolately wild a note.

A dark shape detached itself from the furze, paused a moment upon the edge of an avalanche of moonlight, as if not relishing it, and, in the wake of a cloud-shadow, slid, scarcely perceptible, across.

In a cup-shaped hollow, full to the brim in summer with golden furze, clinging bramble, and age-old hoary elder, but now a cauldron of tossed foam petrified (*alias* snow), the fox checked in his tracks. For a full two minutes he stood there, carven, among the soft confusion. But there was nothing there—only the snow, falling, falling, falling, and the wind tearing over his head.

He was not there by chance, however, 'brer fox.' He knew his job—had to, or die. The hollow *should* have held rabbits by the score, as it always had done, but—not to-night, thank you! Their holes were all about, everywhere, gaping, wide-eyed, empty.

With a flourish of his fine, full brush, the fox flung about, half-petulantly, and—'froze' stiff, face to face with another beast, *not* a rabbit.

White as the wind-whipped snow was that other, but with a black 'paint-brush' on the end of his tail, and in his flat wedge of a head his cruel eyes burned *red*. He was long, low, sinister, and snaky—an ermine, which is a stoat painted white by winter.

There was no need to ask what that one wanted there—not the fox, for sure. Question was whether he was worth killing.

Master Ermine settled the problem, however, by taking a back-somersault—at least, it looked like it—into a rabbit's hole, and going out like a switched-off electric light. And perhaps the fox was rather relieved, for in the wild the stoat has a reputation for many things, but 'hands-upping' is not one of them.

Reynard removed, belly flat and 'slick,' to a furze-bush near the top of the hollow. More than once had he played pirate to the stoat's privateer, and pounced upon a rabbit as the stoat drove it out; but not to-night—to-night, for some inexplicable reason, there was nothing doing.

The moon came out from behind a cloud, as if to see what the shady couple were 'at,' and shone, and shone, coldly still, minute after dragging minute, but saw nothing.

Finally the stoat came out 'for keeps,' far across the hollow, sneezed thrice—dabbing his nose into the snow each time, because his legs were so short—and, with his very own sidelong gallop, vamoosed.

The fox got up, scratched himself dog fashion, and quitted also.

That was the very first time in a lifelong experience either of them had known that hollow to contain no rabbits.

The moon dodged back behind a cloud, as if tired of waiting.

The snow began to fall again.

II.

Reynard dropped his nose, flung up his brush, and started to make a cast round the hollow to see if the populace—his one certain dinner on such a night—had 'refugeed,' so to speak; which they had. And half-way round he halted, so suddenly that he had to sit down on his tail.

There was a slope, steep almost as the roof of a house; there was furze, old beyond memory, and elder as old as the furze, all gnarled and writhen; there were mouths of holes, huge and gaping, regular black caverns, almost large enough to admit a man; there were flints and chalk lumps, big and heavy and scattered, as if quarried by navvies; and the crawling roots of the trees were all polished in places, and all mucked up in others, where the diggers had rubbed their hide or wiped their muddy feet upon them, as fancy prompted. And in the middle of it all, bang in the eye of the 'cynical discomfortable moon,' a beast, heavy, squat, misshapen, uncouth, rugged, malevolent. It was like a scene trans-

ferred straight by magic from some bygone, prehistoric time, a picture of the Stone Age, a cast-back to the things that had been, a dream of the past.

The fox, however, was no dreamer, and it was he who, with the true dog's restlessness and impatience, broke the spell. He moved—put his forefoot down from where he had held it suspended 'twixt rise and fall, and the beast turned its long, black-and-white-slashed head, and—had at him! I am not sure, but think it did grunt. I *am* sure that its long claws gleamed in the greeny-white light. And it is quite certain, too, that everything marked it for a badger. But it was more than that. It was *the* badger, the old 'boar'—hoary with goodness alone knoweth how many years—owner, master, boss, patriarch, leader, chief, what you will, of the colony of badgers represented by those cavernous dug-outs all around.

That, however, was not the point. The fox knew that badger. Every downland fox—and there were more than enough—knew that badger (some had cause to). All respected him, but none looked for him on such a night. He ought to have been asleep deep down in the chalk, instead of up in the cold, looking as if he wanted somebody to 'strafe' as a sacrifice. And the fox—offering, as it were, a fair broadside—got it.

The rest was flying flints and parchment-stiff leaves, an avalanche of grunts and obscene chatterings—which I do not translate because unprintable—and many white fang-flash, over-shoulder threats at reprisals from the astounded fox, as he skated round crawling roots and poised boulders ere he scuttled himself clear. Perhaps some one had been trying to 'draw' Brock with dogs that day, and had upset his notorious temper. Reynard did not know, nor care.

III.

Came our fox then, after about half a mile of half-frozen loafing, to another sudden stop—even more sudden than any that had gone before; but this time he did not 'freeze.' He merely looked—quite casually—down between his neat black forepaws at—well, at nothing. Indeed, there was nothing there; at least, if you except the elemental moan of the Channel tide a few hundred feet below, and the squawk of a herring gull dreaming about his latest sin, somewhere on a four-inch ledge perpendicularly beneath, there was nothing there. Nothing? Nothing, I tell you, but the 'white cliffs of Old England,' and the fox had halted on the top of 'em in full stride, with an inch to spare 'twixt himself and oblivion. Verily, they have strange nerves, these wild-people.

Far down the shore, where the white surf churned with a ghostly glare in the dark, something yelped disconsolately from time to time, as it were, between waves. Our Reynard, however, did not answer, though it was a fox—canvassing the tide-line hungrily, no doubt, for anything old Ocean liked to fling him. It was a fox of the wrong sex to interest him, perhaps; or perhaps, to his mind, the downs were too full of *them* already. Not that he, at any rate, was unsociable, as some people think foxes are; but too much company meant too much competition, and in weather like this he was beginning to realise that there was not enough to go round. Prey, indeed—the teeming rabbits of the downs, the finicking hares, the creeping partridges, the rats about the great downland barns—everything that he depended upon for a living—appeared to have sauntered into Spookland and no more returned. He must live somehow.

Then all at once he stiffened, and quivered from head to heel. He had not moved, mind you; he was too experienced a hand for that. He was still peering down between his neat paws at the turmoil hundreds of feet below him in the sickening, empty dark; but it was nothing there that he saw.

Fact was, he had suddenly become conscious that something or some thing was watching him; eyes unseen were upon him in the dark. You may know that feeling; some do. In the wild, however, they are much more sensitive to it than we mere human beings are. It constitutes for the 'wildies'—most of them, at any rate—a sort of extra sense.

But the fox did not *show* what he felt. That was a simple maxim. Only, about the back of his neck, his hackles rose. Otherwise, he still stared down. He was waiting for the eyes to disclose. If they knew he knew, they might never do so—might attack before he could move.

Then, quick as thought, he whipped round, spun upon his haunches before you could blink, and—found himself face to face with another dog-fox.

For a very long minute the two remained facing one another with that deadly stillness they know in the wild alone.

The eyes of the other fox shone with a peculiarly metallic green in the moonlight.

Oddly enough, they were absurdly alike, those two foxes, in size, calibre, so to say, cut and rig, even in their very fine proportions, and in everything save one feature—colour. In colour they were quite different. Reynard's throat and belly were white, and the tip of his splendid brush was white also, but the other fox had a black tip to his tail, and his underparts were grayish-black, a most exceptional thing. Otherwise, both animals were of the same reddish-brown, of course.

Since they were within fighting range of each other, our own fox, Reynard, had no intention of disclosing his feelings. He had that at the back of him which precluded argument, and

could literally feel the emptiness of the void under his tail.

It was the other, however, who showed his hand. He crouched down on his forepaws like a puppy asking one to play. And he whined. His action was plainer than many a man's words. 'Be friends,' he said, as obviously as if Heaven had given him speech.

And they *were* friends. In three seconds they were 'mock pouncing' like puppies. In three seconds more they were trotting away together across the upflung slopes—two long, prick-eared silhouettes against the white, with full-fine 'fat' brushes trailing out behind.

Heaven help anybody in the wild world now who might find himself in the path of that alliance! One cunning head was bad enough. But two——!

IV.

Something, however, had gone wrong with the uplands that night. It was as if a spell had been cast upon those 'downs that swerve and aspire in change of heights that the dawn holds dear.'

They visited together the Roman camp—a sure 'find' generally.

The long ramps of cushioned turf showed only faintly as snowdrifts now.

And together they peered over the top—but the still white amphitheatre beyond lay utterly empty, uncannily still. Ordinarily, if stealthy enough, Reynard had known the 'camp' alive, as if in the dark night

> The downs are peopled then;
> Fugitive, low-browed men
> Start from the slopes around
> Over the murky ground.
> Crouching they run with rough wrought bow and spear;
> Now seen, now hid, they rise and disappear,
> Lost in the gloom again;

but 'twas only rabbits, rabbits of the downs, and perhaps a hare or two, broken in panic at the scent of him or another foe.

Later, however, when they had squirmed to a far corner, where began the sunken road by which the Roman legionaries could descend swiftly into the Weald unseen, it seemed really as if

> Soft on the dewfall damp
> Scarce sounds the measured tramp
> Of bronze-mailed sentinels,
> Dark on the darkened fells,
> Guarding the camp,

and for a moment both the foxes and the musing observer were deceived. But it was only a 'writhen thorn,' from whose burdened (and still berried) boughs the snow fell from time to time in the wind rushes, with soft and muffled flops.

Together the two encompassed one of the towering, isolated barns of the downs—loopholed for musketry—rearing aloft from its own inky shadow in the moonlight.

Here the rats had always swarmed. And here, ambushed beside the trough—frozen stiff, had they but thought about it—where 'the slow black oxen toiling through the day' were brought to drink, and where the rats must quench their corn-bred thirst, or die, the two foxes waited in vain. No rat showed itself—not so much as a whisker; and no rat made a sound, without or within—those vermin, who seem unable to 'carry on' without making sounds, sounds innumerable.

Together, too, the foxes most carefully crept up to windward of a 'dew-pond on the heights, unfed, that never fails.' But it failed them that night, for 'twas frozen; and of all the numerous hares of the downs who, like many of their lowland fellows, dearly love a drink as a rule, not one, nor any other living thing—as the untrodden virgin carpet showed—had been there.

Then the couple gave it up. For the first time, the downs, their home, had, as it were, locked them out; and they realised in the same moment, I think, that they must, if they would live and not freeze together—their steaming breath was forming in icicles in the triple-edged nor'-easter already—they must turn their red backs upon their beloved downs and hunt elsewhere.

A minute later you beheld them, long, lean, and lithe, galloping easily together, and openly, too, for they knew they had none to fear, adown the sheer northern white scarp of the downs that led to the lowlands, to civilisation, to food, they hoped; but perhaps—as they, of all beasts, well knew—to death.

V

The high outlying fields they passed, all aglimmer and agleam in the snow, their stunted hedges scarcely discernible, but no living thing they saw.

The hedges grew, and the fields got smaller. Trees began; and once a hill-road, and once a chalk-stream, by a bridge, they crossed.

The trees thickened.

The hedges closed in and shut out the view; and suddenly, in a secluded gateway, Reynard stopped—so suddenly that his companion, the 'black' fox, almost trod on his brush.

Reynard's head was down. Reynard whimpered like an excited puppy, and in a second his companion followed suit. In two senses of the term, their tails went up. And well they might, too, for here, plain to see in that placid, frozen glare, leading all one way, downwards, were the unmistakable quadruple tracks—hind-feet always outside and in front—of rabbits galore, and here the larger trail of the hare, and there, again, the odd, miniature bear-like impressions of a stoat, and, not far off, the still more

tiny ursine marks of a weasel. The chain-like trail of an otter was there, too; and the 'broad arrow' of more than one moorhen; and here, there, and everywhere, small but plain, marked with a groove where the tail had been applied as brake, going down into the hedge-ditch, the peculiar intricate foot 'seal' of the rats. They were all here, all going one way, all converging upon—upon what?

Both clever canine heads went up, and stared downhill, and—they saw. Ahead, the moon all aglow on its snow-covered roofs—house and buildings and stacks—the grouped trees and orchard shrouding black around it, lay the big downland farm. *There* were the rubbish-heaps for the otter; there the mangold and the potato-cave, and the kitchen-garden for hare and rabbit; there the corn-bin, the pig-sty, and the wheat-stack for the rats; and rat, hare, and rabbit for stoat and weasel. And here, the two foxes knew, must be their destination.

Till then, you will admit, both young foxes had nobly kept their heads; but from that moment, I think, they were a little bit above themselves—not drunk exactly, but 'a wee bit jolly' with the smells they had scented in the gateway. Perhaps it was that they had—the snow had lasted a week—been debarred from good hunting so long. Perhaps it was the time of year, but—no odds!

They put up a hare in the swede-field, and coursed her, greyhound fashion, whimpering like dogs, neck and neck. But she beat them on the upgrade, and they, remembering the gateway, and being disinclined for a long, uncertain, stern chase, turned back.

They tracked a rabbit into a spinney no bigger than a cottage-garden, and Reynard went in to turn him out, while the 'black' fox waited without. Three times Reynard nobly brought him up to the edge of covert, but each time bunny's heart misgave him. At last, however, he ran for it—all a-bobbing in the moonlight—both foxes only ten yards behind. Across the field he ran a fine race; and through the hedge into the road; and then—nowhere!

The two foxes shot, breathless, into the middle of the road, and stopped.

Then they started.

Two eyes, green and glinting, coldly staring, regarded them fixedly from the inky brambles in the opposite hedge. And in the same moment both foxes, out of the corner of their eyes, were aware of two shapes that leapt into the road farther down, and cantered lithely towards the farm. There was no need to tell *them* what those were. Trust a 'nut' to recognise a 'flapper.' Trust a young fox to spot a young vixen.

Next instant the owner of the eyes was in the middle of the road, barring their path—their *obvious* path.

He was a dog-fox, old, scarred, and hard-bitten, and so patently gray that he almost shone silver in the moonlight.

For one brief, stiffened pause, he measured them. Bent, yellow-fanged, and snarling, he weighed cunning against agility, experience against youth. Then, working on the principle, evidently, that sudden attack is the surest defence, he sprang at both.

But Reynard sprang to meet him. They scarcely seemed to touch, truly, yet there was a flick of gray fur flying upwards, and three crimson beads, growing, all in a row, on Reynard's flank, as he pivoted, quick as light, two yards beyond.

Both leapt at the old fox then, one from each side. There was an explosion of snarls, and a whirl of snow, and how that old gray reprobate managed to get himself clear of that mix-up is a knock-out. A leering, evil grin of lifted upper-lip, and a villainous snarl, he gave them as he jerked himself off. Then, still with an insolent flourish of the old gray brush, he left them.

He may not have known it, of course—and they certainly did not—but those two young foxes were half-brothers. And I have very good reason to believe—it was jolly hard lines, no doubt—he was the father of both.

VI.

What followed after that is best left to—well, the night. Certain it is, however, that a hare by the garden cabbage-patch found herself chased by one fox and cornered by three more; a rabbit, chipping bark in the orchard, ran four ways when frightened suddenly, and found the jaws of a fox or a vixen at the end of each; the rats round the stackyard got, for ten minutes, the fright of their lives; and the farm cat, coming round the barn-corner, innocently enough, so nearly exploded with scandalised horror that people found her on the roof in the morning, unable to climb down. But—but—— W-e-l-l, look here, what happened in the fowlhouse is best left unsaid. It ended in a gun, anyhow, and barking dogs, a double gleam of flame, reports, and a double shrieking hail of pellets.

Then, as the dawn broke, and the redwings began weeping, and the fieldfares started to laugh at them, four foxes—two vixens and two dog-foxes—sore, but full-fed and happy, climbed up to, and vanished into, one of the great, age-old, jungle-like brakes of giant furze that here and there relieve the monotony of the downs.

And what happened after that is—the property of the M.F.H. But I can tell you this—since he makes no secret of it—though hounds, drawing that same furze-brake that same day, began by hunting two young foxes, a 'white' and a 'black,' they ended up eventually by killing an ancient rogue, so old that he was nearly silver. The youngsters must have fouled their scent

with the old boy's somewhere after the beginning, and, if I may so put it, left dear papa to face the music alone. Heigh-ho! but it's the old yarn—like the battleship captain being torpedoed by his own submarine son at manœuvres. What's that? 'Survival of the fittest'? Yes, I suppose so. Nature's bloomin' game all the time. W-e-l-l?

A FORTNIGHT IN BORNEO.

I.

THERE was a pleasant thrill of excitement aboard when the Chinese look-out in the crow's-nest reported land. Seen from the deck, it was merely a thin blue haze on the horizon; but as morning advanced it took shape, and soon we could distinguish mountain-tops and deep valleys. It was our first view of south-eastern Borneo, the 'island of wild men.'

Late in the afternoon we made the small light-vessel that marks the entrance to the channel to B——. Our arrival was reported to the harbour-master, and shortly afterwards we were boarded by the Dutch pilot and customs officer. The customs officer at once required the wireless aerial to be lowered. We had hoped that he might allow it to remain in commission, so that we could receive Singapore's nightly press bulletin, but he would not acquiesce. Rather, he ordered the wires to be lowered immediately and the wireless cabin to be sealed. This done, we proceeded at half-speed, winding in and out up the shallow, silted river-mouth. On both sides the country was densely wooded. Great forests, stretching without a break, clothed plains and lowlands in browns and greens and yellows, until the colour merged indistinguishable in the blue haze of distant hills and darkening valleys. Soon, over on the starboard bow, we made out the little town of B——, the red and white of the houses peeping pleasantly from among the green palms.

We put alongside the petroleum-wharf, a rather slimly built wooden jetty running some hundred yards into the river, and carrying six or eight heavy oil-pipe lines. A footway ran alongside. On a dark night it was advisable to walk warily there, for the path was narrow, ill-lit, and without a hand-rail. Innocent-looking holes and loose logs added to the danger, but a suggestive gurgle in the dark water below effectively incited to caution.

As we neared the jetty we saw two figures, gorgeously apparelled, sitting awaiting our arrival. At first we thought they must be native dignitaries, but they proved to be Malay barbers. As soon as a gangway was run ashore they came aboard. They wore kilts of comparatively sober hue, but their blouses and turbans were of great brilliance. Heavy rings dangled from their ears. In their hands they each carried a little folding-stool, while over one shoulder was slung a box containing the implements of their calling. Stolidly, perfectly indifferent to our battery of cameras, they walked aft to the shaded deck beside the galley door, where they sat themselves down and waited custom. Ere long a steady snip, snip of the scissors bespoke a brisk trade among our shaggy Chinese sailors.

A squad of scantily clad Malays under a native foreman was soon busy with the oil-pipes. Though slimly built, these men were strong, and showed much ingenuity in the handling of the heavy line. They worked to the rhythm of a monotonous chant. When the connecting-line from ship to shore was rigged, the loading of the cargo commenced. The petroleum, or benzine, was stored in huge whitewashed cisterns near the end of the wharf. It was pumped aboard at the rate of eighty to one hundred tons per hour.

Benzine gives off a highly inflammable gas. No fire of any description is allowed aboard a vessel loading. Even the fire down below in the stokehold must be drawn. Smoking is forbidden, and to see that this regulation is enforced several native policemen are stationed on the ship with plenary powers. All cooking is done ashore. A very comfortable bungalow was at our disposal, and there we took all our meals. Sleeping accommodation was also provided, but we preferred to sleep aboard, even though morning found us half-gassed with the heavy benzine fumes. Our Chinese crew had quarters across the road from ours, but they spent most of their time among their compatriots up-town. There was plenty of opium to be had, so with them sleep and food became very minor considerations.

B—— is purely a petroleum-station. The wells, which are extraordinarily rich, are situated some twenty miles inland. Big pipes lead the oil down to the station, where it is refined, and by-products, such as wax and vaseline, are manufactured. The Dutch who own and manage the station number some three hundred souls. Half-a-dozen Britishers and a few Germans and Scandinavians make up the rest of the European population. The remaining twelve thousand inhabitants are of many nationalities. The majority are Malays, but there are also large numbers of Chinese and Indians, with a sprinkling of Dyaks and Arabs and others whom we did not recognise. The Chinese are a very prominent element in the community. They hold important clerical posts in the station, and one of their number is station doctor. But it is as traders they excel. They make admirable merchants. Their capacity for work and for taking pains is

enormous. In bargain-driving the most stony-hearted son of Abraham would bow his head in shame at their cuteness. They run the laundry and the large general store at B——. Here can be had a truly marvellous assortment of goods, ranging from the most fashionable American cosmetics and toilet accessories to fancy biscuits made in London. The Chinese manager speaks excellent English. I was anxious to obtain some curious beaten silver buttons that I had seen worn in B——. His reply savoured of Bond Street rather than of Borneo. 'I am sorry we have none in stock at present, but I will put it on order if you like.' An angel could not have smiled more innocently as he handed me an elegant box of the vilest cigars I have ever tasted in exchange for a roll of guilders. From the local factory we got some very good soda-water. The old Arab proprietor was extraordinarily courteous and extraordinarily fat. Would that he had been a little cleaner! To make sure that our glasses were clean, he rubbed them diligently on his dirty, greasy apron. At parting he bowed alarmingly low for one of his girth, and begged, in broken English, that we might again honour his humble house with our illustrious presence

II.

The town of B—— stretches some three miles along the river-front. It comprises three distinct quarters. Farthest up the river, about half a mile from the station and in no way connected with it, is the native Malay village. This is a mass of huddled bamboo huts built on piles over the river-edge. On the landward side it is surrounded by an impenetrable mosquito-infested swamp. From the sea it requires a native to thread a way through the labyrinth of fishing nets and stakes. Fishing is the main local occupation. The waters teem with fish, and in the market these can be bought for a trifle. Every morning early we saw the natives making for the station, their sanpans deep laden with fish and vegetables. The majority of these sanpans are burned and hollowed out from logs of tremendous hardness; we saw a few made of laths. To drive them a small diamond-shaped paddle is used, assisted by a very cumbersome sail, like a bulging rectangle some twelve feet by four, rigged by means of a long bamboo pole. In fair weather the sail ensures a very good speed, but a puff of wind will capsize a boat, unless it has outriggers. In the use of the paddle the natives are very expert. Such is their dexterity that, going at full speed, the paddles are absolutely noiseless save for a gentle drip, drip of water falling from the raised blades.

The boats used for coasting are stouter than these light river sanpans. We saw one about fifteen feet long. Amidships was roofed by a close network of woven bamboo; fore and aft were unsheltered. On board lived the owner, his wife, and three children. Knowing no other home, they passed their days coasting from river-mouth to river-mouth, landing here and there to gather fruit to stock their scanty larder or to cut bamboo for household requirements. I tried to photograph a small sanpan that came under our lee one day. For the moment our great bulk had taken the wind from its sail, and the set of the current was drifting it towards us. Immediately I took out my camera, however, the occupants hauled down the now useless sail, seized their blades, and paddled desperately down the river like scared water-fowl, casting fearful glances over their shoulders the while. In the market-place the children showed no fear of the camera; but their elders, Chinese and Malay, viewed it with much mistrust. Even our Chinese crew were averse to being photographed.

The European quarter, consisting of large and splendidly appointed bungalows, each in its own beautiful palm-shaded garden, is built on the slopes of the hill overlooking the works. This quarter, but for the exotic beauty and luxuriance of the vegetation, might well be on the outskirts of a big European city, instead of tucked away in the forests of Borneo. Here are all the conveniences of modern civilisation—telephone, electric light, club, tennis-court, the familiar red pillar-box, fire-alarm stations, splendid roads, luxurious motors, and petrol for the trouble of taking. Passing along of an evening—and who shall tell the unspeakable glory of these soft, starlit, tropical nights?—one never failed to hear the merry music of piano, violin, flute, or gramophone. Wafted on the cool, fragrant, night-air, it seemed to lose all mechanical harshness and become

> Such a soft floating witchery of sound
> As twilight elfins make, when they at eve
> Voyage on gentle gales from Fairyland.

The third quarter consists of enormous bungalows built on piles along the river-front. Here reside the heterogeneous workmen of the station, grouped as far as possible according to nationality. Several families are housed under one roof. Without exception, the bungalows looked clean and tidy. All refuse was conveniently dumped from the front-door into the river. Before one of them I saw a Malay woman pounding rice in a big hollow log. Her husband leaned against the doorway, watching the operation. Every now and then the woman paused from her work to chase away some fowls that boldly pecked among the rice. But while she chased and scolded one lot, another lot were ravenously gobbling the rice. The husband looked on in stolid indifference, never offering to help his distracted spouse. With a Malay the less work he does, the finer gentleman he is.

III.

The Dutch have laid a splendid road through the station, with branches inland to the oil-wells

and down the river to the wireless station. Coco-nut palms, heavy with fruit, line the way-side; while all around are clumps of bananas, gorgeous fan and sago palms, and many aromatic trees and shrubs whose names we did not know. A feature of B—— is the number of bicycles one sees. Nearly everybody, man, woman, and child, white, yellow, and brown, possesses a bicycle and an umbrella. These appeared to be the two essentials of Bornean society. The cyclists we saw rode very leisurely, seldom abreast, usually in a long file. Though the road was wide, they invariably crowded into the far side, and their approach was always announced by a constant ringing of bells, commencing as soon as they came into sight, and reluctantly ceasing when they were well past. The Chinese laundryman boasted a decrepit Ford, that rattled and jingled merrily on the smooth roadway. There was a combined tramcar and railway line through the station. The tram made some six journeys only per day at hours likely to suit Dutch officials. A miniature non-stop train ran more frequently. On this the natives used to crowd and jostle with great good-humour. The train was easy to mount, for half-a-dozen hands were always eager to pull you aboard, but in descending you had to trust to luck to land on your feet.

In addition to the principal store, there were two native bazaars where groceries, domestic utensils, cloth, and fruit could be purchased. The booth-proprietors sat cross-legged among their wares or sprawled at their ease on the ground. Fruit was very cheap. For sixpence our Chinese boy brought us three monster pine-apples, half-a-dozen coco-nuts, and a small tree of bananas. But then the Chinese are the most faithful shoppers in the world. They will bargain for an hour over a single banana. A penetrating odour of putrescent fish (a very esteemed Chinese delicacy) pervaded both bazaars, and effectively banished all desire to sample the many sweetmeats displayed. We saw a Malay vending a confection that looked very much like ice-cream. One Chinaman was extremely anxious to sell us a little monkey. He wanted eight guilders (about fifteen shillings) for it, but it looked very sickly, so we did not purchase. Beneath the piles of the bazaar booths were the barbers' saloons. To gain admission you had to crawl on hands and knees. Inside there were neither chairs nor stools. You had your choice of squatting tailorwise or sitting on the ground. To stand upright was impossible, as the roof at its highest was less than four feet high. In shaving, the barbers do not use soap or lather of any kind. They merely dip their thumb in cold water, rub vigorously the hair they want to remove, and then scrape with a razor till it is clean.

In the native quarter the children were many and of many races. For the most part they looked healthy and well-cared-for. Kite-flying and diving among the piles were their greatest pastimes. Little children who could scarcely toddle crowed and chirruped fearlessly in the water. At kite-flying they were very expert. Some of the kites were dragon-shaped, with enormous tails, curiously ornamented and inscribed. Quite a number of the boys played marbles. They do not propel the marble from between the thumb and forefinger of the right hand as we do, however. They hold it between the forefinger and thumb of the left hand, and shoot it with the forefinger of the right. Once we came upon a band of young Malays playing a vigorous game of football along the road.

As regards amusements, the white population have a fine club with tennis-court attached. Tennis in Borneo sounds rather a warm proposition, but, despite its equatorial situation, B—— has a remarkably tempered climate. Even at midday the heat was not oppressive; whilst punctually at three o'clock we had an afternoon shower of about twenty minutes' duration that cooled the air and made it fragrant with perfume from shrub and creeper. The short-lived evenings —it was dark by seven o'clock—were delightfully cool, and tennis was comfortably possible. Twice a week there was an open-air cinema show for the natives. Sometimes as many as four thousand gathered, and the pictures never failed to please. A more quiet, interested, and appreciative audience could not be desired.

IV.

The only really 'wild men' we saw during our stay were our own Chinese crew. On the voyage out they had been gambling heavily. When the captain advanced them some pay at B——, those who had money owing them thought this a good time to square accounts. Those who owed money thought it peculiarly unseasonable. They were in the right mood for trouble, their opium excesses in B—— having nicely primed them. From words it came to blows, and in two seconds the crew's bungalow was a swaying mass of howling, blood-thirsty Chinamen. We looked on, helpless to intervene. Our revolvers were aboard ship, and without them it was distinctly inadvisable to interfere in the private quarrels of forty opium-maddened Celestials. At the outset of the trouble the mate telephoned to police headquarters. Meantime chairs, veranda-railings, uptorn flooring, table-knives, crockery, feet, hands, head, teeth—anything that could be used offensively or defensively—were requisitioned and vigorously plied. No. 3 greaser seemed to be having a particularly rough time. His head was split open, his hand pinned to the wall by a knife, and his feet badly crushed.

From a gambling quarrel it became a racial battle. Some one raised the battle-cry of North

China, the South replied, and under their respective slogans they re-formed themselves. In their fury they frothed and howled with the savagery of wild beasts. The cook provided an interlude. He appeared from the kitchen below brandishing his carving-knife, pausing now and then to whet it on his steel, and uttering a horrible wailing chant at each pass. He looked fiendish. His whole body quivered with passion. The dread 'amok' fever was upon him. At sight of him several of the combatants fled, for in his ecstasy he would know neither friend nor enemy, only the rich red of running human blood. Realising the danger, the second engineer vaulted the veranda, and, running up, threw the cook to the ground. The fall stunned him, and he was easily disarmed.

A moment later a little Malay policeman arrived. A loaded revolver and a Malay policeman—these are the only two things under the sun that will bring a 'Chink' sailor to reason. This one little barefooted Malay scared forty erstwhile raging Celestials as meek as little lambs. Attired in blue uniform, three rings of heavy gold braid, a cowboy straw hat, a sword and a baton, he stepped crisply up to the mate and saluted. The little fire-eater could speak no English, and to our attempts at Dutch and Malay he shook his head, but his hand fingered his sword-hilt as though that were all the language needed. Shortly afterwards half-a-dozen more policemen hurried up. The situation was explained, but the mate would not allow any arrests to be made. Our crew slunk off in two batches; nor did we see much of them until the day the ship sailed, when the police had to ferret some of them out of the opium-dens. Though small in stature, these Malays are dangerous when roused. They are armed with a sword and a bludgeon; a few attain to the dignity of a revolver. They take their calling seriously. At the slightest signs of trouble their weapons are out—to kill. Otherwise they are a very peaceable, orderly body. They look very smart in their blue uniforms, though four rings of heavy gold braid on the arm and no shoes on the feet make a bit of a contrast. Shortly after we sailed, the carpenter confided to the mate that he had made over two hundred and fifty pounds by gambling on that one voyage. 'All one time me makee play fair,' he protested, with suspicious vehemence.

During our stay in B—— there were repeated rumours of strained relations between Holland and Britain. One evening it was reported that war had actually been declared, and that we were to be interned. The captain and other officers, with the exception of the third officer and myself, were up-town at the time. Things looked serious. Neither of us could see the fun in handing over a fine British oil-tank to a few 'square-headed Dutchmen.' But our cargo was only half-loaded; the ship was gas-bound; steam could not be available under twelve hours; and our crew were we knew not where. The third officer unsheathed our sporting-rifles and vowed to shoot any —— son of a Dutchman that came near. However, the rumour of war proved false. Later we learned that the Dutch authorities had held up a telegram ordering our immediate recall. Had our wireless been in commission we should have picked up Singapore's warning to all British ships to leave Dutch ports immediately. Though we were in nowise molested during our stay, the tension still remained, and our company's representative earnestly dissuaded us from going on any of the shooting-trips we had projected.

In these circumstances we were not sorry when the day of sailing came. A fortnight ashore in one port, even though that port be in such a delightful and interesting land as Borneo, is a week too long for a sailor. And when our old steam-whistle woke the echoes in that quiet spot with her three blasts of farewell, we moved briskly about our work, knowing that soon again we should be out on the open sea, that changing, changeless road of marvel and of mystery.

THE DREAMER.

SHE sits and sees the passing ships
  Where the long tides ebb and flow;
With longing eyes and parted lips
  She sees them come and go—
The fleets of brown-sailed fisher-boats,
  And, rolling homeward bound,
The dingy freighters wearily
Dipping their davits to the sea,
  That girds the great earth round.

Morning and evening, day by day,
  She hears the ship-bells ring,
And the brigs put out across the bay
  With canvas bellying;
And when the summer days draw in
  Across the level plain,
The long gray cruisers grimly glide,
Stemming the swiftly ebbing tide,
  Back into port again.

About the lighthouse far at sea
  The long lone roads converge,
Into the pulsing artery
  Of tempest, fog, and surge;
And when the autumn daylight fails
  In the fierce Atlantic squall,
Sudden the stately mail-boats loom
Beyond the headlands in the gloom,
  Triumphant over all.

Her soul goes out from her and strays
  Beyond the horizon's round,
Along the ocean's trackless ways,
  By gulf and bay and sound;
Visions of all that England is
  The eye of faith can see—
Mother of nations yet to come
To greater destinies than Rome
  In centuries to be.

CRUMPLED ROSE-LEAVES.

By Lady Skerrington.

ALL of us know, more or less intimately, some of that large class who spend much time and energy hunting for crumpled rose-leaves under their feather-beds. People belonging to this genus, like the princess in the fairy story, manage to attract a good deal of sympathy from casual acquaintances. Like the princess, they are credited with being 'so sensitive;' and their sympathisers will remark that it is really tragic to notice how ill-luck seems to dog their footsteps. Should a friend who happens to know them more intimately suggest, with exasperated and brutal frankness, that if people are always looking for ill-luck it would be strange if they did not sometimes find it, he is looked upon as utterly callous and heartless.

Most young mothers must have met the elderly friend or relation who listens gloomily to eulogies of the baby's blooming health, and remarks with a scarcely suppressed groan, 'Ah yes, my dear; but you must not expect this appearance of health to last. He will soon be cutting his eye-teeth, and at that time children are specially liable to have convulsions.'

If the child is fat and rosy, she will point out that children of that type are peculiarly susceptible to inflammatory diseases. If, on the contrary, it is slight and pale, an early death from decline is predicted. It is useless to argue that some children *do* live to grow up, in spite of belonging to one or other category, because such a suggestion is instantly met by the rejoinder, 'You must allow that I have had more experience of life than you, and when you are *my* age I am sure you will think just as I do.' Such an argument being, in the nature of things, unanswerable, the conversation comes to an end.

The vagaries of the weather provide crushed rose-leaves in abundance. If the day is hot and sunny, it is stigmatised as 'very exhausting, and such a horrid glare!' If it is cold and frosty, then the pronouncement is that 'ours is the worst climate in the world.' If it is dry, the English language contains no words strong enough to describe the dust; and if it is wet, ruined crops are foretold, and the collapse of the farming industry. A mere ordinary mortal, who is not sufficiently sensitive to feel a crumpled rose-leaf, even though it is covered by only one feather-bed, is sometimes inclined to wonder what variety of weather *is* deserving of praise; but it is judicious to avoid arguments.

It would seem as if rationing had been invented for the express benefit of these rose-leaf hunters; it opens for them such a new and wide field of action. From the moment when such a system was first suggested, they were keenly on the alert, and conversations of this kind were of frequent occurrence:

'I cannot think how *you* will feed your household when rationing is compulsory. I understand from a most reliable source—almost official, only I must not mention names—that we shall only be allowed enough meat for *one* good meal in the week.'

'Like the snakes at the Zoo,' is murmured by the frivolous listener.

'No!' is the indignant response when the interpolation is overheard; 'for the snakes have as much to eat as they *want*, whereas *we* shall have just an ordinary good meal, such as we have been accustomed to have *every* day.'

At every hour of every day food was the one subject of conversation, till the unfortunate listeners, unless they chanced to be like-minded, felt that they would gladly never see a meal again! If they ventured to remark that they saw no use in making themselves miserable by forecasting the horrors of rationing before it was an accomplished fact, they were told it was pusillanimous not to face at once a difficult situation.

The powers that be are good to these rose-leaf hunters, for by the time the subject of food rationing was losing its pristine novelty, the rumour went abroad that fuel was also to be rationed. On hearing this they snorted like war-horses that scent the battle from afar, and their predictions would have chilled the marrow of even an Arctic explorer.

'We shall rarely be able to have a fire anywhere,' they proclaimed, 'and as it will be quite out of the question to use a kitchen-range, we shall have to accustom ourselves to live on nuts, and fruits, and things of that sort that require no cooking.'

'Dear me, how nice! It will be quite like old days, won't it?' would be flippantly rejoined. 'We shall be quite happy, knowing that we are following the example of our arboreal ancestors, and

 [*All Rights Reserved.*]

I shall watch with interest to see if you show signs of reverting to the original type. For myself, neither my teeth nor my digestion will permit of such experiments. And as I hate cold, I think I shall remain permanently in bed. There, at any rate, I shall be warm, and I can turn over and go to sleep when it gets dark. Of course, we shall have to give up baths, but I understand the Esquimaux get on nicely without them, so why not we?'

As prophets of gloom seldom have a very pronounced sense of humour, such remarks would be received with a gasp of horror.

'*I* shall bathe in cold water, and I shall enjoy feeling I am being patriotic when I do it. And how can you do war-work if you stay in bed?'

'I sha'n't do any! I shall read novels, and try to forget how unpleasant life is under present circumstances.'

Any one who could speak lightly of WAR-WORK was anathema, but it might be felt that a few words in season should be addressed to the offender.

It would be tactless to inquire if these admonitions were original. They generally ran very much like this—some people may think they have heard them before—'How will *you* feel when the war is over, and you are asked how you did your bit?'

War-time, of course, provided many new varieties of crumpled rose-leaves, and those who loved gloom could simply wallow in it. In the tragic days following the retreat from Mons these rose-leaf hunters revelled in predictions that in a few months Great Britain would become a German province, ruled over by German officials. If the prophet possessed a lively imagination, the horrors that must supervene would be described with unsparing detail!

If the war news was bad, it was accepted at once. What else could one expect with such a rotten Government, and when neither the commanders of the army nor those of the navy understood the A B C of their profession?

If the news chanced to be good, it would be as promptly discredited. 'We are never told the truth about anything that happens, and good news is reported one day just to be contradicted the next.'

When, by the progress of the Allies, this firm attitude of disbelief was rendered untenable, a rapid *volte face* was effected. 'I really think that I am more disturbed now, wondering what will happen when the war is over, than I was when the war news was at its worst. We sit and talk and talk over the various possibilities till I am almost too depressed to do anything.' And probably the listener is, if possible, even a little more depressed!

We are told that people who are always poring over things that are close at hand gradually become short-sighted, and lose the power of seeing distant objects. So those who are always delving in dark places seem to acquire an amazingly narrow outlook on life. They cannot realise that any subject can be looked at from more than one point of view—the one point of view being, necessarily, their own! Consequently they take not the slightest interest in hearing the opinions of other people, which they look upon as worthless. Those who differ from them are classed as 'fools' or 'knaves,' and they find the very slightest contradiction intolerable. Any discussion is, therefore, impossible, and there never is any opportunity for these unfortunates to revise their standards, so as to realise that some people in the world may be right besides themselves. In Biblical history the Pharisee who stood afar off, and thanked God that he was not as other men, is not represented as a very desirable example; yet in the present day he seems to be the model upon which many try to mould themselves. They do not seem to see that when they arraign their fellow-creatures before the bar of their judgment, they also arraign the wisdom of God, who has chosen to make His creatures after divers patterns, and to permit them to view life from different standpoints. Gloom pervades their religious beliefs, and they delight to dwell upon a God who, according to them, is both vindictive and relentless, and must, like the gods of the heathen, be propitiated by prayers, and ceremonies, and sacrifices. Just as they regard with gloom everything in the world about them, so they see only the worst in their fellow-creatures, and are apt to read a wrong motive into the simplest words and actions. This is doubly unfortunate, as it reacts upon those about them, few things having a worse effect upon people's characters than the knowledge that they are living in a perpetual atmosphere of doubt and distrust.

Of course, we cannot blink the fact that in all lives there are plenty of shadows. But if we keep a gay and gallant heart, we shall endure them more easily than if we had wept over the prospect in advance. And we must always cling to the certainty that whatever happens *must* be for the best, though our finite intelligence cannot always detect the reason for it, and though our undisciplined wills rebel against pain and sorrow. If we strive to lighten other people's burdens, it is a better occupation than weeping over our own; and, in any case, what advantage do we gain if for those about us we make this world a sadder and more dreary place than it need be? Our religion should not consist merely in a succession of forms and ceremonies that weary ourselves and depress our neighbours, but should be something that helps us to make life happier and better, and that gives us a fuller sympathy with others.

No doubt all extremes are bad, and determined optimists can be nearly as annoying to their friends as are these pessimists; but the optimists, at any rate, manage to extract for themselves a great deal more satisfaction out of

life. If the good things they forecast, and love to dwell upon, prove to be merely beautiful mirages, they still have snatched something from the hand of fate. For the pleasure they have enjoyed in anticipation cannot be wrenched from them, whereas the pessimists suffer all their woes twice over.

Those who revel in gloom should remember that our pathway in life does not always meander through dark places, and that the occasional shadows probably help us to appreciate more fully the spells of brightness when they come; for monotony is abhorrent to all of us. Those who have indulged in long walks will remember the aching sense of fatigue they felt when they saw stretching before them, apparently for miles, a long, perfectly straight road. There was nothing to stimulate the imagination, nothing to do but to tramp drearily on to a goal that was always in view; whereas, when the pathway, though rough and narrow, wound carelessly over hills and into dales, the imagination was pleasantly titillated by wonder as to what the next turning might disclose.

There is always a best to be found if people will look for it, instead of diligently hunting for the worst. Even when our path does lead through gloomy valleys where the sunbeams never penetrate, it is surely better, instead of straining our eyes trying to pierce into the shadows, to recall the days when we wandered over breezy uplands where the sunshine streamed gaily, and the grouse called from the heather. And, above all, let us keep our faith that sometime, somewhere—if not in this world, then in one that is fairer and happier—we shall once more, in God's good time, tread just such another joyous pathway again.

KAVANAGH'S LUCKY BEAN.

CHAPTER III.—TRACKED AND TRACKER.

DENNIS KAVANAGH returned to his work at his usual hour, despite the fact that the visit of the small, gray man had wrecked his belief in the stability of things, and appeared to have rendered his past life futile. He managed to perform his accustomed tasks, but after a vague, preoccupied fashion that elicited a sharp word of reproof from the foreman.

When the hour of release came he went back to his lodgings, and tried to think out the new element that menaced his freedom of action. Failing to get a clear perspective of things within the confines of his dingy little room, Dennis decided to go for a long walk, in the hope of adjusting his focus to the new prospect.

As he was leaving the house he brushed up against a man who was lounging at the entrance to the close. He was a stranger; but even in his mental disturbance Dennis noticed that he had a flat, white face.

When he had left the city and reached quiet thoroughfares, the cloud seemed to lift from Kavanagh's brain. He saw the madness of holding himself bound to commit murder to order because of an insane boyish pledge that had been given in a moment of great spiritual distress. Under the starlit sky he planned how to disappear so that even the Society of Silent Workers would find it impossible to trace him. Various confused plans of escape suggested themselves—amongst others, the idea of signing on as a stoker in the brown man's ship, which was on the point of leaving the Clyde; or even, if he failed to get employment on her, of trying to get on board as a stowaway. He felt sure his Lascar friend would help him. But when he turned abruptly to go back, and begin putting some scheme of escape into action, a ray from a street lamp showed him that the man he had brushed against on leaving home had followed him, and was close on his heels.

Baffled, Dennis walked stolidly back to Apsley Place. Before entering the house he looked round for his shadower. He was not in sight, but Dennis had a conviction that he must be lurking somewhere near.

Having lain down without undressing, Kavanagh rose in the night, and taking only a few things in a bag, slipped stealthily, on stockinged feet, down the first stair. But as he turned the angle of the second the dim light of a flickering gas-jet revealed a white, apathetic face looking up at him from beneath. Remounting the stair, and letting himself in with his latch-key, Dennis crept noiselessly back to his wall-bed, feeling like a rabbit who knows that a ferret is waiting at the mouth of his burrow.

The way of escape was already closed, he realised. There was nothing he could do but appear to obey, in the desperate hope that something might intervene to render unnecessary the service demanded of him by the Society of Silent Workers. The thought that he was powerless to control his fate gave him a fatalistic comfort; and the knowledge that the man upon whom vengeance was to be wreaked was his childhood's enemy, Quigley, offered a certain grim satisfaction. Undressing, he went to bed, and slept heavily till morning.

There was an odd exhilaration in the awakening realisation that for him monotonous labour was ended, and that henceforward his life, whatever dangers it might hold, would never again be a dreary round of sameness. A sense of coming adventure warmed his blood and quickened his brain. Passing his position under

rapid review, Dennis saw that the disposal of his worldly possessions would be easily accomplished. When his mother died, he had sold their few sticks of furniture to help to pay the rent. Ever since he had lived in lodgings, and he had never been a gear-gatherer. His big, unwieldy carpet-bag would hold those of his garments he wished to retain. The remainder he decided to give to the thrifty wife of an ailing fellow-workman who had a large brood of children.

Having explained his leisure and his gala-dress to Mrs Knox on the ground that he was taking a holiday, Dennis breakfasted, and then, with some trepidation, visited a large clothing warehouse in quest of the outfit that the gray man had recommended him to get.

Once he had acquainted a deferential salesman with the nature of his requirements, diffidence vanished, and Dennis found himself entering into the transaction with the interest that the purchase of goods for one's own use rarely fails to arouse.

Somehow the salesman gathered the notion that his customer was bound for Australia —an impression which that customer did not seek to correct. The shopman proved sympathetic, almost fraternal, in his desire to help. He knew exactly what would be 'absolutely necessary' for a voyage to the other side of the world—under which category came such articles as a cabin-trunk ('Regulation size, sir, for going under your berth'), heavy clothes for the cold weather, lighter garments for the hot, a good waterproof, canvas deck-shoes, a steamer-chair, and a travelling-rug.

He suggested, tentatively, articles which *might* be required, such as evening-dress, white duck suits for the tropics, and a field-glass. Dennis wisely decided to confine his purchases to those items deemed 'absolutely necessary,' and to leave the 'might-be-required' list altogether out of his calculations.

To avoid any suspicion of mystery, Dennis called at the works before closing-time and gave warning of his leaving, on the plea of having heard of better-paid work in Liverpool. Then he visited one or two friends, to whom he promised to send his new address when he got settled. The past hours had been so crowded with excitement that he found it almost impossible to believe that it was only at noon on the previous day that the visit of the small, gray man had turned his little world topsy-turvy.

On Thursday morning, when Mrs Knox took in his breakfast, she found her lodger with his bag packed, ready to start on a journey. She received his notice to quit and accepted the defrayment of his small debt with her customary taciturnity, listening in silence to his story of having got a better job in Liverpool.

'Was it yon man that gave ye the job?' she asked suddenly.

'What man?'

'The wee man that came the day before yesterday, and pit ye past your denner.'

'That's the chap,' Dennis admitted.

'Imphm!' nodded Mrs Knox, and relapsed again into silence; but she continued to linger by the table, and Dennis caught a twitch of her thin lips and a hint of moisture in her cold eyes.

'Woman, dear! an' are ye sorry I'm leavin' ye?' he blurted out, amazed at these signs of feeling in one who had always seemed so void of sentiment.

''Deed, and I'm all that,' she admitted, and leaving the room, straightway shut herself into the kitchen, and did not reappear until he had left the house.

'It's her that'll get the queer surprise when she hears that I'm a murderer,' Dennis thought as he carried his heavy bag down the stairs to the cab he had been to fetch.

The cab was just driving away from the close, when the driver, in answer to a summons, pulled up with a jerk, and Mrs Knox's nubbly hand thrust a clumsily-tied-up parcel through the window.

'Here, take this. It's jist a wheen scones and cheese for the journey, and two pair o' good thick socks. They were Knox's best, but he never had them on. Take care o' yersel'. It's a long way to Liverpool,' she said in a breath, and before he had an opportunity of thanking her she had turned sharply and disappeared into the gaping cavern of a close that led to the smoky aerie where her widowed days were spent.

At the Central Station Dennis redeemed his new steamer-trunk from the parcels-office, and got his luggage labelled for London. As he went on to the platform he had a notion that his shadower of the night when he had meditated escape was somewhere near; but as he had now abandoned all intention of running away, the idea failed to trouble him. It was not until he was comfortably seated in the railway-carriage, his pipe in his mouth, a comic paper in his hand, that the thought flashed to him that possibly his white-faced shadower was the agent told off to kill *him*, should he fail to execute his task. Kavanagh was not a coward, but he felt his flesh creep at the notion.

The Remenham Hotel, he found, was one of a row of tall, narrow houses in the Euston Road, quite near the station. His arrival had been anticipated, for a room was reserved in his name. The expected communication that awaited him enclosed a ticket for a second-saloon passage to Auckland by the s.s. *Taurana*, and a bewildering assortment of luggage-labels. A laconic note instructed him to join the ship by the special boat-train that would leave Fenchurch Street Station for the docks at ten o'clock next morning.

After supping off tea and cold boiled ham,

and slices of very new bread from a loaf of unfamiliar shape, Dennis went to bed. Worn out by stress of unwonted impressions and rapidly jostling emotions, he slept at once, in spite of strange surroundings and the unaccustomed sounds of the great city, and awoke refreshed to the new day. He had often fancied himself leaving Britain to seek his fortune in some new land. Now that he was actually on the way, he would hardly have been human had he not experienced a sense of exhilaration, of quickened vitality, in the knowledge that at last he had cut adrift from the sordid environs and restrictions of the past.

During the drive to the station the traffic of the London streets engrossed and perplexed him. More than once his cab was held up, blocked by a mass of vehicles so densely packed together that Dennis wondered how they ever would be set free. It was an amazement to him to see how, when the way in front was momentarily cleared, the stream flowed forward again without check or confusion.

The platform at Fenchurch Street Station was crowded with intending passengers by the *Taurana* and the friends who had come to see them off. There was a long wait before the special train came in, and Dennis found himself speculating whether any one of the men near him could be Nathan Quigley. It was quite seventeen years since he had seen Quigley, and he remembered him only vaguely as a big, red-haired man with a thin beard. Still, he thought he could hardly fail to recognise him.

When at length the special train drew up at the platform there was a rush for seats. Encumbered with hand-baggage, Dennis had some difficulty before securing a place in a well-filled smoking compartment. Fascinated by the novelty of his surroundings, he so completely forgot his mission that it was not until the train had passed through a suburb that seemed a forest of chimney-cans, and had reached a district where the masts of shipping pierced the sky, and the flagstaffs erected in the gardens of the little houses denoted the homes of retired sea-captains, that he awoke with a start to fresh consciousness of his position.

The people in the carriage with him were all busy with each other, and Dennis was free to observe them critically. Only one, he decided, bore even the most remote resemblance to Quigley as he remembered him, and this man was speaking in a low voice to a sulky-looking youth, giving him good advice in a Yorkshire accent that at once dispelled any probability of his being the victim Dennis so reluctantly sought.

Just as Kavanagh had arrived at this conclusion, the train stopped at a huge shed crammed with merchandise awaiting shipment, and the passengers streamed through to the gangways leading to the deck of the great liner. On board, a steward relieved Dennis of his hand-luggage, and showed him the upper berth that had been secured for him in a cabin accommodating three travellers. Dennis was interested to find that one of his room-mates was Robson, the lad who had been receiving the parental advice. He was going to Christchurch, it appeared, and his father had journeyed from the north of England to see him off.

'I like your face,' the father said, seizing the opportunity when his son had gone to look for a missing suit-case, 'and I'm taking the liberty of asking if you'll give an eye to my boy here on the voyage. He's a good lad enough, but lately he's been led away a bit, and I'm thinking to give him a fresh chance by sending him out to my brother that's a sheep-farmer in the South Island. Maybe I've brought him up a bit too strict. . . . But if you'll only try to be a good influence to him, I'll pray God for you every day of my'——

'Don't be askin' me!' Dennis broke in, turning fiercely upon old Robson. 'Sure, an' it's Himself that knows I'm nobody to depend on.'

A bell rang clamorously, bringing protracted farewells to an abrupt conclusion; friends left for the shore; the gangways were withdrawn; and Dennis experienced a curious sense of elation in the hope that a mistake had been made, and that in all probability Nathan Quigley was not on board.

As the water widened between the ship's side and the quay, he caught sight of the small, gray man standing unobtrusively back behind a group of frantically waving friends. It was only a glimpse, but the glimpse of that ominous presence was enough to oppress Dennis with a sense of the weight of the shackles that were riveted upon him.

The man he had set out deliberately to murder *was* on board, and his task was to find him out, and to take his life.

CHAPTER IV.—'UNDER THE NAME OF BROWN.'

THE clamour of a luncheon-gong breaking in upon his thoughts, Dennis went down to a meal that, to this unspoiled traveller, seemed the last word in luxury.

Dennis was tall. From his seat at one of the three long tables he had a comprehensive view of the dining-saloon and of his fellow-voyagers. There was the customary medley of second-class passengers—some whom acquirement of unwonted funds had enabled to rise in the social scale, others whom temporary lack of coin had forced to descend. Sundry New Zealanders were returning home after a protracted holiday. A small theatrical company was taking a London comedy on a Colonial tour. Several girls were going out to marry old sweethearts. Young men were crossing the ocean to take up posts or to seek fortune. There were commercial

travellers who spent half their lives traversing the great waters. There were men leaving their native land from choice, and others leaving it under compulsion. But not even by the closest scrutiny could Dennis detect any one bearing the vaguest resemblance to Nathan Quigley.

A babel of tongues, the unfamiliar note of strange accents, gave Dennis the impression of being in unknown territory. Already he felt an alien. The unfamiliar table appointments puzzled and worried him. Confronted with a staggering array of crystal and cutlery, he almost longed for the black-handled knives and forks of Mrs Knox. He felt out of his element, and wished his passage had been taken steerage.

When his table-steward offered him the menu, and he had to make a choice of foods whose very names were strange to him, he got out of the difficulty of selection by listening to the orders given by a loud-voiced bagman who sat near, and echoing them in a lower tone.

Dennis felt relieved when he noticed that a party of fellow-passengers, placed just opposite him, were even more awkward and bewildered than himself. The little group consisted of three women, one old and ugly, another elderly and plain, and the third young and pretty. In the confusion attendant on the first meal of the voyage the table-stewards were necessarily hurried, and the wants of these hesitating, unsophisticated travellers ran a good chance of being overlooked had not Dennis, touched by the sight of their empty plates, completely forgotten his own difficulties and come to their rescue.

'Here! Serve them ladies, quick. You've kep' them waitin' long enough,' he admonished their neglectful steward, in a peremptory tone that earned him the flurried thanks of the older women, and a grateful look from the blue eyes of the pretty girl.

'It's them as well as me that would have been happier in the steerage,' Dennis told himself, his heart, as always, warming to those requiring help. To witness the nervousness of others invariably strengthens our own self-possession. With the knowledge of their shyness his diffidence vanished, and he secretly installed himself champion of the trio of distressed dames, resolving to watch that they were not 'put upon' or overlooked.

The printed list of first and second cabin passengers lay before his place at table. Taking it up, Dennis studied it eagerly. His own name —entered as Mr D. Cavanagh—was there. Quigley's was not. Common-sense curtailed his momentary relief by reminding him that, whatever name Quigley elected to travel under, it would assuredly not be his own.

The remainder of the afternoon he spent in carefully examining his fellow-voyagers for any resemblance to the man he sought. Though he had been a mere boy when Quigley kept the store at Ballymacrana, Dennis was convinced that he would not fail to recognise him. The informer had prominent discoloured teeth, red hair, and reddish-brown eyes. He remembered the tint of the eyes distinctly, for his mother had often alluded to the 'cruel red eyes of Nat Quigley.'

'He's sure to have took the beard off him, an' I'll be lookin' for a clean-shaven man. But the red eyes'll be on him till the day he dies,' Dennis counselled himself as he moved about, or stood against the rail smoking his pipe, and quietly watching the passengers. So far as he could ascertain, Quigley was not on the ship.

Hearing that on the following day the *Taurana* would stop at Plymouth to take on mails and passengers, Dennis conceived a swift idea that the man he sought would be likely to take that opportunity of trying to embark unobserved, and resolved to look out for him there. Should he see Quigley come on board, Dennis decided he would try to slip off, come what might.

In addition to Robson, the young man with the anxious father, Dennis found he had another cabin-mate—Mr Million. Mr Million was a sprightly, dressy old gentleman who prided himself on the number of times he had sailed round the world. Dennis wondered how he would have felt if, instead of this old beau, he had discovered Quigley to be the occupant of the berth beneath his own.

After a comfortable night in his unaccustomed quarters, Dennis awoke refreshed to the interesting bustle of ship-life. The voyage had begun auspiciously. The sun shone; the air was crisp and vital. Everybody was on deck, and in high spirits. The exhilarating influence of the gay scene went to Dennis's head like wine. His care fled. Long before the liner reached Plymouth he had decided that luck was with him, and that Quigley, probably suspecting that his intention to sail on the *Taurana* had become known, had thought it healthier to remain in Britain, and trust to the Government protection he enjoyed. 'An' if the villain does not come on board, devil a foot ashore I go,' resolved Dennis.

Still, there was a chance that Quigley might join the ship at Plymouth; and when they reached the busy harbour, and the liner lay out, awaiting the arrival of the packet-boat, Dennis's heart beat furiously.

To his relief, the only additional passengers who embarked were a member of the New Zealand House of Representatives and his wife and family. When with surprising speed the mails had been transferred to the *Taurana*, and she was again in motion, bound for the other side of the world, Dennis felt as though a burden had been lifted from his soul.

He had an answer now for the Society of Secret Workers. No one could kill a man who was not there to be killed.

Lighter in heart than he had ever expected to feel again, Kavanagh climbed that night

to his upper berth. As he laid down his head his cheek encountered something unexpected. Starting up, he found a note pinned to his pillow, where the shadow of the curtain had prevented his seeing it.

Inside the blank envelope was a sheet of the ship's note-paper. It contained only a few unsigned words. But these words were sufficient to give the recipient a sleepless night.

'*He is on board, travelling under the name of Brown.*'

(*Continued on page 725.*)

SOME MEMORIES, CHIEFLY LITERARY, OF PRINCES STREET, EDINBURGH.

THESE memories, chiefly of the first half of last century, which we propose to recall, have to do mainly with publishers and booksellers, literary people, and literature, with whom and with which Princes Street has many more associations than most people imagine. From 1822 to 1826 the *Edinburgh Review* and the works of Sir Walter Scott and others were published in Princes Street. Princes Street was the birthplace of *Blackwood's Magazine* and its Radical compatriot *Tait's Edinburgh Magazine*, and saw the last days of the quarterly *North British Review*; and the early beginnings of *Chambers's Journal* are associated with that continuation of the street eastward known as Waterloo Place.

While it is now a great street to look back upon for big things in life and literature, Princes Street is also an unsurpassed esplanade to look away from for picturesque effects which charm the last gaze no less than the first. Alexander Smith believed the finest view from the interior of Edinburgh was that obtained from the corner of St Andrew Street looking west towards the Mound, with the Academy buildings in the foreground, and beyond to where 'the Castle lifts, from grassy slopes and billows of summer foliage, its weather-stained towers and fortifications. What a poem is that Princes Street! The puppets of the busy, many-coloured hour move about on its pavement, while across the ravine Time has piled up the Old Town, ridge on ridge, gray as a rocky coast, washed and worn.' Within the past hundred years the street has been transformed from end to end, widened; and that original uniformity which Ruskin girded at in neighbouring streets has been somewhat counteracted. It is now a street of shops and hotels; new buildings, new shop-fronts, and the removal of sunk areas have changed the exterior of what was once a more residential street. A huge hotel at either end is a sign of the times, while the edges of the Gardens to the south have become, after a sort, Edinburgh's Westminster Abbey. The towering Gothic pile to Sir Walter Scott has statues of Adam Black and John Wilson ('Christopher North') on one side, and of Dr Livingstone on the other. The series is continued westwards by those of Allan Ramsay, Dr Guthrie, and Sir James Young Simpson. Around St John's and St Cuthbert's Churches at the 'West End' rests the dust of the mother of Sir Walter Scott, of Raeburn the painter, of the Skenes, of that celebrated preacher Dr Andrew Thomson, of De Quincey, and many other notables. What a revolution since the waste land along the Lang Gate was a haunt of highway robbers, saw General Leslie's army march towards Corstorphine, watched Bonnie Dundee ride off to the help of King James, and witnessed the 'Canter of Coltbrig'! Francis Sempill pictures the man oppressed by poverty who, having baited thrice at Linlithgow on a Scots groat, came

> In at night to Edinburgh town.
> He held the Lang-gate to Leith Wynd,
> Where poorest purses used to be;
> And in the Caltoun lodged syne,
> Fit quarters for such companie.

Archibald Constable, of A. Constable & Co., publishers of the *Edinburgh Review*, the *Encyclopædia Britannica*, of Scott's novels and many other important works, came from 255 High Street in 1822 to No. 10, the first house in Princes Street. This house was built for Neale the silk-mercer, father-in-law of Constable. The warerooms were entered from the street, over a broad flagstone, like a drawbridge, above a sunk area. The upper rooms were occupied by a hotel—one of five in the street then. Archibald Constable would have made a great name in the publishing world even had he never met Sir Walter. He had raised the standard of publishing in Scotland by his liberality to authors. Born at Carnbee, Fifeshire, in 1774, he died at Park Place, Edinburgh, in 1827, at the early age of fifty-three. Lockhart describes this most important member of the book-trade as good-looking, very fat in person, 'but with a face with good lines, and a fine healthy complexion. He is one of the most jolly-looking members of the trade I ever saw; and, moreover, one of the most pleasing and courtly in address.' Before he lost confidence in his publisher, Scott thought him 'as good a pilot in these rough seas as ever man put faith in.' This opinion he modified by saying that Constable without his partner Cadell was the clock without the pendulum, the one having the ingenuity, the other the caution, of the business. An earlier partner than Cadell in the High Street business left, after seven years in the concern, enriched by twenty-one thousand pounds. This shows that A. Constable & Co. were at one

time doing a sound and profitable business. According to Cadell, the gross profits of the firm were sometimes ten thousand pounds a year, and Constable's personal drawings were about four thousand pounds a year.

Thomas Constable, in the three volumes dedicated to his father's working life, blames Scott for privately and so extensively embarking on bookselling and printing transactions, and for the continual need of money for land purchase at Abbotsford, which led up to 'an unholy alliance that soon resulted in a series of bills and counterbills which eventually ruined all concerned.' The end of 1825 and the beginning of 1826 was a gloomy time for Scott, Constable, and the Ballantynes. Constable, who had helped to tide over the affairs of the printers in 1814, had expressed his uneasiness about the condition of affairs in 1823; but now a worse crisis had come. Cadell felt that Hurst & Robinson in London, Ballantyne, and his own firm were 'wading—we have all too much existence by wind capital.' Scott said, 'Do Hurst & Robinson what they like, the Princes Street establishment will be destroyed root and branch.' A bad speculation in hops outside the legitimate business of Hurst & Robinson is believed to have precipitated the ruin of the circle. At first when faced with absolute ruin Scott wondered if they would let him quit the Court of Session, or go abroad and leave his bones far from the Tweed! How nobly Scott shouldered a heavy load of debt of some one hundred and thirty thousand pounds all the world knows. Robert Cadell at 31 St Andrew Square farmed the old and the new works by the author of *Waverley* so that the creditors got their own eventually, and the publisher a handsome fortune. 'Why,' said William Laidlaw, 'apart from all this, cannot they set up Constable again? He has likewise been a real benefactor to his country.' Sir James Gibson-Craig did help Constable to launch his scheme for a *Miscellany* of cheap volumes, for which Scott was writing on Napoleon, and Lockhart on Burns. But 'Napoleon,' and also *Woodstock*, then in progress, went to Cadell, and realised many thousands of pounds for the creditors.

One who saw Constable in his Princes Street warehouse on 25th January 1826 said, 'He seemed in low spirits.' Sir Walter came in, and 'really looked miserable.' We get the reason when we glance at what happened in the home of James Skene of Rubislaw, at No. 126; and before at 39 Castle Street, when Sir Walter shook the hand of his friend, saying, 'Skene, this is the hand of a beggar.' Scott had seen Constable and the Ballantynes, and learned that all hope of reconstruction was gone. On 23rd January, after writing manuscript equal to ten or twelve pages of print, he walked in West Princes Street Gardens with Skene, 'the only one among my numerous friends who can properly be termed *amicus curarum mearum*, others being too busy or too gay, and several being estranged by habit.' The great man talked of his power to rebuild his shattered fortunes, with some mistrust of his vigour, for the best of his energies were already expended. Still, he seemed to experience a sort of determined pleasure in confronting the worst aspect of this sudden reverse. Felicia Skene tells us he came to 126 for quiet and refuge, where he was as free as in his own house. He seemed unequal to any society save that of young people, and once he expressed himself willing to listen to any fairy story if she had one to tell him. She had, and made him laugh heartily in spite of the prevailing gloom. It is touching to notice how the proud laird would sometimes come home by the Castle Hill and through West Princes Street Gardens to avoid curious eyes. Every head used to be turned to gaze at him as he limped along Princes Street.

No. 15 had associations with a defunct publishing firm of religious books, Messrs Johnston and Hunter, who issued in weekly numbers at the price of one penny, and in monthly parts for fivepence, the *Christian Treasury*, which they called 'the cheapest periodical issued.' There were good books in their 'Christian's Fireside Library,' including the Letters of Blaise Pascal. Messrs Shepherd & Elliot were afterwards at No. 15, and published a posthumous volume by Hugh Miller. The name of one of these booksellers, Mr Andrew Elliot, has been associated with No. 17 for over sixty years as bookseller and publisher of guides, sermons, memoirs, and the first booklet by R. L. Stevenson. This shop has its strongest claim to notice as having been the lounge of the Tory *literati* after William Blackwood came thither in 1816, from a shop opposite the University, and issued thence *Blackwood's Edinburgh Magazine* in 1817. The three-volume work dedicated to the rise and after-history of the house of Blackwood, by Mrs Oliphant and Mrs Porter, records the migration of the firm in 1829 to 45 George Street. The then rent of No. 17 was two hundred and twenty pounds a year, and for a warehouse twenty pounds. Lockhart describes the founder of the famous magazine, who previously had been a notable second-hand bookseller, as a nimble, active-looking man, 'with a complexion very sanguineous. Nothing can be more sagacious than the expression of his whole physiognomy, the gray eyes and eyebrows full of locomotion.' Along with John Murray, whose Scottish agent he was for a time, Blackwood had his name as publisher on one of the Waverley Novels. Blackwood offended Scott, however, by criticisms on the proofs of the *Black Dwarf*, while the business methods of Constable and the Ballantynes did not commend themselves to either Blackwood or Murray, so that, apart from some papers in the magazine, what might have been a fruitful connection with the great author never developed.

John Menzies has given his name to the largest wholesale house dealing with literature in Scotland—the Smith & Sons of the North. In 1838 he was issuing guide-books and views of Scottish scenery from 61 Princes Street, where he began in 1834. A removal was made to 2 Hanover Street in 1859 (above what had been William Tait's shop in Princes Street), where the wholesale side of the business of literature was developed, and the agency for *Punch* and many London periodicals was secured. Just about this time there was great activity shown in the issue of new magazines—*Cornhill*, *Good Words*, *Macmillan's Magazine*, and others—for the dissemination of which amongst booksellers the agency of a middleman was invaluable. Practically every book published in the United Kingdom or abroad could be had through this great agency by the booksellers. Year by year the products of the London publishing houses became more familiar in Scotland, either directly or through the agency of John Menzies and Co. The small newsagents wanted the *London Journal* or the *Family Herald;* and there were numberless other serials, from houses such as Cassell, which came later, so that customers were found in every town and considerable village in Scotland. Then the railway book-stalls were inaugurated and the most prosperous of all connections made for the supply of the latest books and periodicals to the travelling public. As the premises became too small, a 'flitting' took place to 12 Hanover Street, and later to Hanover Buildings, Rose Street. An important house has also been established in Glasgow, and one in Aberdeen.

William Tait, the bookseller and publisher of *Tait's Edinburgh Magazine* (1832–1846), was first in 78 Princes Street, at the west corner of Hanover Street, and afterwards at 107. Tait's magazine was as Radical in politics as Blackwood's, issued from No. 17, was Tory. The publisher of *Blackwood's* remarked that *Tait's* was intended 'to put down my magazine completely: so far from doing us the least harm, it has done us a great deal of good.' This Radical literary and political magazine, at first priced at half-a-crown, was reduced in 1834 to one shilling. It had considerable influence in its day, and a good list of contributors, including De Quincey, Mrs Gore, Mary Howitt, Sir T. Dick Lauder, J. S. Blackie, W. E. Aytoun, J. Hill Burton, and Theodore Martin. Cobden and Bright were also on Tait's list. At first Tait seems to have been his own editor, but after 1834 he had the co-operation of Mrs Christina Isobel Johnstone, author of the *Edinburgh Tales* and various novels. Tait got to know Alexander Russel when reading-boy in Peter Brown's, where his magazine was printed, and was the means, along with Mrs Johnstone, of introducing him to provincial journalism. He later introduced Russel to Charles Maclaren of the *Scotsman*, where afterwards as editor he made a great reputation. When Tait started in business he had as partner his brother, Charles Bertram Tait, who left to found an auctioneer's business in Hanover Street. One of his most successful authors was Patrick Fraser Tytler, whose *History of Scotland*, undertaken at the suggestion of Sir Walter Scott, was published here. The son of Alexander Fraser Tytler, Lord Woodhouselee, he was born at 108 Princes Street, then numbered 65. It is said that Carlyle and Scott just missed meeting one another in Tait's shop. This publisher issued, amongst other works, Carlyle's translations from German Romance, Bentham's works, and Brown's *Philosophy of the Human Mind*. When he retired in 1848 Tait purchased the mansion of Priorbank, Melrose, which at his death in 1864 passed into the hands of his brother-in-law, Mr Adam Black, M.P. It was Black who converted Tait from Toryism to Whiggery, in which he went further than his mentor, spending four days in jail for non-payment of annuity-tax. His brother-in-law declined to join him in driving publicly round the town when released from jail. 'Few men,' remarked Black, 'have acquired the glory of martyrdom at a cheaper rate.'

At first, under the designation of Edmonston and Douglas, at No. 88, and afterwards as David Douglas, at 10 Castle Street, another publisher issued a series of high-class literary, historical, and antiquarian books, including works by Dr John Brown, Principal J. C. Shairp, Professor Knight, W. F. Skene, and many others. Between 1863 and 1870 Douglas was both editor and publisher of the *North British Review* (which ceased in 1871), and edited and published Sir Walter Scott's *Letters* and *Journal*, portions only of which were utilised in Lockhart's biography. The editing meant a careful and adequate series of notes. Douglas, who died at the great age of ninety-two, began business in 1847 by the purchase of that of Charles Smith, bookseller and librarian; the firm of Edmonston & Douglas was founded, with S. Edmonston, to be dissolved after 1877. Besides M'Gibbon and Ross's *Castellated and Domestic Architecture of Scotland*, Skene's *Celtic Scotland*, and Dorothy Wordsworth's *Tour in Scotland in 1803*, edited by J. C. Shairp, this firm issued a dainty series of American authors, including books by Burroughs, Cable, Stockton, Aldrich, and O. W. Holmes.

Tennyson wrote his poem 'The Daisy' in an Edinburgh hotel, whether in Princes Street or elsewhere we do not know. Charles Dickens, when in town in June 1841, had rooms in the Royal Hotel, Princes Street. He had a public dinner as welcome, and the freedom of the town was conferred upon him. For reading or speaking to, he regarded an Edinburgh audience as perfect, with a quicker sense of humour and more genial than that of Boston, U.S.A.,

where he recognised a curious similarity of tone. On 8th December 1868 Dickens was sitting at a side-window in Kennedy's Hotel looking up the length of Princes Street, watching the mist change over the Castle, and murdering Nancy by turns. A letter written to Mrs Lehmann on a Sunday descants sarcastically on the gaiety and brightness of the town! The Scott Monument he pronounced a failure. To him it seemed like the spire of a Gothic church taken off and stuck in the ground. With his usual patriotism, Professor Masson regarded it as the finest monument ever erected to a man of genius here or anywhere else.

Charles Kirkpatrick Sharpe, friend and correspondent of Sir Walter Scott, collector of portraits, relics, and ballads, lived with his mother for twenty years at No. 93 Princes Street. Like Scott, he furnished Robert Chambers with some material for his *Traditions of Edinburgh*. Chambers describes him as a thin, effeminate figure, 'his attire a long, blue frock-coat, black trousers, rather wide below, and sweeping over white stockings and neat shoes; something like a web of white cambric round his neck; and a brown wig coming down to his eyebrows.' In the middle of last century Sharpe had an established reputation as an Edinburgh character. Sharpe designed the old tankard presented to Scott when the freedom of the city was conferred upon him in 1814. He drew up a petition from the inhabitants of the west end of Princes Street on the subject of the encroachments of the Mound, and wrote a piece on a possible extension on both sides, that people when drunk might not fall into the Nor' Loch, or that if a hat was blown off the North Bridge it might be easily recovered. Sharpe also suggested that the smoke from the many low buildings to be erected would enable the inhabitants of Princes Street 'to dry their neats' tongues thoroughly by hanging them out of their windows.'

From a house at the west end of Princes Street Mrs Grant of Laggan in 1826 removed to Brae House, on the site of the present Caledonian Station. James Donaldson, publisher of the *Edinburgh Advertiser*, whose name survives in Donaldson's Hospital, was once resident at No. 53. Principal John Cairns was in youth family tutor in the home of John Donaldson, W.S., at No. 124. The queen's printer for Scotland, Mr Tyndall Bruce of Falkland, occupied No. 81; Professor Munro was at No. 109, Professor Gregory at No. 114, Sir Henry Jardine at No. 123, and Lady Foulis at No. 124. No. 84 was occupied in 1811 by Henry Mackenzie, comptroller of taxes, who dabbled in literature to some purpose, and who came next after James Sibbald, the bookseller, in his welcome in print to the rising star of the poet Burns. These are but a few of the literary memories of this noble promenade, the admiration of pilgrims from the ends of the earth, and the pride of all patriotic Edinburgh citizens.

R. C.

THE BLONDE GENTLEMAN.

By Frederick Tilsley, Author of *Cheerio*.

I.

PRIVATE ROGAN was 'fed up.'

He lay on a stretcher in the reception-room of No. — C.C.S. His head was aching and throbbing, and his throat was sore. Occasionally he coughed, a shrill insistent cough that racked every bone in his body. He closed his eyes because they pained him when open, and then opened them again because he could not bear them closed. He was covered with two doubtful-looking blankets. His pillow was a gorgeous Dorothy bag, bulging with his own private property, and from between his tightly compressed lips projected one inch of clinical thermometer.

A pallid R.A.M.C. man, bristling with indelible pencils, approached Private Rogan, removed the thermometer neatly, glanced at it, and then shook the mercury down with a professional flourish.

'What's the matter with me, chum?' asked the patient thickly.

'New flu, I suppose,' answered the R.A.M.C. man concisely. 'Nothing to get the wind up about. Very few die of it—considering.'

'Will it keep me out of them trenches for a bit?'

'Sure thing.' (Several Americans had recently been admitted into No. — C.C.S.)

There was a moment of silence.

Private Rogan gazed listlessly up at the canvas roof above him. The R.A.M.C. man produced one of his innumerable pencils and made mysterious marks on a field medical card.

'Hell!' said Private Rogan with sudden violence. 'I am fed up. Four years of it I've had; and out of that four years I've been to Blighty four times—three leaves, and when I got one on the head. . . . *Gosh, but I am fed up!*'

The other smiled mirthlessly, for he had troubles of his own. 'So 'm I,' he answered, and added, a trifle more brightly, 'so 's Fritz.'

Private Rogan rose suddenly on his elbow. The effort set him coughing gustily, and he fell back again. When the fit was over he pointed a shaking finger at the R.A.M.C. man. 'I 'm

going to swing the lead while I'm here,' he declared jerkily. 'I don't mind telling you, chum, that I'm not going back to them trenches for some time, see? I've done me bit if I never see 'em again, and when they've cured me of this 'ere flu, I'm going to have pains in me legs or something. Anyway, I'm not going back to them there trenches for some time yet; and don't you forget it.'

The R.A.M.C. man heard all this without emotion. Private Rogan's statement neither amazed nor disgusted him. He knew, in spite of anything the perfervid papers might say to the contrary, that men who are seriously ill seldom clamour to get back to the trenches.

'Will they put me in a proper bed?'

'They will; and when you've been in it a few days—just long enough to feel your feet again—you'll be getting into trouble with the sister and the orderlies for sneaking out of the ward without your medicine. I know you soldiers.'

'If I once get into a real bed,' declared Private Rogan solemnly, 'it'll take dynamite to get me out again.'

'I know what soldiers are,' said the R.A.M.C. man. 'I meet plenty of 'em on this job. They're all the same—restless, especially the old soldiers. I'll bet you anything you like you don't stay in bed more than a week.'

'What a hope you've got!' answered Private Rogan in the strange language of his calling.

II.

They put Private Rogan in a real bed, with clean, white sheets, a futurist counterpane, and pillows that were reasonably soft. They washed, and fed, and encouraged him for two days and nights, and then he began to improve. On the morning of his third day in hospital he awoke from a deep sleep, feeling very much like the Private James Rogan he used to know. He badly wanted to ask a number of questions and use his eyes a great deal. It seemed to him that this desire, vague and half-formed, had been troubling him for a long, long time. A voice had spoken to him often during the past forty-eight hours—a sweet, clear voice which had brought peace to his fever-ridden brain, and put to flight the black phantoms of Hell-begotten dreams. A hand had touched his brow—a soft, cool hand that had conjured blessed sleep out of the tortured blackness from which there had been no escape.

In his weakness he had believed that the owner of the voice and the hand must be an angel; now in his strength he knew that something more substantial than an angel had spoken to him and touched him. 'It was a woman,' said Private Rogan to himself, and began to feel rather sorry for angels. Another voice, which he dimly remembered having heard before, wished him 'Good-morning!'

'Morning,' answered Private Rogan, weakly cheerful; and then, struck by a sudden afterthought, he added, 'Are you Charlie?'

'That's me,' answered the other. ''Ow did yer know, Joe?'

He was a short, elderly youth, with solemn, wrinkled countenance and very false teeth. He wore a shiny navy-blue waistcoat, a tattered remnant of better days, over his gray army shirt, and his every movement was accompanied by a musical jingle from a small but complete set of scissors which dangled from his waist-belt.

Charlie was the ward orderly. He had once been in charge of the officers' ward, but was removed with considerable suddenness owing to his incurable habit of addressing everybody as 'Joe.'

''Ow did yer know, Joe?' he repeated.

Private Rogan frowned thoughtfully.

'Don't know—not exactly,' he answered; 'but I seem to have heard that name pretty often while I've been here—sorter in me sleep, if you understand me.'

'That's right, Joe,' said Charlie, nodding delightedly. 'It's the fellers they all call me Charlie, even the two Fritzes, and the sister too—when nobody's about, and me married at that.' His solemn mouth twisted into a grin with startling rapidity.

'Where is the sister?' asked Private Rogan.

Charlie's grin took flight as suddenly as it had appeared.

'Oh, 'er; she's not on duty yet,' he answered scornfully. 'She don't 'ave to go on no bloomin' parade every mornin', an' 'ave a bloomin' sergeant-major after 'er if she's a few minutes late. Not that I care, mind yer; I can manage this ward very nicely without 'er—better without 'er than with 'er, in fact.'

'Is she hard to get on with?' inquired Private Rogan.

'Oh no; she's right enough in 'er own way—always pleasant an' smilin'; but what do a lot of women wanter go messin' about at wars for? That's what I'd like to know.'

'It never did seem to me to be the place for women,' admitted Private Rogan. 'I reckon it's pretty plucky of 'em meself.'

Charlie snorted, and then grinned again.

''Ave yer noticed our two Fritzes yet?' he inquired irrelevantly. 'There they are, right opposite yer. Same complaint as you, too. Beauties—aren't they?—an' quite 'armless.'

Private Rogan raised himself on his elbows, and glowered fiercely in turn at the occupants of the two beds opposite. One was a kindly-looking man, with soft, brown eyes and a soft, pointed beard. Catching the Englishman's look, he smiled at him with a certain pathetic wistfulness, but finding only distrust in the keen gray eyes of the other, he averted his face with a sigh. The second prisoner was a different type. His face was thin and pale, and his brow was the high, white brow of a scholar.

His long, delicate nose was hooked, but not with the gross predatory curve of the Jew. His chin was square and firm, though not aggressive. His lips were thin, but suggested kindness rather than cruelty. His big, steadfast, blue eyes, set wide apart, met the disgusted glance of Private Rogan without either defiance or fear.

Private Rogan was the first to look away. He laughed a trifle uncomfortably. 'Good-looking fellow that,' he said grudgingly. 'I've seen faces like his on bits of coloured glass out of churches.'

'Sister thinks so too,' said Charlie dryly. 'She calls 'im "the Blonde Gentleman," owin' to his bein' so good-mannered.'

'I shouldn't think a woman—not an English woman—would be interested enough in a square-headed Fritz to call him a name like that,' remarked Private Rogan.

'Then you don't know 'em, Joe,' answered Charlie cynically. 'A woman would forgive a man with a face like that worse things than bein' a German.'

III.

Private Rogan glanced again at the handsome prisoner, and decided that he hated him. His hatred grew more bitter with every moment that passed; and then the sister, white, self-possessed, and pretty, appeared in the ward. Quite suddenly Private Rogan forgot he hated the German, that he was sick and in hospital. He forgot everything but the fact that a pretty English girl, with the reddest of red hair and wonderful eyes, was coming along the centre of the ward, and that she would stop at his bed and speak to him. He felt quite certain of this, and he was right.

'Good-morning, Rogan,' murmured the sister. 'And how are you feeling now?'

Private Rogan blushed gloriously, choked, and then mumbled something inarticulate.

She smiled. 'You have been quite ill, you know.'

'Ye-es,' mumbled the patient apologetically.

'But you find life interesting again this morning, don't you, now?'

'Ye-es, miss—sister.'

'Splendid!'

Suddenly she laughed, a little tinkling laugh of sheer enjoyment.

'You poor old thing!' she bubbled, 'you can't have shaved for a week. I know how you boys dislike being unable to shave. If you want a brush or some soap, let me know, and I'll see that you get it.' She smiled and nodded, and then turned to the bed of the handsome German.

Private Rogan's hands clenched convulsively when he saw the quick sparkle in the steadfast blue eyes and the tell-tale flush on the high cheek-bones of the prisoner. Certainly at that moment it would have been very easy to mistake the blonde beast for a very upright gentleman. But Private Rogan was an old soldier, and distrusted the breed instinctively; and to this natural distrust was now added an equally natural, if somewhat illogical, jealousy.

Your 'old soldier' is a primitive person, not much given to introspection. His weaknesses are usually lovable and his virtues often harsh. On those rare occasions when he has anything to give away he gives it magnificently, with both hands, whether the gift be beer or merely his life. He gives his friendship and his love in the same whole-hearted manner. Private Rogan had fallen completely, madly, and impossibly in love with the pretty, red-headed sister. He had fallen in love with pretty girls before, and would in all probability do so again, but even constant repetition cannot make this being in love a less disturbing business while it lasts.

The sister greeted the Germans pleasantly enough. The bearded one muttered something unintelligible, but the Blonde Gentleman spoke English much more correctly and musically than did Private Rogan, and so, naturally enough, the sister confined her studied commonplaces to him. She felt rather sorry for the Blonde Gentleman. After all, there must be a few good Germans somewhere. Practically everybody admitted as much. She had heard soldiers say, for instance, that the Saxons were not too bad, that the Saxons had some of the instincts of gentlemen. At the best, the lot of the prisoner of war is an unenviable one, and the sister was by nature a sensitive, kind-hearted girl. To make those two men as comfortable as possible while they were in hospital seemed to her to be a duty. It was also rather interesting.

The moment she had finished her morning greetings and retired to that holy of holies known as the 'bunk,' Charlie sidled up to Private Rogan's bed, and glancing cautiously around to make sure no third person was listening, said in a portentous whisper, 'Did yer 'ear 'er, Joe?'

'Hear her what?' queried Private Rogan sourly.

Charlie grinned, and then blushed. 'Call me "Charlie"—"Mornin', Charlie," she said, just like that.'

'Have you such a thing as a barber in this hospital?' asked Private Rogan.

IV.

The following morning the sister approached Private Rogan's bed, humming a little tune and thinking of a handsome young flying-officer who had been one of a number of guests entertained in the sisters' mess the previous evening.

'Good-morning, sister,' said Private Rogan.

She started slightly, and then gave a little laugh of recognition. The patient was no longer a sick and dishevelled man. He was well washed, carefully shaved, and, in his own downright British fashion, quite as handsome as the

Blonde Gentleman. The sister eyed him with new interest.

'You are quite yourself again already,' she said. 'A tribute to our nursing.'

'That's old Charlie,' answered Private Rogan, with a grin that showed to perfection two rows of strong, white teeth. 'He looks after me like a mother.'

'Now, isn't Charlie just too wonderful for words?' she answered seriously. 'I don't know what I should do without him. Do you require any writing material? Your people will be anxious about you.'

Private Rogan laughed harshly. 'My people, sister! I have no people. Nobody cares whether I live or die. Suppose I'd died in this bed instead of getting better, d'you think any one would have gone into mourning over it? Not likely. Nobody cares what happens to me.' Private Rogan laughed again, but this time his laugh had a pathetic little catch in it.

Sister's eyes were moist. She sighed. The patient also sighed. Your 'old soldier' is above everything a sentimentalist, and the rôle of picturesque orphan, which public and press alike have forced upon him, suits him admirably.

'Never mind, laddie,' she said softly; 'you can't possibly go through life without meeting somebody who will care for you.' She broke into that sudden tinkling laugh which was characteristic of her. 'Cheer up, Rogan; you are suffering from that horrible depression which invariably follows your complaint. In a day you will be just as much in love with life as ever you were.' Giving him a swift smile, she tripped down the ward to her 'bunk.'

'Aren't men just big babies?' she said to the two other sisters who were waiting to fortify themselves with tea before doing their rounds with their respective medical officers. 'Aren't they, now?'

'Especially the nice, big, manly ones,' replied the elder of the other two.

'And don't they think they are clever?' remarked the third, with good-natured contempt. 'So horribly confident, and masterful, and practical, until'——

V.

'How much longer will it be, Charlie, before I have to get up?' asked Private Rogan in a whisper as the doctor appeared at the entrance of the ward.

'I expect he'll mark you "up" to-day,' answered Charlie; 'also the two Fritzes.'

'We'll see,' answered Private Rogan grimly.

The doctor was a tall man, with a flowing black moustache and a jerky but sympathetic manner.

'And how are you this morning, my boy, hey? How are you?' he barked when he reached Private Rogan's bed.

'Pretty bad this morning, sir. Legs ache like —like anything, sir—rheumatism, or something, sir.'

'Hah, rheumatism! Now, how d'you know it's rheumatism, hey? Lemme see your tongue; put it out—right out. That's right.—Has he any temperature, sister? Hey! has he? Normal —hum!—I'll see your legs now, my boy!' The doctor was interrupted by the faint tapping of anti-aircraft guns. The sound irritated him. He blew his nose violently, gave the sister a despairing glance, and moved on to the next bed. In this way Private Rogan's stay in hospital was assured for one more day at least.

'I could keep it up for weeks, if me conscience would let me,' he boasted later to Charlie.

'D'you want us to lose the war, Joe?' inquired Charlie indignantly. 'Think of poor ole 'Aig doin' his best to stagger along without yer.'

'I only want a few days' rest,' explained the other apologetically. 'Think sister would let me write to her?'

'They all do, Joe,' answered Charlie; 'some of 'em twice.'

'Does she answer 'em?'

'You 'd better ask 'er that.'

'I will,' declared Private Rogan with determination.

VI.

On the sixth day of Private Rogan's stay in hospital, the doctor asked him if he felt well enough to use his legs a little. The patient eyed him speculatively for a moment, and then his eyes wandered to the sister.

'No, sir,' he said firmly. 'If I was to try and stand up now, I should—I should—er—fall down again.'

The doctor shook his head and sighed. He was a kind-hearted man.

'All right'—he nodded briefly to the sister—'we'll give him another day or two.'

When the round was finished the doctor washed his hands at the little table in the centre of the ward, and went away without noticing that he had left his stethoscope behind. Some moments later the sister passed Private Rogan's bed on her way to the kitchen. The Blonde Gentleman, who had been marked 'up' that morning, watched her narrowly. There was a light in his eyes that caused Private Rogan to clench his fists. A few minutes elapsed, and then the sister reappeared. Her gait was slow and her expression pensive; there was a letter from the young flying-officer in her pocket. As she reached the foot of the Blonde Gentleman's bed he said something very quietly to his friend, and they both laughed. The girl glanced at the pair sharply. The man had spoken in his own language, and she knew hardly a word of German, but an angry flush which she could not have accounted for to save her life mounted to her eyes. At that moment the doctor, seeking his stethoscope, re-entered the

ward. So great was her sense of relief at seeing him that she almost ran to meet him.

Now, as the reader is already aware, Private Rogan had, in the early days of the war, received a head-wound which had sent him to England. By way of convalescent training he had been given guard duties in a concentration camp. These duties lasted for nearly three months, and during that period he had, with that faculty so characteristic of the 'old soldier,' picked up much of the language. He understood the Blonde Gentleman's remark perfectly. It is quite possible that the remark would not have been considered offensive in Germany. In all probability a German *Schwester* would have looked upon the Blonde Gentleman's words as light-hearted banter, and would have answered in the same spirit; but Private Rogan was a crude, uncultured Briton, one of the original 'Contemptibles,' and was, therefore, quite incapable of appreciating that peculiar type of humour which appeals so strongly to the German mind. With an agility truly remarkable, considering that his feet had not touched the ground for almost a week, he swung himself out of bed, and stood for a moment, swaying slightly, a huge figure of shapeliness, which even sensible pink-and-white-striped hospital pyjamas could not entirely disguise. Then, his gray eyes gleaming coldly, and his mouth set like a trap, he crossed to the Blonde Gentleman's bed, seized the occupant by his wavy golden hair, and dragged him out of bed. The handsome prisoner was game enough. He rose to his feet, swearing gutturally. In a trice Private Rogan's fist crashed into his face, and the Blonde Gentleman collapsed untidily.

When the doctor had seen the sister safely out of the way, he approached Private Rogan, who was seated on the edge of his bed watching, with an air of gloomy detachment, Charlie's efforts to resuscitate the victim. It was obvious from the doctor's expression that Private Rogan's visit to the No. — C.C.S. was concluded.

'Why did you strike him, hey?'

'Never mind why, sir,' answered Private Rogan sullenly. 'He knows.'

'Well, back you go up the line first thing to-morrow morning.'

'I've been up the line before, sir, and I can go again; but'—Private Rogan drew a deep breath and reached for the Dorothy bag containing his personal property—'I've got sisters of me own, sir, and I've got some respect for women.' . . .

'Perhaps,' reflected the doctor some time later, 'I ought to have sent him to the mental ward, after all.'

VII.

As Private Rogan, complete with pack, rifle, and iron rations, awaited orders in the reception-room the following morning, a pallid R.A.M.C. man, bristling with indelible pencils, looked up from the table at which he was writing, and grinned.

'A week I gave you, and here you are.' The R.A.M.C. man shook his head sadly. 'I *know* you soldiers. You're all the same—restless.'

INDIAN HEMP DRUGS.

I.

THE hemp-plant (*Cannabis sativa*) yields at least three distinct products, or, rather, groups of products — viz. (1) a bast fibre, largely employed in the manufacture of cordage, ropes, and coarse textiles; (2) an edible seed, from which a useful fatty oil is expressed; (3) the narcotic hemp drugs appearing in trade in three chief forms, known as *bhang*, *charas*, and *ganja*. The habitat of *Cannabis sativa*, in India, lies along the North-Western Himalayas and in the Sub-Himalayan zone. In a wild or spontaneous state it is a plant of waysides and waste places, in appearance and choice of situation somewhat akin to the familiar nettle of the homeland. The wild growth is very abundant in certain localities, where soil and climatic conditions are favourable. For the manufacture of fibre or drug the wild plant is said to be useless, or nearly so. From time immemorial the plant has been cultivated, for the production of fibre, along the slopes of the warm, temperate Himalayas—in Garhwal, Kumaon, Nepal, Simla, Kangra, and Kashmir. It can be completely acclimatised over the greater part of the plains; but the results of experiments hitherto have proved unfavourable, so far as the production of fibre is concerned. On the plains hemp is cultivated for the narcotic products mostly, and a short study of the place occupied by these in the fiscal system of India is the main purpose of this article.

The narcotic principle of the hemp-plant begins to form in the early stages of growth, and reaches its greatest abundance about the time the flowers appear. It gradually diminishes as the leaves pass maturity, and is entirely absent, or nearly so, from leaves allowed to turn yellow.

Bhang consists of the specially dried leaves and flowering shoots of the male or the female plant (or of both together), whether wild or cultivated. When prepared for ordinary consumption, *bhang* is ground to a paste, of which an emulsion is made, and drunk in that simple form, or flavoured with sugar, spices, cardamom, melon-seeds, or milk. *Majun* is a sweetmeat made from the emulsion; it is extensively eaten all over India. Occasionally musk and

other perfumes are added to disguise the objectionable smell; while to make the beverage more intoxicating and poisonous, opium, *dhatura* seeds, arsenic, strychnine, aconite, oleander-root, and the seeds of black henbane are sometimes used. Of all forms of Indian hemp, *bhang* is the least harmful. It is the beer or refreshing drink — the occasional indulgence or luxury—of all classes. A large percentage of the people use it, and apparently with less injurious consequences than result from the similar consumption of alcohol in Europe. In the Report of the Hemp Drugs Commission, to be referred to later, mention is made by witnesses of places where the beverage was given daily to all applicants free of charge. Its use in certain religious observances is considered essential by a large section of the community. *Bhang* is also smoked, in Arabic being called *hashish*.

Ganja is the dried flowering-tops of the cultivated female plants, which become coated with a resinous exudation in consequence of being deprived of the opportunity of setting seed. To secure this result, the male plants are deliberately removed from the field at an early stage by an expert known as the *poddar*. Every male plant is uprooted after one or two visits have been paid by him. As the female plants begin to form *ganja*, all the large leaves on their stems and branches are removed, and the manufactured article is valued very largely by its freedom from leaf. Colour and smell are also features of merit. The chief centres of hemp cultivation for *ganja* are North Bengal and the Central Provinces—the drug produced in the former being known in the trade as *baluchar*, and in the latter *pathar*. Several varieties of the drug are recognised, according to the method of manufacture. To prepare flat *ganja*, the stems are cut with a sickle about six inches above-ground, tied together by their ends, and carried to the selected place of manufacture. The inflorescences are then placed on the ground one by one, and trodden underfoot so as to cause the agglutinated flower-tops and smaller leaves to become compacted into flat masses. Where round *ganja* is required, the heads are rolled underfoot so that they are less firmly compacted, and assume the form of rounded or sausage-shaped masses. Broken fragments, or flower-tops detached from the twigs, whether of flat or round *ganja*, are called *chur*. The refuse from the manufacture of *ganja* is often sold as *bhang*. The use of *ganja* is not nearly so universal as that of *bhang*; its price confines its purchasers to the well-to-do classes. *Ganja* is smoked by its devotees.

Charas is defined as a resinous substance that appears spontaneously on the leaves, stems, inflorescences, and fruits of the hemp-plant when cultivated in cold and dry countries. It is practically the active principle, and consequently a more powerful drug than either *bhang* or *ganja*. The resin appears shortly before the flowers begin to form, and is present over a larger proportion of the plant than is the case with *ganja*. *Charas* is a greenish-brown, moist, resinous mass possessing the peculiar odour of the hemp-plant. When kept for some time it hardens, becoming friable and brownish-gray in colour. The drug is not produced in India. Supplies come from Yarkand, Central Asia, *viâ* Kashmir and Kulu—the only two routes of import sanctioned by Government. The name *charas* is said to mean a 'bag' or 'skin,' and has doubtless some allusion to the skin packages in which it is imported from Central Asia. *Charas* is almost exclusively used for smoking, though some of the finer qualities are employed for medicinal purposes. It is admitted on all hands to be a more pernicious drug than either *bhang* or *ganja*.

II.

Prior to 1893 little was known in regard to the consumption of hemp drugs. In March of that year the Secretary of State for India directed the appointment of a Commission to inquire fully into the cultivation of the hemp-plant in India, and the manufacture and consumption of its narcotic products. The Commission's Report, issued in August 1894, was reviewed by the Government of India in March 1895; and in March 1896 an Act was passed giving effect to the Commission's conclusions, which, in the main, were accepted by Government.

The action of the drugs in causing insanity has, according to the Report, been greatly overstated. The moderate use of them is attended by no evil physical effects. Excessive use of hemp drugs in any form, however, indicates and intensifies mental instability. It tends to weaken the mental power, and may even lead to insanity. But in the year of the Commission's investigations, only in the case of 7·3 per cent. of lunatics admitted to all asylums in India could hemp reasonably be regarded as having been a factor of importance. Moreover, the insanity produced gives way, as a rule, to treatment, and since the drug creates no craving, its discontinuance is possible, and the restoration of the mental faculties is almost instant. It would seem satisfactorily proved that no form of Indian hemp possesses the property of establishing a craving for its continued and extensive use. Total prohibition, even were that possible, would be strongly opposed by the majority of the people, though the fiscal control established by Government as a result of the Commission's Report meets with general approval.

The general conclusions arrived at by the Commission were as follows: (1) that the total prohibition of the cultivation of the hemp-plant

for narcotics, and of the manufacture, sale, or use of the drugs derived from it, was neither necessary nor expedient; (2) that the policy to be adopted should be one of control and restriction, aiming at suppressing excessive use, and keeping moderate consumption within due limits. The means recommended for the attainment of these objects were: (1) adequate taxation of the drugs by combination of a direct duty and fees levied for the right of sale; (2) prohibition of the cultivation of the hemp-plant, except under licence, and the centralisation of such cultivation; (3) limitation of the number of shops for the retail sale of hemp drugs; (4) limitation of the extent of the legal possession of the drugs. The Commissioners recommended that the methods adopted to attain these ends should be systematic, so far as possible uniform for the whole of British India, and that their adoption by certain native states should also be suggested.

Having provided the necessary legislation to carry the Commission's recommendations into effect, the Government of India, in April 1896, enunciated the general lines of policy which the provincial Governments should bear in mind in adapting the local excise systems to carry the legislation into effect. In regard to *ganja* and *charas*, it was laid down (1) that cultivation of the hemp-plant for these drugs should be restricted as much as possible, the production of *ganja* and the import of *charas* being, however, permitted under proper control and restriction; (2) that all *ganja* and *charas* should, on production in or import into any province, be liable to a direct quantitative duty —such duty being realised by means of a system of bonded warehouses, where the drugs would be stored, but would remain the property of the cultivators, the dealers, or the importers; and (3) that the drugs should be freely carried, under suitable restrictions, but without payment of duty, from the place of production or import to a bonded warehouse, or from one bonded warehouse to another, either within the same or in another province, duty being realised thereon on issue from a warehouse for sale in the province of consumption.

As regards *bhang*, it was considered that no effort should be made to extirpate the spontaneous growth of the hemp-plant, and that no restriction should be placed on the use of the wild plants or on their manipulation for the manufacture of fibre. Government declared that if (*a*) the cultivation of hemp for the production of *bhang* were prohibited or made subject to the payment of an acreage duty, (*b*) the collection of *bhang* from wild or self-sown plants by licensed wholesale and retail venders for the purpose of sale were only permitted under licences, and (*c*) the transport of *bhang* so collected were carefully regulated and restricted, it would be possible to exercise adequate control over the consumption of the drug, and to subject it to a moderate quantitative duty in addition to the tax levied, in the form of fees, for the privilege of vend.

In accordance with this policy, the hemp drugs arrangements of each province were carefully considered and revised, with results which may be summed up as follows. The cultivation of the hemp-plant is absolutely prohibited in Burma, Assam, Baluchistan, Coorg, Ajmere-Merwara, and Berar. In other provinces it is permitted only in limited areas and subject to careful restrictions. Adequate quantitative duties are levied on *ganja* and *charas*, and, in most provinces, on *bhang*. Storage of the drugs in Government bonded warehouses, prior to issue to licensed venders on payment of duty, has been enforced. The rules regulating the manufacture, import, export, transport, sale, and possession of hemp drugs have been revised in all provinces in the direction of greater stringency. These measures of control have also affected the native states which derive their supplies from British territory.

In the financial year 1912-13 the hemp drugs revenue of British India totalled, roughly, 120 lakhs of rupees, or, say, £800,000. The average consumption of hemp drugs per 1000 of the population in the same year amounted in Madras (the lowest consuming province) to 0·65, and in Bombay (the highest consuming province) to 4·6, pounds. The average taxation per pound, raised from duty and vend fees, varied from 2·8 rupees in Ajmere-Merwara to 10·1 in Bengal and Assam, equivalent, approximately, to 3s. 9d. and 13s. 6d. respectively. The average revenue per head derived from hemp drugs amounted to a trifle under one penny. The weapon of taxation as a curb on consumption is wielded with no uncertain hand by local Governments when consumption shows signs of getting out of hand.

HEARTS COURAGEOUS.

I CANNOT hear the murmur of the brook,
That from the hill pursues its onward way,
For Heaven demanded, and stern warfare took
All sound divine from out each glorious day
Yet, gentle stream, thy voice through mem'ry's book
Runnest alway.

Mine eyes are sealed; I cannot view the hills,
Those wind-swept spaces where the flocks abide;
But calm is here, a blessedness that fills
My darkness with the peace of eventide.
O flower-sweet land! thou op'st, with hand that thrills,
A gateway wide.

I have no voice wherewith to give my meed
Of thankfulness for things exceeding fair,
Yet at love's call angelic minstrels speed;
My lips are mute, but birds sing everywhere.
Yea, oh my God, o'er all the world's deep need
Broods Thy dear care.

HITTING THE BEACH AT TOGOLAND.

By Captain MONAHAN.

PART I.

I.

THERE is no more vexed question in the navy than that of boats. Especially abroad, one's ship is nearly always anchored in the roadstead of the sea, and officers and men are at the mercy of whatever whims and fancies the commander may have on the subject of boat-routine.

Nowhere is it a more burning question than on the West Coast of Africa. The natural harbours of this portion of the Dark Continent are few in number, considering the length of the treacherous coast-line. Going ashore means running the gauntlet of what is often the wildest surf in the world. All the same, junior officers call the West Coast 'Commander's Paradise,' because there his pets lie where he likes to see them—on the boat-deck. The ship's steam-pinnace, cutters, and other small service craft are unsuitable for entering this noisy, foamy terminus of the Atlantic. The breaking waves, to say nothing of a probably violent contact with the beach, would soon make short work of their square sterns. To ride such bolshevik seas in safety a boat having a pronounced sheer at each end is needed. Then the impinging waves have an uplifting instead of a swamping effect; and when the vessel grounds with a rush, as it usually does, no damage occurs. The official surf-boat of the West African coast fulfils these requirements, is manned by hefty natives, and loses no time in making its way alongside a man-o'-war. The accommodation, however, is extremely limited.

'Will there be any chance of going ashore?' was on the tip of everybody's tongue when H.M.S. *Blastus* arrived off Lome, Togoland.

It is not every day of the year one has an opportunity of visiting a conquered German colony. Apart from the natural curiosity felt on such an occasion, there is always the call of the fleshpots. The victualling situation on the West Coast is a very serious one indeed. Even when fresh meat can be readily obtained, the cold-storage facilities of the old cruisers (known as 'punishment ships'!) on that station are of the most meagre description. A day or two out, and the swine-cask is almost certain to be broached. Salt pork then takes its place on the menu three times a day. It is surprising how warmly the pinkish-looking stuff is acclaimed by some of the seasoned ones. Staff-Paymaster de Carteret (who revered anything in the shape of an old service custom) usually went into smacking ecstasies whenever it appeared on the table. Not so Temporary-Surgeon Newcome, the stormy petrel of the mess. He abhorred the stuff, and resented its advent with a hatred that apparently had its inception in the early days of childhood.

'I can quite appreciate your pretended pleasure,' was apt to be the doctor's sarcastic rejoinder to the 'Pay;' 'it saves your department ever so much trouble. Under this cast-iron system of yours, the ship's company are supplied with only the bare necessities of life—bread, tea, meat, and potatoes; and even at that, whenever you 're unable to procure supplies as conveniently as you would from a naval victualling-yard, you 're only too ready to force this vile pig on us. There seems to be no elasticity about your arrangements. Here in Africa you wouldn't dream of giving the men chicken, or taking on a live bullock for a sea-trip, as the French do. Indeed, it 's hard enough squeezing enough lime-juice out of you to keep scurvy down.'

At which De Carteret would rant about the insolence of temporary-surgeons and their appalling lack of knowledge regarding 'service' customs. Did Newcome want the ship turned into a food emporium? Was not the *Blastus*, after all, a fighting-ship?

Newcome then further incensed the irascible paymaster by asking cynically what could she fight? Was it not true that any modern torpedo-destroyer, with high-velocity, mid-line four-inch guns, could easily outrange her and put her out of action without even running the risk of being hit? . . . .

Nevertheless, salt pork continued to occupy a prominent place on the menu.

II.

Aside from the stopping of the propellers, and the rattling of the cable-chains as the anchor seeks a gripping-place on the bed of the sea, there is another constant phenomenon which is particularly significant of any one of H.M. ships fetching up anywhere. The officer-of-the-watch comes down from his lofty perch on the fore-

 [*All Rights Reserved.*]

bridge. Telescope under his arm, and sword-belt round his waist, he begins strutting up and down the quarter-deck, keeping one eye on the shore and another on the port and starboard gangways, which have been lowered by this time. Quartermasters, corporals-of-the-gangway, messengers, and side-boys await his orders, which are likely to flow fast and furious in a foreign port where all sorts of dignitaries come aboard, from the king of the Bunga-Bungas to a consul-general, every one of them extremely sensitive on the subject of receiving the salute to which his rank entitles him.

The *Blastus* had barely performed the last rites of the cable-deck, and scarcely a shadow was to be seen anywhere on deck—the sun being almost directly overhead—when a signal-rating came up to the officer-of-the-watch and reported, 'Two surf-boats pulling in the direction of the ship, sir.'

'You're wrong, my lad,' the duty officer rejoined, focusing his glass. 'They're using the paddles of this coast; and a thumping good speed the first boat's making.—She's got an army bloke in her,' he added, turning to Surgeon Newcome, who had his reasons for standing by and watching the approach of the boat with the greatest of interest.

It was a pretty sight seeing the jumper-clad natives dipping their paddles to the crooning rhythm of an African boat-song. Instead of having ordinary seats for passengers, each boat contained what is known as a 'mammy-chair,' so called because the Elder-Dempster people use it for transferring women and children to and from their ships. It reminds one of a switch-back railway compartment.

As soon as the surf-boat containing the officer neared the starboard gangway, the quartermaster blew his whistle in the peculiar long-drawn-out fashion that has been in vogue from time immemorial, stopping before the boat actually touched the gangway. The side-boy waited at the bottom of the steps with a salute; and the quartermaster again intervened, this time piping the army gentleman over the side (as the expression goes), everybody of course standing to attention, and the officers saluting the moment the stranger stepped on the quarter-deck. 'My name's Manners, and I've come to call on your captain,' the ruddy-faced khaki-clad visitor announced. The commander, who received him, explained that the skipper of the *Blastus* was suffering from a touch of malaria, but would be pleased to see him in his cabin.

'He's the Governor's aide-de-camp,' the commander informed the officer-of-the-watch as soon as he returned from seeing Manners safely below. It was not long either before the captain sent word that the Governor of Togoland requested the pleasure of the company of six officers to lunch, and would those who wished to accept hand their names in to the commander?

Newcome lost no time in going up to the senior officer in question, and asking the time-honoured question, 'May I go ashore, sir?' 'Please,' was the answer, his name being put down first on the list. The surgeon was not taking any chances this time, because he had been done in the eye on several former occasions. One has to be on the top line in the navy when there are free lunches to be snapped up for the asking!

The six lucky officers did not take long in getting into their 'No. 1' tropical uniforms. Helmeted and in spotless 'whites,' they seemed to emerge simultaneously from the companion-way. The party consisted of the navigating officer, the paymaster, the chaplain, the captain of marines, the surgeon, and Lieutenant Macmurdo, R.N.R. Poor Mac! A short time afterwards he went hunting submarines in H.M. Mystery-Ship *Bomballa*. Coincidently with his new appointment the two U-boats made their famous descent upon the West Coast, and the *Bomballa*, unable to compete with their superior guns, was sunk by shell-fire, Macmurdo being killed on the bridge early in the action.

As soon as the aide-de-camp joined them, they disposed themselves in the two boats, the mess-man and the canteen manager also being given a passage in order to purchase supplies. Several hundred eyes watched them push off from the ship's side. That is where the trying part of such a cruise comes in. The ship's company have so few opportunities of *hitting the beach*, as going ashore is called. On the other hand, whatever trips happen to be on are usually very agreeable ones, with every detail arranged, so that all one has to do is to sit back, so to speak, and enjoy one's self.

July is not the most salubrious month in the year to be on any African station, but riding the Atlantic swell that morning in a surf-boat was about as perfect a sensation as one could desire. Hot, of course; but Sierra Leone had prepared the party for that. They had never seen anything finer than the startling purity of the sky; and as for the sea's blueness—well, as the pilot remarked, it was about as Prussian as the Kaiser had been able to get it!

Instead of swaying in unison with the paddle-dips of the men, the coxswain chipped in an alto every now and then on top of their boating-song, and they went ahead with a swing. They were no beauties, those men of Togoland. Black as ebony they were; their noses were depressed, cheek-bones prominent; and as for their foreheads, they did not so much appear receding as gave one the impression of having been struck a smacking good blow, a sort of ledge being left overhanging the eyes. Nevertheless, the ugliness of these racial marks is more than neutralised by their amiable smiles, and the comical raillery which seems to be their natural way of communing with each other. The West Coast natives make splendid sailors, accustomed as they are to going to sea not in the big ships of Europeans,

but in frail 'dug-outs,' which they hollow out of the trunks of suitable trees. A dug-out and a fishing-line are usually a native's sole capital. They have little use for money, regarding it with amusement inasmuch as the daily 'catch' of fish enables them to exist, providing a commodity they can exchange for whatever else they require.

III.

The Lome front appeared far more symmetrical than anything hitherto observed on the coast. The town was more or less equally disposed to right and left of a pier which jutted out far beyond the surf. A row of palms all along the beach made a splendid background for the silvery surf breaking on the yellow sand. Behind them stood immaculate white houses with red roofs. So far as one could make out, the prominent buildings were of the square limestone variety so common in the tropics. Arched windows opened on to wide verandas, which spread themselves round the rooms within.

The fascinating feature about African towns is that the transition from houses to dense bush is usually quite abrupt. 'What brave fellows must live beyond that pale!' Newcome had often thought on cyclonic nights—and there are many such during the rainy season. Off Liberia, for instance, the thunder sometimes crashed and boomed continuously several nights in succession, and from the deck of the *Blastus* there was visible a play of lightning such as is never seen in England. These fierce storms terrify the imagination. One fancies the black man in his grass-hut, and the 'four-footed beasts of the earth, and creeping things, and fowls of the air,' trembling like aspen leaves as the colossal conflict of the elements goes on around them. What are the thoughts and the fears of these natives? Do their immature brains save them from the apprehension of being struck lifeless any moment? Do they sink down on their knees and invoke the protection of their newly-found God? . . .

'You see, we don't need to go through the surf,' Manners said, as the boat was hove-to off the end of the pier, the only one of its kind on the coast. The swinging-arm of a small steam-crane was manœuvred over them by the pier people, a wire-line hitched on to the cupola of their 'mammy-chair,' and the contrivance lifted out of the bobbing surf-boat. Before ushering his charges into the waiting cars (all of them of German make, left behind by the departed enemy!), the aide-de-camp called attention to the pier's structure. It had as supports a series of inverted tripods the apices of which rested on heavy iron balls in the stone abutment. The idea of this arrangement, of course, was that the upper works (which were easily replaceable) could be washed away, say during a tornado, without the stability of the foundations being affected.

The cars turned off to the left, driving over a road as smooth as many an English one. The solid character of the former Deutsch-Westafrikanische Bank building was an eloquent reminder of what the Germans had been attempting to do on the coast. None of the native quarter was observed on this part of the journey. Newcome understood it to be fairly well separated from the white; which is as it ought to be. The doctor recollected with some sadness the conditions obtaining in Sierra Leone. There he had seen native huts in the middle of the town. Now the immediate proximity of such huts must be regarded as an infected area, because black people have the malarial parasite in their blood practically from birth. Any one bitten by mosquitoes hovering near native habitations is almost certain to contract malaria. Thanks to this and to the lack of protective netting (such as they have at Panamá), British soldiers and sailors in Sierra Leone are infected on a vast scale; and there is frequently a heavy sick-list on board H.M. ships from this disease. The gravity of the thing lies in the fact that the parasite often becomes a lifelong companion; and malaria is being gradually introduced into Kent and other English counties favourable to the development of the parasite-bearing mosquito.

The cars were in the outskirts of Lome now, traversing an extensive wood that almost reminded one of the New Forest. The trees were as large as beeches or chestnuts, and ever so many bright flowers were to be seen, many of them perennial, Captain Manners said. The wonderful sensitive plant, the puzzle of botanical philosophers, flourished by the wayside. Humming-birds darted in and out, and creatures flew past with plumage that seemed to reflect all the colours of the rainbow. Nevertheless, the visitors missed the lively song of the skylark. The pilot said that bird was afraid to rise on account of the danger of being sun-struck! Indeed, the twitterings of the feathery tribe in general were somewhat disappointing. On such a morning their English cousins could scarcely have held themselves back; they would assuredly have broken forth into pæans of chirping delight. Every degree nearer the equator apparently exacts its penalty in point of using up that reservoir of something or other which expresses itself in spontaneous outbursts of poetry or the really deep throb of song. The simple native mind may go as far as crooning a boat-song, or a Gregorian chant of sorts, but truly noble carolling is indigenous to the temperate zones. The tropics, then, for fierce emotions; the lack-lustre lands for sentiment, which is, after all, behind the great achievements of life.

Newcome noticed one thing. The natives were extremely polite. Everybody went out of his way to salute, salaam, or doff his cap. 'I hope we don't spoil them,' Captain Manners said as the car drew up before the broad steps of what used to be the Wohnung des Kaiserlichen Gouverneurs von Togo.

GERMAN TRADE WITH LATIN-AMERICA.

By M. C. Beverley.

THERE are said to be 500,000 Germans in Brazil, which would mean that about one-fiftieth of the total population of that enormous and exceedingly fertile republic is composed of Teutons.

I am not aware of the actual number of Germans in other South American states, but the totals must be very high; and there is not the slightest doubt that the Germans are much liked and highly respected by the Spanish-Americans.

Nearly all of these Germans are banded together by the 'German Society,' to which no would-be member is admitted until the most searching inquiries have been made as to his record, standing, and nationality. In addition to this bond of union, there are musical, literary, and sub-military societies, which are conducted with a view to the genuine improvement of the Teuton, and which cannot—and do not—fail to impress the Spaniards most favourably.

While we Britons have neglected Spanish as an all but obsolete language, and have grievously offended a proud European Power by most tactless references to her as a 'dying nation,' the Germans have assiduously set themselves to cultivate a great and valuable friendship with all Spaniards, especially with the transatlantic descendants of the Conquistadors.

Spaniards are ceremonious, generous, and deeply religious; and the German man of business—after a thorough training in the Spanish language and Spanish ethics—adopts ceremony, generosity, and, above all, religion, as a good basis for trade dealings with the Spaniard. It goes without saying that nearly all the correspondence between Germans and Spanish-Americans is carried on in Spanish—and perfect Spanish, too. No ceremony is neglected, and no order, however small, from a Spanish-American is overlooked or carelessly acknowledged. The German who receives a small order for a few dozen buttons, or a like number of cups and saucers, duly 'kisses the hands' of the minor Spanish tradesman, and is as civil and obliging in carrying out the order as if it were for a boatload of crockery or a shopful of haberdashery. There is no undue pressing for the payment of accounts, no threat of 'legal proceedings,' so beloved of the British tradesman; and a polite, reasonable, and patient tone is adopted throughout. Sometimes a suggestion is made that when the sheep have been shorn, or such and such a crop has been harvested, the Spanish *estancia* holder will perhaps please remember the German creditor. This forbearing attitude has done much, and will do much more in the future, to secure foreign trade for the German.

All Christian festivals, to say nothing of birthdays, Independence Days, and other anniversaries, are punctiliously observed by the Teuton, who thereby endears himself to the fastidious Spaniard; and one old German of whom I wot is wont to have his Christmas or Easter greetings inserted in red type, while the body of the trade letter is in violet ink. 'Glory to God in the Highest! Peace and Goodwill on Earth to Men!' has a very fine effect as a scarlet line across a page of violet typing; while such exclamations as 'Thanks to God!' 'God with us!' &c., make their mark with a race whose religion is part of their daily life.

When the balance-sheet has been received in Germany, the American agent—whether German or Spanish—is never forgotten. He has his due share of the profits, and is not left to grumble and solicit in vain. This commendable conduct on the part of the Teuton might well be copied by firms in the British Empire, where shabby treatment of subordinates is going far to bring disaffection and resentment to a head.

Not only do Germans print the catalogues destined for South America in Spanish, as stated by Mr Henry Leach in the July number of *Chambers's Journal*, but one enterprising firm had thousands of copies of a pamphlet entitled *The History of the Baralong* printed in both Spanish and Dutch, and distributed all over Spanish-America and the Dutch East Indies. That Baralong tract (written in masterly style) had, and will have, far-reaching effects; and one can only wonder that we could not, or cannot, do likewise with a pamphlet recounting the barbarous treatment of that brave man, Captain Fryatt.

The homely festivals of the Germans resident in Spanish-America—their Christmas-trees, their decorated and beflagged busts of the Kaiser on his birthday—have appealed greatly to the Spaniards, who delight in anniversaries and respect tradition; whereas the English cult of the latest 'comic' song, the latest and most vulgar buffoon, and dancing all day long will produce only contempt among the educated classes, and do harm among the rank and file of the population—should we contemplate taking the Germans' place in South American trade.

The writer has seen many photographs of German family and business groups taken in Latin-America, and has been struck by the frequent presence of Indian or Spanish-Indian servants in these groups. Such dependents sit amongst their employers, apparently happy and on the best of terms with them; and the impression received is very pleasing. Very graceful gifts are exchanged between Spaniard and

German; and when a German business man has lived some years in a South American city he will be presented with a valuable token of his fellow-citizens' esteem—a beautiful bronze, or something of the kind, and countless charming bouquets of flowers.

All these ties between the Latin and the Teuton are not likely to be severed in a hurry, and certainly not by traders who know nothing of, and care less for, Spanish manners and traditions, and who do not even trouble to learn the Spanish language.

But apart from the amenities of life, the Germans have thought out and studied the question of post-war trade with Spanish-America with real thoroughness, and have prepared large quantities of goods ready for immediate shipment when practicable. Some of the everyday wants of the South Americans are as follows, and the Germans are said to have the necessary stocks in great abundance: chinaware and crockery; pins, needles, safety-pins, hairpins, &c.; hosiery—especially black and navy-blue stockings for women and children; buttons and beads; lace goods (of Plauen type); hops; butter and cheese (both of which are exceedingly bad in South America); essences and liqueurs.

In these lines the Potteries, Birmingham, Nottingham, and Kent might very well furnish enormous quantities of superior and desirable goods. But the question is—Do they supply them? Do they intend to supply them?

In conclusion, I may state from actual knowledge that in a great part of Spanish-America, especially in Bolivia, Peru, and Chili, the natives are so illiterate that they can hardly write their own names; consequently *all* clerical work *has* to be done by foreigners. Of these foreign clerks the majority are German. And, to quote from the *Report of the Committee appointed by the Prime Minister to inquire into the Position of Modern Languages in the Educational System of Great Britain*, 'we are told that the Latin races of America are unwilling to learn English or any other foreign language.'

What an opening for the British man or woman willing to learn Spanish!

KAVANAGH'S LUCKY BEAN.

CHAPTER V.—THE RED EYES OF QUIGLEY.

AFTER many perturbed hours Kavanagh fell into a troubled slumber. From a nightmare, in which, giddily hanging head downwards from his upper berth, he was trying to strangle Nathan Quigley, who occupied the berth beneath, he awoke to find the sensation of vertigo remain after the illusion had fled. The *Taurana* was in the Bay of Biscay, and the vessel was already reeling in a way disconcerting to all except the best of sailors.

On attempting to dress, a spasm of nausea drove Dennis back to his berth, where he lay torpid, suffering little so long as he remained prostrate. The altered weather conditions left Robson unscathed; but Mr Million had lost all his jauntiness, and lay supine, a feeble, toothless wreck.

Remembering the information conveyed in the laconic note that he had discovered pinned to his pillow, Dennis—at the expense of an attack of sickness—secured the passenger list, which was in his coat-pocket, and, when he again felt composed, studied it under a new light.

A confusing number of Browns appeared to be on board. There were Lady Brown, daughter, and maid; Colonel Machieson Brown; Mr and Mrs Cadogan Browne, infant, and nurse; Mr Andrew Todd Brown; Mr and Miss Brown; and Mr Isaac Brown.

The first three lots, Dennis concluded, must be first-saloon passengers. He was already acquainted with Mr Isaac Brown, who called himself a mining expert, and who, even thus early in the voyage, had shown himself persuasively active in cajoling his fellow-voyagers into playing cards in the smoking-room. There still remained Mr Andrew Todd Brown, and the Mr Brown who was travelling with Miss Brown.

As he lay listening to the groans of Mr Million, and the occasional crash of crockery in a pantry near by, Dennis cursed the physical weakness that held him prisoner, and determined that, well or sick, he would be out of his berth next day.

By noon the following day the *Taurana* was either in somewhat smoother water or Dennis was becoming more accustomed to her motion, for he managed to stagger to the half-deserted deck and lie in his deck-chair, muffled in his rug. The fresh salt air proved the best of remedies. The tumbler of whisky-and-soda and the dry biscuits suggested by his steward completed his cure. And in the afternoon, when the pretty girl ventured on deck, looking pale, but distinctly alluring in a scarlet cloak, from beneath whose hood her dark hair curled softly about her face, he was able to help her to her chair, and offer her the use of his rug. Under the influence of his kindness she lost her shyness, and became almost communicative, and Dennis found his impressionable heart thrill to the music of her Irish accent.

In reply to his inquiry, the pretty girl admitted that the motion had 'come over' her a bit, but not for long; though her cabin-mates, Mrs and Miss Younger, were very bad still.

'But it's my father that's the sick man. It's the storm that fair put the terrors on him, the creature! He thinks every minit' the ship's sinkin' to the bottom!'

In the night the wind fell. Next morning saw the *Taurana* steaming along on an even keel. The air was mild, the sun shone, and most of the deck-chairs were occupied by pallid passengers who were congratulating themselves, and each other, that the worst of the voyage was already over.

Free now from physical handicap, Dennis resumed his task of fitting the names to the different Browns on board. Andrew Todd Brown, he discovered, was a bank clerk from Aberdeen, who was going out to an appointment at Dunedin. To his surprise, the pretty Irish girl with the blue eyes and the accent that touched his heart-strings was Miss Nora Brown; and her father, who, being a wretched sailor, had remained in his cabin since the *Taurana* left the Thames, was the only unrevealed Brown on board. Though Dennis agreed with himself that it was most unlikely that any relation of so nice a girl could be guilty of vile treachery, he yet felt that he could not rest until he had seen Nora's father and satisfied himself that he was not Nathan Quigley.

When Dennis went awkwardly up to bid her good-morning, Nora Brown looked up from her lace-work with a shy smile of welcome. Mrs Younger, already repenting her precipitance in having quitted the immutable town of Montrose for an unstable ocean, was huddled in her chair. Opening a jaundiced eye, she glanced up at Dennis, and shut it with a groan significant of disgust with the whole universe.

'It's yourself that's the fine sailor entirely,' Dennis accosted Nora admiringly. 'An' how might your father be keepin' to-day?'

'He says he is a bit easier now, an' he's thinkin' of comin' up on deck. It was the ship's doctor that was tellin' him he would best rise up to once, for he'd never get right lyin' down there. I was to go down and fetch him up in two or three minutes. Now's the time he'll be requirin' me.'

Rolling her lace-work in a clean handkerchief, Nora put it carefully away in the pocket of her chair before hastening off; and, drawing back a little, Dennis watched anxiously for her reappearance with her father.

As he waited Dennis recalled the last time he had spoken with Quigley. It was on the evening of the day on which they had received news of his father's death in the jail infirmary. Passing down the one street of the little village at the darkening, Dennis had seen Quigley standing at the door of his shop. Inviting the boy inside, Quigley had surprised him by giving him a bag of sweets for himself, and a handful of silver for his mother. 'Tell her a well-wisher sent it,' he had said, as he pressed the coins into the boy's hand. Running swiftly home on his shoeless feet, Dennis had burst through the women sympathisers who crowded the kitchen, and reaching his mother, who sat by the turf-fire, her face buried in her hands, he put the money and the bag of sweets on her lap.

'See, mother!' he had said excitedly. 'See what I've brought ye!' Uncovering her face, the widow had looked in a dazed way at the shining coins. 'It's *money*. It's big money, mother! An' it's a well-wisher sent it. Nat Quigley told me to tell ye that.'

'Quigley—Nat Quigley? Holy Mother! was't Quigley that gave ye the money?'

He remembered the sudden flame in her tear-red eyes, the shrill anger in her grief-hoarse voice, and the manner in which, clutching at the coins and the bag, she had rushed from the house into the rain; and how she hastened along the wet road until she reached Quigley's shop.

Following close upon his mother's heels, Dennis had been a dumb spectator of the scene that ensued. The flickering light from the solitary candle set on the counter had cast weird shadows on the dark interior, and lit up Quigley's startled face. Mrs Kavanagh was a tall woman. Drawn up to her full height as she stood on the threshold, she might have been some outraged queen. Dennis had felt as though this transformed mother was a stranger to him.

For a long moment she had stood, silent, confronting her 'well-wisher.' The counter had formed a barricade between them, but Dennis saw Quigley shrink back against the shelves that were laden with canisters and bottles of sugar-sticks, as though he feared a blow.

Then, raising her hand, Mrs Kavanagh had thrown the money full in his face. 'There's yer blood-money back to ye!' she had said in a tone of concentrated bitterness, and, without another word, had turned and left the shop. As for Dennis's bag of sweets, it lay where she had unconsciously dropped it outside the cottage door. In time the rain washed away the paper, and the sweets remained a sodden mass in the gutter. Sweets were rare and precious delights to the boy, but he had never touched those. In common with the money, to him they were accursed. That was many years ago. And now he was waiting impatiently for the first public appearance on board of the man Brown, who, he told himself, might be Quigley.

But when at last Nora came on deck, the invalid she supported with daughterly solicitude proved to be a short, elderly man with white hair and trembling limbs. In all respects he seemed the very antithesis of the informer, and Dennis experienced a sudden relief in that his fears had proved without foundation.

Mr Brown revealed himself as rather a difficult parent for so sweet a daughter to please. He was

querulous and fidgety, thought the deck draughty, regretted he had allowed himself to be persuaded to leave his snug cabin, insisted on having his deck-chair moved into the shadow, on the plea that the glare from the sun and the sea hurt his eyes, for whose weakness he wore tinted spectacles.

Seeing Nora struggling with the clumsy chair, Dennis hastened forward and helped her to place it in the desired position. Then, when Mr Brown had been finally settled in it, with a cushion at his back and a shawl over his knees, Dennis slipped away, and returned bearing a glass of brandy-and-soda for the invalid—a timely attention which Mr Brown accepted without demur, and Nora acknowledged with a radiant smile.

'Thank ye kindly, sir,' Mr Brown said. 'By the light that shines! it's the thirsty man I am this day. My little girl here was tellin' me she's been indebted to ye durin' my indisposition, an' I'm thankin' ye for that too.'

As the spirit sent a tinge of colour into his pallid cheeks and new life through his veins the old invalid became loquacious, and expressed admiration for the scene before him. 'What a marvellous sight this is! Ay, truly, "they that go down to the sea in ships, that do business in great waters: these see the works of the Lord, and His wonders in the deep,"' he repeated unctuously, his thin lips caressing the brim of the tumbler. Taking a biscuit, with the remark that neither bite nor sup had crossed his lips that day, he nibbled at it with teeth that were remarkably white and even for a man of his years.

Rapidly recovering, Mr Brown evinced a healthy natural interest in the affairs of his new friend—an interest so strong as almost to entrench upon curiosity. He was pleased to hear that Dennis had been brought up in Scotland, and cordially approved his intention of settling in New Zealand. 'It's a good land, is that same. An' a fine country in which to be earnin' your bread by the sweat of your face, as the Book says. A big, strappin' young fellow like yourself'll be makin' a fortune off the land in no time at all. No, there's not much chance for an old chap like me, that the grasshopper's becomin' a burden to. But I'm wantin' to give my Nora there a better opportunity nor ever I had. It's herself that'll be makin' the splendid marriage out there.'

To Dennis's disappointment, Nora's father proved to be a sanctimonious individual, much given to quoting Scripture in season and, more frequently, out of season, and sadly prone to show extreme economy, even niggardliness, regarding the minor expenses of the voyage. As the days wore on it became more and more evident that to be 'out there' was undoubtedly the climax of Mr Brown's feverish desires. His one craving was to hasten on the end of the voyage. The weather continued fine; the ship was making record runs; but no progress was good enough to satisfy Mr Brown.

'I don't know what ails the man at all, at all,' said Nora one day to Dennis. 'But it's easy to see that, if he could, he'd get out and push the ship.'

The hours might lag to Mr Brown, but to Nora and Dennis they seemed to fly. Halcyon days they were, passed on an enchanted ship that sailed an enchanted ocean. Dennis had not told Nora that he loved her. He felt that to do so would not be fair until he was more sure of what lay in wait for him. But there are things that women know instinctively, and Nora hardly required to be told.

Meanwhile the entertainments committee had organised well. Competitions in deck games, bridge tournaments, concerts, and informal dances succeeded in swift rotation. From most of these gaieties Dennis and Nora held aloof. A feeling of not being to the manner born made them more kin to each other. Though, yielding to the persuasion of one of the actresses, Nora had appeared at the costume-dance as Little Red-riding-hood, wearing a white frock with her scarlet cloak, and carrying a fancy basket containing the historic cake and jar of honey. She had the happy excitement of winning the second prize; and Dennis, who thought she was the loveliest thing alive, shared in her triumph.

During those sparkling days Dennis almost forgot the elusive traitor he had set out to murder, and thought only of Nora, and of the new land to which they were speeding. The firm conviction that Nathan Quigley was not on board had relieved him of all sense of responsibility.

They were beginning to count the lessening number of days to the end of the voyage—Brown with a kind of stifled exultation, the young people with growing regret—when one morning Nora appeared at breakfast alone. Her father was not so well; he was keeping his berth, she explained. No, he was not complaining of any special ailment; and he refused to see the doctor.

When the second day came, and Brown was still invisible, Dennis saw that Nora seemed troubled. In a quiet corner of the deck he asked her the reason.

'It's my father that's botherin' me,' she confessed. 'The creature's not like himself at all.'

'Sure, an' the doctor'll set him right in a jiffy. Will I tell him your father'ud like to see him?'

Nora shook her head. He could see that the blue eyes fringed with the black lashes were full of tears. 'It's the mind of him that's bad, an' not the body. He was like this afore ever we came on the ship, but he's been better lately. An' now the spirits of him is down again. He keeps wakin' nights, an' has the awful dreams.

An' last night he says he never closed an eye. There 's something troublin' his mind, an' I don't know what to do with him at all, at all.'

'Faith, but I'd be the proud man to be helpin' ye,' Dennis said tenderly. 'If I was to see him, now. . . . But I wouldn't like to be intrudin'.'

'More like it would do my father good to see ye. It 'ud cheer him up a bit. I'll run down an' ask him,' Nora said, hurrying off.

In a few minutes she reappeared on deck, and Dennis was glad to note that her step was lighter. She nodded assent from a distance.

'Yes, he says you can come.' Taking him to the end of the long passage, Nora indicated the door of the double-berth cabin of which her father was the sole occupant, then retired, leaving Dennis to usher himself in.

To his surprise, the door seemed to be fastened from within, for, after knocking, he heard the sound of a bolt being drawn, and of a scurry inside. Then Brown's voice said, 'Come in. Come in.' And Dennis entered, to find the invalid hunched up in bed with a big Bible propped up against his knees. A faint spirituous essence tinctured the close air of the cabin. At the back of the berth, partly concealed by the bed-clothes, Dennis saw a black leather bag that was Brown's inseparable companion.

'Shut the door. Are ye sure it 's fast?' Brown asked nervously. Then, recovering something of his customary ingratiating manner, he thanked his visitor for coming, and invited him to sit on the couch.

'Sure, an' it 's vexed I am to see ye in this predicament,' Dennis said with sincere sympathy, for he was genuinely distressed to know that Nora's father was suffering. 'Is there anything I can be doin' to help ye? Will ye not be for seein' the doctor? They say it 's the rale clever man he is.'

The cordial commiseration in his friend's tone appealed to the invalid. For a moment he seemed to tremble on the verge of a confidence; then, in a hesitating voice—a voice full of genuine self-pity—he began to unburden himself.

'Man alive! there 's no doctor on earth, let alone this boat, that can cure my trouble. It 's the world that has always misjudged me. Like the Psalmist, it 's myself has been surrounded by evil speakers and ill-wishers. An' me the honest man with the heart of a patriot in me! An' all I was askin' was peace to lead a quiet life.' As Brown waxed excited by the recital of his woes his brogue became more pronounced, but Dennis did not notice it. He was trying unsuccessfully to think of something suitable to say.

'It 's the wicked imaginings of my enemies that has driven me out of the Ould Country. Like King David when he was oppressed, I said, "Oh that I had wings like a dove! for then would I fly away, and be at rest."'

Concluding that Brown's sufferings were purely mental, and therefore groundless, as his daughter had hinted they were, Dennis yet felt sorry for him. He knew that imaginary ailments were by far the most difficult to cure, and the pity that filled his kind heart was revealed in his face.

'There 's a verse here that shows how David endured the sting of malicious tongues and contumely the same as me,' said Brown, fumbling with the leaves of the Bible, and then taking off his glasses the better to find the place. 'See, here it is.'

He pointed out the passage that was to reveal the affinity between his sad case and that of the royal Psalmist. But what the verse said Dennis never knew; for, as Brown met his gaze, Dennis found himself looking down into the red eyes of Quigley—those eyes whose tell-tale hue the tinted glasses had so successfully concealed.

How the remainder of the interview passed Dennis never remembered. His purely mechanical replies must have pleased the invalid, for he left the cabin with Brown's invitation to return soon echoing dully in his brain.

CHAPTER VI.—THE PASSENGER WHO PLAYED PATIENCE.

STUNNED by the discovery that the man he was pledged to murder was the father of the girl he loved, Dennis could not face Nora, though he knew she was anxiously waiting to receive his report on the condition of the invalid.

What he craved was a quiet place in which to formulate his thoughts. But never had the ship seemed so crowded. Stewards were setting the tables for luncheon in the dining-saloon. In the usually deserted music-room the rehearsal for an impending concert was in progress. Noisy groups, busy with bull-board and deck-quoits, usurped most of the deck-space. It appeared to Dennis as though the feeling of horror he experienced must be clearly branded on his features, but all were engrossed with their own pursuits, and his perturbation passed unnoticed, except by an indistinctive man who sat at a little table playing one of the seemingly interminable games of patience that occupied most of his leisure every day during the voyage. When Dennis strode past him, looking as though he had seen a ghost, the solitary player, leaving his game uncompleted, quietly gathered up his cards, and having put them carefully into their case, folded up his table and went below.

Descending to his cabin, which he confidently expected would be untenanted at that hour, Dennis was annoyed to find fate still against him. Before the mirror Mr Million was trying the rival effects of half-a-dozen new neckties. When the aged beau had made a tardy decision and left the cabin, Robson flung open the door

and entered in a vile temper. Dragging out his steamer-trunk from under his berth, he began routing among its contents to find money to pay his card losses to Mr Isaac Brown, who was an exigent creditor. It seemed to Dennis as though there was not a corner in that floating world where he could be alone.

When Robson had gone, and at last he was free to think, Dennis found that the capacity for consecutive thought had temporarily abandoned him. His usually clear mind was a medley of broken ideas. He felt dazed, inclined to argue that the situation was impossible.

Then, as his brain gradually began to steady itself, he became amazed at his own blindness in not having earlier discovered the identity of Nora's father. After having been warned that Quigley was on board the *Taurana*, travelling under the assumed name of Brown, how he had failed to recognise the informer at once was a puzzle to him now.

The only possible explanation was that his boyish recollection of Quigley as a big, red-headed man had confused his more mature vision. He had forgotten that the man who had towered in height and breadth over a boy of ten might look small and thin to a stalwart man of twenty-seven. He had failed to remember that in the passing of seventeen years Quigley's auburn hair might have become thin and white, and his ugly tusks have given place to teeth that were white and even. The Nat Quigley he had known had a wife and a baby. He had never considered the possibility of the wife having died, and of that infant daughter having grown up into Nora.

And there it was that his soul revolted most bitterly against destiny. But for the existence of Nora, with the ingrained memory of his father's ignominious death, and of his mother's long-drawn-out agony, to goad him on, he might have stooped to rid the world of a Quigley. But for Nora. . . . How could he kill the father that he knew she loved? The contemptible informer had evidently been an affectionate parent to her. To murder Quigley now in cold blood, as he had set sail to do, might purge the universe of the meanest scoundrel, but it would leave Nora defenceless and alone, in a strange land where she had not a single friend. How could he meet Nora again without revealing the sudden difference in his attitude towards her? Dennis wondered. Only a few hours earlier, full of his affection for her, and assured that the absence of Quigley had rendered his task void, he had determined that Nora, and none other, should become his wife. That blissful dream had been abruptly dissolved. Existence had once again become a state haunted with dread certainties.

The sound of a gong called to luncheon, and Dennis mechanically obeyed its summons. At the door of the dining-saloon Nora was waiting to intercept him. Her pretty colour had faded; her eyes were wide with dismay.

Drawing him aside, she spoke in a low voice. 'It's troublin' you again that I am,' she said apologetically, 'but it's my father. . . . He says will you speak to him?'

'What's he wantin'?' Despite himself, Dennis spoke roughly. Quigley was the last person he desired to encounter at that moment.

'Ah, the dear only knows!' she sighed. 'He's come over that queer again.' Then, coming closer to breathe the thought that had been torturing her, she whispered, 'You don't think it's his mind that's goin', do you—that his senses is leavin' him? He keeps imaginin' things—an' there's nothing! Och, then, it's jist heart-breakin' to see him!'

'He'd best be up on deck,' Dennis counselled, remembering the whisky-tainted atmosphere of the small cabin. 'It's the clean air would do him good.'

'An' it's the true word you've spoken, an' never a lie came near it,' Nora said gratefully; 'an' it's yourself's the one to persuade him, if any mortal can.'

'Well, I'll see if I can get him to come up for a bit,' Dennis promised unwillingly. 'I'll be after askin' him now.'

When he had forced himself to re-enter Quigley's cabin, Dennis was sensible that a lamentable change had taken place in the occupant during the short time that had elapsed since his former visit. Then Quigley had been apprehensive and vaguely alarmed. Now he was in a state of abject terror. His face was ashen; his upper lip trembled irrepressibly. The Bible lay neglected. He had ceased to plume himself upon the similarity of his situation to that of the persecuted Psalmist.

'Put the catch in the door, an' come close,' he gasped in a scarce audible voice. 'Are ye sure it's shut?' He was clutching at Dennis with hands that shook. 'I told ye I had enemies, but I didn't tell ye the whole. They threatened to murder me, but I thought I had jinked them. I never guessed they could have done it; but they've got me trapped here.' Leaning forward, he hissed into Kavanagh's ear, 'There's a man aboard come special to kill me!'

Dennis started back. 'What makes ye think that?' he asked jerkily, finding it incumbent on himself to say something, and scarcely recognising his own voice. Being deeply engrossed by his own affairs, Quigley failed to notice any change in the demeanour of his visitor.

'I guessed they'd try it on me. I knew they'd never be willin' to let me slip; but I thought I'd been too clever for them. . . . Till this very day, when I saw him.'

'Ye saw him!' Dennis was puzzled. 'Who did ye see?'

'The man that's to kill me. Isn't it that same I'm tellin' ye? Ye hadn't been more than ten minutes gone out of here, an' I was lyin' quiet-like, when the tail of my eye caught the

door openin' a crack—I 'd forgotten to bolt it—an' the evil face of him looked in.'

'What did he say?'

'Not wan word came out of the sneerin' mouth of him, but there was bloody murder in his eye.'

Convinced that the pitiful wretch before him was the victim of his own bad conscience, Dennis tried to make light of his fears. 'It would jist be the steward come to see if he could clean the cabin.'

'Devil a steward about him! I knew him. It was yon man that takes up with nobody, an' jist sits playin' himself with them bits of cards. I know what he 's after. He 's jist watchin' his opportunity, an' when he gets me off my guard he 'll kill me.'

'An' what makes ye think it 's that man?' Dennis asked, knowing all too well the real man who had been detailed to commit the crime. 'Did ye know him afore?'

''Deed, then, an' I did not.'

'Then what for would ye be thinkin' ill of him?'

Hereupon the old man fell into a frenzy of terror, giving no reason for his conviction, but imploring Dennis to save him, and insisting that, could he only get safe to land, he would escape the dangers that threatened him on ship-board. And Dennis found himself soothing him, telling him that his fears were groundless, and assuring him that, so long as he was there to protect him, neither that man nor any other would do him any harm.

Having succeeded in partly convincing Quigley that he was the victim of imagination, and having induced him to swallow a sleeping-draught that he fetched from the doctor, Dennis went on deck.

Luncheon was over, and the people were beginning their afternoon amusements. The patience-player had already arranged the cards for one of the interminable games that occupied so much of his time.

As Dennis passed his table the man raised his head and looked up at him. The glance was but a momentary one, but as their eyes met a thought flashed to Dennis that drove the blood from his heart. This, then, was the agent appointed by the small, gray man to see that he, Dennis, fulfilled his mission. If he failed, by some means or other, to compass the death of Quigley before the *Taurana* reached Auckland, this man would kill him, Dennis.

So that was his tracker. It required no special gift of prescience to convince Dennis that if he failed to execute his task and let Quigley escape, there was no escape for himself. 'And he 'd do it proper, too,' Dennis told himself. 'He 's not the one to bungle the job.' Something about the watchful quiescence of this outwardly indistinctive being made Dennis think of the unobtrusive, yet unremitting, vigilance with which a spider lies in wait for his prey. This man's part of the bargain would be carried out unflinchingly. He looked as though his work would be neatly and methodically done, without leaving any trace likely to bring guilt home to the agent.

As Dennis pondered over Quigley's story, light gradually dawned upon him. He saw that this man, whose business it was to keep them both under observation, had probably known when he was closeted with Quigley in his cabin, and that, noting Dennis's agitated demeanour when he reappeared on deck, he might have concluded that Dennis had killed Quigley, and have peeped into the cabin to see if the deed had been accomplished. It was probably the patience-player, too, who had pinned the note on his pillow—the note warning him that Quigley was travelling under the name of Brown.

Urged thereto by a species of mental desperation, Dennis decided that no power on earth would induce him to kill Nora's blackguard father. A certain kind of heroic recklessness rendered him indifferent to the shadow that menaced his own life. But with the knowledge of that ghastly overhanging fate he found it impossible to resume his former happy light-hearted relations with Nora.

'I should take shame to myself for the way I 'm treatin' her, and so I should,' he thought one night, after he had seen the blue eyes fill with tears at what she believed his coldness. 'But it 's not for me to be makin' up to her, an' maybe leavin' her a widow before ever she 's been a wife.' So, at the cost of real self-denial, he resolutely kept love out of their conversation; and Nora, realising the change in his attitude towards her, and fearing it was owing to some shortcoming of her own, was almost broken-hearted.

(Continued on page 741.)

HUMOURS OF THE CONSULAR SERVICE.

By a Retired Consul.

CONSULS are, as a rule, a much-maligned class, and it is indeed to their credit that, except in isolated cases, they manage to keep on good terms with their nationals in the various ports or districts to which their Government consigns them. It is but seldom that a Consular officer vacates a post except with regret on both sides. Consuls are, too, a misunderstood set. The actual regulations confine Consuls' duties to protection in general of British

commercial interests and to aiding their nationals in a general manner, and they are told that even a letter of introduction from the Foreign Office in no wise entails the entertainment of the individual so armed. Yet, whilst many commercial houses at home regard a Consul as a universal information bureau and a species of unpaid agent supplied by a beneficent and all-wise Government, the British travelling public seem to look on him and his Consulate as a *poste restante*, lost-luggage office, money-changer's bureau, ticket-office and tourists' agency, and pose travel problems sometimes which would stagger even a Cook or a Gaze employee. His private abode is to them a kind of free hotel and restaurant—open day and night.

In fact, there is nothing under the sun which the unfortunate Consul is not called on at times to do. I have on divers occasions and at various ports been asked to advance money in large sums on no security whatever to undoubted wastrels—'I'll get my people to send it you when I get home;' to find and engage a suitable nurse in England, and bring her out at Government expense; to trace relatives of obscure natives of the land in which my post happened to be who had emigrated to America or Canada, with no more information than the missing one's name; to sell cheques on various countries and towns; to bear false witness against all kinds of persons' neighbours. On one occasion I was asked to christen a baby. 'You marries us and you buries us; then I don't see why you shouldn't christen us!' exclaimed the applicant, the wife of a workman, thereby raising a moot point for the consideration of the Foreign Office.

Once a stout lady, in the regulation green tourist veil and other garments, having settled herself in an arm-chair in my Consulate (at most she required a *visa* to her passport), brought out a little book, asked me to note in the margin the correct pronunciation of words and sentences in the language of the country, and departed, a tower of indignation, on my hinting that neither my time nor my inclination allowed of my doing this. 'I shall let the Foreign Office know, and get you removed,' was her parting shot.

Foreigners in general, too, pay British Consulates the undesirable compliment of coming to them where no Consul of their own country is resident—and often where one is. Americans, especially, are prone to this habit, which after all, in their case, is not to be wondered at. The writer one morning, when going early into his office to fetch a book left there, encountered a stout individual in a peculiarly checked suit, his nigh scarlet face pierced by a long cigar, and was assailed with (no 'Good-morning'), 'Say, I am John Y. Short of Minnesota. Have yew any mail for me?' On my denying the imputation, he continued: 'Well, then, I waant yew to tell me how many of these francs go to an American dollar.' He seemed utterly surprised when I explained that I was nothing of a banking expert, and that my duties were confined to the needs of my fellow-subjects only. Equally without any greeting, he left, but flipped a cigar on to my table as he turned to the door—I presume as a form of remuneration for services rendered. I gave it, I remember, to my office-boy, who stayed at home two days recovering from its dire effects!

The marriage question is always a great grievance with girls resident abroad, whom it is extremely difficult to make understand that, whilst a male British subject can be married at a British Consulate to a female of foreign nationality, a woman of British nationality cannot similarly espouse a foreigner. 'But I want to be married so as to remain a British subject,' is the usual cry. One English girl, about to be united in wedlock with a native of another country, asked me, when going through the formality of the civil marriage at the local tribunal, whether the problematical children would be British subjects if the two names, Snooks-Lacroix, for example, were joined with a hyphen in registering! She went sorrowful away when she found that she would in no wise remain English. In a short time she returned to know what would happen if her husband settled in England and became naturalised, and appeared still more mystified when I told her she would naturally become once again a British subject.

The troubles of English nurses and governesses in families abroad are the cause of much premature baldness among Consuls, who, although the regulations tell one in such cases only to recommend a good local lawyer, must for pity's sake often act as mediator or arbiter between employers and their nationals. The old saying of six of one and half-a-dozen of the other gives the odds in most cases. Some of the complaints with which such people come are most ridiculous. A very usual one is not getting strong tea at breakfast, to say nothing of eggs and bacon, &c., in countries where coffee is the only morning tipple.

The brother of a would-be governess in a family at Galatz, Roumania, wrote to a colleague of mine there (it must have been from Yorkshire), asking information as to the family's respectability, and whether there was a good golf club, and would his sister get some decent hunting!

Most awkward are the questions sometimes put to one. A governess, newly arrived, came to me complaining of having to bath a boy of nine. She herself must have been fifty-five, if a day! I was helped from a most embarrassing situation by the military attaché, who had called in for a chat, and who proposed that the lady should wear blue glasses! She fled immediately, and I never saw her again.

It was the native servant of a colleague at a Balkanic port who, meaning, doubtless, to pay a delicate compliment to her master, got the Consular flag off the post and went to a cheap mask-ball draped in it—whether as Britannia

or as symbolical of the Board of Trade, one was never able to ascertain, as she left the Consul's service next day.

Ports, with their attendant tramp skippers—I beg pardon, master mariners—and sailor-men are responsible for much matter of a humorous nature. I well remember the look of wonder on the face of a ship captain at my laughing at his statement: 'Well, Mr Consul, it's that steward of mine. He asked leave to go ashore for half-an-hour a Toosday afternoon to stretch his legs a bit, an' now it's Friday!' A visit to the port lock-up quickly discovered the gentleman in question, with a black eye, and clothed, except for remorse, in only a greyback and breeches, he having drunk the rest.

We are (very unjustly, I consider) looked on as a nation relatively poor in linguistic knowledge. This no doubt accounts for the following. Going home late one night, from a mild game of bridge, I came on three deck-hands in a very parlous state in the hands of the local 'bobbies.' I inquired the reason, and was told that they, the sailors, after drinking deeply at a wine-shop, had tried, in mercantile parlance, to 'rush it'—that is, to bolt without paying. The attempt had failed miserably, with the result as I found it. In a tactful talk with the police and the keeper of the house of entertainment I arranged for their liberation on the bill, and the damage to waiters' eyes and noses, being made good. The two less drunk of the sailor-men agreed; but the third, who put the tearing of his sanguinary cap far above all else, could not be brought by me to see the extreme fairness of the arrangement.

'Now, take the advice of a Britisher. Pay up your share and get aboard, otherwise it will probably end in your being locked up and getting a larruping with a ramrod!'

'You ain't no countryman of mine!'

'Yes, I am. What makes you think I am not?'

'If you're English, 'ow the h— could you talk to them —— policemen?'

One incident always shines bright amongst all others in connection with ports and sea-lawyers. It was a Sunday afternoon, and my man called me from a favourite pipe and a thrilling Tauchnitz to the yard of the house, where, as lightly clothed as the steward above mentioned, except for shabby crimson slippers, stood an individual whom I at once decided must be a ship's fireman. 'Now then, what do you want?' I snapped angrily, annoyed at this interruption out of Consular hours.

'Are you the British Council?' (We are all 'Councils' with sailor-men.)

'Yes, I am.'

'Well then, I demand financial 'elp to enable me to get to my ship.'

I could easily see the masts of the shipping from my yard. 'Now, you get quickly out of this, otherwise you'll get yourself into trouble.'

'Ah, you're the sort o' —— the likes of us pays income-tax to keep in soft jobs, are yer?'

'Ease it, Bill!' came with vapours of spirits, wafted on the air.

I then perceived another at the gate, clearly a disciple of the first, but a waverer. 'If you're not out of this at once, I shall have you put out.'

A string of quite unprintable language, interlarded with occasional 'Ease it, Bills!' from the Greek chorus at the gate.

I turned to my man and told him in the vernacular to go out the back-way and fetch a policeman.

'You ought to be re-moved—yes, re-moved. That's what ought to be done with the likes o' you. Council!'—witheringly. 'I'd make a better Council than you out o' wild tiger.' (I believe this to be the fo'c'stle term for salt pork.)

'Ease it!' here suddenly disappeared, his place being taken by a native policeman, who, good lad, taking in the situation at a glance, walked quietly and quite unobserved up behind the man of fire and gave him a 'killing rabbits' on the back of the neck. Before he could recover from the effects of the unexpected rear attack, the fiery one was being hauled down the yard and into the street. But he managed to shout out as he clung a moment to the gate-post, 'All right, cocky, you're top dog now; but I knows a place in Shields where I can get 'and-bills printed at threppence a 'underd. I'll 'ave a thousand done about you, and leave some in every blighted port I comes to.'

The best person at dealing with such characters was a certain Consul, formerly in the army, now of the great majority. He was most benevolent-looking, and was known to some of his friends as the 'Jolly Bishop,' which sobriquet described him exactly. He would lead complainers on with 'Indeed, my man?' 'Dear, dear!' &c., until the sea-lawyer, carried away, would forget himself and drop into his usual style of conversation, which, of course, included swear-words. At the first of these the 'Bishop' would jump up, seize a mighty malacca stick, and with a 'How dare you use such language in Her Majesty's Consulate?' attack the offender, hip and thigh; whereupon the visitor would meekly transport himself back to his ship.

Once, when a man had deserted his ship and came to me complaining that he was starving, I told him that, in any case, he was smelling strongly of spirits.

'Well, Mr Council, you see, people will pay for drink for any one, but will not pay for food'—which is unfortunately true in most cases, and says little for our vaunted civilisation.

I spoke above of the various functions which the public think a Consul should discharge. A jockey, who was to be married at the Consulate, was asked by the Consul at what time he would like the formality to take place. 'Oh, it's as you like, sir; just before the breakfast.'

'Well, what time is that?'

'Just what time suits you, sir.'

'But it has nothing to do with me,' replied the Consul, much afraid of being invited to the festivity.

'How not, sir? I thought you supplied all that.'

I have called this paper 'Humours of the Consular Service.' One must not think from this that it is in general a sprightly profession. There is much hard work attached to it, and a great deal of extremely monotonous routine, apart from the loneliness of very many ports, and these are really but poorly requited by the salary.

CONSCIOUSNESS.

By Bart Kennedy.

IT is as a small light in a vast, dark place.

The mind is a world of strangeness and dreams and inscrutable shadows and fathomless abysses. It holds within it all things. It holds all our memories, and the memories of those who held the small light of consciousness before us, and the memories of those who held it back even to the time, profoundly far away, that we call the Beginning. And as the mind holds what went before, so must it hold what will come after, even as the future of the world is held in the world of this very actual time that we call the present. Ay, the future of man must be held within this magical domain, the mind, that man inherits from man.

But the small light of consciousness has but the power to illume feebly the past and the present. It cannot show us the future that is contained within the vast mind-domain. Wonder not at this, for it is so. It is there. It will surely emerge into the radius of the light of consciousness. Ay, it is there, but we cannot make it out with this feeble light. We can make out only the things we have touched—the past and the present. Indeed, to be truly exact, we can make out only the present. For the past we see but in little part and in a confused way. And the past that is from us a profound reach of time we see not at all, even though it is exactly registered within this magical mind-domain that we have inherited. We know it is there at times—when we stumble against it.

Consciousness is but a feeble thing.

Even is it as a pilot that understands not the ship he is steering, nor the direction in which he is going. And at times the helm refuses to obey him. Monstrous rocks suddenly rise up before him. He is going through a calm, fair sea, and all at once his ship is in the grasp of a mighty whirlpool. He, the pilot, Consciousness, is confronted with all manner of obstacles that it is impossible for him either to foresee or to deal with when he sees them. He is sailing over an ocean that is uncharted. He has neither map nor compass. He may take no observations that he may absolutely depend upon. There is no firmament with fixed stars by which he may plan out a direction.

He sails on in the midst of darkness and shadows and change. At times there appear bright lights, but they suddenly go.

He is forced to guide the ship as best he may through vagueness.

And still, though Consciousness be but a feeble guide, it is the only guide that there is in this mind-domain of shadows and abysses and inconceivable distances. It has evolved from out this mysterious and wondrous domain. Though its sceptre be composed of shadow, and though a breath may disenthrone it or thrust it aside, it is still king.

When it lays down its sceptre there come the fantasies of dreams. It is still Consciousness, but a fugitive Consciousness that has lost all power of governing. It wanders, irresponsibly, through its dominions. It beholds unbelievable things. And it possesses a prescience that it possesses not when it grasps the sceptre of reigning. It understands the unknowable. It surmounts the impossible. Laid bare before it are the secrets that lie in the inconceivable distances. It discovers in its domain heavens that it knows not of when it reigns. It discovers hells strange and terrible. It passes at will through solid substances. It performs miracles. Though it governs not, though it be but as a slave, it is possessed of a power unimaginable. It is the master of all the elements, and the solver of all the mysteries. It pierces down into ocean depths; it soars through the upper air. Nay, it goes out to the stars. There is nothing to hold it, nothing to stay it. It explores inconceivably strange worlds. Past, present, and future are to it but words. It possesses the secret of binding them together. It raises the dead into vivid life. It casts the living into the tomb. It commits terrible crimes. It performs noble and virtuous acts. Its power is infinite——

When it lays down its sceptre in dreams.

These realms that Consciousness may not explore when it grasps the sceptre of reigning!

Whence did they come? What are the secrets that lie within their unreachable recesses? Consciousness knows that these realms exist, for in dreams it passes into them. It explores their lone and strange and silent places.

Within them are held mystical secrets that lie behind veils that are enclosed within veils.

Herein is held the secret of the unition of the life of the past and the present and the future. Herein is held the secret of the power that holds in place the stars. Herein is held the secret of what lies before and behind the fire of life. All, all is contained within this glorious and infinite domain—the mind: the mind that existed before that puny measure-concept which man calls Time, and that will exist when man no longer needs to use it. Let it not be forgotten. The mind in its vastness is God. It is of all the worlds and all the stars.

Truly is Consciousness but a feeble and shadowy king.

Save in dreams.

Save in glorious, splendid, magical, limitless dreams.

Then indeed is Consciousness, though but as a fugitive, though but as a slave, a king of a power and a might transcendent. His weak and shadowy sceptre is transformed into a wand crowned with a jewel of dazzling, piercing light. The darkness of the realms is gone. The light from the wand of dreams illumes the manifolded tortuousness of secret labyrinths. It shines into the faces of demons terrible and strange. It falls upon the celestial brows of angels. It illumes eternal depths. It reveals to Consciousness the secret and ultimate wisdom that it is not given it to behold in the waking darkness.

Wand of dreams!

You give to the disenthroned king a power that is of God. Though he rules not, you are to him as the sceptre of all-reigning. Though he sees not, you give to his eyes the vision that beholds all things, that pierces into all things.

The mind is woven from the woof of dreams. And the waking state, wherein Consciousness grasps his shadowy, insecure sceptre, is but as a dream, dark and dim, that is held within a dream of glorious light.

In this dim, waking dream Consciousness is but as a light in a vast, dark place. It reveals not what lies in the surrounding, resplendent light of the great dream that encloses it.

It is the guide; it is the pilot; it is the king. But its power, in the dim, waking dream, is feeble. It knows not where it is, nor whither it is going. No sure knowledge has it of its wide and vast domain. It understands not the powers and the mysteries that surround it.

Save in the vast dream that lies outside the dim dream in which it is king.

When it lays aside its sceptre, there is given to it the full vision of the might and the power and the glory and the wonder of God.

THE COMING OF THE CURLEWS.

By H. Mortimer Batten.

I.

SINCE the old man who kept his chickens on the mountain-side could remember, a pair of curlews had bred annually in the patch of sheltered swamp in the corner of Black Allotment. No one knew the wild-life of the mountain-side better than this old man. For years he had jotted down the arrival of the migrants, the date when he first saw trout heading up the tiny brooks, and so on; but this year he was a little worried. The curlews, his favourite birds, were a fortnight later than ever before.

For many days the river, that recognised highway of the migrants, had been apulse with life. The first redshanks had passed ten days ago; he had seen an oyster-catcher and golden plovers galore; while the lower slopes were already alive with the cheery 'Kee-wit' of the lapwings. But the curlews—where were they?

It was a matter of some importance, for to the old man spring-time was impossible till he heard the first call-note of these birds. To him it was the curlews that brought the spring, not the spring that brought the curlews. In truth, they were well on their way, and only the exceptional lowness of the river had prevented the arrival of spring a week ago. For the curlews, finding vast areas of desolate mud-flats exposed, were dallying on their way from the coast marsh-land. Usually they arrived in flocks; but this year, owing to the delay, the flocks away down the river were breaking up into packs, the packs into straggling groups, and finally the groups into pairs. And when at length the last smoky city was left behind, the little towns gave way to sleepy villages, and ultimately the blue Pennines hove in view, the couples quietly disappeared, as couples generally do, each pair heading for some remembered spot dearer to them than any other place on earth.

Thus one evening the old man, seated on his step, over his pipe, heard a sound of laughter high overhead—of wild, piercing laughter which seemed to bid the very hills to awaken. He jumped up with a start, and almost bit his lip. 'Mary!' he cried. 'Mary, the curlews is come!'

Then at last he hobbled up the hillside to inspect his chicken-coops in readiness for a prospective generation of roosters—a task he never attended to till his calendar, which was surely the most unreliable of all, told him that spring had really come.

But the old man was a little puzzled. True

that his favourite birds had arrived as usual to nest in Black Allotment; but one thing worried him, and he said to his friend, 'William, I ain't seen no flocks of curlews this year. Do you reckon the fighting at sea can have harmed them?'

The other old man grunted, but ventured no comment, so our hero went his leisurely way. Twenty minutes later, when he was putting down his parsley-seed, the other old man came and leant over the gate. 'George,' he said, 'I don't reckon it's the fighting, because I call to mind that in 1857—that's longer than you can remember, George—there weren't no flocks of curlews—just solitary birds like what you see this year.'

George grunted, and the other old man went back to his hoeing. Presently George straightened his back, relit his pipe, and hobbled after him. 'William,' he said, squashing a caterpillar on the wall-top, 'did you say 1857? That was the spring the bridge was swept away, weren't it?'

William agreed that it was. 'A terrible dry early spring,' he explained; 'then terrible wet all through April. The lambs'——

And thereafter the conversation wound its leisurely way through quite different channels.

II.

But the curlews had come—that was the main point; and now day and night they were astir, flying, alighting, calling, cackling, hovering like gigantic humming-birds, and wheeling in mid-heaven like mighty hawks awing. When they rested no man could say, for the little white-walled village far below fell asleep with their wild calls ringing in its ears, and awoke with the joyous morning to hear the same triumphant notes aloft.

Whether or not all this searching and discussion concerned a suitable nesting-place one cannot tell; but if it did, one fails to comprehend the grounds for argument, for in the end the curlews chose a grassy mound for their nest which was exactly like a thousand other grassy mounds dotting the whole swamp. It would seem, however, that some of these mounds were better from the curlews' point of view than others, for the hen-bird made a dozen different nests on different mounds ere her final choice was arrived at. She would scrape a hole in the ground, lie on it, sit in it, turn round a few times, then decide she didn't like it. All this time her husband looked on with uncomprehending admiration; then, grasping the idea at length, he made a nest on his own account, sat on it, sprawled over it, even went so far as to line it with grass. His wife, however, had now succeeded in that most difficult of feminine tasks—she had made up her mind, and so she stole the lining from her husband's nest to finish her own.

In due course three eggs were produced—large for the size of the bird, and of the same drab hue as the surrounding grass and ling. They were not really very beautiful to look upon, but their colour was truly serviceable, for none but a trained eye, which knew just what to look for, could have picked them out. To the curlews they were the most beautiful things in all the world.

If the birds had been restless before, they were more so now—or, rather, the male bird was, for while his wife covered her treasures he mounted guard not far away, flying from wall-top to wall-top, from boulder to boulder, or rising straight skywards on quivering wings to a point of observation, suddenly to drop like a stone to earth. Nothing escaped his unremitting watchfulness. When the shepherd-boy mounted the hill, whistling to his dog, the curlew would warn his mate by a melancholy 'Toy-e-toy-e;' then, if the boy or the dog drew nearer, his notes would rise in volume, and he himself would dash from point to point, flying, alighting, screaming, screaming, till at length his mate slipped from her nest to run stooping though the grass, suddenly to rise a-wing a hundred yards away and join him, clamouring in chorus.

Thus they advertised the locality of their nest, till one day the boy turned aside and searched the marsh from end to end. Twice he passed within a few feet of the eggs, but their colour saved them even from his keen eyes, till he conveniently decided, 'There ain't no nest at all.'

When, a day or two later, old George hobbled up to look for the nest, the alarm of the birds was not so marked. Him they saw daily when he came to feed his chickens, and evidently his slow and quiet movements were less disturbing than the movements of the shepherd-boy. Even when old George picked up the eggs and examined them, the curlews looked quietly on from the neighbouring wall-top with scarcely a murmur, and the old man went his way happy in the knowledge that all went well with the birds he loved.

III.

The curlews were curious birds, and one of their many curious ways lay in their solicitude for others. Normally in the wild each creature cares for itself, and leaves every one else to do the same; but the curlews could faithfully be described as the sentries of the hillside. One evening the fox, sneaking down from the heather-line, was walking straight for their nest, when the male bird swooped so low as almost to lash the freebooter with his wings. The fox leapt like a flash of fire, but too late to catch that hurtling cannon-ball from the blue—and the leap carried him out of the direct line of the nest. The female crouched motionless on

her eggs, and the fox did not locate her, for kind nature at this season takes all tell-tale scent from the brooding mothers of earth and air.

In the next field the old blue hare was quietly feeding. He did not see the fox creeping from tuft to tuft, till the wheeling curlew, finding his wild alarm-notes unheeded, swooped down and brushed the hare with his wings. Such a warning could not pass unobserved, and away went little Brown Lugs with ears acock, leaving reynard to glare maliciously at the interfering bird.

IV.

Old George had put some new perches in his hen-house, and that night he must needs take his lantern and hobble up to see if the fowls were using them. Unfortunately he forgot his hat, and the wind was so strong that the lantern flung long, dancing shadows everywhere. George was just about to open the hen-house door, when there was a wild scream overhead, and down came the male curlew, to dash itself at the bewildering light, then fall at the old man's feet.

'Oh, poor thing! Poor thing!' said George. He picked the bird up in his old shaky hands, but finding no hurt had befallen it, he launched it into the air again. Round and round the bird flew, screaming wildly, to dash into the lamp once more, hypnotised by the light, so that old George was compelled to extinguish the flame. He went back in the dark, and, unable to see his way, walked into the swamp and got his feet wet, reaching home tired and chilled.

Next day the old man was in bed, and the day after that the doctor shook his head gravely. George was a very old man, you see, and quite ready to go when the call came. At sundown he sat up and enjoyed his tea; then he fell asleep with his Mary at the bedside, holding his poor old hand, knotted and lined by a life of slow and honest toil.

At midnight a curlew, attracted by the candle in the room, flew twice round the house with its piercing, joyous call-note. Old George awoke. He smiled faintly. 'Listen, Mary—the curlews!' he said.

To him it was the voice of spring, the voice that had brought the spring of his boyhood, of his courting youth; that had brought the spring in the quiet days of his autumn.

'Yes,' said the old woman, 'your curlews, George!' And she too smiled.

An hour later the curlew again flew round the house, settled on the window-sill, looking in at the wonderful light, then tapped three times with its bill against the glass and flew away.

But old George did not hear. He had ceased to wonder why the curlews had not arrived in flocks that year, and his Mary thought nothing strange about the happening. She, too, was very old, you see, and she knew how George had always loved the birds.

When, a day or two later, they carried old George out, to rest him in that quiet little corner where the sweet syringa grows, his wife noticed that the curlews were calling louder than ever in Black Allotment. She thought it was because of her George, for she did not know that at that very hour three little fluffy chicks had burst from their sombre shells and crept into the world of Life.

THE WALTZ OF THE LEAVES.

When Autumn has thrown silver mist o'er the valley,
And hedgerows with berries of crimson are dyed,
Then the leaves loose their hold of the twigs and the branches,
And out on the wind's mighty pinions they ride
O'er the cornfields now stripped of their sheaves;
O the joy and the madness,
The whirling wind-gladness—
The waltz of the first yellow leaves!

The copses that stand by the onrushing river
Are blind with the glory that circles them round,
As faster and faster the leaves are a-twisting,
And gold is the carpet that covers the ground.
The swallows from under their eaves
Have flown South, but to heaven
New glory is given—
The waltz of the bright yellow leaves.

The light of Autumn fades from off the hillside, and the days
In heavy fog and purple cloud-wreaths die,
While beneath the naked trees that lift gaunt branches to the winds
The drifted leaves in sodden masses lie.

But when snow lightly touches the meadows of Flanders,
And icicles hang from the banks of the streams,
Then, like ghosts of the past, on the grave-scattered hillsides
Whirl leaves madly dancing the dance of their dreams.
And the cold sky their glory receives
O'er the sleeping, still meadows
In lights or blue shadows—
The waltz of the dead yellow leaves.

LORNA KEELING COLLARD.

*** TO CONTRIBUTORS.

1*st*. All communications should be addressed to 'The Editor, *Chambers's Journal*, 339 High Street, Edinburgh.'

2*nd*. For its return in case of ineligibility, postage-stamps should accompany every manuscript.

3*rd*. To secure their safe return if ineligible, ALL MANUSCRIPTS, whether accompanied by a letter of advice or otherwise, *should have the writer's Name and Address written upon them* IN FULL.

4*th*. Poetical contributions should invariably be accompanied by a stamped and directed envelope.

THE HEART OF THINGS.

By Henry Leach.

London, *Yesterday.*

AMID a condition of things in which hope seems at times to halt before confusion and perversity, only the aeroplane unfalteringly progresses higher to its ideals. It is like a star in the gloom of the aftermath of civilisation's greatest tragedy. Each day it gathers a new achievement. The wonders of progress cannot be ranged in comparative order; but if they could, would not man-made flight be the first of them? There is a mark of its superiority in this, that even now when it is so little novel, when any one for a pound or two may experience a few minutes of the sensation, the newly initiated are asked by their friends in sincere curiosity for an exposition of their emotions. How did this adventure strike the mind? What were the flier's feelings like? they eagerly wish to know—for they cannot guess. It is the new emotion that most persons have not experienced. Descriptions vary with the man, of necessity; and it is an advantage. Often they fail in reality and intensity, because emotions as they have been felt are considered and reflected upon in some analytical fashion a while after the experience, and there is nothing so fleeting and so difficult to realise at a later time as an abnormal and intense action of the mental and nervous system. The strong emotional periods are as bubbles rising from the seething mass of life; they burst and vanish. In the intense experience of half-an-hour there might be a hundred quick and definite thoughts, each of but a few seconds' duration, and on the following day perhaps not six of them could be recalled, though it was with these lightning fancies that the drama was composed. Thoughts in their vast volume are near infinity, but most of them slip away uncaught.

* * *

To myself, engaged upon a first adventure in extended flight, it seemed that a matter for most marvelling was presented and produced effect ere the higher air was taken. It lay in this, that such as I should make a flight of good length, some fifty miles or so, by one of the most powerful planes, when for the first time 'twas given to the air. So firm, so sure, are now the knowledge and the confidence of these flying folk that, having prepared a plane, they do not speculate upon its capacity for flight; they know it entirely and without a test. We for ourselves know that they know it, have confidence in their confidence, to the point that we stake our most precious lives upon it. Such is the truth without embellishment. The man is master to the point that he knows that in this untried thing he shall be lifted above the clouds, dart over a wide country, and at any place of choosing alight within a yard of the appointed spot. Enjoying the distinction and the security of having for host and pilot on this private and special mission one, Captain Sir John Alcock, who fixed himself in history by first flying the Atlantic Ocean, I did this thing. Our flight was from near London to Southampton by a 750-horse-power Vickers-Vimy aeroplane upon a sunny summer's morning. It seemed an odd and remarkable affair. One was at work in an upper room in London. The bell of the telephone rang, and Captain Alcock (with whom the matter had been discussed), speaking, desired to know if I would start with him within the hour, for there was a new machine to be plighted to the air that morning. 'Do not trouble about your clothes,' said he; 'just a cap, and a raincoat if you please. It is warm enough when flying.' One mistaken fancy gone! It was then half-past nine. . . . At four o'clock in the afternoon, again in the upper room, I resumed the morning's interrupted task. We, plane and writer both, had made our maiden flight. Sir John Alcock, satisfied, young enough to delight in everything, had added fifty miles to the tens of thousands he had darted through the sky. The plane had hardly quivered or trembled. From its atmosphere, its home, its human makers, it seemed to have inherited, as one might say, an instinct which did not fail. It knew the air; it leapt joyously to it at the first offer. For myself, at four in the afternoon I was already wondering upon my feelings in flight, and turned curiously to the many notes I had written in the air. It was not a callous thing to write at such a stupendous time, for let it be said at once that the essence of the experience was tranquillity—wonderment indeed with fine emotion, and yet tranquillity. One did not feel the same; there was a sense of a spiritual and corporeal change, of deep experience; and yet it was as if one had partaken of the hasheesh of

 [*All Rights Reserved.*]

Monte Cristo, and gone half-dreaming through these south of England skies. We were at peace in a strange freedom in some unworldly way, and above all things tranquil. Never save in the last moments of consciousness before sleep had one experienced such a soft placidity. It was the dominating sensation · it existed, but cannot be explained.

* * *

Of us three who walked across the Brooklands flats from the Vickers headquarters to our bird's nest, where lay helpless many others not yet so fully fledged, one was Mr R. K. Pierson, chief designer of them all and the many that had gone before. Thus he was the human parent of this most prodigious family. He related some points and episodes in the romance of this affair that were new to me, points which only he fully knew and understood. How did he know that F 8610, waiting for us over there, charged with the safety of our most precious persons, would really fly—fly straight for fifty miles—and would not need to descend quickly for any reason, and would not overturn? He gave his reasons. Our F 8610 was an exact copy, to the minutest detail, of the machine by which Captain Alcock had crossed the Atlantic. There was no difference whatever in engines or in anything. They were the same. The War Office, it appeared, had ordered many of them, and this was one, making her trial and delivery at the same time. The queen-mother, the real Atlantic machine, as we now perceived, was in the spacious nest, or aerodrome, amid the young ones. A vast company of humans—girls of strong frame and delicate touch among them—were at work upon the wings of this expectant brood. And all the parts of every plane, copied from or modelled on the plans by which the queen-mother was reared up to her proud perfection, were cut and shaped, and fitted accordingly, to within one two-thousandth of an inch, measured by micrometer. You cannot imagine a two-thousandth of an inch. Regard the scale. There are the inches and the halves and the quarters, the eighths and the sixteenths. Then the measure quits this divisional theme. Yet one can imagine the thirty-seconds, and with an effort, observing a hair and fancying the splitting of it, even the sixty-fourths; but after that, beyond a hundredth, one's grasp of realities helped by hard imagination is unloosened, and the effort ceases, with the single thousandth still so far away. But Designer Pierson does some of his chief business with his pretty two-thousandths; they are of more consequence in his system than the forty-two feet six of height to which rise the queen-mother and her latest child to leave her, F 8610, or the glorious sixty-eight feet of wing-span with which our new clipper will sail the air. This two-thousandth limit of margin for error in metal parts and many others is always the thing that matters most. It is not merely a nominal standard; it is insisted upon. Testers and inspectors, more and more of them, and Mr Designer Pierson see that it is obeyed. Thus they know that F 8610 can and will do, without demur or falter, all that her famous parent did—and Southampton is not so far away as Newfoundland. This unthinkable exactness, exerted by micrometer, the acuteness of such as this Pierson, engineers of a new era and new school, who to their native genius and their engineering skill add an artist's inspiration, who seek, indeed, to realise almost poetic fancies of their own—such is the secret of the F 8610 and how she flew with us before she knew. She waited at the open doors, her wide white wings in the biplane form, ready for the start. One regarded her with a vast respect, for never more sincerely could her responsibilities be appreciated. At each side of her beak was a polished propeller, ten feet six of span per blade, and back of each a Rolls-Royce engine of 375 horse-power which spun it round at the rate of twelve hundred revolutions in each minute—twenty per second. That also is difficult to imagine—but later we heard the noise of it! Whenever she may have occasion to fly along in the fighting way she will carry twelve bombs weighing each two hundred and fifty pounds, and three Lewis guns also may she bear. Then, at full load, she would weigh twelve thousand pounds; this morning, awaiting us, she was nine thousand. Heavier than air indeed! Again our simple understanding, trained upon mean limitations of earth, slips and fails. Let loose a penny, but a fraction of an ounce; see how unhesitatingly, heavily, it falls, obedient to old father Gravity. And here are nine thousand pounds—and I!—to ascend some thousand feet, a mile or so, and fly along at a hundred and twenty miles the hour, and do as one may please—fling somersaults if in the mood. Many men have flown by planes, but not all have had such planes to fly by. So may there be reason for some reproduction of our personal log during this first flight, when ideas were fresh-born and the emotions effervesced.

* * *

'Well, in you go!' There sounded something finally committal in these words. Time for compliments and praise had passed; the practical and serious business of flight was now beginning. Here was a brink, with a chasm upwards to which we were to swoop. We were to leave the solid surface as never before; space was to be experienced. There was that one tremulous moment—and in a subject by no means devoid of nerves it was the last ever felt of the most passing shadow of apprehension whatsoever. This indeed I regard as one of the most peculiar of the psychological results. Despite Pierson, despite Alcock, despite the proud two-thousandths of this perfect craft, I do not understand why I was not afraid. That is to me one of the special points of this experience. I had thought I should have some

touches on the nerve; yet it was tranquillity and soft confidence all the way, up for the first thousand feet, higher for the second, leaping lightly to the third, higher and higher, and then swift darting amid the clouds towards the sea, with England in her summer looking lovely down below. Earth, save in a dreamy contemplation, passed away, and one floated serenely in a new mid-heaven when the Isle of Wight, in a silver setting, came into view on the port side down below, and one regretted beginning to descend so soon. But let us take the key-words of our log, and expand to a full meaning the thoughts that were taken and loosed again in air

* * *

Lumbered into the aft gun-pit, as told to do. Sir John Alcock took his pilot's place in front, and adjusted his airman's cap. One quarrels now with the injunction that nothing such was needed by a civilian in the aft gun-pit, even though he was some way behind and his back was to the wind. This gun-pit is a sort of well, a hole in what they call the fuselage or belly part of the machine. Seated on a small shelf inside, half one's body projects from the top of this well, the aperture being a ring some two feet in diameter. In verity this is a chief gunner's seat. One sprawls the arms in a way of ease along the fuselage of polished wood and over the sides, and looks along the top of the thing towards its fancy bi-planed tail with the strings up to it that the pilot pulls. The real wings are above one and behind. So far as these things go, the gun-pit berth seemed comfortable enough. The inside of the fuselage was open to us; it was like the bottom of a skiff with the top roofed in, with the rather important difference that part of the floor on which one might crawl *à plat ventre* was made of transparent glass, and that where the glass ended there was nothing at all, just a big hole in the bottom of the aeroplane. Through this in war a gun would be projected; the glass is for the gunner to observe what lies—or flies—beneath him, and know when the moment for his shooting comes. . . . 12.19, and they were loosening something; it was now too late for any change of mind! But at first the craft just 'taxied' for a spell, limped along on her little wheels to a place where she might really stretch her wings. There was a halt for a few seconds. Then the pilot moved a lever, or one supposed he did. Who-r-oo-ooo-oooo....! *Crescendo, con furore!*

* * *

Tricks of language would be flimsy stuff for description of a roaring moment when seven hundred and fifty aerial horses sprang to their whirlwind game. The sudden thunder of their flying feet was merciful in its deafening intensity, for a moment later the senses were unconscious of it—with strange consequences that shall be noted. But the fancy one had, clear and true and well-defined, from this tremendous whoop, a wild roar of exultation, was of this mighty thing alive at last, and bounding in a furious joy to its own element. The frenzy and the freedom, the delirious leap of joy—real enough were those suggestions. And true enough it also seemed that this thing that Designer Pierson had fashioned had now, like a bird Galatea, come to life—and that was perhaps the reason why a new tranquillity was laid upon the landsman in the gun-pit, and he thought no more of machinery and its various faults. The rest was a placid happiness. First thoughts? There were hardly any. I saw the ground was going; well, let it go! Nothing mattered. Still a minute or so later one was looking round for the aerodrome and could not find it. Goodness! So far behind, so far below, two miles back and down a slope of forty degrees or so. It was then I remembered our capacity of a couple of miles a minute, and knew I had never moved so fast before. But there was little sensation of either rising or advancing or of being in air at all—only a perfect steadiness and security. I tested the steadiness by the notes I began to make on paper. You know the tremblings in even the smoothest express trains, and how they jog the writing; here I could have undergone a writing-test upon which my all was staked. One could have threaded the finest needles or balanced on a finger a glass full to the final drop of liquid. This was strange with those nearly thousand horses flying, but there were stranger things ahead. Anyhow, one perceived that this air was a soft and kindly thing, and good for roads. I was told that at first we rose on an air gradient of about one in fifty, steepened later to one in thirty. . . . H-h-haaa! Just a slight mental tremor. We were up perhaps a thousand feet, or it may have been more, when She (meaning F 8610; but if it suits the War Department, that style is too wasteful of memory for me), who had been gliding on the evenest keel, suddenly seemed to dip in three long, quick steps, tilting a trifle sideways and making the least suspicion of a shake—no, it was not a shake either, but a feeling of something. Then She glided on. (The Log: 'Sudden—O—drop!') It transpired that we had struck a choppy patch of air, which had bumped Her; but it was really nothing. Captain said later that the airway had been somewhat rough that day; there was a stiffish thirty-miler spouting from the north-west. All was smoothness again, and the man in the gun-pit settled down to sights and thoughts. Rising though She was, She had seemed horizontal quite, but now for a second She seemed to cock her tail up. You see, I watched closely. (Log: 'Tail-up—first time—little.')

* * *

The glass floor of our establishment attracted me, for it presented a fair picture framed by our thin timbers. It was mostly a soft, luscious green. It was Surrey verdure—fields and spinneys and extensive woods—but, well as

I knew it, it had never seemed so liquid green below. And in this I made some discovery, I think. We were now up more than three thousand feet, and the vision of things below, with no more than normal assistance to the eyes, was most marvellously acute and definite. I could mark the spires of churches, cottage gardens, building formations that at such a distance on the flat would have needed telescopes for finding. It was the pure and superior atmosphere through which we peered. Now one understood the value of railways to airmen—long, clean, straight cuts right through the country, clear beyond all else, marking the way to everywhere. Captain Alcock had told me he used railways, stations, manufactories, a hill or two, and divers objects and excrescences as his direction marks. But the hills were hard to see, to one looking down on them. There were the Surrey hills—Hindhead and all round about which I know well—some of them nearly a thousand feet, but scarcely could they be distinguished from the surrounding flatness. A chaste scene was Surrey from the air on this sunny day—though we were moving over into Hampshire now. So nice and oddly shaped were all the fields, fitted together so perfectly like one big jig-saw puzzle, making compact order from all irregularity. Inevitably one lapsed to some light philosophies, the Struggle of Man being a compelling theme, for there was an instinct of something Olympian in our personal situation. It was a sincere reflection. Here is Log: 'Man for all his strikes is an orderly kind of beast—railways so straight—fields nice shapes—how beautiful is the world in sunlight!' For a moment one thought of the war, human effort, difficulty, contradiction, suffering. Stupid perhaps, but there was a compelling tendency to such reflections. It seemed, from the air, more pitiable, sadder than ever; and it was not a forced or exaggerated sentiment.

* * *

More Log: 'Falls—dips—as on waves in sea when yachting.' Yes, that was the exact sensation. The only change from the perfect undeviating glide was a faint, hardly perceptible rise and fall just like a yacht's on a waveless sea in a very gentle swell. It was dreamy, soothing. (Log: 'Quite comfy; could read or work.') Had there been nothing for the eyes and mind to do, I should assuredly have turned over for a little sleep. Log is very interesting here: 'Turning forward—great sensation of fresh air in solid blocks.' Exactly! I should not have thought of that now had I not written it then. You see, the civilian in the gun-pit had his back to the seven hundred and fifty horses, and the back, moreover, was up against the gun-pit wall. He rose for a moment, turned about—and did something in the way of gasping! For windshields were not, there was a business of a hundred and twenty miles an hour proceeding, and with those twelve hundred revolutions a lashing back-wash of churned air was flung hard against him—or so he thought. Not for more than a second could the eyes withstand it, and all the furies were shrieking through the air. The propellers were spinning too fast for even their circuit to be marked. And when by some chance the lips were parted, the fresh air of these high heavens choked in by solid pieces. There was—I mean it—the distinct sensation of eating it. A few minutes later there was the Log again showing the reality and persistency of this impression: 'Lots of fresh air—hitting me!' I remember holding out my arm at right angles to our line of flight, and having difficulty in sustaining it, the wind-force was so great. There was another curious thing: it occurred to me to cough. Not that I was cold or needed any coughing, but just as English beings do cough. So I did then—goodness, nothing happened! No sound, no sensation of coughing. I tried again—same result. A first sensation of alarm, as though something might have gone amiss with my lungs, but then an understanding and reassurance. The man in the aft gun-pit was stone-deaf! There was not the slightest sound from anything! Now I realised that the roaring engines had been silent to me from the start. I spoke, shouted, screamed. Not a sound, the faintest even! Inside me even there was no sound, for speaking amid great noises one sometimes hears, as it were, one's voice thrown back within. No, there was nothing, and the illusion of suspension of throat action in the coughing business was clearly due to the failure of suggestion that is made by sound. Here let it be said that on alighting at the end of the flight the deafness was absolute. Friends' voices could not even faintly be heard. An hour later they were with difficulty audible when loud; then there was a gradual but slow improvement. It was a couple of days before the hearing was normal again. (And oh for the airman's padded head-dress in our next scamper through the winds!)

* * *

We were more than half-way through when Log had it again: 'Most comfy journey;' and again, 'Gentle heaving like small yacht;' and again, 'Feeling of absolute confidence—don't mind swaying.' (Fine fellow in the gun-pit, eh?) Premature, perhaps, for Log at 12.33: 'Tail shaking—one or two bumps—beginning not to care.' (Was passenger not splendid? One enjoys this objective regard of him.) We would quote much more of Log, but only a little must suffice: 'All alone; nobody seen.' One wonders if that was a weak attempt at aerial humour. I don't remember the sensation, though I recall the reflection that one could not have communicated with Captain Alcock, even had one wished to do so, without first crawling along our apparatus—and this latter was a contemplation

when my cap flew loose and settled shivering in the strings of the elevating plane in the tail, which led to certain important speculations not unconnected with self-preservation. One remembered then the thrilling stories of how pilots in peril had crawled along their wings. Somehow it did not now seem such a desperate thing to do—merely a matter of balance and holding on—the point being that all sense of dizzy height was lost. That cap of mine was twenty feet away along the fuselage, a yard or so in width, and if Pilot had seen and had insisted, I am almost certain I could have fetched it back, nervous creature though I be. There is another suggestive note in Log: 'Can see our own shadow down below creeping over the fields. Could that be noticed below?' That was interesting. There was our sharp silhouette, black on green and gold, and a big thing, too, crossing the fields, in at one side, out again at the other, leaping the hedges in such style. High up here the shadow looked a big thing; of course, upon the surface it would not be discerned. It followed us throughout. Log asks: 'What are those little pin-heads in the fields?' They were really ricks of corn. My friend Cleary, who has committed most adventures in nearly every land, saw Captain Alcock off from Newfoundland, and was a kind sponsor to me in this enterprise, had told me to lie down in the fuselage and put my face through the hole in the bottom thereof for the most perfect view. It was worth it.

* * *

Log said at 12.50: 'Think we are beginning to descend.' It was a fear—a sad one. At 12.57: 'Tail up—can see propellers—rocking.' Alas! it was nearly done, and it was so pleasant there. The hard earth came back, bigger and bigger, but not more beautiful. One began to see too many material and ugly things. Nearer and nearer—quickly—we glided like a martin down, the little wheels touched the ground, and we stopped within a yard of the appointed place. Half-an-hour of perfect placid life.

KAVANAGH'S LUCKY BEAN.

CHAPTER VII.—WALKING THE PLANK.

THE long voyage was coming to an end at last. During the final three days intense excitement prevailed on board the *Taurana*. Much packing was accomplished. With the near prospect of tips in view, stewards and stewardesses redoubled their attentions. Novices among the travellers consulted more experienced voyagers as to the largess deemed customary or expedient, and were staggered by the amount of the sums recommended to be given. Protestations of undying friendship were exchanged, only to be speedily forgotten. At least three rash matrimonial engagements—happily breakable—were rushed into.

Dennis Kavanagh, whose mind was filled with sick longing for the home that might have been his, with Nora as his wife, kept his desires shut in his heart. Looking back to the night in his dismal Glasgow lodging when, with the Lascar's lucky bean glowing in his hand, he had asked for a new life in a new clean country, and ground of his own to till, he now regretted that he had not included in the wish a request for a wife that he loved. And then he told himself bitterly that, after all, the brown man had been wrong as to the magic qualities of his gift; for if he reached New Zealand, a murderer, only to be buried there, surely the bean had proved itself a mockery of a talisman.

He derived a savage satisfaction from the belief that never again would the bean have power to delude any poor mortal into false hopes of a glorified future, as he had destroyed it by fire. He did not guess that at that moment the bean, its occult properties unimpaired, lay snugly hidden away in a large pill-box in a dresser-drawer in Mrs Knox's kitchen.

Probably the so-called 'Mr Brown' was the most excited of the entire company of ship's passengers at the near prospect of reaching land. Restlessness possessed him. He talked incessantly about the future; made countless plans, only to unmake them. Sometimes he referred to himself as a tourist, and thought he would travel and see the country. At such times he read up a guide-book, and exhaustively discussed excursions to the Hot Lakes, the Wanganui River, or the Southern Alps. That scheme would suddenly be ousted by an avowed intention to take up land, until he decided that he was too old to break new ground, and speculated how a little farm, already cleared and stocked, would suit him. Sometimes he wondered how a country store might repay a man prepared to invest a little capital in it. But through all his vapourings one thing was painfully evident—his intense craving to get on shore.

In these last days he had completely lost his fear of the patience-player. Either Brown had concluded that he had been mistaken regarding the man's evil intent, or Dennis's promise of personal protection had reassured him as to his bodily safety; and, though he always kept close to Dennis, Brown never again referred to his day of panic.

With his self-constituted protector matters were different. Try as he might, Dennis was ever conscious of the presence of Mr Folsome, the player of patience. He was a quiet man, of pleasantly unobtrusive manners, who was

rumoured to be taking the voyage for the benefit of his health. It was curious that he left no impression of individuality on any one except Dennis, to whom he seemed the one strong personality on board. Were Mr Folsome specially conscious of Dennis's presence, he betrayed no sign of it. He lived by system, his time being methodically portioned out. Twice daily he paced a measured mile round the deck. During one hour of the morning, and another of the afternoon, he rested, stretched in his long deck-chair. For his dyspepsia, a bottle of pepsin tablets stood by his place at table, and he drank only mineral waters.

The long-looked-for hour had come at last. The good ship *Taurana* had passed the Great Barrier, and was threading her way between the islets of the beautiful Hauraki Gulf, at the head of which stands the picturesque city of Auckland. The voyagers, silent now, thronged the bows, eager to glimpse their land of promise. Mr Brown, clad in an extraordinary tourist suit of checks and a mackintosh, and carrying his heavy leather hand-bag, was foremost in the crowd. Engrossed in arrival, he forgot to impose his company upon his protector, and Dennis, seizing the opportunity when her father was thus preoccupied, sought Nora, and found her, seated alone, in a deserted corner of the deck.

She received him without a word; and the wistfulness of her expression and the knowledge of her forlorn condition broke down all the barriers of resistance that Dennis had so resolutely raised between them.

'Oh darlin'!' he said, throwing prudence to the winds, 'it's us that's for partin', an' the words that I would be speakin' to ye, I darsen't. But in the dark days to come I'd have ye keep mind that there never was another woman in the world for me—barrin' only yourself, Nora.'

As she listened to his impassioned words Nora's sad face became transfigured. 'Oh man, dear, and me that was well-nigh breakin' me poor heart thinkin' you wasn't carin' for me at all, at all!' she breathed in a tremulous whisper, then sobbed for sheer joy.

'Oh, Nora dear,' Dennis murmured, almost in tears himself, 'whatever comes between us two, ye'll maybe keep mind of me?'

'I'll never forget you till my dyin' day, and maybe not then neither!'

'An' if the Powers had willed it, could ye have put up with me for your own man, Nora?'

'Oh Dennis, and it's us that might be the happy couple,' she was sighing, when their solitude was invaded by Mr Folsome, the patience-player, who came quietly along the deck, followed by a steward bearing his folding card-table and some light luggage. He, too, was dressed for going on shore. Dennis came back to earth with a bump, leaving Nora alone in the heaven to which his confession of affection had raised her. Then Mr Brown appeared, and attached himself to Dennis. Now that the long-anticipated moment had actually come, the informer's nerves were in a state of extreme tension. He was alternately pale and flushed, and began innumerable sentences, only to forget to finish them.

The *Taurana* was nearing the wharf, on which friends of the arriving passengers were assembled. Signals of recognition were exchanged, even greetings called across the rapidly lessening dividing space. Then the *Taurana* lay in to the wharf, and the voyagers clustered round, eagerly ready to claim early use of the gangways.

At this point Mr Brown's impatience threatened to get beyond his control. To be within a few feet of the coveted land, and to be blocked by a mob of fellow-passengers and expected to yield precedence to a pack of women, proved almost too much for his strained endurance. Dennis tried to soothe him with repeated assurances that there was nothing to do but wait patiently, and that the delay would soon be ended.

All the time Dennis was acutely conscious that just behind them in the line stood the man who had journeyed so far to kill him if he failed to obey the orders of the Society of Silent Workers and put an end to Brown. Once Dennis glanced round at Folsome, only to encounter a gaze as tranquil and expressionless as ever. To his own surprise, Dennis was quite calm. He even felt a certain sardonic curiosity as to the means Mr Folsome would employ in disposing of him; and he was conscious of a slight sensation of chagrin in the conviction that the thing would be so neatly and swiftly accomplished that he would probably never know what had hurt him!

Seeing that, farther down the deck, a supplementary gangway of broad planks was being placed for the conveyance of luggage from the ship to the wharf, Brown conceived the notion that it might afford a more expeditious method of landing than waiting his turn at the passengers' gangway. Breaking out of the queue, he hastened over, accompanied by Dennis, and waited impatiently for the moment when the wide boards would be securely fixed in place. Quietly and unobtrusively, as he did all things, the patience-player followed on their heels, and stood, still wearing his admirably detached air, close behind them.

When the planks were in place Brown did not lose a moment before starting to cross. There had been a sharp shower earlier in the day, and the boards were wet. As he stepped on to the railless gangway, encumbered with his waterproof and the leather bag that was so absurdly heavy for its size, his foot slipped a little on the greasy surface.

'It's slippery! Take care, Quigley!' Dennis cried in warning, involuntarily stretching out a hand to catch him should he fall.

He had spoken the name unconsciously. It was only when he saw Quigley start violently,

and met the horrified glance that he cast back, that Dennis realised the fatal mistake he had made. Even then it was too late. In jerking away from the outstretched hand Quigley had overbalanced himself. For one giddy moment he swayed perilously; then, weighted by the heavy bag, he lurched over, and, with a hoarse scream of terror, plunged into the narrow strip of water that lay between the ship's side and the wharf. For a ghastly instant his convulsed face showed upon the surface of the water, then disappeared.

At this moment of his enemy's extremity Dennis forgot everything — forgot that, did Nathan Quigley meet his death by any means whatever, his own life would cease to be forfeit —forgot that the informer's death would leave him a free man, free to marry Nora, and to lead the life he so earnestly desired. He was oblivious of all possible benefits to himself, and remembered only that a fellow-creature was drowning within a few yards of him. Casting down the things he carried, Dennis threw himself into the water, striking his head as he fell.

Some time later he recovered consciousness, on dry land, to find himself a hero, raised to that enviable height by his chivalrous, though rash and unsuccessful, attempt to rescue a drowning fellow-passenger.

Nora's tears of grief at her father's loss were mingled with tears of joy at her lover's safety. When at length Brown's body was recovered, it was found that the weight of a belt (heavily lined with gold coins) that he wore had probably helped to drown him by preventing his body from rising to the surface.

The bag he had been clutching when he fell into the water was never recovered. So the greater portion of Quigley's blood-money has lain for twelve years at the bottom of Auckland Harbour. As for the patience-player, he drifted out of Dennis's life as unobtrusively as he had drifted into it. They never met again.

. . . . . .

As a sequel to the above record, a recent item from the New Zealand press may be of interest. 'At Kaitara, her pretty homestead near Dargaville, Mrs Dennis Kavanagh was the recipient of many congratulations when the news was cabled that her husband, Corporal Dennis Kavanagh, had been awarded the Victoria Cross for conspicuous gallantry in the field. Corporal Kavanagh, V.C., who is a native of Ireland, settled in Auckland Province a dozen years ago. On the outbreak of war he was one of the first to enlist in the New Zealand forces, and he has seen much fighting. He has three young sons.'

THE END.

HITTING THE BEACH AT TOGOLAND.

PART II.

IV.

IMAGINE a white cloister-like building, with arched windows, shaded verandas, and Moorish towers at either end, and you have some idea of Government House at Lome. Only, one must see the Atlantic breaking on the beach a stone's-throw away to appreciate the grandeur of the view from the first floor, where the living-rooms are situated. There the Governor awaited his guests on the spacious landing. He was a little man, dressed in the khaki uniform of an army major, with a stubbly moustache, and the grayish-brown complexion acquired by a long residence in the tropics. No spouse ever shared the eighteen years he had spent in Africa, so the wife of Captain Manners acted as hostess. She was a Yorkshire lady, who was fast taking on the pinched, bleached appearance so characteristic of Englishwomen sojourning in hot climates. The war was hitting these ladies very badly, owing to travel restrictions preventing many of them from returning home for the change they needed so badly.

The Duke of Mecklenburg was the last German governor of Togoland, and he had furnished the house very tastefully. The draperies were light and chaste, and, except in the dining-room, wickered furniture predominated, giving a cool, airy look to the house. Nothing had been disturbed. All had been left exactly as the duke had said *auf wiedersehen* to it, 'in case,' the Governor remarked with a twinkle in his humorous brown eyes, 'we ever give it back to them.' Paintings of Friederich der Grosse, Bismarck, Kaiser Wilhelm, and other trappings of the German Empire were very much in evidence—bespeaking such a toleration and respect for an enemy's household arrangements as has rarely been heard of in military history.

After a round of sherry, the party sat down to lunch. There was not much of the conqueror about them; and indeed at that time (July 1917) the situation did not look any too rosy for the Allies, with a large amount of tonnage being sunk every day of the week. All the same, it was a jolly lunch. The pilot's irresponsible chatter alone would have kept any fair-sized gathering going strong. Whether it is the reaction from many silent hours on the bridge or not, most navigating officers are extremely garrulous whenever they get the chance. In addition to being blessed with more than his branch's usual allowance of conversational talent, the *Blastus's* pilot had the loudest laugh in the service. Time and again his messmates had suggested that a gramophone record ought to be made of it, so that the

mess might, on the one hand, reap royalty benefits therefrom, and, on the other, transmit to weaker posterity incontestable evidence of guffaws rivalling in their loudness those of Megaphonos, the famous Greek! . . .

The padre did not say much. Two and a half years on that coast had pretty well done for him, as his sunken eyes and hollow cheeks testified. He could, indeed, tell most people something about the pain of Africa! The captain of marines, fresh from the ship which has been in more fights, perhaps, than any other fighting unit, the intrepid *Lion*, communed with Manners on the military situation. Staff-Paymaster de Carteret related his high-diving exploits to the Governor. Macmurdo always got on well so far as the ladies were concerned, and on this occasion Mrs Manners was quite *simpatico* with his submarine adventures in the Baltic.

Newcome sat next a friend of the Governor, a Mr Weatherspoon, whom he understood from Manners to be a sort of colonial adviser to the Government, although originally he had started out as a planter. He was a big-limbed man, with a slightly melancholy, set expression, suggestive of deep thinking. Newcome did not take long to break the ice of his apparent reserve. Like Mr Wells, the doctor was ever on the trail of imperialism; and here he was face to face with one of those unassuming pro-consuls who are content to spend the greater part of their lives in out-of-the-way places, and have made the British Empire what it is.

Newcome's first query would have been disallowed as a 'leading question' at any naval court of inquiry. 'Do you think, sir,' the surgeon asked, helping himself to guava-jelly for his mutton, 'our imperialism is a bit antiquated?'

Weatherspoon looked at him gravely as he sipped his red wine. 'I don't know whether I should call it that. I think it ought to be Americanised,' he answered slowly.

'I take it, then,' Newcome followed up quickly, 'Crown colonies are apt to suffer from the proverbial cobwebs of Downing Street. In other words, our policy, which ought to be progressive, is allowed to crystallise, to become a monument of sorts, like the Pyramids, but not really worthy of the ever-changing momentum of our genius.'

'Young fellow,' Weatherspoon reproved, 'your metaphoricalness is apt to be confusing to an African barbarian like myself, but I think I understand what you mean. Crystallisation is far too pretty a term; it conjures up something artistic—and Sierra Leone is anything but that. Stagnation is a better word,' the ex-planter said musingly.

'Great minds think alike,' Newcome agreed sententiously, if a trifle boldly. 'I've had Sierra Leone on the brain for some time, partly because I think it's one of our oldest colonies. What a bonanza that place has been to the gentlemen of Lombard Street!'

'And we haven't yet presented it with a proper sewage system, or electric light—not even a cold-storage plant, so that we might have ice for our cocktails,' Weatherspoon said bitterly, clapping his hands absent-mindedly for the servants to fill up the glasses again, as if he were master of the household. 'That's what I mean by saying it's high time we did a little Americanising. Let's start by eradicating malaria from our towns on this coast, the same as the Yanks mopped up Havannah, and made a paradise out of Panama.'

'It seems we're too fond of planting the flag, giving the place a rate of exchange, perhaps a tennis-club, and then imagining our work is done,' Newcome reflected. 'I've actually seen able-bodied officials at Sierra Leone who, when it was too rainy for a game of some kind, or they couldn't find a fourth for a "rubber," were at their wits' end for something to do; and yet think of the material problems they could be working out! There is so much to do'——

'You've hit the nail on the head,' Weatherspoon burst in. 'What we need is a director of materialism, some one who will give us better sanitation, netting to keep out the mosquitoes, more machinery and modern appliances generally to make life more tolerable for the people we govern. We make too much of self-determination. These natives must be taught first, led in the right direction, so that eventually they will be capable of deciding what is conducive to their own welfare. There are millions of them all over the world depending on us for leadership. Are we giving it to them in the best materialistic sense? . . . That crane on the end of the pier is a symbol of progression to me,' Weatherspoon said, as they all rose in obedience to their hostess, and went out on the veranda to watch the Atlantic ambling in, in a good-humoured sort of way, as if it were mighty pleased with itself; 'at least, it enables a white man to land on this coast in a decent and becoming manner.'

V.

With characteristic good sense, the Governor of Togoland protected his guests from that awful hour after lunch when all life tends to be reduced to somnolence in the equatorial region. He sent them off on a motor-ride.

The *Blastus* had not called at Lome merely to enable the officers to have a good time. The four-funnel cruiser's real business was to convoy a couple of transports which were taking native troops from Togoland. The motorists passed the last of these troops on their way to the embarkation pier; and well-set-up fellows they looked, marching with a well-trained, elated bearing, as if they were only too pleased to fight against their former masters. It was understood they would eventually fetch up on the East Coast.

The party visited the native quarter. The streets were well made, the houses mostly square,

and all of them whitewashed regularly, Manners said. Their thatched roofs sat upon them like so many mushrooms. Fencing was resorted to a good deal for the purpose of imparting a look of regularity to the streets and corners. The natives appeared to be of an extremely amiable disposition, and whenever the party got out and walked, they stood deferentially aside until the white men went by. There was not nearly so much nakedness among the women and the girls as at Sierra Leone; and whereas in the principal town of that colony, Freetown, the females did most of the work, carrying tremendous burdens on their heads, here the labour appeared to be more evenly divided. Most of the children were pot-bellied, Newcome believing this to be due to the large spleen they develop early in life as the result of malaria. Many of them, too, showed cone-shaped protrusions in the vicinity of the navel. The doctor explained these ruptures as being due to the indifferent way in which the severed cord is treated at birth—once more demonstrating that primitive habits do not necessarily give unblemished results, and that science can always be depended upon as nature's first assistant. The aide-de-camp declared immorality to be quite uncommon among the people of Togoland. There were two kinds of love—Christian (that of legitimate wedlock), and pagan (free sort); and most of the natives had a great abhorrence for the latter. Virginity was greatly prized; and no wonder, Newcome thought, as the car turned an unexpected curve in an out-of-the-way corner of the native quarter, and they came upon a maiden drawing water at the village pump. She was probably not more than fourteen, but her slim body showed perfect development, and made the doctor think of a beautiful bronze Venus he had seen in the Vatican Galleries.

They went on to the Catholic Mission. Although German, this had been allowed to carry on the good work of teaching the natives all kinds of trades, the skilful outcomes of which were displayed in the Mission's shop. It is feared that several of the officers of H.M.S. *Blastus* disobeyed the injunction which is laid upon service people not to trade with the enemy, by buying Koh-i-noor lead-pencils! Alas! the missionaries afterwards forfeited all right to the hospitality which had been extended them so freely. One of their order was apprehended in the act of attaching an infernal machine to a British cruiser. His excuse was that the supposed interests of the Kaiser weighed more heavily with him than his vows. So different from the example of his betters, the early saints!

Of course, the visitors looked in at the post-office, bristling with its German eagles. That is always a *sine qua non* of a visit to an out-of-the-way place. Everybody was keen to buy Togoland stamps. Captain Manners told them that when the country was first occupied not a stamp could be found. It so happened that about this time a neutral ship was taken into Sierra Leone, and a consignment of German stamps for Togoland discovered among the contraband. These were sent on to Lome, stamped 'Anglo-French Occupation,' and issued in the ordinary way. Needless to say, they were snapped up immediately, some individuals making nearly a thousand pounds out of them.

The officers were returning to Government House, when, as they passed the pier again, the pilot surveyed the *Blastus* through the binoculars he always carried on such expeditions. 'Hello!' he exclaimed; 'they've hoisted the "Blue Peter." That means a recall. The transport must be finished taking off troops. Sorry we shall not see Mrs Manners and the Governor again. Will you please give them our kindest regards, and say how much we've enjoyed ourselves? We're awfully obliged to you also for all you've done for us,' he assured the courteous aide-de-camp.

The latter waved all thanks aside. 'It's a great pleasure to see you chaps. Goodness knows when we'll see a man-o'-war again,' he said somewhat wistfully, as if he were feeling the exile a bit. 'The Governor will be very sorry you can't come to tea. Good-bye and good luck,' he wished them.

They got safely aboard; but what a 'head' Newcome had from drinking red wine in the middle of the day in the torrid (most of them called it horrid) zone! 'Confound imperialism,' he grumbled, 'if it means a headache like this!'

THE END.

GOOD LUCK AT 'POKER.'

I.

THE main incident in this story is absolutely true, and forcibly exhibits the inhuman treatment to which jurors serving on murder trials were subjected by those in authority seventy years ago. At the same time, it shows how a human life trembling on the knees of the gods was rescued by a providential stroke of good luck as the result of a proposal made by one of the jurymen to gamble for the prisoner's life.

The circumstances were related to me some time after the occurrence by the chief actor in the drama. My old friend James Simmer was a keen sportsman, who cherished a rooted antipathy to capital punishment, and he always declared that if it should ever be his fate to be summoned to serve on a jury in a murder case, he

would never, no matter how clear the evidence against the prisoner might be, consent to a verdict of 'Guilty.' In course of time Mr Simmer was served with a *subpœna* to attend the Old Bailey Sessions at the Central Criminal Court and form one of the jury empanelled to try for his life a man charged with a peculiarly atrocious murder. Simmer, being a man of superior education, good social standing, and genial manner, was at once elected foreman of that jury.

The details of the trial, which lasted several days, are of no consequence. Suffice it to say that the evidence, though circumstantial, appeared to point conclusively to the guilt of the prisoner in the dock; while the eloquent efforts, close reasoning, and brilliant speech of the eminent counsel engaged for the defence completely failed to convince the learned judge, who summed up strongly against the culprit. During the judge's lucid epitome of the evidence a large piece of plaster fell from the roof and settled on the desk in front of his lordship. Raising it in his hand so that all in the court might see it, he said, with a humorous twinkle in his eye and a self-satisfied chuckle, '*Fiat justitia, ruat cœlum.*' After pausing a little for the Bar and the jury to appreciate to the full this witty and appropriate quotation, the judge concluded his speech with these words: 'Gentlemen of the jury, you are here empanelled and sworn to well and truly try the prisoner at the bar for the crime of murder. I have placed the more important features of the case before you as succinctly as I am able; I have deleted from the mass of evidence everything not bearing directly on the charge; and from the close attention you have paid to all that has been brought forward by the Crown prosecutor and urged by the eminent counsel for the defence, I am certainly unable to perceive that there can be the slightest doubt in your minds as to the nature of your verdict.'

The usher of the court thereupon conducted the jurymen to the retiring-room. After a prolonged absence of the jury, the judge, becoming impatient, sent round to where the jurors were deliberating to inquire if there was any point in the evidence on which they required further elucidation, and what chance there was of their reaching a unanimous verdict. The reply returned was that they were not agreed, nor did there seem to be any likelihood of any such agreement. Again a message was sent, to meet with a similar reply. 'Then, gentlemen of the jury, you shall remain in custody until such time as you shall have agreed upon your verdict. His lordship will remain in close attendance to the court to receive your decision when you may have arrived at it.'

II.

This took place on a Saturday afternoon, and, as was the invariable custom at that period, the jury were escorted by warders to the London Coffee-House, situated on Ludgate Hill, there to be locked up, 'without food, fire, or light,' until they had decided upon a unanimous verdict. At first eleven out of the dozen arbiters on the destiny of the accused were in favour of returning a verdict of 'Guilty,' but our friend the sporting foreman obstinately stood out for an acquittal. However, *he* had come fully prepared for eventualities. Over his arm he carried a warm Inverness cape, upon his person he bore a plentiful supply of sandwiches and a goodly flask of sherry to sustain the inner man, while a bulky tobacco-pouch, with a well-seasoned pipe, provided ample consolation during his enforced detention in custody.

Stolidly impervious to all the reasoning and arguments brought to bear upon him, he still maintained his determination with dogged obstinacy. Hour succeeded hour with unrelenting monotony. Occasionally the foreman munched a sandwich, took a pull at his flask, or varied these proceedings by smoking his cherished meerschaum. Although at ordinary times a generous and altruistic mortal, he now was obdurate to all the suggestions made by his fellow-jurors, and churlishly refused to share with them any of his creature comforts. 'I do not say the man is innocent—I don't for one moment believe he is,' he stated; 'but I do say that I will never consent to a verdict which will consign a fellow-creature to the gallows.'

The deep-toned bell of St Paul's struck the hour of midnight. The chilliness of the room, the need of sleep, and the lack of food combined to exercise their influence; one after another of the recalcitrant opposition surrendered—not from conviction, but from discomfort and exhaustion. With leaden feet the hours crept slowly onward till presently daylight began to dawn, by which time the two camps had become equal, and now stood at six for a verdict of 'Guilty,' and the same number against. The impasse continued unaltered. For a long time it seemed a practical exemplification of the insoluble problem of an irresistible force trying conclusions with an immovable body.

Towards the afternoon the foreman, actuated by some feelings of compassion towards his less fortunate fellow-sufferers, once more addressed them: 'Gentlemen, I have always been determined that by no action of mine should a human life ever be sacrificed, and I was quite prepared to remain in durance vile for a whole week, if necessary, rather than surrender my lifelong convictions; but out of consideration for your sufferings and discomfort, I am willing to make you a sporting offer and leave the decision as to the guilt or the innocence of the poor wretch in Newgate to chance. Observe: I shall balance the poker upright in front of the empty grate. I shall then slowly count "One! two! three!" You will range yourselves, half your number on either side, two

yards away. At the word "three" we shall all jump. If the poker falls to the side of the opposition I shall give in to your verdict of "Guilty," but if it comes down on my side you will join me in returning a verdict of "Not guilty."—One! two! three!'

At the word 'three' the twelve men jumped for all they were worth. A human life hung in the balance; on the fall of that poker depended the momentous verdict! And the poker fell with a clatter to the side of the foreman! The warders were summoned, and the jurors, relieved from the long tension of suspense, were escorted back to the Old Bailey, and re-entered the jury-box. In reply to the question put by the Clerk of Arraigns, 'How say you, gentlemen of the jury; do you find the prisoner in the dock guilty, or not guilty?' the foreman replied, 'Our unanimous verdict is, "Not guilty."'

The judge, who had been hurriedly fetched to receive the verdict, was seated behind his desk, on which, carefully folded, lay the ominous black cap. He appeared completely paralysed with astonishment on hearing the announcement. 'Gentlemen of the jury,' he said, 'I utterly fail to understand the reasons that have guided men whom I assumed to be gifted with at least ordinary intelligence in arriving at such an absurd conclusion. I must say that I differ from your verdict *in toto*. However, the responsibility, thank Heaven! rests on your shoulders, not on mine. I am here only to give effect to your finding.' Turning towards the dock, he continued: 'Prisoner, owing to some incomprehensible form of mental aberration on the part of the men who had sworn to well and truly try you on the evidence before them, I have no option but to discharge you, which I do most reluctantly. You may consider yourself extremely fortunate to escape hanging.' Once more addressing the occupants of the jury-box, the judge said with scathing irony, 'Gentlemen, your valuable services will be dispensed with by the Crown for the next ten years.'

III.

Some twenty years later the following paragraph appeared in the columns of the *Midday Telegram*: 'Some days ago a terrible accident, attended with fatal results, happened to a convict who was injured by the premature explosion of a cartridge while employed in some blasting operations in the quarries at Portland, where he was undergoing a long term of penal servitude for burglary with violence. The man was so seriously injured that his death, after several days of terrible torture, came as a happy release from his sufferings. Fortunately, however, before the end came he was able to confess in the presence of the chaplain and the governor of the prison that he alone had committed a most atrocious murder twenty years ago. . . .

'In connection with this notorious crime, the mystery of which is now solved, many of our readers may remember how nearly a man, now proved to have been innocent, suffered the extreme penalty of the law. In point of fact, it was only owing to the determined resistance on the part of one of the jury that he escaped the expiation of the crime on the scaffold. It is a great source of satisfaction to the public to learn, after so many years, that the jury were fully justified in acquitting the man charged at the time with this most brutal murder. Once more the truth is revealed, a man's innocence is established; while the real culprit has punishment meted out to him by Providence. Thus we have a further confirmation of the fact that,

Though the mills of God grind slowly, yet they grind exceeding small;
Though with patience He stands waiting, with exactness grinds He all.'

TWO STARTS: WHAT THEY HAVE TAUGHT ME.

By a DEMOBILISED OFFICER.

THE return to civilian life has awakened many young officers to the unpleasant fact that in the battle for freedom they have lost many of the accoutrements necessary for the battle of life. Numbers of them came to war straight from a public school, and the majority were healthy, average boys. A certain familiarity with the names—maybe the writings—of a few classical celebrities, a sound knowledge of the pursuit of sundry types of ball, and an unshaken belief in the futility of the Gallic tongue formed the mental porridge which they had properly digested. Morally they were probably sound, and more especially so if athletics was their religion. In sympathy with these I write. My experience may be of value to others, and self-analysis be encouraged in consequence.

During the last few months I have talked much with young officers whose plans for the future may be briefly summed up in their own words: 'I think I'll go abroad or somewhere.' The vagueness of this phrase, and the number of times I have heard it repeated, have led me to a little exposition of what happens when one goes to the Colonies minus profession or trade, minus capital, and (as is often the case) minus capacity for sustained hard manual work. Well, here is my own story.

Two years previous to the war I left my public school and set sail for Canada, with a little money and the mental equipment with

which a paltry thousand pounds or so had endowed me. No band or eager crowd of employers met me on the quayside at Montreal. This, however, did not particularly upset me. My ambition was to ranch, and I *knew*, after studying many pamphlets, that the Golden West would greet me. For a year or so I would gain experience; gallop o'er the prairie, and assist to round up the cattle of some wealthy ranch-owner; then, having saved enough money, take a homestead of my own. The first rung on the ladder of fortune would be scaled. Now, nothing of this kind did happen. It very rarely does.

I travelled comfortably and by easy stages to Calgary, succeeding thereby in spending the greater part of my small capital. The rest quickly vanished in a search for work. On the very day I parted with my last dollar to an ill-favoured Chinese restaurateur, I obtained 'a position' on a so-called ranch in the foothills. The owner, a cadaverous individual of no fixed nationality, demurred a good deal at taking a totally inexperienced young man in a collar and 'boiled shirt,' but eventually engaged me at the modest wage of fifteen dollars a month and board. He took the trouble to point out that 'pink' teas and garden-parties were not in vogue in his part of the country, and that a friend of his would willingly exchange for my rather nice line in summer suitings something more adapted to my prospective environment.

A few details of my life with this employer will be sufficient to illustrate my point. As an appetiser I rose daily at 5 A.M., cleaned out a couple of stables, groomed three horses, and milked five cows. I then breakfasted—or, rather, devoured—an allowance of baked beans, molasses, and pancakes. A dour lady, with the immobile expression of a screech-owl, watched over me, and successfully prevented any chance of dyspepsia. From breakfast onward I laboured continuously till about eight at night, with intervals for such refreshment as I have described above. Many jobs came my way, which I will not attempt to describe. Sufficient to say that a ten-hour day of hoeing turnips, or riding on a roller up and down a field, is not exactly the best use to which a public-school education can be put. The sleeping accommodation was limited. I was expected to share a bed with a person who enjoyed the distinguished name of 'Ike.' Accustomed during the greater part of his career to mass formations in bed, he regarded me as no interloper. His rather odoriferous nature, however, made me seek the floor. Soon after my arrival he took his departure—accompanied by my watch.

The amusements (when time permitted) were not extensive. Of a Saturday night one might sit on an upturned apple-barrel in the village store, discuss turnips and a concoction known as 'root-beer,' and, if so minded, expectorate freely.

A bath was obtainable on Sundays, either in the creek or in one of the pig-buckets. The weekly regularity with which I performed this function was a source of much concern to this household, whose custom it was to celebrate bi-annually.

Such, in brief, was my life for six months. I then left the job, treated myself to baths and respectability for a week, and finally, for lack of further capital, drifted into another job of similar nature—though with slightly better conditions. For two years I played with time and opportunity in this fashion. Some of the jobs I undertook as a potential farmer were a great deal pleasanter than the one I have described, but not one of them led anywhere. At the end of that time there was just enough money saved to pay my fare to England.

Now, I do not wish to deny that many men have done well by going to the Colonies to farm—even without capital or much practical knowledge—but the majority were not public-school boys. If the last-mentioned type of man wishes to farm, he must have capital at his back—and plenty of it. On the other hand, provided he dislikes the amenities of our higher civilisation, is a confirmed woman-hater, and revels in a fourteen-hour day, homesteading offers a golden opportunity.

Being young, I was impressed with the fact that in severing my home connections, and leading this somewhat roving life, I was being a bit of a dare-devil. This feeling, I believe, was shared by, and sustained, the great majority of potential farmers whom I met on my periodic visits to town. Our time on these occasions was spent in loafing round the hotels and visiting the Employment Exchanges. Only a small percentage of these men were 'remittance men.' The rest were mostly of the middle class, whose fathers, having spent much on their education, were unable to provide for them further. They therefore got no money from home, and had it been forthcoming, would probably have scorned to take it. They had come to Canada imbued with hope, energy, and courage, but no knowledge of any use whatever in the world of affairs. Circumstances alone had reduced them to the kind of life I have pictured, and unless things have greatly changed, such will be the lot of many more who seek fortune indiscriminately in the Colonies. The Colonials do not want our particular type for *ordinary labourers' tasks*, and one soon gets to know it. Self-respect diminishes and one's mental and moral fibre is impaired.

Now, most young officers tell me that they are no longer boys, that the war has taught them much, and that there is little likelihood of their drifting into the sort of life I have described.

I enlisted in '14 as a private, served three years in France, three years as an officer in the infantry. These are some of the lessons that I have learnt:

1. The effects of battle are only transitory. A 'big night' in the mess will soon dissipate them. Any great mental or moral change in a man comes about gradually, and is the result of continual impression. The excitement or shock of action is too short-lived and sudden to have any lasting effect. It is rather like a bad dream. The ordinary life of the trenches was, without doubt, unpleasant. I recall working-parties, strafes, and patrols with a certain maudlin pleasure after my third glass of port; but if ever I think of these things when going about my ordinary business, it is only with a sense of the intolerable boredom I suffered. The war to most of us has been not a continual impression, but a series of disjointed impressions, which, because they were short-lived, have left little mark.

2. I have learned to enjoy the company of good fellows whose motto, owing to circumstances which war induces, was, 'Let us eat and especially drink, for to-morrow we may die.' Now, this motto had many advantages during the war, but the effects are going to be somewhat difficult to overcome. Mr Cox—bountiful as he was—gave many of us opportunities to indulge expensive, and in some ways harmful, pleasures, which we now find difficult to forgo.

3. I flatter myself that I have learned something of the control of men. Whether my old company would echo that sentiment I do not know, but it is eminently satisfactory to myself. Probably all officers possess this feeling of—shall I say?—superiority. But a word of warning. It is a great deal easier to control men under that rigid system of obedience which is the watchword of our army than it is to perform the same function with men who are allowed to think for themselves and act as they please. The 'sergeant-major' method is not much good with the British workman.

4. The war has taught me to take everything as a matter of course. Consequently my imagination is dulled. Surprise is a big incentive to imagination, and to be surprised is '*infra dig.* after one has been through a war. It is a great effort at present to take a concentrated interest in anything.

5. My capabilities have, to some extent, been revealed to me—nay, more: my weaknesses. As far as knowledge of self goes, I am much older than my years. Is this an advantage? In a young man I don't think it is. Unbounded confidence in self and a certain amount of blind enthusiasm—these are the assets that carry a young man over the obstacles that confront him at the beginning of his career. Many of us are now only just starting our careers, but we have partly lost these invaluable assets.

Such are some of the lessons I have learnt during the war. There are others—but from a money-making standpoint I am no further advanced than when I left school. To 'go abroad or somewhere' would be to drift into the same old life, with the same lowering, unproductive results. The army has taught me nothing that could possibly lead me into any other channel. I have, therefore, settled down to learn a distinct business. It is a tremendous effort, but as the memory of the war and its lessons fades, to the same degree will my task be lightened.

THE MONTH: SCIENCE AND ARTS.

STRAIGHTENING A BUCKLED SHIP.

IN the great explosion at Halifax the British ship *Curaca* had her superstructure blown away and her back broken. When this vessel was refloated it was found that although she drew sixteen feet two inches of water amidships, the depth of the bow under water was only seven feet, and that of the stern nine feet eight inches, showing that she was buckled to the extent of nine feet two inches and six feet six inches at bow and stern respectively. In this condition, says the *Scientific American*, the *Curaca* was raised, temporarily repaired to the extent necessary to make her float, and brought to New York under her own steam. In order to straighten the hull she was floated into a dry dock, and the water pumped out until she just touched the keel-blocks amidships. The two ends were then very carefully secured so that it was impossible for them to fall over or alter their position excepting in a vertical direction. Next the plating on both sides of the ship was cut at the buckle from the deck down to the water-line. Further pumping was then resorted to, and as the water-level fell in the dock the cutting process was continued, with the result that each end of the ship gently settled down upon the keel-blocks at the bottom of the dock until the vessel was completely straightened. During the operation frequent inspections were made to determine that both the forward and the after sections remained upright, and that the bow had not twisted. Once the *Curaca* was straightened, the task of joining her together again, and making good the damage, was a comparatively simple one.

COLD CAUSES BREAD TO BECOME STALE.

Comparatively few people care to eat stale bread, and most of us rejoiced when bakers were once more allowed to sell new bread. The reason why bread becomes stale has been investigated recently by Professor J. R. Katz of Amsterdam, who has discovered that the staleness is due to low temperatures, and not merely to loss

of moisture. The experiments of Professor Katz were based upon the keeping of bread for forty-eight hours after it was taken out of the oven. He found that if the temperature was maintained at 140 degrees Fahrenheit the bread was quite fresh at the end of the period, but if the temperature was reduced to 122 degrees Fahrenheit a certain amount of staleness was discernible, the process becoming more rapid until a temperature of about three degrees below freezing-point was reached. Curiously enough, at lower temperatures than this the degree of staleness is reduced, until at a temperature of liquid air the bread is again perfectly fresh. On the strength of these experiments it has been suggested that bread could be kept fresh till required for use by placing it in a fireless cooker immediately after removal from the oven.

SCIENCE IN THE GREAT WAR.

In his presidential address to the British Association at Bournemouth, Sir Charles A. Parsons, K.C.B., D.Sc., F.R.S., made some interesting references to the development of scientific instruments for war service, special attention being directed to sound-ranging and listening devices. For instance, mention was made of the apparatus of Professor Bragg and his son, whereby, from the recorded times at which sound-waves from hostile artillery reached a number of receiving-stations, the positions of these guns could be located to within fifty yards at a 7000-yard range, thus enabling our artillery to concentrate their fire on certain areas with good prospects of destroying the guns in question. After referring to hydrophones for locating submarines, and their limitations owing to the disturbances caused by the instruments dragging through the water and waves striking the ship, Sir Charles mentioned experiments in this connection by Sir Richard Paget on sea-lions, and Professor Keith's explanation of how the hearing organs of the whale are constructed. Under water sea-lions were found to have directional hearing up to speeds of six knots; and the hearing organs of the whale were said to resemble hydrophones to some extent. Based on these investigations, water-filled fish-shaped bodies made of celluloid, varnished canvas, or the like, with hydrophones fixed in the centre of their heads, were towed at some distance behind ships in search of submarines, the wires to the observers being carried by the tow-ropes. In this position the disturbing noises from the submarine-hunter itself were minimised, and sounds from enemy craft could be heard up to speeds of fourteen knots and over considerable distances. Another interesting war development was referred to by Sir Charles in the following words: 'Leader gear, first used by the Germans to direct their ships through their minefields, and subsequently used by the Allies, consists of an insulated cable laid on the bottom of the sea and earthed at the farther end, through which an alternating current is passed. By means of delicate devices installed on a ship, she is able to follow the cable at any speed with as much precision as a railless electric bus can follow its trolley-wire. Cables up to fifty miles long have been used, and this device promises to be invaluable to ships navigating narrow and tortuous channels and entering or leaving harbours in a fog.'

AN AUTOMATIC GUIDE-BOOK.

Now that railway fares are so high, it is often found that a number of persons can travel to a distant point with their luggage at a lower cost by motor-car than by train; and this frequently applies even when the car has to be hired from a concern which supplies a chauffeur and makes a profit out of the transaction. Many people travelled to the seaside for their holidays by motor-car last summer; others used cars for touring; and the railway strike in the autumn forced large numbers to travel long distances by motor in the absence of trains. In cases of the kind, when the driver is passing over a road which is new to him, certain information has to be acquired regarding such matters as hotel accommodation *en route*, dangerous crossings or hills, together with particulars of speed-limits where imposed. In the United States information of this description is now supplied automatically to drivers of motor-cars as they go along. The information is printed on a tape which is moved round by the wheels of the car at exactly the right speed, instructions relating to the particular part of the road being driven over being visible to the driver as he sits at the steering-wheel. This indicator also gives the exact position of the car at any time, and it is almost indispensable at night for this reason. According to the *Scientific American*, thousands of miles of road in the east and middle west of the United States have been logged and recorded on tapes by the company which is introducing this new apparatus. Service-stations are to be established in each city, where tapes for various routes will always be kept on hand for free distribution to users of the automatic road-guide.

NEW PARAFFIN CARBURETTER FOR MOTOR-CARS.

Supposing that results equal to those obtained with petrol in motor-cars could be realised from paraffin at half the cost, few owners would continue to use petrol. Hitherto the appliances for running motor-cars on paraffin have not proved entirely satisfactory, the reason (according to Mr Charles Dawson, who has perfected a new method of using the heavier fuel) being lack of homogeneity in the mixture of paraffin vapour and air at various loads and speeds. In previous paraffin vaporisers the oil has been evaporated in a chamber heated by the exhaust gases, or by the admission

of a small portion of these gases into the induction-pipe. In Mr Dawson's device the paraffin is vaporised at the jet by what is practically red-hot air, the latter having been drawn through a multitubular heater in which a large surface, heated on one side by the exhaust, is exposed to the air on the other. Moreover, the tubes are small and thin; hence they heat up in a few seconds—an important point in connection with the quantity of petrol needed for starting. When the engine is just ticking round by itself, the hot air supplied to the jet suffices to give a correct mixture; but as soon as the throttle is opened and the speed increases, a piston is drawn upwards by the extra suction of the engine and uncovers additional air-holes, at the same time allowing a paraffin needle-valve to rise and admit more fuel. In this way the mixture is always exactly proportioned to give the best results at all loads and speeds. However, the proof of the pudding is in the eating, and the writer recently had a long run in a small American car fitted with Mr Dawson's device. For starting, the hot-air pipe leading to the jet was primed with petrol from an ordinary lubricating oil-can (such as might be used with a lawn-mower) holding about a quarter of a pint. Two or three squirts were enough—perhaps a teaspoonful—and the engine started at the first turn of the handle. After the engine had been allowed to run for a couple of minutes to warm it up, a start was made, and the car was taken for twenty miles or so over some of the most hilly and winding roads in Kent. The results can be best summed up by the statement that no one would have known that the car was not running on petrol, every conceivable test (including going up hills on the high gear until the engine all but stopped) being made to try the flexibility, which appeared to be perfect. Moreover, there was not the slightest sign of pinking (pre-ignition) at any time, although the engine was designed for petrol and no alteration had been made to the compression. With previous devices for using paraffin for motor-cars the compression has had to be reduced, otherwise pinking took place. The exhaust, also, was perfectly clean throughout the test. The device is equally applicable to all petrol-engines, whether in boats or aeroplanes, or for producing electricity; and the inventor claims that his appliance will vaporise yet heavier and lower-priced fuels than paraffin, such as gas oils, while with extra heat even residual oils, such as are used in Diesel engines, can be employed.

A NEW DIVING-BELL FOR SALVAGING.

What is practically a diving-bell in a new guise has been devised for salvage-work by Mr Simon Lake, the well-known American inventor of submarines. The most striking feature of this appliance is that access can be obtained to it while it is at the bottom of the sea. The diving-bell consists of a steel chamber which measures about twenty feet in length and eight feet in width, and is of sufficient height to let the occupants stand upright. A steel tube four and a half feet in diameter and seventy-five feet long connects the bell to the parent ship. At the bottom end this tube divides into a T piece which fits into huge bearings in the bell chamber, the latter, therefore, being hinged and able to remain level, whatever the inclination of the communication tube. The upper end of the tube, again, is carried on hinges, the result being that the bell chamber can be raised or lowered to suit the depth of water without interfering with the communication from the parent ship. Communication at the bottom end is through one side of the T piece into an air-lock, where the pressure is gradually raised to that inside the bell chamber before the communication door is opened. In the bottom of the bell chamber is an opening with a water-tight door, measuring about three feet in length by about five feet in width, through which objects can be picked up from the sea-bed. Like the submarine, the diving-bell is caused to sink by admitting water into tanks until the buoyancy is overcome, but the depth is controlled by wire ropes running over a framework at the bow of the parent ship; in fact, the operation is almost exactly similar to that of raising or lowering the ladder of a dredger. In addition to giving access to the bell chamber, the communication tube serves to carry electric light and telephone cables, besides the compressed-air pipe and other accessories. A motor is fitted to the diving-bell whereby it can be moved along to a limited extent by a wheel under the bottom. Outside of the communication tube is a ten-inch suction-pipe which passes through the bell chamber. Its upper end is connected to a powerful pump on board the parent ship. This appliance is used for dredging up grain and other materials which lend themselves to removal by pumping when carried in a stream of water. Already a certain amount of coal has been raised from Long Island Sound banks by this apparatus. Athough the above experimental device can reach depths of about forty feet only, it is considered that no serious difficulty would be met with in designing a similar diving-bell with a communication tube three hundred feet long, which would be sufficient to reach the greatest depths at which men would be capable of working.

HOME-MADE FOOD-COOLER.

The evaporation of liquid is known to produce cold in proportion to the amount of moisture that is carried off by the air. So rapid is the evaporation of ether, for instance, that ice can be produced by this means. The evaporation of water also has a powerful cooling effect, and this fact is taken advantage of for the cooling of water for condensing steam in large electric generating-stations, the water being allowed to

trickle over a large number of shelves arranged in a tower. A home-made cooler for food based upon this principle was recently described in *Popular Science Siftings*. The appliance consists of a wooden framework covered with galvanised wire netting, a number of shelves for holding the comestibles to be cooled being arranged inside. Tapes provided with buttons are tacked to the edges of the framework, and on to these pieces of flannel, flannelette, or coarse cotton material can be buttoned to cover the sides. At the top is a rectangular enamel pan containing water into which dip flaps of flannel turned over from the upper edges of the frame. These flaps serve as wick siphons to keep the encasing material moist. The whole arrangement stands in a pan of water. One side is provided with hinges, and opens to give access to the shelves. Although the temperature inside this cooler does not nearly reach freezing-point, it is many degrees lower than the surrounding atmosphere. The refrigerator should be kept in the shade, preferably where currents of air will play upon it. The plan of buttoning on the covers allows of these being taken off and washed at intervals. The covers should be of white material, as this absorbs less heat than do coloured covers.

HUGE FARM WITHOUT HORSES.

Most readers of this journal know that in America farming is conducted on a scale that is colossal in comparison with the largest agricultural operations to be seen in this country; but there are few who will not be astonished at the size of a wheat-farm in Montana and Wyoming that was originated and established by Mr Thomas D. Campbell, in furtherance of the recent efforts of the United States Government to increase the production of wheat. This farm covers an area of no less than 200,000 acres, and is divided up into forty sections of 5000 acres. A remarkable feature of the concern is that all operations are carried out by machinery, not a single horse being employed. Instead, huge tractors, the largest ever built, do all the work of ploughing, seeding, and harvesting, explains Robert H. Moulton in the *Scientific American*. Each section is provided with one of these giant tractors, while a dozen are held in reserve in case of breakdowns. A manager is in charge of each section, which has its own group of permanent buildings, but the general management is entirely in the hands of the originator of the scheme. All operations are carried out to scheduled times, this system being possible owing to the dependable character of the weather. The capacity of the tractors may be gathered from the fact that fourteen of them have ploughed more than 350 acres of virgin soil in a day. Even if the yield of this farm be no higher than twenty bushels an acre, it will mean no inconsiderable addition to the year's crop.

PROFESSIONAL MEN AND EXCESS PROFITS DUTY.

There are strong indications—and indeed more than indications—that claims for excess profits duty are going to be pressed against professional men in circumstances where it has been thought (or assumed) that there was immunity. The tax is laid on 'all trades or businesses of any description . . . excepting . . . offices or employments, and any profession the profits of which are dependent mainly on the personal qualifications of the person by whom the profession is carried on, and in which no capital expenditure is required, or only capital expenditure of a comparatively small amount; but including the business of any person taking commissions in respect of any transactions or services rendered, and of any agent of any description (not being a commercial traveller, or an agent whose remuneration consists wholly of a fixed and definite sum not depending on the amount of business done or any other contingency).' We shall make no attempt to discuss the matter, but shall merely state enough to indicate the lengths to which the claim is apparently to be carried. (1) Stockbrokers are liable. The reasons are that stockbroking is not a profession, or at any rate not a profession dependent mainly on personal qualifications. But apparently, even if it could be held to pass these two tests, it would still be liable on the ground of taking commissions. (2) Commercial advisers paid by commission are liable. They might pass the test of personal qualifications, but their business is not recognised as a profession; and, again, even if it were, it would apparently be unavailing in the face of remuneration by commissions. (3) Mr Justice Peterson has recently dealt with a case in which a claim is made by the authorities against a technical advisory engineer remunerated by a commission on turn-over. The case came up on an action by the engineer for a declaration of non-liability, and that has been thrown out; but this involves no decision either way on the question of liability. What is feared, however, is that the Inland Revenue intend to maintain that any professional man, be he civil engineer, mechanical, electrical, marine, or mining engineer, architect, surveyor, or the like, is assessable to excess profits duty (if excess profits exist) unless he receives all his remuneration as a predetermined fixed amount—e.g. a lump sum, or so much per month or per year; and that any variation by way of percentage or otherwise, with reference to turn-over or profit or any other element, renders him liable. This at least is the way in which we have heard it put, and our only doubt is whether, as so put, it shows the full extent to which such claims may be pushed.

To Correspondents who wish fuller information regarding new inventions, publications, &c. mentioned here, addresses will be furnished, when possible, provided a stamped and addressed envelope or post-card be sent to the Editor, 339 High Street, Edinburgh.

THE BROWN NABOB'S MONEY.

By J. S. FLETCHER.

CHAPTER I.—END OF THE BROWN NABOB.

FRIARGATE, in Normansholt, a short, narrow street leading away from the south-west corner of the Market Place, has, since memory can tell of it, been almost entirely given up to solicitors, auctioneers, and accountants. Its tall houses, the front-doors of which are approached by low steps set between pilasters, bear the stamp of professional gravity; almost every high, narrow window of the lower floors is shrouded from the curiosity of the pedestrian by a wire blind, inscribed with a name or names wrought in gilt letters, most of them much faded. Only two breaks occur in the monotony of the street. One is made by a square, railed-in courtyard, at the rear of which a solid old house affords accommodation to the private banking firm of Shillito, Wilbrick, & Partners; the other is where a low-roofed Jacobean mansion, also set back a little from the line of its neighbours, presents a frontage of old red brick, partly covered with ivy, and contrasts cheerily with the prevalent pale yellow of its stucco-faced surroundings. This, called Friargate House, is the only private residence in the ancient thoroughfare. Where it stands, once stood a house of Grey Friars—certain ruins of their house may be seen in the tree-shaded garden at the rear.

For many years, at the end of last century, Friargate House remained untenanted and neglected. Its owner, an old lady who had retired to Scarborough, appeared to have forgotten its existence. Suddenly she instructed one of the neighbouring auctioneers to offer it for sale. It was put up for auction at the Crown Hotel, in the Market Place, one spring afternoon in the year 1899. When the auctioneer read out the conditions of sale, he was hopeless about getting a bid. But there was at that time staying at the 'Crown' a stranger, an elderly gentleman, Mr Martin Farmadale, who had come to Normansholt to take a look at its antiquities. Within five minutes of the sale's opening he had bought Friargate House for £6500; within an hour he had paid over the purchase money; before evening he had given full instructions for the immediate restoration and renovation of his new property; and by the end of the summer he had settled down.

For the next six years Normansholt knew no more of its new inhabitant than that he was a bachelor gentleman who kept a housekeeper, two maids, and a boy in buttons; that he paid his bills every Saturday morning, in hard cash; and that every day he took a ten-mile walk, always in the same direction, after which he was not again seen outside his own door until another sun had risen. There were, of course, rumours about him. He was said to be very wealthy, and entirely without relations. There appeared to be little doubt—this was founded on his known predilection for curries and similar highly flavoured dishes—that he had spent most of his life in India, and had made a fortune there. As for his outward seeming, he was a little, squat, tubby sort of man, who wore his clothes tightly buttoned across his chest, carried a very large umbrella, and sported old-fashioned whiskers on either side of a mahogany-hued face. From the first week of his settling down to his hermit-like existence in Normansholt he became known as the Brown Nabob.

The Brown Nabob was now dead, having come to his end just as suddenly as he had come to Normansholt, and on this, an autumn, afternoon his funeral equipage stood at the gates of the old house in which he had lived for six quiet years. It was not an imposing equipage. It consisted, indeed, of a hearse and one roomy mourning-coach. The coffin, an affair of plain oak, was already in the hearse; the undertaker's men were ranged alongside the black horses; the undertaker himself was hovering about the open door of the house, evidently in a fidgety state. Overhead, from a corner of the Market Place, the great bell of St Eanswythe's Church was tolling dismally. And inside the house three men waited, in a heavily furnished, rather gloomy dining-room, on the table of which stood decanters of port and sherry. One of these men was Mr Shillito, senior partner in the banking firm across the way; another was Dr Milford, from round the corner; the third was Mr Haddlesey, a solicitor, whose office was next door on the right-hand side. The banker was sipping a glass of port; the doctor had just set down the empty glass wherein he had sampled the dead man's

 [All Rights Reserved.]

brown sherry; the solicitor was gazing fretfully through a crack of the drawn blinds, his eyes directed towards a door on the opposite side of the street. He had been so gazing for five minutes when the undertaker looked into the room.

'We're late already, gentlemen,' murmured the undertaker. 'I fixed three o'clock sharp with the vicar, and it's past that now, and we can't get to the cemetery in less than ten minutes. Hadn't we better'——

'We can't go without young Denton,' said the solicitor sharply and without turning from the window. 'Those were my instructions from the deceased: young Denton was to go with us, and return with us. I don't know what's keeping him—I told him myself to be here at ten minutes to three.'

'Well, you know what the vicar is, Mr Haddlesey,' said the undertaker. 'He's a model of punctuality himself, and'——

'I suppose there are reasons why we can't go without the young man?' suggested the banker, setting down his glass. 'Perhaps you're aware'——

'I'm aware of nothing, Mr Shillito,' answered the solicitor. 'I know nothing at all beyond what the late Mr Farmadale told me to do just before his death. This young fellow was'——

'Why not send across to Petherfield's office, and hurry him up?' said the doctor.

But Haddlesey suddenly left the blind, and turning away from the window, began to draw on a pair of new black kid gloves. 'He's coming,' he said. 'Tumbling over himself, of course.'

The undertaker hurried out to the door of the hall, passing, with a reproachful shake of the head, a young man who came running breathlessly and made for the dining-room as if well acquainted with its location. Denton burst in with glances, right and left, which denoted humble apology.

'Very sorry, Mr Haddlesey,' he blurted out. 'Very sorry indeed, gentlemen! Not my fault, though—I couldn't help it. We're awfully busy at our place, Mr Haddlesey. The guv'nor's quite angry because I asked for an hour off—said he didn't know whatever reason there could be for my presence.'

The three men, who gave a mere glance at Petherfield's clerk, were secretly of Petherfield's opinion. Nobody who looked at young Bellamy Denton could have fancied his presence necessary at anything except his own humble job. He was obviously one of the multitude—born to obscurity and humility—the sort of young man whose duty was to thank everybody else for allowing him to exist. His hair was nearer red than auburn; his pale, mild blue eyes were fringed by sandy eyelashes; his plain features were liberally covered with freckles; his nose was a snub, and his mouth a slit. The only redeeming feature in him was a resolute chin. Plain—very plain, and homely—very homely; and his plainness was accentuated by the black mourning-clothes he had borrowed for the occasion, not one single garment of which fitted him. The trousers, too short, revealed an inch or two of gray sock. The tails of the coat came much too far below the crook of the wearer's knee; its collar rose too high above the nape of his neck. As for his black cravat, it had already worked round under his left ear. The silk hat which he had borrowed, and about which he had clumsily fastened a band of crape, was as much too small as the gloves which he was nervously drawing on were too large. The other men, as they looked at him for a second, mechanically eyed their own well-fitting garments, and felt a strange sense of incongruity.

'You're nearly twenty minutes late,' grumbled Haddlesey. 'However'——

He led the way from the room, the banker walking at his side. The doctor followed. Bellamy, instead of falling into line with him, walked a good yard in his rear. And when they came to the mourning-coach he glanced doubtfully at the box, as if his proper place was by the side of the driver. But out there the undertaker was master; in another moment the clerk found himself in a corner of the stuffy old carriage, with his back to the horses, and the doctor sitting at his side, while the banker and the solicitor confronted them from the more honourable positions. The procession moved off up Friargate, and the two or three women and children who had lingered to see it start turned away, grumbling at its lack of ostentation.

'A curious old man!' murmured the banker, as the coach began to traverse the cobble-stones of the wide Market Place. 'Something mysterious about him, eh?' He gave the solicitor a side-glance. 'I suppose you don't know much?' he suggested, with a spice of elderly inquisitiveness. 'I don't know, of course, if you knew much of him?'

Haddlesey pointed a finger at Bellamy Denton's freckled face. 'That's about the only chap in Normansholt that knew him,' he said incisively. 'If you want to know anything, Mr Shillito, ask him!'

Bellamy, to whom the banker was a very great and terrible personage, blushed scarlet under his inspection, and shifted his eyes to the less formidable solicitor.

'I, Mr Haddlesey!' he exclaimed. 'I don't know anything about the late Mr Farmadale, sir—except what—what I do know, you know. No more than that, sir, I assure you.'

'You're the only Normansholt man who had ever been inside his house till last week, when he sent for me, and for Mr Shillito, and for Dr Milford,' retorted Haddlesey dryly. 'And you used to go there pretty regularly, by all accounts.'

'For a purpose, sir; for a purpose!' answered Bellamy. 'It was this way, you see, Mr Haddlesey. One night, two years ago, I happened to get into conversation with Mr Farmadale, down there near Barbican, and it came out that I could play chess a bit. So he asked me to look in and play a game with him; and after that I used to go regularly. Three nights a week, sir, ever since then. But—I don't know any more than that.'

'Did he ever give you anything for your trouble?' asked the solicitor.

Bellamy blushed again, but his eyes faced his questioner steadily enough. 'Well, now that's over and done with, Mr Haddlesey,' he answered, 'I don't mind saying. He did! I didn't want to take it, because I'm fond of chess; it's all the games I play, and he taught me a lot—a tremendous lot, d'you see, sir? But he would insist on it. Yes; he gave me a sovereign every Saturday night. I've saved the whole lot of it—every penny.'

The banker, a tall, solidly built man, made a little approving murmur somewhere inside his capacious throat, and regarding the clerk with a new interest, bent forward to him. 'Did Mr Farmadale ever tell you if he had any relations,' he asked—'ever mention anything in that way?'

'Well, sir, he did once remark—casual-like—that he hadn't,' answered Bellamy. 'I forget what it was that brought it out, but he did say that he hadn't a single relation living—not one.'

'Did he ever tell you what he meant to do with his money?' inquired the banker.

'I once heard him say—and not so long ago—that he'd left his fortune to a thoroughly deserving object, sir,' replied Bellamy. 'But, of course, I didn't ask anything further—some charity or other, I took him to mean.'

'Did you ever hear him mention what he was worth, or where he'd made it?' asked Haddlesey. 'I suppose you weren't playing chess all the time?'

'Most of the time, sir,' answered Bellamy. 'That was what I went for. No, sir; I never heard Mr Farmadale say what money he had, or where he'd made it. But I know he spent nearly all his life in India. He'd—perhaps I oughtn't to mention it—he'd a very fine set of chess-men, in ivory, that he'd brought from India. He used to say he'd leave it to me, but it may have been his joke.'

'You hope he has, eh?' said the banker, smiling good-humouredly.

'I should be very proud of it, sir,' assented Bellamy. 'I've never seen a set like it, sir.'

'Here we are, anyway,' said Haddlesey, as the coach pulled up at the ornamental gate of the cemetery. 'And there's the vicar, looking in anything but a Christian state of mind. However, we can't hurry things now, even for him.'

Half-an-hour later banker, solicitor, and doctor turned quietly away from the open grave; Bellamy Denton lingered behind. When they were gone, and he was alone, save for a grave-digger, he pulled a small cardboard box from his pocket, took a tiny bunch of roses from it, and, with a shy glance at the grave-digger, dropped it on the coffin; then, with another quick look into the grave, he hurried after the other three and subsided into his corner. The coach went back up Cemetery Lane, and through the Market Place into Friargate, and discharged its occupants.

Bellamy turned to the solicitor. 'You'll excuse me now, Mr Haddlesey,' he said. 'I promised Mr Petherfield I'd be back the minute it was over. We're that busy'——

'Petherfield'll just have to do without you, then, for a few minutes longer,' said Haddlesey. 'My instructions from Mr Farmadale were that four persons were to be present at the reading of his will, and you're one of 'em. I don't know what's in his will, and I don't know why you should be there, but you'll have to come in while it's read.'

Bellamy glanced nervously across the street. It chanced that Petherfield, who was an insistent person, and terrible in wrath, was looking out of his window, and the clerk paled under his glance. He half-turned; but Haddlesey, nodding at his fellow-solicitor, shepherded his captive into Friargate House.

'Well, as soon as you can, then, Mr Haddlesey,' pleaded Bellamy. 'Mr Petherfield'll have the skin off me if'——

'Come on, now!' commanded Haddlesey, and pushed him into the dining-room, whither the banker and the doctor had already repaired. He closed the door, and motioned his companions to draw chairs to the table. 'Now, gentlemen,' he continued, taking a seat at the head and helping himself to a glass of port, 'we'll do this business. And, to start with, I think I'd better make an explanation, and I think Mr Shillito will follow it with another A week ago the late Mr Farmadale, with whom I had never had any transactions before, sent for me, and in Dr Milford's presence told me that he knew he was not going to live many days, and handed me this sealed envelope, which, he said, contained his will. He would not tell me its contents. He gave me instructions to read it, as soon as his funeral was over, to you three. That's all.—Now, Mr Shillito.'

The banker drew a somewhat bulky packet from an inner pocket of his overcoat and laid it on the table. 'My story is something like yours, Haddlesey,' he said. 'After you'd been with him, Mr Farmadale sent for me, and in Dr Milford's presence handed me this sealed packet, and told me it contained the whole of his property. He asked me to take care of it until the reading of his will, and—that's all.'

Haddlesey picked up the sealed envelope,

took a penknife from his pocket, and sliced open the flap. He drew out a single sheet of paper and unfolded it. The banker and the doctor, watching his face carefully, saw a quick gleam pass over it. Bellamy, whose sole immediate concern was to get away to Petherfield's office, saw nothing of that gleam; he was staring at the clock.

'Well,' said Haddlesey, after a moment's pause, 'here it is, then—short, too. I'll read it.

'"This is the last will of me, Martin Farmadale, of Friargate House, Friargate, Normansholt, in the county of Yorkshire, formerly Commissioner of Bundelwara, Bengal, India. I devise and bequeath all my estate and effects, real and personal, which I may die possessed of or entitled to, unto Bellamy Denton, of Number Seven, Trinity Terrace, Normansholt, absolutely. And I hereby appoint the said Bellamy Denton sole executor of this my will, and I revoke all former wills and codicils. Dated this seventh day of April 1904."

'That's all,' added the solicitor sharply. 'It's all correct—duly signed, and witnessed by the housekeeper and the parlour-maid, both highly respectable persons. Well, I suspected something of this sort, but not quite what's here, Mr Denton'——

'Stop a bit!' said the doctor. He stretched out a quick hand, hurried some wine into a glass, and turned to Bellamy. 'Drink, man!' he said authoritatively. 'Drink!—pull yourself round—come on, now!'

Bellamy drank, and choked, and made an effort, and suddenly pushed away the glass. He turned a wild stare on Haddlesey. 'Is—is it right?' he asked thickly. 'You're not'——

'Good Lord, man, of course it's right!' said Haddlesey. 'Buck up! What a slice of luck! The question now is—what's it amount to?'

He turned to the banker, who was already breaking the seals of the bulky packet which he had laid on the table.

THE FAIRY-TALES OF SOUTH AFRICA.

By E. L. M'Pherson.

I.

JUST half-a-century ago, when the Rev. Dr Callaway, afterwards Bishop of St John's, Kaffraria, published his *Nursery Tales of the Zulus*, the *Saturday Review* classed these stories with Grimm's *Märchen*, the *Zendavesta*, and the *Veda*, and prophesied that in fifty years the collection would become as valuable as the few remaining bones of the dodo.

The prophetic words are slightly exaggerated, for copies are still procurable, though they are rare and costly. The writer, however, had the extreme good fortune to find one in a Natal rectory, where it was in danger of being cast into a jumble sale. It came originally from the library of a theological college in England, and had been given to a young priest in case he should find it useful in his labours in South Africa. The librarian of the college had been clearing out 'rubbish,' and a later worker in the same field as Bishop Callaway consented to part with the book for a few shillings!

This is not the first time that treasures have been cast aside carelessly, and South Africa in the past has been notoriously indifferent to many of her good things. Her indifference to the great treasure of wonder-tales told by the natives, especially by the Zulus and the Basutos, is one of the most surprising and saddening instances of wasteful neglect, for in wealth of fancy and in rich and poetic diction these are not easily surpassed.

Bishop Callaway took the stories direct from the lips of members of his flock, partly as a means of learning their language, and in his work the Zulu text appears side by side with the English version. He was, moreover, an ardent student of the folklore of many nations, and the notes appended show his deep knowledge of the legends of almost every people under the sun.

He was amongst the first of the missionaries to collect the native tales and to treat them with respect. Others, in their zeal to teach the new faith, held the stories in contempt, and to-day the 'educated' native, even if he is acquainted with the lore of his people, will not acknowledge it for fear of being laughed at for his childishness; and if it had not been for the timely work of Bishop Callaway, the world would have lost many a beautiful fairy-tale.

Luckily, too, there have been other scholars and missionaries who have shared the enthusiasm of Bishop Callaway, and before passing on to speak of the stories themselves one must mention the names of a few who, like him, saw the beauty of the native lore and made haste to rescue it from the destruction with which it was threatened.

When Sir George Grey, that accomplished scholar and far-sighted statesman, became Governor of the Cape Colony in 1854, he requested all magistrates, officials, and traders to collect the stories told by the natives, and he established the Grey Library in Cape Town as a repository for such manuscripts and as a centre of work. He appointed Dr Bleek, the great student of Bushman lore, as its first custodian. Dr Bleek.

one may remark in passing, preserved the dying language of a dying race, and reduced it to writing—a work in which he was assisted by Dr Lucy Lloyd, his sister-in-law, and which is being continued by his daughter, Miss Bleek, who has also done much to discover and preserve the cave-drawings which show these primitive people to have been possessed of a remarkable artistic gift. Another scholar of note is Dr Theal, who, in addition to writing a history of South Africa, has found time to collect some of the native legends.

About the middle of the nineteenth century and later, the German missionaries did good work in Damaraland; but, with the exception of Bishop Callaway, the most enthusiastic among the missionaries appear to have been the members of the French Protestant Mission in Basutoland. They were the first pioneers, and as early as 1842 Arbousset and Casilis began to take down the stories from the lips of their converts; and their work to-day is being carried on by M. Jacotet, who has published volumes in French and in English, but is unhappily hindered by want of funds from publishing his most recent work. Others are in a like difficulty, and, through lack of a Folklore Society such as existed in Cape Town in 1879–80, much good material is wasted. Here and there some enthusiast gathers together a few stories, which are published in a tiny pamphlet by a small local press. The edition is limited, and in a year or two runs out, and so the fairy-gold of South Africa is squandered.

II.

But now to the stories themselves. Roughly, these may be divided into two groups—the animal tales or fables, which are generally satiric in character and full of humour; and the romances, in which gallant warrior-chiefs, beautiful princesses, and the dreaded witch-doctor play their part.

These romances appear to belong chiefly to the Zulus and the Basutos, both of whom are superior in intelligence to the great majority of the South African peoples, and it is mainly from their stories that quotations will be made.

In all probability the reader will not at first be attracted by the legends, for up to the present no one has attempted to give them a literary form. He will be wearied by the tedious repetition, and he will be repelled by the grossness natural to the native mind, but he will assuredly be rewarded if he will but persevere.

To many the unfamiliar setting will be a drawback; but is there not charm in all things new? True, the reader will look in vain for the knightly graces of the Court of King Arthur, or the beauty of La Belle-au-Bois-Dormant; nor will he find any figure to compare with Puck making merry in the heart of an English wood, and directing the revels of His Majesty King Oberon through the brief darkness of a summer night, till the gay carol of the lark heralds the dawn. But if romance be in his soul, he will come to recognise the majesty of the native chief, wrapped in a mantle of skins and crowned with a head-dress made from the many-coloured plumage of the wild birds of the veld; he will look with wonder on the beautiful dark-skinned maiden adorned with anklets and armlets of shining brass; and in the witch-doctor standing on the hilltop, with rod raised towards the pitiless blue, praying for the mercy of the rain, he will find a figure not unworthy to rank with the great enchanter Merlin. The wonder and the beauty are there to all who have eyes to see. There is moral grandeur too, and in the figure of Senkenpeng, the Basuto girl who consented to sacrifice herself to Bulane, the Water-God, we have a maiden victim who may rank with Jephthah's daughter, Iphigenia, or Andromeda.

Through the ages poet and artist have taken the legends of East and West and have woven for them the fairest of raiment, but strip them of all their trappings, and in their naked beauty they are essentially the same as the stories of the South; and so much do they resemble one another that they seem as the children of one family, some of whom have been carried away to dwell in palaces, while others have been left to wander over the sun-steeped veld or to hide within the untrodden forests of Africa. One day—unless Romance be dead—there will surely emerge a writer who will give shape and form to these primitive tales, and raise them to the place which by right is theirs. The Hans Andersen or the Perrault of South Africa has not yet come forward, but among the natives there will assuredly some day arise one who, bearing in his heart all the traditions of his people, will lift these stories into the front rank of literature.

The statue lies within the marble, waiting only for the hand that shall release it.

III.

One of the most beautiful of the legends, which is found in varying forms, bears a close resemblance to that of Cupid and Psyche. A girl—usually one who has been neglected and ill-treated in her home—is carried away by an unseen husband, whose face she must not seek to look upon. She dwells alone, tended by invisible servants, until after the birth of her child. When the child is a year or two old, she receives permission to return and show the little one to her friends; and after the visit is over, she is welcomed back by her husband, a great and renowned chief, who openly claims her as his wife.

Again and again we come across the Enchanted Prince condemned to wear the form of a hideous five-headed snake until he is redeemed by a maiden bold enough to take him for a husband; and there is a startling familiarity in the history of the Princess whose tears, falling into a pool,

bring to her aid a Frog. The Princess does not weep for a lost golden ball, but because she has been ordered to take for her husband a foster-brother, and thereby offend against the custom of her tribe. The Frog puts an end to her troubles by swallowing her, carrying her back to her father's kraal, and restoring her to the mother who had left her on the veld, a helpless babe, and had returned to find her darling carried away.

Here is Callaway's version of the meeting between mother and daughter, the beauty and the simplicity of which need no comment.

'She took her brass rod, and went and entered at the gateway, and she passed across the cattle-enclosure; she went in the middle of it; she came to the opening, she went out, and entered the house of her mother. Her mother followed her into the house and said, "Whence comest thou, damsel?"

'She said, "I am merely on a journey."

'The mother said, "Tell me."

'She said, "There is nothing. I am merely on a journey."

'The mother said, "Women are satisfied who have such fine children as you. For my part, I am in trouble; my child was lost; I left her in the valley; she died there."

'The child answered, saying, "Why did you leave her? Did you do it because you did not love her?"

'She said, "No; the Queens made me forget her. They would not allow the nurse to carry her."

'She said in answer, "No. There is no woman who can forget her own child."

'She said, "No; it happened through my not being accustomed to carry a child; for she used to remain with the nurse."

'She said, "Yes; you did it because you did not love me."

'She began to look very earnestly at her; she saw that it was her child.

'When she saw her she rejoiced. She lauded her with the laud-giving names of her child. The mother took her robes, and girded herself; she took her head-ornament, and put it on her head; she took her petticoat, and put it on; she took her staff and went out; she leaped for joy and "Halalaed;" she went into the cattle-pen; she played, leaping with joy. The people wondered and said, "What has happened to Untombinde to-day? Why does she rejoice so much? Since the time her first-born died she has never rejoiced, but has constantly been sorrowful."'

In time the lost Princess is given in marriage; and here are the words in which she resigns herself to the care of her husband's father:

'She took brass, and placed it before her father, and prayed, saying, "Sire, take care of me for ever, for now I am in thy hands, preserve me."'

The wicked Queens—in other words, the jealous wives of the chief—play the part of the cruel Stepmother of Western story; and the Cannibal, the dread monster who carries off his victims in a bag and roasts them, corresponds to the Ogre of nursery lore. There is also a wicked old woman, Longtoe, who devours children, and whose approach is always heralded by the cloud of dust raised by her enormous toe, —surely first cousin to the Witch in high-peaked cap so familiar in European lore. In fact, the *dramatis personæ* of our own fairy-tales are all here in slightly different guise. We have the birds who carry messages, and the mouse who guides the traveller on his path. We have talking trees, and strange instruments of music, which, untouched by human hand, breathe forth sweet sounds. There is, moreover, a wonderful world beneath the sea where life goes on much as on land, and upon whose rich pastures vast herds of cattle graze peacefully; and there is a land beneath the earth, the Kingdom of the Dead, to which men have strayed like Ulysses of old. There is a Heaven Kingdom, too, to which one may journey by climbing a great tree which has its roots deep in the earth, and of which the branches are lost in the clouds.

Here is a description, taken from one of Callaway's stories, of this Heaven Country, into which a brother and a sister had climbed to escape the pursuing cannibals.

'They found a very beautiful house there; that house was green, and the floor was burnished; and the country of the upper region was very beautiful; they walked about there continually, and looked at it, for they saw it for the first time. But the earth they saw was at a great distance below them.'

IV.

The writer is not rash enough to offer any suggestion as to the origin of these romances. Probably they date back to the far-off dawn of human life, when, in the beautiful Sesuto phrase, 'the world was fresh from the hand of the Creator.' It is patent, however, to the most unlearned and uncritical observer that numbers of the stories have come from the East, brought probably by the Arab traders who are known to have penetrated far South, doubtless in search of slaves for the market. One of these legends, 'The Rock of Two Holes,' bears a marked resemblance to the 'Open Sesame' story. Within the rock cavern dwells a cannibal, and at his voice, and his alone, the great wall of rock swings open. To what words it opens we are not told, but, oddly enough, sesame plays a part in the story. His victim who escaped, a girl, scattered sesame—a favourite dainty with cannibals—on the ground, and thus kept her pursuers occupied until she reached the giant tree, which she climbed, and which brought her safely into the Heaven Country.

Two stories at least seem borrowed from the Old Testament. In the one we have a chief who delivers his people from the dominion of a conqueror, and, by lifting his rod, causes the waters of a deep river to part and let them pass to the other bank in safety. We have also a story recalling that of the Tower of Babel. A tribe eager to reach the moon, 'the shining plate of the Lord,' build a great tower, that they may grasp the bright treasure and bring it to earth. The tower falls, and all the men and women of the tribe are crushed beneath its ruins. The children alone, who were playing in the kraal at some distance from the scene of the disaster, are saved.

The story of the youthful virgin-mother who gives birth to a son fairer and wiser than any child who ever saw the light, and who, when he reached manhood, went from place to place healing the sick, is surely an echo of the teaching of the early Portuguese missionaries who followed in the footsteps of Diaz and Da Gama.

Mention has already been made of the wearisome repetition often found in these stories. This is due, doubtless, to the fact that the stories have for generations been handed down by oral tradition only. Children—and the natives are but grown-up children—are not wearied with the repetition of an incident, and, moreover, the narrators have a great dramatic gift, and the telling of the story is enlivened by change of tone and by gesture.

One must say a few words about the beauty of phrase which is characteristic of the stories. Our traditional 'once upon a time' gives place to 'uncounted years ago.' The waning moon has been 'eaten by time' or 'devoured by the days.' Travellers on a long quest 'journeyed until that moon died.' A witch-doctor in preparation for his mystic calling 'becomes a House of Dreams.' The beauty of a girl is 'like the good green grass refreshed by rain.' A girl drawing water knew, through that telepathic sense so strong among the natives, that her sister had been carried away by a monster, and we are told that she 'felt her sister's departure.'

In conclusion, one is impelled to quote the beautiful blessing of the Basutos, a benediction unsurpassed in any tongue: 'May you go softly all your days, and may your face be as the morning sun!'

REDRIB.

THE LIFE-STORY OF A BROOK TROUT.

By H. Mortimer Batten.

I.

REDRIB never knew his mother. He was hatched in a tiny, sandy-bedded pool away up on the heights of Bareface Mountain, together with teeming thousands of similar minute fish-life, perhaps 1 per cent. of which would grow into adult trouthood. Early enough the weeding-out process began, and we shall see how this multitude of little fishes dwindled to the merest few ere the lush green grasses overshadowed the lower levels of the burn.

When first Redrib was hatched he was, like his brothers and sisters, a perfectly formed little fish, except that to his underside there clung a little oval bag of glutinous substance. This was the yolk of the egg from which he came, and it supplied him with sustenance for many days after his birth. Each day the appendage was smaller, each day Redrib himself a little more developed and a little livelier, so that when the natural food-supply gave out he was quite well able to pick up morsels of food for himself.

Hatched in the sandy pool, along with the thousands of tiny trout, were two veritable fiends of destruction in the hideous form of the larvæ of dragon-flies. Behind a pebble one of these would crouch with tail erect like a scorpion, and when a baby trout drifted near, it pounced upon him and drained his life-blood till only the empty skin remained. At the end of a week there were dozens of empty skins washed up on the sandy shore. But one morning one of the larvæ made the mistake of striking at the bill of a drinking grouse, and was promptly hoisted ashore, while on the same happy day the other was snatched up by a dipper prospecting among the pebbles on the bed of the burn.

In a fortnight the lassitude of their extreme infancy had left most of the young trout, and though they still spent the bulk of their time resting on the gravel-bed, they were capable of yard-long darts which served to circumvent the miller's-thumb and most of the deadly insect-life. Then came a heavy rainstorm, which swelled the burn bank-high and entirely altered the bed of it. Many of the tiny trout were swept away, many more were buried alive, and little Redrib, borne on by the tide, narrowly escaped a hundred different fates ere finally he came to rest in the deep dam of the water-trap. Vast number of his brothers and sisters were drawn over the weir into the underground culverts which supplied a throbbing city, forty miles from this wild region, but of these some might live, to become white, wall-eyed trout, existing underground in the

black, silent passages, perhaps for many years to come.

Redrib grew quickly, and by the end of June he was a perfect little brook trout, even to the red and black spots and the lustrous golden eyes. He would hang in the current under his favourite alder-bush with quivering tail and vibrating fins, pouncing upon any atom of food with the fury of a shark. Often he had colossal struggles with drifting worms larger than himself, and he would rise a dozen times at the same gauzy-winged Mayfly, till finally he wrecked it by a dexterous flip of the tail, when he and his nursery mates would tear it limb from limb.

Redrib was a born wanderer, but all his wandering tended in a down-stream direction, so that by this time he was a mile below the sandy pool, at a point where the bent allotments joined the heather of the greater heights. He knew nothing of the world without—how the air was filled with the wild calling of mother-curlews, mother-redshanks, and a thousand other anxious mothers of earth and air. His world—the world of that tiny stream—was one complete in itself, and for everything of the world of earth and air without there existed here an exact counterpart. The stream, too, had its hawks in the form of weird insects gliding above. True, they belonged to the surface, to the realms of air, but many of them could dive at an instant's warning and snatch their prey from the bed of the pool. The stream, too, had its stoats and weasels, which skulked among the shadows, ready to pounce upon the unwary. Then there was a vast assortment of minor life, much of which was leaving the water at this season, to creep up the grass-blades, and there assume forms more wonderful and startling, leaving behind the empty husks of aquatic days.

II.

August brought a long drought, and the tiny brook dried up to the merest trickle. Soon even the trickle ceased, and there remained only a pool here and there, filled with the brightest, clearest crystal that ever percolated through a gravel-bed. In one of these pools, not more than three yards long and two yards wide, Redrib was land-locked with a hundred of his friends, and—worst of all—a last year's trout, eight inches in length. They were in little danger of starvation, for flies were plentiful, but the unnatural condition of things brought about many a real menace in other ways. To begin with, the last year's trout turned cannibal, and hid in a shadowy nook, which he never left except to dart upon some unwary mite that drifted by. He would doubtless have accounted for all of them had not two wild-cats, the sole survivors of their kind in the district, taken to haunting the burn at this period. One day they appeared on the bank, glowering down into the water with vicious yellow eyes. The little trout knew instinctively that the felines were dangerous, and Redrib, wise in his generation, immediately hid under a pebble and 'nuffin' said.

One of the cats crouched at the narrow neck of the pool, while the other walked along the bank, and drove the frightened fish under the very nose of his waiting accomplice. The yearling's nerves gave out, and he darted from his hiding, to be scooped into the air by one lightning sweep of the crouching feline's forepaw. Three other trout were caught ere the cats left the pool—two of them being grovelled from under the bank by the groping forepaws of the fur-clad anglers.

Some of the little trout died of fright after this adventure; several more were swallowed by a kingfisher; and the owls which, like the cats, had taken to hunting the burn as its waters dwindled away accounted for so many of Redrib's friends that ere, finally, the rains came there were scarcely a dozen of them left. It is thus that nature's whole balance is upset when man steps in; for ages past the trout had deposited their spawn in this burn, and so long as there was water enough in winter for the spawning fish to reach their recognised 'reds,' they would continue to do so—yes, even though that distant city stole all the summer supply, and left their children stranded in pathetic little ridges among the pebbles.

At length, with the veering of the wind, there came a mighty flood, and Redrib, now strong enough to battle with it, swept joyously down-stream, feasting as he went, till he reached a still, shallow stretch of water with a bed of silver sand. In this loch were flashing multitudes of little trout—not one of them more than eight inches in length. It was the nursery of the spawning brook, for, being only two acres in area and nowhere more than three feet in depth, it offered no attraction for larger fish. So here Redrib rested a while, feasting and splashing with his fellows, and nowhere in all the world was a merrier, safer nursery than the loch of silver sand.

III.

The autumn faded by, the water became icy cold, and Redrib spent most of his time under a flat boulder, not exactly hibernating, but somewhat torpid. This was part of nature's scheme of protection, for now there began to appear many adult trout, all voyaging up into the hills as Redrib's mother had voyaged the year before. Many of them were mammoth fellows—black, gaping leviathans; and though all were obsessed with the desire to travel, the old bulls would have played sad havoc in Silver Loch but for this period of winter torpor which caused the tiny fish to hide.

When April came Redrib was a fine yearling trout of seven inches in length, and now, with the desire to travel once more upon him, he threw

in his lot with a devil-may-care band of youngsters at the tail-end of the adult procession passing down-stream. So Silver Loch was left, and down over many a sparkling weir, across many a deep and shadowy pool, Redrib and his mates splashed their scintillating way. In one of the pools he had a narrow escape, for suddenly from the depths below there rose a strange, waving shape. Straight at the little trout it came, a hideous, writhing, serpent form; but, luckily for Redrib, he kept his head and did not attempt to aspire to the heights of a flying-fish. He darted to left and right like a startled snipe; but the little fellow nearest him, who made for the surface and jumped, fell back into the jaws of the eel, and there his history ended. Thereafter Redrib knew that when travelling strange waters it is best to keep to the edge and avoid the shadowy depths.

Another month of idle travelling brought little Redrid to yet another loch—this time a noble sheet of water of profound depth. The name of the loch is Colgart, and on its mighty rocky shores the peregrine and the buzzard have their nests, hidden from the four winds by nature's towering buttresses. Dangers enough had beset Redrib's voyagings hitherto, but they were as nothing to the dangers that existed here. Here he could never have survived his helpless infancy, and thus we see the wisdom of the guiding hand which takes the mother-trout away into the tiny springs to lay her eggs, where the little ones will be safe at any rate from the greatest of their foes—their own kind!

Redrib arrived in Colgart just in time for the Mayfly hatch, and during the days that followed the surface of the loch was literally brown with gauzy-winged life. All day Redrib, with armies of his fellows, rose and splashed along the shallow margins, gorging to repletion, then wrecking flies for the fun of the thing. Redrib grew at an alarming speed, and his dashing energy would have been bewildering to watch. He took an immense joy in being alive, and very often he tried his strength with his fellows. One of these fights resulted in himself and another fish of the same size getting their jaws interlocked, and thus they struggled till the other fish, the weaker of the two, became limp and unresisting. Then Redrib struggled hard to swallow him. Of course, it was impossible, since they were both the same size, but for ten minutes Redrib persisted, till the other fish was torn and bleeding; and this incident, brought about by a contest for the possession of an insect turned from under a pebble, had the effect of influencing the whole of Redrib's future career.

Though the small fish kept to the shallow water of the loch-margin, the night was a veritable horror to them, for with the coming of darkness there rose from the shadowy depths many a big black form, to feed upon the narrow shelves. More than once a movement in the water warned Redrib to skedaddle for his life, and glancing round as he darted off, he would see a pair of mighty gaping jaws with hooked teeth pursuing him—see two savage golden eyes of horrifying size sweeping towards him through the blackness. Once he was driven ashore by one of these giants of his own kind, and there this story would have ended had not a friend once more appeared in the disguise of a mortal foe. Redrib was drifting idly when his mammoth relative rushed at him from the depths, and Redrib, having cleverly dodged, made, as usual, for the shallow water, where the big fish would be at a disadvantage he himself would not share. But the cannibal trout persisted, rushing along with tremendous noise, his broad back out of the water, till Redrib, darting and dodging, found himself suddenly high and dry on the gravel-bank. And there he struggled and gasped, while his adversary lingered not a foot away watching him fiendishly. Another kick and Redrib would have been between those awful jaws, but at that very instant the gray post standing near suddenly transformed itself into a bird. Two big gray wings wafted the air, and with one sedate and ungainly hop the heron reached the spot. A lightning stab of the bayonet bill, and the big fish, impaled through the eyes, was dragged and jerked up the gravel-bank, leaving behind a streak of crimson on the crystal flood. And while the heron strove to swallow the mammoth of the depths, good luck and gravity, rather than sound judgment, took Redrib back to his natural element.

Other narrow escapes Redrib underwent ere the cold and leaden touch of winter settled upon the mighty loch. Once one of the party of cormorants which had their stronghold on the lonely island in the centre of the loch pursued him hither and thither till his breath gave out, and it was only because a perch, no longer than himself, but a good deal heavier, dashed out to swallow him, and itself got swallowed, that he managed to escape.

But Redrib's enemies became fewer and fewer as he himself grew. Once he fed with gusto on the larva of a dragon-fly of the kind he once had dreaded, and now he found that when he erected his dorsal fin and opened wide his jaws the smaller fish fled from him towards the shallow water. He no longer frequented the extreme edge, but moved with the medium weights between the sunny shallows and the murky depths; but it is to be feared that very often now he voyaged shorewards, and returned a few seconds later with a little pink tail showing between his jaws.

IV.

That winter Redrib mated with a female trout of his own size and age, though she was smaller in the head and more rotund of figure.

Together they journeyed up the burn to Silver Loch, sometimes struggling for hours till completely exhausted to mount a rocky shelf, but always in the end their efforts succeeded. On and up they voyaged, obsessed by the one desire to gain some distant point, and though it is not to be expected that Redrib should recognise the place, their voyagings at length ceased in the very pool where he was born.

Here the female trout got busy making her nest, which she did by nosing away the gravel in a long groove running lengthwise with the stream. In this groove she laid her eggs, covering them with sand by the movement of her big underfins; while Redrib helped at intervals by nosing the piled-up ridge back into place. The fertile eggs were sticky, and stuck to the end of the pool; the infertile ones drifted away so as not to foul the bed. When the whole batch was safely harboured the adult trout turned down-stream again, their parental duties faithfully and fully accomplished.

At Silver Loch Redrib dallied for a while, and the criminal tendency which had showed evidence at so early an age now rapidly developed. He was fiendishly hungry, and for days he wrought the most appalling havoc among the small fry of the nursery loch. Early spring found him still there, a wolf in the sheepfold; and when, finally, he decided to proceed on his leisurely way, he found the exit of the loch so shallow that he decided not to trouble. And so he remained in the nursery loch till a heavy spate in late summer fairly carried him out, and down to Colgart Loch he went.

If any further influence had been needed for the framing of Redrib's future, that period in the nursery loch decided it. All trout are cannibals more or less, but the trout that settles down to live exclusively on its own kind soon comes to bear, in every line of its being, the brand of the cannibal. That summer Redrib's head and mouth grew enormously. True, he put on weight all round, but the development of his upper parts was out of all proportion. He took to hiding in the deep waters, seldom stirring during the day, and at night ranging the shallow shelves like a frenzied tiger. The result was that the gold and silver left his flanks, which partook of the murky gloom of the greater depths. No longer a creature of the sunshine, no longer a joyous nerve of life in the dancing, sparkling spray, we leave him now for a while to the sombre depths in which so many of the mysteries of his life were hidden.

V.

Few wild creatures, whether of earth or air or water, die by the natural course where they have lived. Sooner or later, when their prime is past, there comes the call to wander off; and twelve years after the day that a tiny bright-eyed brook trout glanced and flashed from the loch of silver sand towards the great world of the lower loch, a mammoth black trout sallied forth from the depths of Colgart on a last fierce voyage of discovery. Men would have told you that this creature was of the black loch species, and had you said, 'This is a common brook trout,' few would have agreed.

Redrib was now an eight-pound fish, but had he been perfectly proportioned he might have scaled twenty. His head and his fins were huge; his tail would have been huge but that the lower half was worn away by constant contact with the sand. Down from the loch to the river he went, travelling once more through sparkling, flashing water—down, and still down, amidst drifting blossoms, till the hills were left behind and green meadows spanned the valley. More than one angler he encountered *en route*, leaving them gaping at their tackle, himself hardly aware that a hitch had occurred. So in due course the meadows too were left, and the river wormed its dark and oily course between the gray walls of a city.

A row of little urchins sat with dangling legs at the quayside fishing for the swarms of minnows invisible in the depths below. One of them, more ragged even than the rest, with a willow wand for a rod and a length of string for a line, suddenly scrambled to his feet with a frightened shout, clinging to his primitive tackle for dear life.

Redrib had seen the swarm of little fish drawn by the common attraction of the line of baits, and had dashed into their midst out of sheer ferocity. All of them scattered but one, which was in the embarrassing predicament of having just swallowed the urchin's bait, and him Redrib swallowed with a snapping and a worrying of mighty jaws.

By some whimsicality of fate, there was no flaw in that urchin's tackle. The string was sound; the knots were good; the small-eyed hook refused to snap. Steadily, remorselessly, Redrib was drawn to the top, lashing the water into foam, and two loitering bargemen lent a willing hand in sealing his ignominious fate.

Thus, washed up with the dregs of the human city, filtered with the driftwood to the outside edge of the loch of men and women, he who had been great among the small, a despot of the depths, fell to the smallest and least, the humblest of all human anglers. But about the silver bed of a lonely little loch, away back in the hills, there sported a new generation of yearling trout, each weaving its own life-history, a fabric of bright and scintillating shades—in the making of which the turning of a pebble, like the breaking of a thread, might decide the texture for good or ill, a thing of coarseness or of beauty incomparable.

THE 'JOLLIES'—A REUNITED AND HAPPY FAMILY.

By Lord Teignmouth.

THE Admiralty have announced the approaching amalgamation of the two Royal Marine corps. Thus, after an independent existence of rather more than a century, the Marine Artillery, or 'Blue Marines,' are to be absorbed into the parent stem from which they originally sprang. The measure has been long overdue. But sentiment has always intervened, and it needed the Great War to supply the necessary impulse.

The fact of there being two distinct corps of Royal Marines will doubtless come as a surprise to many civilians. And as the divorce arose out of a situation which reflected very little credit on the naval service of the period—in connection with an episode that has slipped out of recollection, even in the navy—it may be well to recall the facts.

And first it must be explained that throughout the entire period of our last great war (the Napoleonic struggle, 1793–1815) there was no established system of gunnery instruction in the British Navy. Every ship was left to its own devices in this vitally important matter, with the inevitable result that in many instances the science and the practice of gunnery were shamefully neglected. The principle on which most captains fought an action was to lay their ship alongside the enemy—within 'close pistol-shot,' so that their gunners 'could see the whites of the enemy's eyes,' and thus could not fail of hitting the target.

This was all very well, provided the enemy could be brought to 'close action;' but there were occasions on which this lack of training proved disastrous. Let the following two examples suffice.

In the year 1794 a squadron was ordered to capture the town of San Fiorenzo, in the north of Corsica. It was necessary first of all, however, to destroy a tower, at the entrance to the bay, commanding the anchorage. The tower mounted only three guns—one twenty-four-pounder and two eighteen-pounders, garrisoned by thirty-three French soldiers under command of Ensign Thomas le Telier—not a very formidable work for a British squadron comprising line-of-battle ships to tackle. To make sure of the business, however, troops and guns were landed in order to bring their fire to bear from a height, and arrangements were completed for a joint-attack by land and sea the following morning.

The naval attack was entrusted to the *Fortitude* (seventy-four guns, Captain W. Young) and the *Juno* (forty-two guns, Captain Samuel Hood), which vessels, after keeping up an unremitting fire on the tower for two and a half hours at fairly close range, without making any visible impression on the work, drew off out of gun-shot, the *Fortitude* with her mainmast badly wounded, many of her shrouds cut away, three of her guns dismounted, many shots in her hull, on fire from a red-hot shot sticking in her side, and with a loss of six killed and fifty-six wounded. The *Juno* escaped with trivial damage and no loss of life.

The fire from the height had been equally ineffective; and it was not until heavier guns had been brought to bear from the same spot, and red-hot shot poured on to the devoted garrison—by which means the bass-junk lining of the parapet was set on fire—that these brave and skilful gunners, only two of whom were wounded, were forced to surrender.

Most justly does our latest naval historian refer to the exploit of these gallant Frenchmen, who, with three guns, beat off a naval force of 1000 men and 118 guns, as 'a really magnificent defence.'

Two years later, on the final abandonment of San Fiorenzo, an equally discreditable exhibition of British naval marksmanship was afforded. While the last of the stores were being removed from the beach, hostile 'snipers' kept up a constant fire on the boats. 'One man, with peculiar audacity and firmness,' wrote an eye-witness, 'took possession of a point of rock within musket-shot of the *St George* (ninety-eight guns), and continued firing at her, undaunted by the fire of several guns directed upon him from some of the line-of-battle ships; until, having, as was supposed, expended his ammunition, he rose and walked deliberately away.'

British gunnery must have been a standing joke in Corsica for long afterwards. And the surprising part of the business was the utter inability of those concerned in these shameful exhibitions to learn the lesson conveyed: an inability destined to bear most bitter fruit later on, when our ships encountered the highly trained gunners of the United States.

Lord St Vincent—Captain Jervis, as he then was—in reporting, two years later, the destruction of the tower to the officer who suffered such a discreditable defeat at the hands of its garrison, wrote, 'I have the satisfaction to acquaint you that the Martello Tower is reduced to a heap of fragments;' and wound up with an allusion to 'the spirited attack you made upon it in the *Fortitude*,' as if that was something to be proud of, instead of very much the reverse.

One result of this indifference to the art of gunnery was that when the bombardment of Calais, Boulogne, and other French ports was undertaken in 1804, soldier artillerymen, under their own officers, had to be embarked to work

the mortars. Now, the tars of those days had the most supreme contempt for landsmen, and especially for soldiers, whom they would refer to as 'having nothing to do but pipeclay their breeches.' And as the artillery officers were young and high-spirited, they resented this affected contempt, and quite naturally objected to being under naval discipline, being often commanded by naval officers much younger than themselves, with the result that there were constant bickerings. It was this friction that drew from Lord Nelson the plaint: 'There is no real happiness in this world. With all content and smiles around me, up start these artillery-boys—I understand they are not above that age—and set us all at defiance. It would be better for the navy to have its own corps of artillery.'

The outcome of the trouble was the establishment of the Royal Marine Artillery, a body of skilled gunners obtained by selecting intelligent men from the Marines and passing them through a special course of gunnery training. Following the custom of the army, the men were eventually clothed in blue and organised as a distinct corps—and admirable service they have rendered ever since. The finest eulogium ever earned by a body of fighting-men was that accorded to a battalion of the newly organised Marine Artillery serving under Colonel Charles Napier, the future conqueror of Scinde, at the sack of Little Hampton during the war with the United States. 'Never in my life have I met soldiers like the Marine Artillery,' he wrote; 'we suffered much from fatigue and hardship, but never was seen anything not admirable in these glorious soldiers. Should my life extend to antediluvian years, their conduct at Little Hampton will not be forgotten by me.'

The particular circumstances which called this splendid corps into being have long passed away, however. Gunnery is now recognised as the *raison d'être* of the navy. The existence, therefore, of a special corps of artillerists is not only an anachronism, but an implied slur on the naval service. The proposed amalgamation has not even the merit of novelty. As long ago as 1841 Admiral Sir Jahleel Brenton wrote: 'The custom of making a practical gunner of every man in the ship by the system so happily pursued on board the *Excellent* has rendered this distinct branch of the Royal Marines unnecessary.' No one, therefore, can accuse the Admiralty of undue haste in effecting this reform.

The sequel to the 'Battle of the Tower' in Corsica was a singular one. So deeply impressed was Lord St Vincent with the defensive properties of what he termed 'this powerful, though simple fortification,' that he caused a model of it to be made and presented to Lord Cornwallis, together with the expression of a hope that he might 'see such works erected on every part of the coast of England likely for an enemy to make a descent on.' The suggestion took shape early the following century, at the time of the 'Invasion Scare,' when a line of Martello Towers was erected along the south-east coast; and very useful they proved—after the war!—as barracks for the men of the Coast Blockade service, a force established for the prevention of smuggling.

The coincidence is not a little singular, though it has escaped notice, that Napoleon, 'The Scourge of Europe,' and the towers erected to keep him out of England, both originated in the island of Corsica.

The origin of the word 'Martello' has been variously assigned in our gazetteers and works of reference. There is, however, no real mystery about it. Old French maps of Corsica give the name of the tower as 'Torre Mortella'—so called from its proximity to Mortella Point. Now, as *mortella* signifies 'myrtle' in Italian, one naturally concludes that the promontory obtained its designation from the abundance of myrtle growing around. Our name, Martello, is simply an English corruption of Mortella, which came into vogue amongst the naval officers employed in Corsica—*vide* Lord St Vincent's letter. The only connection the tower can claim with a 'hammer' (the meaning of the Italian word *martello*) is the terrific hammering its garrison administered to a British seventy-four-gun ship in 1794. It would have been a chivalrous act on the part of the British Navy to have allowed the tower to remain intact as a memorial of a really astonishing feat of arms on the part of a small French garrison. It would have been a still more graceful act to have engraved thereon the words that adorn our own noble structure of St Paul's: '*Si Monumentum requiris, circumspice.*'

PASTORAL REMINISCENCES.

By Sir George Douglas, Bart.

RECLINING high up on the steep slopes of Cocklaw, and glancing through warm dreamy atmosphere across the valley, I caught the sound of laughter and of shrieks, of bleating sheep and barking dogs. It was the shearers' dinner-hour at Kelsocleuch, and looking down upon the distant farm-buildings, I could make out the shearing-pen, the huddled unshorn sheep, even the 'teats of 'oo;' but not a human form was to be seen. All had withdrawn out of the heat. And the shrieks I heard, be it said, were uttered in the female register, subdued by distance, and were by no means those of genuine distress. So, as of old, in the days of Virgil and

Theocritus, there was daffin' and rude courtship by the sheepfolds.

The atmosphere, I have already said, was dim with mist—a pearly heat-haze, as of milk clouding clear water; so that dimness of vision, mixing with the drowsiness of summer noontide, came at last to engender dreams—that is, recollections; for are not these the old man's dreams?

I was once more a boy of eleven years—a schoolboy spending, not his holidays, but (ever so much better!) his term-time away from school. For, my elder brother having developed scarlet-fever during the vacation, the schoolmaster would have none of me; and so, to have me out of the way throughout the infectious desquamation period, I had been packed off into the hill-country and boarded with a shepherd's family. From my point of view this arrangement was ideal. In the first place, it carried with it all the privileges of illness without any of its penalties. In the second place, it meant being 'on one's own,' for the first time in one's life. And though the hill-country was not altogether new to me, the hill-life was entirely so. Can you wonder, then, that my six weeks of shepherd-life remain ever memorable? My host was a fine specimen of the Scottish Border shepherd—a noted wrestler, who in youth had thrown Noble Ewebank, the Westmorland champion. For my father's sake, he and his wife and family treated me, if not 'like a prince,' at least with a kindly courtesy such as I have never seen surpassed. As for me, I was, if anything, rather over-conscious that I owed it to myself to make a good impression. And if I did upon occasion presume to give myself some few airs, I sincerely trust and believe that these were foolish rather than aggressive. It was scarcely in my nature to throw myself actively into all that went on around me; rather was I an interested onlooker, drinking things in. And as, even in those conservative pastoral districts, the features of life have greatly changed since then, I trust that a few reminiscences gleaned at that time may be found not quite wanting in interest.

My constitution was exceptionally susceptible to impressions of the weird, and I shall never quite forget an impression I received one night, when the members of the shepherd's household were comfortably seated round the fire, the males reading, the women stitching. All at once, from without the circle and behind the shepherd's wife's chair, there spoke a voice which was not one of our voices, and, looking up, I saw a figure which was not one of ourselves. It appeared to have started up from nowhere, and must, as a matter of fact, have come noiselessly into the room, which, in a house where there were several dogs, was an unprecedented occurrence. The figure was that of a tall and fine-looking man—fine-looking, that is, in so far as any man can be whose eye has no 'speculation' in it. I saw at a glance that he was not as the rest of us were.

The single word he had uttered had been the harmless inquiry, 'Shirt-making?' which he addressed to the shepherdess—thus constituting himself one of the company without even going to the expense of a preliminary salutation. And as no one, excepting myself, showed the slightest astonishment at his intrusion, I at once regained my composure. The intruder, as I afterwards learned, was a half-witted wastrel, known as Daft Wull, whose life was spent in wandering through a wide segment of that country-side. Except when provoked, he was inoffensive, so that the kindly inhabitants of the district were content to treat him, as I have seen idiots treated in Roman Catholic countries, as a sort of God's Deputy. So Daft Wull never wanted for a meal or a night's lodging, and it was noted that the wise sheep-dogs never bayed his arrival. Long afterwards I heard that he had disappeared as mysteriously as he had come; for none of us had ever known his origin. It may be that he found burial in the shifting gravel-bed of some raging hill-stream; for, had he perished in a snowdrift, his bones must eventually have come to light. Or it may be that an unidentified body, cast away on Bewcastle Waste, was that of poor Daft Wull. Only once had I seen him roused. It was at the 'sheep-bathing,' when shepherds are employed in shedding their sheeps' wool, whilst an assistant, bearing a bottle fitted with quills at either end, pours an insecticide solution along the parting thus made. One of the young herds had 'yoked upon' Wull, and Wull could not stand it. He just lifted the full-grown lad with one hand, and chucked him, without a word spoken, over the half-door of the shearing-house. It was a trifling specimen of what he could do when occasion called on him, and it had no doubt its due effect.

It is said that the Scottish peasant inclines to associate all striking features of the landscape with the Devil, and, sure enough, a jutting boulder not far from Kelsocleuch was known as Split-the-Deil. But in this case the association was not with the authentic Prince of Darkness, but merely with a local character who had earned the nickname of 'The Deil.' The rock rose from the side of a blind road, and one winter's day, when it was crusted over with frozen snow, 'The Deil' was approaching it on horseback, in the teeth of a bitter wind, bearing a heavy load of hay. And, beneath that hay, it was shrewdly suspected that he had smuggled goods concealed. As he drew near, the wind snatched a wedge of ice from the rock and dashed it in his face, splitting the nose. As his offence was one against the laws of contraband only, I imagine that the community would be too large-minded to view his misadventure as a 'judgment.' It served the purpose, however, of giving the rock

a name which has stuck to it ever since; whilst, for ourselves, the reminiscence carries us back at least a century, into days when Free Trade bore a significance other than that which Cobden gave it.

The summer I am speaking of was one of memorable drought. If I remember right, there were two such in succession, and I believe there has been nothing to equal them in this respect until the summer of 1919, just half-a-century later. The hillside pastures burned, and the pools upon the Cheviot plateau shrank. And thereby hangs a tale, for many sheep, accustomed to drink there, got entangled in the peaty mud of the recently uncovered shore, and failing to extricate themselves, became submerged, or perished from starvation. Indeed, I well remember that on the day when we ascended to the summit of High Cheviot, we found more than one drowned carcass adding its touch of grimness to the austerity of the landscape, whilst rams' skulls, such as I afterwards learnt to associate with Rome, were in evidence to right and left. But, though the earth around us might be ugly, the atmosphere of that particular day was of especial beauty. The sky was pure, a light brisk air had made our ascent easy, and when we came to look down from the east end of the mountain-top, it seemed that the far-off surf-line of the North Sea lay almost vertically beneath us. Well, the unprecedented danger now being incurred by the sheep served to bring out a fine trait of devotion in one of the herds. He was an athletic youth, by name Bob Robson, who, on making his rounds one morning, found a ewe deeply bogged in the slough, and on the point of perishing. He made up his mind to save her. So, having stripped himself to the skin, he made a loop in a strong-grown tuft of heather, passed the crook of his shepherd's-staff through it, and keeping hold of the staff, plunged into the mud. He had soon grasped the bleating ewe with his disengaged arm, but the mud beneath his feet was bottomless, and had engulfed him breast-high ere he succeeded in dragging her ashore. After watching her recovery, it occurred to him that he was naked, and caked in peat-soil up to the nipples. So he set off to race across Cheviot-head towards the clear waters of the Mereburn, therein to wash himself clean. And now a ludicrous situation developed; for, though you may visit the Cheviot plateau a hundred times and find it vacant of human occupants, it so happened that a brilliant young Oxford student, who was at that time acting as tutor in a neighbouring family, had chosen that morning for climbing the hill to see the sunrise. He caught sight of Bob, was immensely impressed, and went home to write a letter to the London press, describing the singular survival of primeval usages in certain outlying districts of Northumberland—where to this day the natives may be found dispensing with clothes, and smearing their skins with a substitute for woad. Such, at least, is the tale as it was told to me. But let me add that, though I vouch for the truth of the first part, I am inclined to suspect the second part to have originated in the teeming brain of my friend Tom Crosby, a noted *farceur*, and to have been by him designed as a hit at a certain passage in Macaulay's *History*, in which the too credulous historian has described the savages of the Upper Tyne in the early days of the eighteenth century. Let future historians balance the evidence in the one case and the other.

The waters of the river Kale abound in eels, and a favourite night-ploy of the local herds at that time was the sport known as eel-shearing. It is quite distinct from eel-spearing, and consists in luring the eels to the surface by means of a flare, and then gripping them between the roughened points of a species of lazy-tongs manufactured by the Hownam blacksmith. In this manner whole sackfuls of the fish would sometimes be taken between the darkening of a Saturday night and the dawn of the next morning; and, as the eel is a shrewd biter, it is worth mentioning that he sometimes gave as good as he got. Being regarded as one in whose system the seeds of fever might be lurking undeveloped, like a foe in ambush, and who must, therefore, be guarded from wet feet and night-air, I was forbidden to take part in this pastime. But darkness and the motley throng of straggling sportsmen made it easy to evade observation, and when at last I did come face to face with my temporary guardian, it might be assumed that the mischief (if any) was already done, and that interference would now be too late. As this was one of the sports in which girls occasionally took part, romantic convention requires that I should have fallen over head and ears, not indeed into a pool in Kale, but in love. But though the setting moon shone on a scene of bewildering loveliness, and the girls were pretty and friendly, I distinctly recall the great efforts I made to avoid them, and to keep always with the men and the lads.

Nearly opposite Kelsocleuch, on the other side of the valley, there was a small dry-stone enclosure known as the Drovers' Park. Abutting on the Cocklaw hill-track, it was pastured indiscriminately, in terms of an ancient right, by drovers and by tinklers, who brought sheep or horses over the Border. Well, one night, whilst I was still an inmate of the shepherd's house, a company of gipsies, driving horses, took up their quarters in the park. Their arrival instantly attracted us youngsters to the enclosure, and the gipsies were so far friendly as to make some slight use of our assistance in watering horses, collecting fuel, and the like. The alien nomad life was full of interest and fascination for us, and the fine young horses running loose fulfilled the measure of our

delight. But the spirit of mischief still predominated; so that, when the tinkler fires were burning low, Tom Elliot remarked to my host's son, Mark Davidson, what fun it would be to enter the enclosure while the gipsies were asleep, drive off the horses stealthily, and conceal them within the Kelsocleuch stell, or sheepfold. This proposal was quite in the spirit of the old Border reivers, whose blood beat in the veins of all of us, and, of course, it found immediate favour. And so, after a night of eager wakefulness, the gray of morning beheld Mark Davidson steal forth, bearing a feed of corn. Reaching the park, he set the gate wide, unhobbled the gipsy horses, and mounting one of them, led the others to the hillside. As we watched his movements from our distant coign, Kinmont Willie seemed to live again.

But the gipsies were light sleepers. A vague sense of something wrong roused one of them, and in a moment the theft was discovered and the hue-and-cry raised. Mark heard the volley of threatening shouts which was sent after him as soon as he was sighted, but instead of pausing or turning back, he only pushed on faster than before. Then the hillside became alive with gipsy men, women, children, and dogs, all pursuing, or urging the pursuit, whilst Mark ambled gloriously forward, driving the captured steeds before him. Alas! he was a better herd than rough-rider; the ground was uneven, his horse stumbled, and down he fell. Ere he could rise, the leading gipsies had gained on him, and as they were reputed to be very formidable customers, there was a moment when we trembled for his skin. But at this juncture an opportune diversion was effected; for it happened that Jasper Midway, the fat farmer, was bringing a pig over the Border, from Uswayford, by the drove-road. Startled by the unusual disturbance, his pony bolted, and overturning the cart, rolled Jasper and the pig together upon the bents. None of them was hurt; but the pig had regained its liberty, and meant to make the fullest use of it; whilst the farmer had no mind to lose the pig. Accordingly a new and even more absorbing chase began—the little pig darting hither and thither, and the big farmer pounding after it. And so overpoweringly ridiculous was this hunt to look upon that the defrauded gipsies were fain to hold their sides for laughter; and when at last old Jasper had caught his shot by the hind-leg, and had fallen on his corporation in doing so, they were quite ready to forget the trick which had been put upon them, and to fraternise with Mark, or Jasper, or any other body in the little crowd that had gathered round them. For laughter is a potent humaniser, solvent of frets and grudges of all kinds!

MERSEY TERRIERS.

By OSWALD WILDRIDGE, Author of *The Luck-Penny*, &c.

WITH the tide at the half-flood mark, the gates swung slowly back into the lock-pits, and the fleet of tugs made a bolt for the open river, looking for all the world, as Captain Enoch Carron put it, 'like a pack o' terriers'—a frisky, boisterous pack, some of them making a rakish cant as the helm was thrown hard over, and every one tossing up a flurry of creamy foam. Soon, however, the pack ceased to be a pack. Three of the boats sheered away to the north, heading for the spacious freedom of Liverpool Bay; five of them rounded-to by the jetty, and there made fast to await a further call; a couple cut across into the fairway, where they snuggled in by the hull of a Cunarder, which, in spite of her power, would be unable to find her berth in dock without their help; and the rest, having been ordered south, scurried up the river to Birkenhead, to the Sloyne, and to the gates of the ship-canal at Eastham. As for the *Tuskar*, from whose bridge Captain Enoch Carron watched the varied manœuvres, she had been locked-out on river duty all the night, and was now dropping down to the jetty for instructions.

'Just like a pack o' terriers,' Carron repeated, clearly well pleased with the phrase; 'and some of them,' he reflectively added, 'are every bit as queer in their ways. That's one of the things about tugs. Now, take a sight of this squad. Most of 'em look as much alike as a handful of peas; half a mile off a landsman couldn't tell t' other from which—even a lot of deep-sea men wouldn't manage much better, and yet there isn't two of 'em alike. For the folk who live with 'em, they've all got points which make them a bit different in their looks, and if you want to know how much different they are in their ways, you'd better ask their skippers.'

Here he made a turn across the bridge, murmured a call to the mate, who was steering, for 'a bit more starboard,' and then began again: 'That's it—different in their ways. Like you and me and other folk. They've all got manners and customs of their own. You may turn half-a-dozen tugs out of the same yard, all the same length and draught and beam, driven by the same engine-power, built t' the same specifications, and yet some of 'em 'll do things what none of the others will, and the cleverest swab ashore or afloat can't tell the reason why. F'r instance, here's the old *Tuskar*. I'll own she's got a few tricks she'd be better without, but when it comes to answering the bell she's a reg'lar duck. And

as it's time I was getting the way off her, I'll show you, if you'll keep your ears tuned up.' Whereupon he signalled for 'half-speed astern,' and while his hand was yet on the telegraph-lever the deck jarred violently beneath our feet, the hull shivered and groaned, and under the stern the water broke into wild commotion. 'What did I tell you?' the skipper demanded. 'She was going astern before the bell was done speaking. That's how a tug ought t' be, and in a foreign docking commission I'd part with a chunk of her horse-power before I'd part with her obedience. Now, that's the *Tusker*. And yonder, there's the *Tuscan* standing-by that Swedish trag—might be sister-ship t' this one for size and power and general build, but *she* doesn't answer on the dot, not by ever so many seconds, and so she's mostly put on t' third-rate jobs.

'What's that? Ay, ay, I dare say you're right. Mebbe it isn't much of a mystery, one set of engines being a bit slower than another; but then it isn't only engines. Often enough it's the boats themselves, and it's there you run athwart the things you can't explain. Now, there was the *Porcupine*, that I was in ever so many years back. She was an out-an'-out wall-crab. A lot of boats have a fancy for a wall, as I dare say you've found out for yourself, but the *Porcupine* beat the band. Set her against a wall and she'd stick closer than a brother. Simply wouldn't come away. You'd think sometimes you'd have t' go overboard and push her off, and many a time I've thought I was going t' shake all her rivets out before I could get her t' budge. That was the only cranky trick she'd got. Out in the fairway she'd come about like a yacht an' do anything I asked her t' do.

'But I think the rummiest craft I ever handled was the *Dauntless*. She was a grand boat, too. Did some of my biggest deep-sea tows with her. Set her in a seaway and she'd stand up t' the heaviest wind that ever blew; but if you asked her t' come out of dock with a bit of weather on, she'd jib like a horse at a brow. And how d'ye think I used t' manage her?' Here the skipper's face expanded in a magnificent grin. 'Why, I used t' turn her round and back her out. Against a strong wind and tide she'd come through the locks a mighty sight better stern first than head on. Now, it's gospel truth, is that. Don't know why she did it, and I only found it out by accident; but it's the truth. Set her stem on to it and she'd jibe and do everything she shouldn't do; but drive her stern first and she'd manœuvre as easily as though that was the proper way t' go about it. So it's what I'm telling you: they're all different, have all got ways of their own, and you can't show rhyme or reason for it. But here we are at the jetty, and that puts an end t' my preachifying. I'll away t' the office and see what's stirring.'

So far as the captain was concerned, this was indeed the end of what he pleased to call his preachifying, but he had touched the strings of memory, and a host of other happenings came trooping out of the past. There was, for example, the case of the *Titan*, or, better still, that tremendous baptism the Mersey gave me on my day of introduction to its 'pack o' terriers.' Our mission was the docking of a Houston liner in one of the branches of the Queen's Dock, the *Tartar* being told off for service on the bow, and the *Trojan* being given the greater task of hanging on to her stern. From the shelter of the Canada Basin, while a hurricane wind boomed overhead, we watched her go by; and then, side by side, the tugs gave chase, but long before the liner was 'rounded-up' Mistress Mersey had convinced us of her temper. Not that her conduct provoked any sense of resentment. Had the jade but known it, that four-mile run in the teeth of her tantrums made a passage of delirious delight. At no time is there any make-believe in the tug's deportment; she is built for business, and to business she strictly attends. Moreover, heavily engined as she is, she has no taste for fancy work, and so she goes smashing through everything she meets, where other craft might make a show of buoyantly riding across the tops. And because of this we played a lively game upon the bridge; across the canvas dodger we watched for the signs; when the spindrift flung itself over the stem we ducked, and a roistering flume swept over our heads and swirled down upon the deck abaft the engine-room hood. Even if talk had been desired, there was little opportunity, but now and again, as Captain Ned Morrison wiped the water from his eyes, he cracked a joke; and once he begged a word of praise for his boat. 'Takes it bee-u-ti-ful, don't she?' he suggested. And when I asked about her conduct 'outside,' he waxed still more enthusiastic. 'Some tugs are only built for river work, and them I wouldn't cross the bar in,' he said; 'but I'd take the *Tartar* anywhere.' Then he jerked his thumb to starboard where the *Trojan* was pegging alongside. 'But that's the tug for you!' he cried, and it seemed as though a note of envy blended with his praise. 'Did you see about that wreck on the Burbo last month? Well, she's the tug that towed the lifeboat out!'

There we had it—the hall-mark of the two. Aboard his own boat he would trust his life 'anywhere,' but the *Trojan* was the tug of distinction. She had towed the lifeboat out!

THE AFTERMATH.

TRENCHES run o'er plain and hill
From Nieuport to the sea,
Craters grim and many graves
Speak of agonie.
Ruined town and shattered fane
Rise against the sky.
Underneath the circling stars
Echoes whisper, 'Why?'

AFTER TRAFALGAR.

By H. W. Household, M.A.

I.

THE story of the Battle of Trafalgar, as it is generally told, closes with the death of Nelson. The immortal tragedy is acted, the hero dies, the curtain falls, and the audience depart. They neither know nor care what happened afterwards; yet there were many happenings of no little interest. Perhaps, if the tale of them is narrated apart from the main story, it will win the hearing which it so seldom gets.

. . . . . .

Storm followed battle. Nelson had seen it coming. There was no mistaking the meaning of the fall in the glass, or of the heavy swell that was rolling in from the westward on the morning of the 21st of October. A great gale was approaching from the Atlantic. The position of the Fleet would be full of danger. The shoals of Trafalgar were close at hand to leeward, and at Cadiz, not far away, sharp watch would be kept for any opportunity of cutting off disabled ships as they drifted shoreward. Masts would be crippled after the fight, and sails and rigging would be shot to pieces on many a ship. It would be safest (if it were possible) to ride out the storm at anchor; so before the battle opened Nelson signalled to the Fleet to 'prepare to anchor after the close of the day.' It was almost his last care as he lay dying. 'Anchor, Hardy; anchor!' he said when Hardy came down to the cockpit to take his last farewell.

'To this,' says the doctor's story, 'the captain replied, "I suppose, my lord, Admiral Collingwood will now take upon himself the direction of affairs?"

'"Not while I live, I hope, Hardy!" cried the dying chief, and at that moment endeavoured ineffectually to raise himself from the bed. "No," added he; "do *you* anchor, Hardy."

'Captain Hardy then said, "Shall *we* make the signal, sir?"

'"Yes," answered his lordship, "for, if I live, I'll anchor."'

But in a few minutes Nelson was dead, and Collingwood was in command. 'Anchor the Fleet! Why, it is the last thing I should have thought of,' said Collingwood to Hardy when he heard from his lips of Nelson's intention; and the signal was never made. Perhaps it was impossible to anchor. 'Few of the ships,' said Collingwood afterwards, 'had an anchor to let go, their cables being shot.'

During the night the wind took pity on the stricken ships, and, shifting southward, let them drift slowly out to sea. On the morrow it was blowing strongly, with heavy squalls from time to time. Before long there was trouble with the prizes. That day the prize crew of *Algésiras* were overpowered by the prisoners. Leaky and dismasted, she had been caught by the storm where a south wind only added to her danger, and was drifting fast towards the shore. The British on board were only fifty, the French 600. Fifty men could not save the ship; 600 might. So the prisoners were allowed to come on deck. They seized their chance. The British, with not unkindly force, were put in confinement. Small jury-masts were quickly rigged and sail was made upon them. With difficulty *Algésiras* was worked off the dangerous coast, and brought into Cadiz. The prize crew were then most honourably released, and sent back on a frigate to rejoin the British Fleet.

The same day *Bucentaure*, Villeneuve's flagship, also mastless, went upon the rocks. By night a gale was blowing from the north-west. *Redoutable*, in tow of *Swiftsure*, 'being actually sinking, hoisted a signal of distress. The latter ship immediately sent her boats, and brought off part of the prize crew and about 120 Frenchmen, which were as many as the boats would contain. At 10.30 P.M., the *Redoutable* being with her stern entirely under water, the *Swiftsure* cut herself clear. At about midnight the wind shifted to north-west and still blew a gale. At 3.30 A.M. on the 23rd, attracted by the cries of the people, the *Swiftsure*, which had wore to the southward, again sent her boats, and, from three rafts which the French crew, amidst a dreadful night of wind, rain, and lightning, constructed from the spars of their sunken ship, saved fifty more of the sufferers, making a total number of 170. . . . Captain Lucas had been previously removed to the *Téméraire*. The remaining survivors of the *Redoutable's* late officers and

 [*All Rights Reserved.*]

crew, and thirteen of the *Téméraire's* and five of the *Swiftsure's* men perished in her. Other casualties were the consequence of this night's gale. The *Fougueux*, having on board, besides a great portion of her late crew, thirty men belonging to the *Téméraire*, drifted on the rocks . . . and was totally wrecked, with the loss of all on board, except about twenty-five persons.'

During the days that followed, *Berwick*, *L'Aigle*, and *Monarca* shared the fate of *Fougueux*, and the loss of life was heavy. Others Collingwood destroyed at sea, finding it impossible to save them. *Santissima Trinidad* and *Argonauta* were scuttled and sunk; *Intrépide* and *San Agustin* were set fire to. One by one the sea laid claim to Nelson's prizes.

On the morning of the 23rd another danger had threatened. Led by an enterprising captain, five of the ships that had escaped with Admiral Gravina, the second-in-command, put out from Cadiz, with several frigates, for an attempt upon the drifting prizes. *Santa Ana*, Collingwood's great prize, battered and unmanageable, had drifted too far inshore, and the Spaniards cut her off and carried her into Cadiz. *Neptuno*, too, they recaptured, but the fury of the storm was too much for them, and they lost her on the rocks. That was the limit of their success. Collingwood was ready for them. He still had ships enough in fighting trim. These now cast off the prizes or the dismasted British ships that they were towing, and formed a line of battle covering the cripples. The enemy could do no more—no more but pay the price. They had recovered two shattered hulks (one of which was wrecked soon afterwards), but of the five ships that came out from Cadiz, only two returned. The Spanish *Rayo* and *San Francisco de Asis*, with the French *Indomptable*, all ships that had suffered little in the battle, were lost upon the rocks.

Out of the thirty-three French and Spanish ships that had fought at Trafalgar, there now lay in Cadiz only ten. *Santa Ana*, *San Justo*, *San Leandro*, *Principe de Asturias*, and *Montanez* still flew the flag of Spain, and with them were French *Pluton*, *Neptune*, *Algésiras*, *Argonaute*, and *Héros*. Five at least were utter wrecks, shot-torn and battered beyond repair, and not one of all the ten ever saw service at sea again. The French ships were still in Cadiz in 1808 when Spain declared war against Napoleon, and the Spaniards seized them and made prisoners of their crews.

II.

For a few days after the battle four ships that had fought there were still at large upon the sea. Rear-Admiral Dumanoir, in *Formidable*, accompanied by *Duguay-Trouin*, *Mont Blanc*, and *Scipion*, was flying northwards for shelter which he never found. On the evening of the 2nd of November Captain Sir Richard Strachan, with four of the line and four frigates under his command, came upon Dumanoir off Ferrol, and at once gave chase. All that night he followed, and all the next day and the next night. By eleven o'clock on the morning of the 4th, Dumanoir found that he could not escape, and accepted the inevitable battle. By half-past three it was all over, and the four French ships were prizes, with only two masts still standing on the four.

Though of Nelson's prizes, the eighteen that were left upon the field of battle, only French *Swiftsure*, and the Spaniards *Bahama*, *San Ildefonso*, and *San Juan Nepomuceno*, remained in British hands, of the twenty-seven glorious ships of the British Fleet that had fought at Trafalgar not one was lost. By the evening of the 24th, when the gale had somewhat abated, Collingwood, with the best of them, could be seen from Cadiz watching the port as closely as ever. 'It more astonished the Spaniards,' he wrote, 'than the beating they got; and one of them said, when I assured him that none of our ships were lost, "How can we contend with such a people, on whom the utmost violence of the elements has no effect?"'

Courteous and even friendly messages began to pass between the shore and the British Fleet. On the 2nd of November Collingwood tells in a letter how, 'to alleviate the miseries of the wounded as much as in my power, I sent a flag to the Marquis Solana, to offer him his wounded. Nothing can exceed the gratitude expressed by him for this act of humanity; all this part of Spain is in an uproar of praise and thankfulness to the English. Solana sent me a present of a cask of wine; and we have a free intercourse with the shore. Judge of the footing we are on, when I tell you he offered me his hospitals and pledged the Spanish honour for the care and cure of our wounded men. Our officers and men, who were wrecked in some of the prize ships, were most kindly treated: all the country was on the beach to receive them; the priests and women distributing wine, and bread, and fruit amongst them. The soldiers turned out of their barracks to make a lodging for them; whilst their allies, the French, were left to shift for themselves, with a guard over them to prevent their doing mischief.'

A few days later Collingwood was writing to Solana to thank him for a 'present of a cask of most excellent wine.' 'I wish,' he adds, 'I had anything half so good to send to your Excellency: but perhaps an English cheese might be a rarity at Cadiz; and I accordingly take the liberty of begging your Lordship's acceptance of one, and of a cask of porter.' It is good to know that the party which Solana invited to taste these rarities liked them so well that they were finished at a sitting.

Meanwhile the noble Gravina lay dying. There was no bitterness in his heart as he thought upon the genius and the splendid daring of the dead admiral, whose great blow at Trafalgar had dealt to him defeat and death. 'I die happy,' he said as the end drew near. 'I am going to join Nelson, the greatest hero the world has produced.'

III.

It was more than a fortnight before the news of the battle reached England. Not until the 26th was it possible for Collingwood to send off his despatches. On that day the schooner *Pickle* left with them. She reached Falmouth on the evening of the 4th of November, and early in the morning of the 6th the news was known in London. Joy at the great victory was almost swallowed up in sorrow at the death of Nelson. 'Not one individual who felt joy at this victory, so well-timed and so complete,' said Lord Malmesbury, 'but first had an instinctive feeling of sorrow. . . . I never saw so little public joy. The illuminations seemed dim, and as it were half-clouded by the desire of expressing the mixture of contending feelings; every common person in the streets speaking first of their sorrow for him, and then of the victory.' In the Fleet it was the same. The letter from a sailor on *Royal Sovereign*, who wrote home immediately after the battle, lets us see what he and his fellows felt. 'Our dear Admiral Nelson is killed,' he wrote, 'so we have paid pretty sharply for licking 'em. I never set eyes on him, for which I am both sorry and glad; for, to be sure, I should like to have seen him—but then, all the men in our ship who have seen him are such soft toads. They have done nothing but blast their eyes and cry ever since he was killed. God bless you! Chaps that fought like the devil sit down and cry like a wench.'

But even then there were those who counted Nelson happy in the moment of his death, and to-day there are few who would not agree with the noble words which Lady Londonderry wrote from Ireland when she heard the news. 'The sentiment of lamenting the individual more than rejoicing in the victory,' she said, 'shows the humanity and affection of the people of England; but their good sense upon reflection will dwell only on the conquest, because no death at a future moment could have been more glorious. . . . He now begins his immortal career, having nothing left to achieve upon earth, and *bequeathing to the English Fleet a legacy which they alone are able to improve.* Had I been his wife or his mother, I would rather have wept him dead than seen him languish on a less splendid day. In such a death there is no sting, and in such a grave there is everlasting victory.'

In France, Napoleon did his best to prevent his people from learning the true story of the great defeat. After Villeneuve's action with Sir Robert Calder in July, he had made haste to proclaim a victory. The papers were full of the battle. 'Far otherwise was it when the news of the battle of Trafalgar reached Paris. A grave-like silence was imposed: not a word, not a whisper transpired.'

In a manner with which in recent days we have been familiar, Napoleon tried to make France believe that the British had suffered very heavy losses. A few weeks after the battle a semi-official paper was furnished with an imaginary 'extract of a report sent by Vice-Admiral Collingwood to the Admiralty.' It was pretended that Collingwood had told how eight ships, *Royal Sovereign* among them, had been sunk by the French guns. Their very names were given; and of the eight, two had not even been present at the battle. The next thing was to make out that the French losses had been comparatively light, and were due rather to the storm than to the genius of Nelson and the prowess of the British Fleet. In a speech delivered in the following March, Napoleon told how the 'storm occasioned to us the loss of a few ships, after a battle imprudently fought.'

So Villeneuve was to share the blame with the storm. Poor Villeneuve! He had been bold, but he had not been wise! Yet Napoleon's orders had been very plain. 'Our intention,' he had said, 'is that wherever you meet the enemy in inferior force you will attack them without hesitation.' He would not even let the admiral choose his moment. Everything, he was told, 'depends . . . on the promptness of your leaving Cadiz.' Villeneuve knew well enough that he was sailing to defeat and ruin. If the battle was imprudently fought, the imprudence was Napoleon's. It was he who threw away the Fleet. But Napoleon was not going to bear the blame. That is not the way of emperors. He would fix it on the unhappy admiral. Villeneuve never expected anything else. He knew that he would find no mercy. Early in April 1806 he was released on parole, and returned to France; but he could not face the emperor. He shrank from the brutal and dishonouring injustice that would be his lot. Rather would he die. And so it was. A few days after he had landed he was found dead in his bed, stabbed by his own hand.

Three months earlier Nelson, with stately ceremony, had been borne to his last resting-place in St Paul's Cathedral. The Prince of Wales and his six brothers went before the coffin; Sir Peter Parker, Admiral of the Fleet and one of Nelson's oldest friends, followed it as chief mourner. Thirty admirals and a hundred captains were there to bear him company. In the crypt under the centre of the great dome of St Paul's they laid Nelson, and there he lies

to-day. 'His body is buried in peace, but his name liveth for evermore.' Like Drake, in very truth he remains an undying guardian of his country's liberty and honour, for the tradition which he created, and the imperishable story of his peerless deeds, inspire still, and will always inspire, the fleets of Britain for their task.

THE BROWN NABOB'S MONEY.

CHAPTER II.—TRANSFORMATION.

HALF-AN-HOUR later—the time being then close upon five o'clock—Bellamy emerged from Friargate House, crossed the street, and walked into the lower room at Petherfield's. The office-boy, who was copying a letter, turned from the press and regarded him as he might have regarded a hardened criminal who was just about to be placed in the dock; and Herbert Judd, Bellamy's fellow-clerk, came hurrying up with a warning look and a whisper.

'Petherfield's in no end of a wax, old man!' he said. 'You've been out nearly two hours. Better clear out for another ten minutes till he's gone home, and face him to-morrow. It's impossible to get that job done to-night now—nobody but you knew where all the papers were. Cut off till he's hooked it!'

'No!' retorted Bellamy. 'I'm going up to him. The fact is, Bert, I—I want to see him.'

He moved towards the stairs, and his fellow-clerk looked at him inquisitively.

'Anything happened, old man?' he inquired half doubtfully

'All right,' said Bellamy. 'Quite all right, Bert. I—I'll tell you—later. I—but, yes, later—later!'

He went slowly upstairs, knocked at Petherfield's door, and entered, with his usual softness of step and timidity of demeanour. He had been Petherfield's slave for ten long years, and it was impossible to realise that he was now his own master.

Petherfield stood on his hearthrug, his back to the fire, a cigarette between his lips. He was a biggish, fattish man, who looked much more like an actor than a solicitor, and was secretly proud of the suggestion; a good-looking man, too, with a consciousness of the fact. But his eyes were set somewhat too close together, and his nose came to rather too much of a point, and his mobile lips were inclined to sneer. They were sneering now, and Bellamy knew that when he sneered Petherfield was more dangerous and more vexed than when he stormed.

'Pity you should trouble to come back, Denton!' said Petherfield in bland accents that were almost oily. 'An hour or two makes no difference, of course! My time's yours, you know—also of course. Pray go back to whence you came, Denton, if——'

Bellamy then did two things that he had never done in his life before. He interrupted Petherfield with a word and a look—that was one; he sat down in Petherfield's presence, uninvited—that was the other.

'Wait!' said Bellamy. He lifted a hand and smoothed his red hair with a gesture which showed that he was confused. 'I—the fact is, Mr Petherfield,' he went on while his master stood gaping at him, 'I couldn't come sooner—Mr Haddlesey made me stop, sir. I've come to tell you, Mr Petherfield—something's happened.'

'Yes!' said Petherfield. 'Something has happened, my good friend—we've lost the five o'clock post for those papers! That's what's'——

'Not that,' interrupted Bellamy. 'At least—I'll get those papers off, sir, by the six—extra stamp, Mr Petherfield. All right. But—Mr Farmadale, sir, to whose funeral I've been'——

Petherfield took his cigarette from his lips, threw it away, and selected a new one from a box on the mantelpiece.

'Well?' he said.

Bellamy heaved a deep sigh.

'Left me all his money, sir,' he answered. 'All—his—money! All!'

Petherfield let the cigarette drop and turned sharply on his clerk.

'What!' he exclaimed. 'You? All his money? God bless my life and soul! Why—what's it come to?'

'That's just it!' muttered Bellamy in an awe-struck whisper. 'I feel as if—as if I was dreaming—it's awful. A hundred and sixty thousand, sir—just about!'

Petherfield jumped in every fibre of his fleshy frame. 'No!' he shouted. 'A hundred and sixty thousand! Who said so?'

Bellamy nodded wearily at the wall behind his master—the bank lay beyond that wall. 'Mr Shillito has it,' he answered. 'He reckoned it up. He's got everything—title-deeds, railway shares, stock—all sorts—and all of it. First-rate gilt-edged securities, he said. He totted up the value. A hundred and sixty one or two or three thousand—all mine! I—I left it with him.'

'God bless me!' murmured Petherfield. 'Never heard such a romance in my life! My dear fellow—my dear Bellamy'—he came forward, with the mobile lips wreathed in a peculiarly sweet smile, and with a readily outstretched hand—'a thousand congratulations,

my good friend! You have been with me many years, Bellamy, my boy, and we may have had our little tiffs; but you'll find none—none who will so sincerely rejoice over your good fortune as your old friend and master—none! God bless you, my dear fellow! Dear, dear me!—whoever would have thought it? By-the-by,' he added, as Bellamy, who never remembered having shaken hands with him before, timidly withdrew his fingers, 'you're sure about the will—no flaws, eh? No—loopholes for anybody else, my boy?'

'Mr Haddlesey says the will's as sound as if he'd made it himself,' answered Bellamy. 'Not a doubt about it, in any way. And Mr Farmadale hadn't a relation in the world.'

'Capital! Capital!' murmured Petherfield unctuously. 'The Lord be praised! My dear lad, what are you going to do?'

Bellamy looked down at his knees and wagged his head, on which the too small hat was still perched. 'I—don't—know!' he whispered. 'I'm all of a turn. But'—he sprang up and made for a drawer in one of the cupboards—'those papers! I'll have them off, Mr Petherfield, by the late fee collection. There's nothing to do but enclose them.'

He was leaving the room, but Petherfield caught his arm. 'Listen!' he said. 'You must have some one to talk to, my boy. Who better than your old guide and philosopher and friend? Come down this evening to The Acacias—better still, come to dinner—seven o'clock, sharp—pot-luck, you know. No ceremony. Just run home, change your clothes—I saw you in a nice tweed the other day—and walk down. Then—quiet bit of dinner—quiet bit of advice.'

'Thank you, sir,' responded Bellamy. 'Much obliged to you. I'll be there at seven.'

'Give those papers to Judd,' said Petherfield. 'Tell him to send them off. At seven, then—delighted.'

Bellamy descended the stairs and drew Herbert Judd into a corner away from the office-boy's large ears. He placed the papers in his fellow-clerk's hands with some precise instructions, and then sank his voice to a whisper. 'Bert!' he said. 'What do you think? The old gentleman's left me all his money! All!'

Herbert Judd started back and examined Bellamy's homely face closely. 'No kidding?' he said.

'It's right,' protested Bellamy. 'You can't be more astonished than I was! I'd hoped for the chess-men, but as for the whole lot—Lord! But I'm getting used to the idea now. Oh yes—it's all mine. Every cent!'

'How much?' asked Judd.

'Hundred and sixty thousand, so Mr Shillito reckons it,' replied Bellamy. 'He has it. I say—I'm going to dine with Mr Petherfield, and I want a new tie, and I've no coin on me—lend me half-a-crown.'

Judd pulled out some loose silver and held it towards the applicant. 'Well, I never did!' he exclaimed. 'Good heavens, old man, what ever will you do with it?'

Bellamy picked out half-a-crown from the silver and made for the door. 'Oh, I don't know!' he answered. 'It's—dreadful. Get those papers off, Bert—I must go home and change, and get down to The Acacias.'

'Going to tell the old woman and the girls?' asked Judd, following him out into the hall, and still regarding him with a species of terrible fascination. 'Gad!—they'll jump out of their skins!'

'No use keeping it back,' replied Bellamy, with more or less of dolefulness. 'It'll be all over the town by supper-time: Haddlesey won't keep it in. Well, so-long, old man, for the present—see you later.'

He went out into Friargate, now deepening into the first gloom of the evening, and slunk, rather than strode, past the bank and past Haddlesey's office. The news might already have leaked out, and he was afraid of being stopped and congratulated; he was afraid, too, he scarcely knew of what, as he glanced out of his eye-corners at Friargate House, and remembered that every stone of its ancient walls and every inch of soil on which the building stood belonged to him. Two hours ago he had been valued at twenty-eight shillings a week; now he was worth some six or seven thousand pounds a year. But the man in the draper's shop at the corner of the Market Place did not know that yet, and when Bellamy asked for a new tie he brought out the cheap goods, and Bellamy, from sheer habit, spent eighteenpence.

He went home then, still avoiding notice. 'Home' was No. 7 in Trinity Terrace, a small and meanish street running out of Cornmarket. Bellamy lodged there with one Mrs Parker, relict of a departed tradesman, who had left her two daughters and a houseful of furniture. The two daughters were teachers in the church school; their mother spent her time in looking after the house, wherein she had found room for Bellamy Denton and Bert Judd, whom she already regarded as future husbands for Evie and Kittie. But so far there had been no negotiations towards matrimony. The young men and the young women were on pleasantly close terms, and went innocent walks together, but it was an unpledged, untrammelled Bellamy who presently walked into the little parlour and confronted mother and daughters.

He looked at them meditatively and in a queer spirit of silence as he shut the door behind him. He was thinking. He knew that his Trinity Terrace days were numbered—Friargate House awaited him; he had nothing to do but walk in next morning—that night, if he liked—and hang up his hat. And he was relieved when Kittie Parker, who was inclined to levity and pertness,

laughed openly at the sight of his ill-fitting mourning.

'Well, you do look a sight, Bellamy!' she exclaimed. 'Where did you borrow that lot? I think the old Nabob might have left you something to buy a black suit with, if you had to have one!'

Bellamy glanced at Evie. She was his particular property, as Kittie was Bert Judd's. Kittie was little, elfish, quick of tongue and movement; Evie was a comfortable, motherly sort, large-eyed, slow-thinking—the sort of girl you could walk with in silence. She used one word to Kittie's twenty. All the same, she found her tongue now.

'Don't be so rude, Kittie!' she said, flashing up in defence of her motherless chick. 'You're too personal.'

'Rot!' retorted Kittie. 'Of course, the old fellow should have left him ten guineas to buy black.'

Mrs Parker, in the act of lifting the tea-pot from the tray round which she and the girls were sitting, waved it at Bellamy. The act was one of hospitality; Bellamy and Bert took their supper at half-past-six.

'Just in time for a cup, as you're home so early,' she said. 'Get a cup and saucer, Evie.'

But Bellamy shook his head. He laid down the new tie on the edge of the table, and sank heavily into a chair. 'You might as well know it,' he said, looking from one to the other. 'Everybody will, before long. Mr Farmadale's left me all his money.'

His mild, patient eyes had settled on Evie's placid face, and he saw her turn scarlet from throat to brow. But Mrs Parker dropped the tea-pot with a bang, Kittie screamed as a splash of the hot tea fell across her wrist, and Evie jumped up for a cloth and hid her confusion.

'Bellamy Denton!' exclaimed Mrs Parker. 'You don't say! All?'

'Every penny!' answered Bellamy. 'Mine now—all the lot. Everything!'

'What might it come to, now?' asked Mrs Parker.

Bellamy's eyes wandered round the tea-table as if he were estimating the value of the crockery, the linen, and the buttered toast. Thence he looked up at a fly-paper which dangled from the gas-bracket. ''Bout a hundred and sixty thousand pounds,' he said.

'Lord, ha' mercy!' muttered Mrs Parker. 'It's—it's almost like a miracle! And—and that house, too?'

'All's mine,' assented Bellamy. 'Every mortal thing. Means quite six thousand a year.' Then he glanced again at Evie. But Evie was mopping up the spilled tea, and his eyes wandered to Kittie.

Kittie had propped her elbows on the table and was staring at him. Suddenly she smiled. 'What'll you do with it?' she asked. 'Twenty-eight bob a week—and six thousand a year! Lawks!'

'Nonsense!' said Mrs Parker. 'Of course he'll know what to do with it!' She glanced at the new tie. 'What's that for?' she asked.

Bellamy got up, looking at the clock. 'I'm going to dine with Mr Petherfield,' he said, picking up the tie. 'He asked me to—we've got to talk. I must change my clothes.'

'Dine—at Mr and Mrs Petherfield's?' exclaimed Mrs Parker. 'Why, you ought to have evening-clothes!'

Bellamy's face fell. 'He said pot-luck,' he murmured. 'Does—does it matter?'

'All the Petherfields dress for dinner,' remarked Kittie. 'I've seen 'em, through the windows, many a time. Every night—we all know what snobs they are!'

Mrs Parker was looking Bellamy up and down. 'I've a brand-new dress-suit that belonged to your father,' she said suddenly, glancing at Evie. 'He got it that year he was town councillor, to go to the Mayor's Ball; he didn't wear it more than twice. It'll just fit you, Bellamy—like a glove. I've everything, put away—dress-shirt, ties, shoes. Come upstairs.'

Bellamy shifted his weight from one leg to the other. As was the case whenever he was in doubt, he looked at Evie; but Evie was otherwise occupied. 'Oh, well, if you think I ought'—— he said doubtfully. 'I didn't know they were like that every night.'

'Every night!' affirmed Kittie. 'I know!'

'Come upstairs,' said Mrs Parker.

She shepherded Bellamy to the upper regions and played valet to him; finally she conducted him downstairs again and showed him to the girls. The deceased Parker's suit fitted him well; brushed, shaved, apparelled in gloomy black and snowy white, Bellamy looked a new man.

'Fine feathers!' said Kittie.

'One thing he wants,' observed Mrs Parker critically—'a muffler for his neck.—Kittie, go up and get me that big white silk handkerchief out of the top long drawer in my room.'

Kittie tripped upstairs, laughing; Mrs Parker went into the passage to get Bellamy's overcoat; he and Evie were left alone. He looked at her shyly; Evie looked at the tea-cups which she was washing at a side-table.

'Evie!' he said suddenly.

'Yes, Bellamy?' she answered meekly.

'What d'you think of it?' he asked. 'Not—not this—but—the money, and all that, you know?'

'I don't know,' she answered very slowly. 'I can't realise it. What do you think of it?'

Bellamy glanced at the door. Kittie could not find the silk handkerchief, and Mrs Parker had gone upstairs to help in the search. He went closer to Evie. For a moment they looked at each other; then Bellamy drew back.

'Blessed if I know what I think!' he murmured. 'You 'll have to talk to me. I 'm—I 'm sort of lost!'

Then Mrs Parker came down and finished him off, and bustled him away, and he went out into the town, thankful beyond measure that darkness had fallen.

MORE DUST FROM AN ENGLISH LAWYER'S PAPERS.

By G. H. Browning.

AMID the tortuous mazes of the law there is no path so difficult as that which leads through the Probate Division. In all but testamentary matters a man may correct mistakes of law which have been made; a faulty conveyance or lease of land, a defective settlement—these things may be cured if the mistakes become apparent in his own lifetime. But a will, which operates only from death, cannot in the same way be purged of error; there weakness is a fatal malady, for he whose intentions are written therein has passed to the incommunicable shore before they are construed by his sorrowing kindred.

And just as this branch of the law is the most complex for the layman, so, it appears, is it the most interesting for the lawyer; for the solution of testamentary problems involves him in human drama and pathos and sentiment in all their crudity. That silent yet eloquent paper left by him whose voice can never intervene to still the storm it raises, or the carelessness which has resulted in the leaving of no such paper at all, arouses in a marked degree the cupidity of interested parties, the anxious hopes of relatives, and the careful schemes of the covetous; it invites men to forgery and deceit, and lying that may never be stripped of its false garb, because dead men tell no tales.

The records of the Probate Division would indeed prove sad reading for the angels; they are damning evidence against the morals of mankind.

It is astonishing what a large proportion of these evils is due to the simple desire to revoke a will. A man makes his will, and afterwards, changing his mind, wishes to revoke it. Simple enough, it would seem. Put your pen through it, or if it is with your bankers or solicitors, tell them to do so for you; or, better still, burn the false witness. But it is not always simple—unfortunately the law seldom is simple. True, if you take the document in your own undeniable hands, consign it to the flames, and stand over it until the last particle is utterly consumed, it will manifest no Phœnix powers by rising from the ashes to confound your plans when you are dead; but short of this thorough extermination of the pest by your own hands, you cannot tell what mischief it may achieve in the time beyond your time, for, like an obstinate weed of indestructible growth, it will often spring up in the most unexpected places and work havoc in the garden of your desires.

Some considerable time ago there was a man who thought it a light matter to slay his testamentary dragon. He merely pierced it in divers places with his pen, inscribed on its back 'This is revoked,' and cast it into his wastepaper-basket. Presently a servant entered the room, took out the wastepaper-basket, and carefully placed the will on the kitchen table. There, the record confesses (to the horror of all good housewives), it remained for some eight years, when the testator died. And when these strange people, who could suffer a will to lie about the kitchen for years on end, produced the document in court, it was held that the will was *not* revoked.

In another case, a man died without anybody appearing to know the whereabouts of his will, until a woman who had shared his house for some years produced from a box a little handful of torn-up pieces of paper. These, she declared, were the treasured remains of the missing document, which her lover himself had destroyed, giving her directions to burn the pieces; but instead of obeying his behest, she, ultimately with his sanction, had placed the collection in the box whence they were now brought to light. The Court was dubious; it shook its bewigged head gravely, and in that unimpassioned voice whose even tenor betrays its long acquaintance with human frailty, declared simply that it didn't believe the story; and it granted probate of the will, for all that it lay before the disputants in fragments.

On one occasion a man destroyed his will during an attack of *delirium tremens*. The pieces were carefully preserved by his alarmed relatives, and presented to his repentant eyes on his recovery; whereupon he expressed his horror of the mad act, and declared that he would speedily make amends by executing another will. Unfortunately, however, a more serious affliction than extreme intemperance visited him before he could carry out his good intentions, and he died without having set his hand to the promised document. Notwithstanding these things, an indulgent Court declared that the original will still stood.

And now, on the principle of 'another and another cup to drown the memory of this impertinence,' let us take an even more curious instance of the longevity of wills. The scene is a bedchamber, the persons of the drama an elderly lady of feeble mind, and her sister-in-law,

of a distinctly vigorous mind. They are engaged in earnest conversation, and presently the elderly lady places her last will and testament in the other's hands for her to read. Evidently the terms of the document are unfair in the sister-in-law's views, for that lady, in the full enjoyment of her vigorous intellect, flies into a passion, and, in spite of the old lady's anxious remonstrations, tears the obnoxious paper into bits and flings them into the fire.

The old lady was afterwards pressed to make another will, but in her feeble condition declared that she was unable to bring her mind to the task, and she died without having yielded to persuasion. Let it be observed that at her death there was actually no will in existence; it had been utterly consumed by the flames, although it transpired that a copy was in the possession of the person whom she had named as executor. Yet, when the facts were laid before the Court, the judge decided that, as the will had been destroyed contrary to the wishes of the deceased, probate should be granted.

The clue to these strange decisions may be found in an Act which was passed in the first year of the reign of Queen Victoria, or in the general principle of the Courts, which strive with might and main, within the statutory limits of their powers, to give effect to the last wishes of all citizens and to defeat the ends of ill-doers. That Act (which, it should be observed, does not apply to Scotland) declared that no will can be revoked except by another will, or by a document executed and attested as a will and declaring an intention to revoke any previous will, or by 'the burning, tearing, or otherwise destroying the same *by the Testator, or by some person in his presence and by his direction*, with the intention of revoking the same.'

Difficulties frequently arise where a will has been mutilated with the intention, not of revoking it *in toto*, but of altering some of its provisions. The expression 'to cut any one out of a will' is familiar to every one, but it is something more than a figurative expression, for there are instances on record of this cutting-out process having literally been effected. There was once an old lady who, having taken umbrage at some fancied slight, did actually take a pair of scissors in her indignant hands and clip out the name of a gentleman who had offended her, wherever it appeared in her will; and the document was admitted to probate in its mutilated state.

The case of a paralysed man affords another instance of how far mutilation of a will may extend without being fatal. The sufferer in this case was partly speechless, and paralysed down one side. Two days before his death he intimated to his doctors that he wished to make a will. Accordingly his desires were interpreted by means of signs and recorded on a card, which the invalid executed by a mark and the doctors initialled as witnesses. Subsequently these gentlemen were persuaded by a relative of the testator that they had taken upon themselves undue responsibility in so acting, and after explaining this to the testator and intimating that the writing on the card should be regarded merely as a memorandum, they erased their initials. After the patient's death the card was found in a handbag which he kept at his bedside, and evidence was adduced that he had shown it to a lady whom he had intended it to benefit, and begged her to take it. The Court adjudged that, in spite of the mutilation in that most vulnerable part of a will—the attestations—the document was not revoked.

It may be added that, if as many even as a baker's dozen of wills be found, it cannot be assumed that the last one only is operative—unless it expressly revokes all previous ones; for, generally speaking, a later will cancels an earlier one only so far as it is inconsistent with it.

None of us is so ignorant of the ways of English law as not to know that if we neglect the troublesome formality of paying our rent we may be hurled neck and crop into the street; but very few of us are aware of the pedantry of the ancient common law which fetters our landlord's drastic powers. In every properly drawn lease, after the landlord has granted the property to you for a certain term of years at an agreed rent, and you have bound yourself and those mysterious and unapprehended persons, your 'executors, administrators, and assigns,' with several reams of legal phraseology of unintelligible complexity, you find at the tail of the deed, where the sting is, a clause which provides that if you fail to pay your rent, *whether it be legally demanded or not*, the landlord may eject you and terminate the lease. In those italicised words there reposes unsuspected power, for if by inadvertence they should be omitted from the deed, mark what the landlord is constrained to do ere he may move the machinery of the law.

He must formally demand payment of the exact sum due, and on precisely the day when your delinquency places the lease on the brink of forfeiture; and even of that fateful day he cannot choose any one of the twenty-four hours, for his demand must be presented at such convenient hour as will give you sufficient time to count the money before sunset. It is of no use for him to come clamouring for his due whilst you are at breakfast—you do not need the live-long day to count out your gold; hence the landlord must possess his soul in patience until the sun dips down towards the horizon, and he must watch that orb, whose gilded hues will no doubt present themselves agreeably to his sight, and see that it does not dip too far before he has delivered his ultimatum, or he will have to wait until the next quarter. Should he make his demand, say, ten minutes before sunset, he must

continue to do so until that daily feat has been duly achieved. And it is of no use for him to whisper his importunities through the back-door keyhole: he must appear boldly at the most conspicuous part of your house, which probably is the front-door, and declare his requirements there. Moreover, should he, after all his care and trouble, be so unfortunate as to find no one at home, he must nevertheless request payment from the unresponsive door, for it is required of him that he shall obey the very letter of the law and make his demand though there be no ears to hear but those of the letter-box. Furthermore, if your memory should so far have betrayed you as to leave two quarters' rent outstanding, your landlord must require payment of the second instalment only or his demand will be wholly bad.

This is the ancient common law of England, and though every landlord in the land jointly and severally lifted up his voice in indignation at its pedantry, the venerable god would have its inexorable way.

THE KILLING OF A SHIKARI

By F. C. C.

I.

FOR a hundred years or more it has always been the unwritten law among sportsmen in India that no two *shikaris* should hunt in the same valley at the same time. This law holds good in Kashmir, Tibet, Chamba, and generally throughout the Himalayas. The reason is obvious. Big-game shooting cannot, in those parts, be carried out by two guns in the same valley; the rifle-shot of one *shikari* far down the valley, reverberating from rock to rock, from ravine to ravine, might well destroy the best day's stalk of another *shikari* higher up the same valley. Therefore the golden and honoured rule is: 'One sportsman, one valley.'

Only one instance do I know of two *shikaris* hunting in the same valley at the same time, and hunting the same quarry, each being ignorant of the presence of the other. Exactly how long these two had been hunting in the same valley is unknown, but undoubtedly the one who shot at and killed the other was not the legitimate owner of the sporting rights of the place. The presumption is that the dead hunter had been at work up those hills and ravines long before the other set foot in the valley or on the mountain-crests above it.

It is this tragedy of the killing of one *shikari* by another that I now relate.

II.

I was quartered at the depot at Nynee Tal, in the Himalayas, with a detachment of my regiment. It was the end of July, and the season at that gay spot was in full swing. Having got three weeks' leave, I started off with my *shikari*, Mir Singh, to do a triangular trip *viâ* Ranikhet, Malwa Tal, and Bhimtal. I hoped to get a gural or two on my way to Ranikhet, and I had previously had good sport mahseer-fishing at Malwa Tal, where I had bagged a panther also earlier in the year. At Bhimtal there was more fishing to be had, and the wooded banks of the lake abounded with kakar, the so-called barking deer of the Himalayas.

The gural is the chamois of the Himalayas. He is one of the commonest of the Himalayan ruminants, but is not much sought after by sportsmen because, generally, when in the haunts of this member of the Bovidæ family, they are either intent on larger game or are on their way to more favourite hunting-grounds. The gural, however, is by no means to be despised as a quarry for the keen rifle-shot, and gives excellent sport; though to make a bag of any sort it is necessary to be well up in the habitat and the peculiarities of the animal. Quite a small buck is he, not more than twenty-five inches at the shoulder, of a brownish-gray colour, darker on the legs, and with an almost black stripe along the spine. He is extremely difficult to see, especially when the grass is long, as it is in August. The gural, in a way, assists the sportsman by wearing a white bull's-eye on his throat, and many a time have I spotted his whereabouts by this mark alone, when otherwise, unless on the move, I should never have discovered him. The horns are like those of the chamois—very insignificant. One great drawback is that the horns of the doe, although a bit shorter and thinner, are very similar to those of the buck, and on occasions a female is shot by mistake.

There are few buck harder to get a shot at than the gural, partly because the little beast is extremely wide awake, partly because he frequents very steep bits of the mountains, and, lastly, because his protective colouration is eminently well adapted to his environment and the animal himself gives but a small target to draw a bead on.

On the whole, the gural lives a safer life than most game in India. Not being a marauder of crops to any extent, he is rarely harassed by the natives. He is very seldom shot at by the *sahib*, except in the close neighbourhood of hill-stations, and there the animal is but seldom found. His greatest enemy is undoubtedly the hill panther; but it is only on his grazing-grounds that he fears that stealthy hunter, for his sleeping-places are too steep and rocky for *Felis Pardus*. Moreover, the *Laga-Baga*, as the panther is called in the Himalayas, finds a much

easier way of filling his stomach. He haunts the neighbourhood of villages and sheepfolds, following the shepherds up to the summer grazing-grounds, and heavy is the toll these silent cat-like foes levy on the flocks and even the dogs of the sheep-watchers.

Many men go hunting the gural in the middle of the day, but they might just as well stay in bed. The midday siesta of this animal is a long one, generally in a cave or some most inaccessible spot. The only way is to look for him at daybreak, or in the evening hours when he is on his grazing-grounds in the grass and bushes of the mountain-side.

III.

On the second day out of Nynee Tal, Mir Singh woke me up at 1 A.M., and we commenced our stumbling climb along goat-tracks, up what seemed impossible precipices, with but a shaly foothold and eternity yawning on the *khud* side. By day the going was bad enough; in the dark it was a blind-man's-buff over sharp rocks and through thorny bushes. We were practically at the top of the ridge before the sun rose, and there, well covered by a projecting rock and the long grass, we threw ourselves down for a rest, and to await until real daylight made the use of my telescope possible.

To those who have lain on the open mountain-side in the Himalayas, no matter whether on active service, shikarring the wily Mohmund or Swati, or whether more peacefully employed in sport, there is something enthralling in the grandeur of it all that no words can adequately express. Half-dreamily, restfully, and wonderingly one gazes up at the vast canopy of the heavens above, with all the countless twinkling stars, and how despicably insignificant it makes a poor mortal feel! Yet how it seems to uplift one's finer senses and to envelop one's soul in a sort of peace and perplexity that is both soothing and disturbing!

The false dawn has come and gone. Soon real dawn will be shedding its gray lights and shadows over mountain-peaks and mysterious valleys. There, to the north of us, we can just dimly outline the next and somewhat higher ridge of the mountains; and beyond that, as the light gradually grows with the opening day, we discern the battlemented peaks of the Niti Mountains bordering on the land of Nari Khorsom, looking, in the shadowy distance, more like the pinnacles and turrets of some mountain sultan's palace than the result of Nature's world-forming upheavals. Far, far away, still farther north, as morning wakes the slumbering night from his long repose, and ghost-like shades and shadows dissolve in the realities of the landscape, we can see in the nether heavens, floating, as it were, in the morning mist, with apparently no earthly foundation, the great snow-peaks of the southern barriers of Tibet. The whole moving and kaleidoscopic panorama of Nature's *kinēma* is fascinating and wonderful.

See! First one, then another, of these cold gray snow-clad peaks pales with the excitement of the coming moment till each appears like a pearl of great price set in the heavens. Then a faint pink blush, first here, then there, all along the snowy range, announces the coming of the 'lord of day,' as, rising beyond our horizon and below the distant hills, as yet unseen by us mortal men crouched among the grasses and rocks, he touches with his morning kiss the virgin peaks of the 'Roof of the World.'

A few moments more, and the golden orb rises in majesty above the mountain-ranges to the east; and what we pictured in our morning meditations as turrets and pinnacles of a far-off sultan's palace are suddenly splashed with gold and disclose themselves as mountain-peaks.

'Awake! for morning in the bowl of night
Has flung the stone that puts the stars to flight;
And, lo! the hunter of the East has caught
The sultan's turret in a noose of light.'

. . . . . .

Dreaming when dawn's left hand was in the sky,
I heard the voice of my *shikari* cry:
'Awake, my lord! the daylight now is here,
And with thy telescope the gural-buck descry.'

This latter quatrain is not exactly correct according to our old friend the Tentmaker, but it embodies practically what Mir Singh said as he gently touched me on the shoulder and suggested that the *sahib* should bestir himself about the morning's work.

IV.

The mountain-ridge we had climbed at night ran east and west. The summit was mostly rocks, with here and there, just below the weather-worn crest, smooth grassy *mergs*, and lower down more grass and thick bushes. At the foot of the slope ran the *nullah*, still deep in shadows as the sun was yet low on the horizon and hidden from these depths by mountain-ridges—a long, winding, narrow ravine with many a pool and waterfall, and delightful shady nooks upholstered with maidenhair and other ferns. On either side of the stream and midway to the crest of the hill were steep precipices, overhanging rocks, and deep foliage, a secure resting-place by day and night for the nimble-footed gural.

A little higher up from where we were resting, and more to our right, was a great shelf of overhanging rock sloping upwards, from which we could obtain a fine view of the valley beneath and to our left, and also of the sloping *mergs* nearer the summit. My *shikari* decided that I should spy out the land from this point of vantage, while he crept round the southern side of the ridge to prospect the southern *nullah*. For half-an-hour I carefully scanned each likely spot, but never a sign of life did I see save what might have been a black bear nosing among the bushes at the far end of the ravine, some mile away.

Suddenly, in the centre of my glass, I detected a movement among the rocks and bushes below the grassy *merge;* then lost it; then picked it up again. Yes, surely that was a slight movement of horns I saw; and next moment, as he turned, there was the white bull's-eye on the throat of a gural. I gave a low whistle, then another, which brought the *shikari* stealthily to my side. He, like most of his kind, was blessed with the eyes of a hawk. '*Hah, sahib, beshak, gural hain, dekkhye do, tin, panch.*' His eyesight was even better than mine with the glass, and I was no mean hand at spotting game; but he had already counted five gural. There they were, far away to our left, half-way up the mountain-side, grazing slowly upwards. Impossible to tell, at that distance, if there was a buck among them; they must have been a good thousand yards off.

Our plans were soon concocted. Away westwards, along the ridge on which we were lying, just below the summit and immediately (but far) above the herd of gural, was another great overhanging rock with probably a cave-like depression underneath, similar to the one on which we lay prone. If we could get along the southern side of the ridge, then up over the top, and down as far as the outcropping rock, it would give us a good range of the grassy *merge* on the slope of the hill in front and on both sides, and, as gural feed as a rule upwards, there was every chance of a shot if we could get there before our quarry emerged on to the little grassy plots.

Quietly we slid back from off our crag and wended our way just below the crest on its southern side. The going was bad in parts, and in steep places the grass was like ice. It was well we were both shod with grass sandals. Twice during our journey the *shikari* peered over the summit, and was able to report that the gural were still below, slowly feeding upwards. At last, thinking that we had gone far enough to reach the overhanging rock on the other side of the ridge, we crept up and peered cautiously over the crest. There, sure enough, was the great flat stone just below us and to our left. Fifty yards of open country lay between us and the sheltering rock, and had to be crossed without disclosing our presence.

Stealthily we moved on our 'tummies,' like snakes, through the long grass, taking care that neither breaking twig nor falling stone should betray our advance, and we were soon under cover of the big flat rock. Mir Singh slowly wriggled himself up our side of the rock and cautiously looked over. He lowered his head, then shook it, and signed to me to come up alongside. Not a sign of any gural. We had won the race so far. There before us, for about fifty yards, stretching far away to our right and left, was an ideal grazing-ground for gural. Immediately below this small *merg* the hillside suddenly steepened towards the next plateau. If the gural grazed up as far as the grass just below us, I ought to get an easy shot either to the front or to the right or the left. If they contented themselves with the lower feeding-grounds, our point of vantage would be of no use, and we should have to work ourselves lower down the hill. It was well worth waiting where we were for a bit, as the day was still young. Very carefully and quietly arranging some grass near the summit of our rock so as to conceal our heads, we lay prone, with eyes and ears alert, but never even a whispered word between us. Thus we awaited events.

v.

Luck was evidently with us that morning. We had not long to wait. First of all we descried the head of a gural over the top of the long grass, then another. I made a half-movement with my rifle, but the *shikari's* hand detained me, and he whispered in my ear that both were does. Then, butting at one of the does on his way up, there came a buck, who, with a somewhat skittish movement of tail and horns, settled himself to graze on the actual *merg* below us, some little way to my right. The grass was so long that it concealed all but his head and the dark stripe along his spine. What a shot—barely sixty yards off! I should have bagged him then and there had not Mir Singh called my attention to a far finer buck moving up from the lower ground to our left. Then the slightest movement in the grass suddenly riveted my eyes once more on the leading buck, and I saw him nosing the air, while he gave two sharp hisses, the gural's warning sound of danger. For a moment or two he stood like a statue, the three does which had joined him on the plateau gazing steadily at him. Had he detected us? Would he bolt? I decided to have a shot at this buck instead of waiting for the chance of the larger one below. Better bag this one, I thought, than, by waiting, perhaps lose the chance of both. To do this, however, I found that I must raise myself a few inches higher up on the ledge, and in moving I shifted a small bit of loose shale on the top, which fell over the far side.

What happened then was all so sudden and unexpected that I had no time to think. As the loosened shale fell on the ground beneath our overhanging rock a panther sprang out into the air, almost touching the muzzle of my rifle in his rush. Hardly knowing what I was doing, without in any way taking aim, I loosed off the right barrel at the panther as one would at a flushed snipe.

'*Wah, wah! Ma Bap Re!*' ejaculated my *shikari* in his intense surprise and wonder. What actually happened to the panther I did not know. He just seemed to disappear over the ledge where the gural had been standing.

Mir Singh, in spite of his excitement about the panther, did not lose his head for a moment. He shook me by the arm, and pointing to my left, shouted, '*Gural, maro, maro* [kill], *sahib*.'

There they streamed across the open. There must have been some seven of them in all. My surprising adventure had quite driven the thought of buck out of my mind. Meanwhile away went the quarry. Mir Singh made a peculiar whistling sound, as I have known *shikaris* to do when trying to stop the running oorial in the Salt Range. The leading buck suddenly stopped and stood stock-still for about five seconds, showing his flank and giving me an easy shot from a prone position at not more than 180 yards. I missed him! I felt at the time, when pressing the trigger, that I was not over steady; but, then, one does not put up a live panther under foot every day, and so there was some excuse. We got up and ran across the open in the direction in which the gural had gone, I loading my rifle on the way, hoping for a running shot at the disappearing buck beyond the next ridge of the *merg*, but never a glimpse of a gural did I see again that day.

Then we walked back, just to have a look at the ground below the ridge over which the panther had bounded, and there, in the grass, not dead, but paralysed by a bullet-wound in the lower spine, lay the panther, not fifteen yards from the place where we were standing. He raised himself on his forelegs at our approach, gave an angry growl, and tried to drag his body down the hill. A bullet through the heart put an end to his sufferings and to his hunting, in this world at any rate. '*Wah, wah!*' cried Mir Singh, with a pleased smile on his face. 'He too, your honour, got up with the rising sun to hunt gural, but the *Laga-Baga's* hunting-days are now over. *Shabash!*'

Little had I or Mir Singh thought that another *shikari* was out hunting in this valley, and lying in wait for those very same gural; but such had undoubtedly been the case. The panther knew as well as we did the probability of the animals grazing up towards our rock, which provided good cover 'for man and beast.' He was watching his prey from underneath the rock, I from above it. So intent was he on his sport that his acute ears did not detect our stealthy crawl towards his rock. He was waiting till the buck came a bit nearer to make his deadly spring. It was only the falling shale that either frightened him or caused him to make his leap for breakfast sooner than he had intended.

'The panther, in all its varieties, is a true cat. It stalks its prey, and kills it by suddenly springing on it from some hiding-place.' Thus did this *Laga-Baga* of the Kumi valley. He was a fine specimen of a hunter, this panther whom another hunter had deprived of his breakfast and his life. He measured over six and a half feet—not a bad length for a hill panther—and his coat was in the pink of condition, and glinted golden in the morning sunshine. I stood and gazed at the unexpected bag my morning's stalk had brought to my rifle, and marvelled greatly at the pure luck for me and mischance for the beast that had lodged my aimless bullet in his spine. Undoubtedly he was the real proprietor of the hunting-rights of this valley. He had fixed his bivouac in these parts long before the arrival of the white-man-usurper, and his was the melancholy fate to be shot at and killed by another *shikari*, both hunting the same quarry.

God rest the soul of this gallant *Felis Pardus*! Dogs, some folks say, have a heaven; if so, why not the cat-like sportsman of the East? I *salaam* to the spirit of the spotted hunter of the Himalayas, and wish him 'good hunting' in the Elysian Mountains.

THE WORLD'S BIGGEST ROSE-GARDEN.

FANCY a rose-garden eighty miles long and several miles wide! The imagination reels at the idea, and yet that is what might have been seen any summer in Bulgaria before the war broke out. Even the war has not destroyed the industry, and with the restoration of peace the scene will once again be possible.

The world's largest rose-garden is situated on the Thracian plain, with the little Bulgarian town of Kasanlik as its centre. There are 173 villages in the district, each devoted entirely to rose-culture. Where in other lands the peasants would be growing wheat or rye, the Bulgars of this area devote themselves wholly to the growing of roses.

The industry dates back two centuries, and is a legacy from the Turks, who first discovered the special quality of the soil—a soil which produces roses capable of yielding a more exquisite essence than the blooms of any other country. From the chance planting of a single rose-tree by a wandering Turk at the end of the seventeenth century there has grown up an industry which employs a whole country-side, and is one of the mainstays of Bulgarian trade.

These miles and miles of rose-gardens are established with one object—the production of that delicate perfume known to the world as attar of roses. The plantations are arranged in high parallel hedges, a hundred yards long or more, and growing to the height of a tall man. When the rose-harvest begins, about the middle of May, the plantations present a busy scene. Gathering takes place each day, and all the villagers right down to the young children work from dawn to dusk. Production varies, but the average yield is about 6,250,000 roses per acre.

The collected blooms are despatched to the various centres for distillation. The operation of distilling the rose-water occupies from one to one and a half hours, and it is essential that all the petals picked on a particular date shall be distilled on the same day. Twenty-four hours' delay in distillation means a considerable loss in the yield of the perfume. To extract the attar from the rose-water a second distillation is necessary, and in this process the liquid first obtained is reduced to one-eighth its original volume. Thus, from forty quarts of rose-water not more than five quarts of attar can be secured.

Some idea of the necessity for such huge rose-gardens can be obtained when it is stated that the yield of perfume is never more than one-twenty-fifth of 1 per cent. More than 4000 pounds of roses are required to produce one pound of attar. Imagine it for a moment—over 1,500,000 roses to make one pound of the precious attar!

In 1904 no less than 8147 pounds of attar of roses was produced at Kasanlik. That meant the distillation of something like 13,657,312,000 roses, all of which were grown on the surrounding plain.

The traveller in Bulgaria at the end of May or in early June can ride for eighty miles and feast his eyes on damask blooms, breathing all the while the scent of millions of roses. But the miles of bloom are not comprised in one or more great gardens. The flowers are almost all the product of the humble peasant tilling his own little plot. There might be an advantage in large gardens, but the risk would be proportionately greater. Under the existing arrangement, if a crop is damaged the peasant bears the loss; if it is a success, the merchant comes along and buys, and since some two or three buyers have a monopoly of the trade, the peasant has to sell at whatever price they fix.

THE STORY OF LOCHAN-NA-CHEAIRD.

By C. C. Maconochie.

I.

I TELL this story, as nearly as may be, in the words in which it was communicated to me.

. . . . . .

An August sun beat fiercely on my back as I left the road which creeps up the heather at the bottom of the glen. A rise of 900 feet or so in about half a mile on a moor which slopes to the south is about the hottest place on earth, and before I reached the top I was in a state of heat comparable with that in which the immortal Miss Carolina Wilhelmina Amelia Skeggs found herself on a celebrated occasion. So it came about that I sat down to rest and cool myself under the shadow of a friendly rock, and it may not be unfitting to seize this opportunity of explaining how I, a member of the Canadian Expeditionary Force, chanced to be climbing the hills which lie between Loch Chon and Loch Katrine on a day when my regiment was still actively engaged with the enemy on the Flemish front. To do this I must go back two generations in the family history.

My grandfather, as a young man, was a crofter in the Loch Ard valley, and my grandmother was born under the shadow of the Eildon Hills. After their marriage, in the earlier part of last century, they emigrated to Canada, and there my grandfather, like many hard-headed Scotsmen, flourished exceedingly and made his pile. He was thus enabled to bring up his only son in a way which he could never have done in the Old Country. His son—my father—married in his turn, but he and his wife both died shortly after my birth, and so it came about that I was reared in the house of my grandparents. How they gave me the best education money could ensure is a matter of no relevance; but one element of my home-life must be noted, as it is possible that in it may be found the clue to the story I am about to tell.

Though neither of my grand-parents ever revisited Scotland, in spirit they remained Scots of the Scots, and clung to the history, traditions, and legends of their native land; their bookshelves contained many volumes of the poetry and prose of the Borders, of Highlands and Lowlands; and, needless to say, in the Waverley Novels the dweller in the land of Thomas of Ercildoune and the descendant of the cattle-lifters of the debatable land in the Graham country found a common and congenial hunting-ground. This antiquated lore they both delighted in handing on to me, and thus, through my grandmother, I early became familiar with the ballads and tales of the Border reivers, and with the legends of the fairies and bogles who were wont to haunt the valley of Tweed; while from my grandfather I learned about Rob Roy and his broken clan, and heard the sombre traditions and eerie stories which seem to spring up naturally in all places where rugged mountains and desolate moors predominate.

From my grandfather I heard the authentic history of the Rev. Robert Kirk, minister of the parish of Aberfoyle, who ventured to write an elaborate treatise on the laws and customs of the Fairy Commonwealth, and was as a punishment taken prisoner by the Little Folk, and

dragged beneath the earth on the Fairy Knowe (as it is still called) near his manse, where, if all tales be true, he remains in captivity to the present day. From my grandfather, too, I heard the mysterious prophecy that when no Graham shall live in the glen, and when the Duchray Water (that is, the infant river Forth) shall run round a certain rock in the Comer valley, riderless horses with fog on their saddles and bridles shall run wild on the sides of Ben Lomond. The river runs round the rock, and no Graham lives on the banks of Loch Ard; but the Great War has come and gone, and Scotland has been spared the battle which some of the old inhabitants of the glen feared would lead to the fulfilment of the prophecy.

Then he told me of the water-bull which lives deep down in Lochan-na-Cheaird—the little loch of the tinker—and lures travellers into the black water, there to be devoured at his leisure; and the less legendary story of the poor woman who lived near Rob Roy's Well, above General Wade's road from Aberfoyle to Inversnaid, whose little son was kidnapped by a caird or tinker and carried off into the wild hills to the north and never heard of more.

Bailie Nicol Jarvie and Morris the gauger, creations of a wizard's brain, were to my grandfather as real as Rob Roy and Helen Macgregor, and little less real to me when a child.

Thus my infant mind was steeped in romance. But some years on a high stool in a merchant's office, followed by nigh on four years of the Great War, with all the grim reality of the trenches, the dirt, the danger, the rats and 'waur beasties,' and the eternal noise of guns and shells, had driven all that romantic rubbish (as I then deemed it to be) out of my head. So, when I was sent back from France, in the last summer of the war, on a month's sick-leave, much shaken and slightly wounded by the explosion of a high-explosive shell, I was about as prosaic and unimaginative a member of the Allied forces as you would meet in a day's journey.

II.

I feel that I have been an unconscionable time in coming to the story which I set out to tell, but now I need only add that my first thought after I crossed the Channel was that I must visit the homes and haunts of my ancestors as soon as possible; and so it came to pass that I found myself in the first week of August lying panting on the heather under the shadow of the great rock, with a fishing-rod (borrowed from a friendly inhabitant of the glen) as my only companion.

The path to the Tinkler, as Lochan-na-Cheaird is familiarly called, leaves the main road at Rob Roy's Well, near the east end of Loch Chon, and for a few hundred yards winds westwards along the lower slopes of the hills. At the point where it turns northward to breast the main ascent there stand the ruins of an old cottage, the home of some crofter long passed away. As I walked past I stayed for a few moments to look at the ruin, but saw nothing more interesting than four crumbling outer walls, and a crumbling hearthstone on which, as in the Rhymer's Tower at Ercildoune, 'the hare might kittle' in peace and quietness. As I turned away, however, a queer thing happened. Suddenly, out of the corner of my eye, I saw—or thought I saw—a woman run out of the ruined door, and look wildly up the path on which I was bound. I swung round in a moment, but a steady gaze at the ruin showed nothing but the bare roofless walls, as deserted and melancholy as before. I was certain that I had caught a glimpse of something living and moving, but now, though I could see the whole of the interior of the cottage, there was evidently no living thing within or near it.

A strange shiver ran through my body, and for a moment a sense of something unnatural overcame me; but the feeling soon passed off, and, till hours afterwards, I never gave the matter a second thought. When, rested and to some extent cooled down, I left the shade in which I had been sitting, and resumed my toilsome climb, none of the eeriness which had seized me remained, and before long I reached the point 'where wind and water shears,' and entered a narrow glen, carpeted with moss and withered grass. There not a sound met the ear, not a grouse stirred nor a sheep bleated, only the moisture rising from some marshy ground near at hand danced weirdly in the great heat.

As I passed on the loneliness and the desolation seemed to enter into my very soul, and I experienced that feeling of being crushed by the immensity of the solitude of the moor which is so powerfully depicted by John Buchan in his terrible story of 'No Man's Land.' In vain I whistled, and even sang aloud, those songs, from 'Tipperary' and 'Pack up Your Troubles' downwards through an endless series of sentimental and futile ditties, with which we soldiers of the Empire had cheered our spirits in the face of death and discomfort for four long years. All was of no use, and every step I took the feeling grew stronger.

> A sense of mystery the spirit daunted,
> And said as plain as whisper in the ear,
> The place is haunted.

Like the schoolboy in the sombre poem, 'The Grave,'

> I heard, or thought I heard
> The sound of something purring at my heels.
> Full fast I flew, and dared not look behind me;

and I confess it was with a sigh of relief that at last I sighted the waters of the lochan, black, but glittering in the sun, lying beneath me in a cup or valley between the rocky summit of Ben

Venue and the lower hills above Stronachlacher. All remained still as death as I descended the path to the water's edge.

A glance was sufficient to show that fishing was out of the question. The surface of the loch lay calm and polished as a shield of blue-black steel; not a trout stirred, and only here and there was the uncanny stillness of the water broken by the bursting of oily bubbles of gas generated by the heat in the decaying vegetation with which the bottom of the loch was clothed.

As I sat idly gazing over the water I fancied that for a moment I caught sight of something big and black and shining which rose to the surface; but I did not see it clearly, and I lazily thought that what I had seen was caused by the release of a larger volume of gas than usual from the bottom.

Gradually the heat and the oppressive heaviness of the atmosphere overcame me, and I lay back upon the heather and fell fast asleep.

III.

How long I slept I know not, but it must have been for some considerable time, as when I awoke my teeth were chattering with cold, and I found that my clothes were wet, owing to a heavy fog which, coming up from the east, had obscured the sun. Any man, however, who has served in Flanders is too well accustomed to being wet through to be greatly inconvenienced by a few drops of clinging mist; but behind the mere discomfort caused by the rapid fall of the temperature there was an uneasy feeling in my mind that I was not alone—a feeling which was in no way dispelled by a hasty glance behind me. A sense of the unseen pressed upon me and overcast my spirit like a cloud. Perhaps my fears were due in the main to the knowledge that to be caught near nightfall in a persistent fog among the rocks and wastes of these desolate moors is no laughing matter, even in summer, and I was relieved to find that, for the moment at least, the mist was thinning perceptibly.

As I stood wondering in which direction I ought to go to get out of the valley, the wisp of fog which had surrounded me cleared off sufficiently to enable me to see the water on one hand, and, at a distance of three or four hundred yards, the sheep-track down which I had come from the watershed, where a dark thunder-cloud seemed to hang. I rapidly took my bearings, preparatory to starting for home immediately. Glancing round, I saw that another fog-wreath was already crawling over the water, but before it completely covered it I saw—this time quite distinctly—a shapeless and gleaming black mass rise to the surface, roll over, and then slowly disappear within a few yards of the spot where the path touched the margin of the loch, and the sound of a sullen, heavy plunge reached my ear. Then the mist closed again, and with a strange feeling of disquietude I hurriedly made preparations for a start directly I could see a few steps before me.

Once more the chilly breeze which had risen blew the fog aside, and fixing my eyes on the path which would lead me away from the gloomy loch, I took a step forward. As I did so, to my astonishment I saw two figures come out of the cloud high up the side of the hill, and I confess that by this time the sense of eeriness, and the uneasy feeling that close at hand an unknown and horrible thing was wallowing in the water, had so settled down upon me that the mere sight of two human beings acted as a charm upon my nerves. No thought of the supernatural remained, my one thought being that if the worst came to the worst I should have companions in my long and dreary wanderings through the increasing darkness.

The glimpse I got of the two travellers was but a short one, but it sufficed to show me that one was a small boy, whose arm was grasped in the hand of his companion. As he went he hung back, as if unwilling to go farther; but the man who dragged him on seemingly took no notice of his reluctance, and I attributed the reckless speed at which he came down the steep descent to a natural wish to get out of the thickest of the fog as quickly as possible. I could see that the older wayfarer was heavily laden with a pedlar's pack, on the outside of which were slung what looked like pots and pans, and I remember thinking that in these days a travelling packman was an anachronism, however common his kind may have been in the days of my grand-parents.

Partly from joy at having secured companions in my misfortunes, and partly in the fear that, as the fog was again thickening, the pedlar might fail to see the loch and run blindly into its black depths, I waved to him and shouted at the top of my voice. As they were again blotted out of view I stood quite motionless listening for an answering shout, but not a sound broke the deadly stillness. I was so close to the two that I fully expected to hear their footsteps, or the clatter of the pots and pans, and I could hardly imagine that in such a place and in such circumstances no notice should be taken of my cries; but so it was.

IV.

Blindly I staggered forward through peat-hags and rank grass and heather, and when I was not more than twenty yards from the path I caught a glimpse of the two standing on a rock which projected over the water. To my dismay, I saw that the man had torn off his boots, and that his pack lay on the rock beside him. Just before I lost sight of him I saw him stoop down and snatch up the boy from the ground, and I shouted wildly again, as I knew that at that spot the water was deep up to the edge of the rock. It flashed across my

mind that the man's idea was to wade through the water and so save himself the long detour round the head of the loch—a path which he had to take if Loch-Katrine-side was his goal. I knew that to make the attempt was sheer madness, but a moment after the fog came down I heard a heavy plunge, and then scream after scream broke the silence. As I stumbled forwards there came a horrible sound of a struggle in the water, and then the cries died away in the inarticulate gurglings of drowning men.

By this time I was so close to the scene of the tragedy that by stooping and looking along the top of the water I could see that not ten feet from the rock the surface of the lochan was still bubbling, and that wave upon wave of mud-stained water rose from the bottom as if the struggle were still being carried on in the depths below. Then, as I gazed, in the middle of the troubled waters there rose the shapeless mass which I had twice before seen; it turned slowly over, and sank quietly and heavily to the bottom. In my horror I ran forward and plunged as deeply as I dared into the muddy depths, but the bank shelved so suddenly that I could advance but a few steps, and looking in front of me, I quickly realised that I was too late to be of any assistance.

Hardly had I struggled back to the bank when, as though Nature had drawn a veil over a tragedy too ghastly to be enacted in the light of day and withdrawn it when all was over, the freshening wind cleared the fog for a time out of the whole valley, and I was able to satisfy myself that neither the man nor the boy was still visible in the water, and that neither of them had escaped to the other side.

So obsessed was I with the fear of the unknown, and so horrified at the terrible scene which had been enacted before my eyes, that it must have been some minutes before I recovered my senses sufficiently to realise that I was searching every cranny in the rock for the pack which the man had laid down before he took the fatal plunge, and peering into the black water for any signs of the two or of their baggage. Needless to say, I found nothing. Then, like one in a dream, I struggled along the muddy peat which covered the margin of the loch, looking for the footprints of the two victims, but though I could trace my own footmarks deeply embedded in the mud, there was not a mark to show that any other human beings had ever crossed it on the way to the rock.

It was then, and not till then, that the full horror of the scene seized my mind—the stories which I had heard years before of the lost boy and of the bull of the lochan flashed across my brain, and I knew that what I had seen was the supernatural re-enacting of a crime and of a horror that had been committed on that spot possibly centuries ago. Blindly I staggered a few steps up the path, and the last thing I remember before I swooned away is that the mist again enshrouded me, and that in the midst of it I saw wreaths of fog which took the form of noisome beasts that gibbered at my torture.

I must have fallen forward in my desperate endeavour to escape from that valley of death, for when I came to myself I found that I was lying shivering with deadly cold, with my face buried in the heather and my fingers in my ears in my endeavour to shut out the whisperings and mutterings of the invisible phantoms that surrounded me. With one despairing bound I leaped from the ground and shouted aloud for help, but no help was at hand. Still the deadly silence surrounded me (I no longer heard the whisperings), but from the precipices of Ben Venue echo flung back my shouts.

Madly I turned my face to the hill and raced for safety and the sight of human beings, and as I went I recognised with deep thankfulness that the higher I ascended the less I felt that the power of evil had got a hold upon me. At last, after what seemed to me an age of running, I reached the top of the pass between the two valleys. There the fog had collected in black clouds, caught in its flight before the wind by the high tops, and just as I emerged into bright sunshine on the slope above Loch Chon an old cock-grouse, perched, as is their wont in fog, on some isolated knoll near at hand, called loudly to me out of the mist, 'Go back, go back, go back!' Even now I remember that, such was my joy at the thought of what I had escaped from, I called back with hysterical courage, 'Go back, you old devil! I'll see you damned first.'

That is a bald and accurate account of what I went through on that terrible day, but I feel that it is too much to expect that you should believe that what I have told you actually happened. To you the only possible explanation of my story will be that my nerves had been more completely shattered by shell-shock than I realised, and that I was merely the victim of temporary hallucination; but I know beyond all question of doubt that I saw and heard all that I have described. A vast and lonely moor in Scotland is one of the most eerie places on God's earth, and I am not the first who, in such desolate places as the valley of the Lochan-na-Cheaird, has realised the nearness and the terror of the Unseen, and gone through experiences seldom dreamt of in the philosophy of ordinary men.

SHADOWS.

VANISHED shadows leave no trail
On the mountain or the vale;
But they lent refreshment sweet
In the noontide's fervent heat.

So, if sorrows press thy heart,
When, in good time, they depart,
May their only ling'ring trace
Be that heart's yet finer grace.

PART I.

I.

WHEN Julius Lothar Schneider left his father's house in the Rhine Province in the early eighties of last century, and emigrated to England in search of fortune and such fame as he might happen to achieve in the process, it must not be thought that there was anything discreditable in the affair. Schneider *père* was a country parson of a type now so extinct in Germany that it would seem fit to rank with the characters in Grimm's Fairy Tales. Kindly and tolerant, profoundly ignorant of the world beyond his own immediate parish pump, and quite content to remain so, he cultivated his glebe, lived on terms of the utmost good-fellowship with his parishioners, and brought up a healthy family on an income so small that it required a magnifying-glass to make sure it was there.

Needless to say, with such a handicap he could hardly launch his boys in the world, and when young Julius mooted in a hesitating, tentative way his desire to proceed overseas, he found, somewhat to his surprise, his father's blessing awaiting him.

The railway in those days had not penetrated the wilds in which he was bred. He consequently performed the first stage of his journey in the carrier's cart, and arrived in due course, somewhat lachrymose and sentimental, as is the nature of Germans, at the ancient cathedral city of Cologne, whence he took train, and in the fullness of time found himself at Flushing.

Julius had formed but a very hazy idea of the sea, and when, descending from the train at the water-side, he saw what appeared to his morbid fancy a small paddle-boat awaiting him, his spirits sank to zero. When at last the packet cast off and encountered a nasty choppy sea in the Channel, he discovered they could sink still lower. Not to put too fine a point upon it, he was very violently seasick, and did not enjoy it, particularly as, being a third-class passenger, he was confined to the deck, where sheets of spray washing over him soaked him to the skin. However, his trials came to an end at Queenborough, where the packet, with a final coquettish toss of her heels, tied up, and an exceedingly miserable and bedraggled young German made his way ashore, to be confronted by a Customs man with the inquiry as to whether he had anything to declare.

To this inquiry he returned a blank stare, coupled with the usual foreign addition of a comprehensive wave of the hands, and his sole sheet-anchor, 'No spik Eenglish.'

''Ere, pass the word for Vanderloo,' said the Customs man authoritatively, and the polyglot Dutch interpreter made his appearance. '*Haben Sie etwas steuerpflichtig?*' ('Have you anything dutiable?') For all reply, Schneider tendered his little portmanteau containing his scanty outfit, and was allowed to pass. Exhausted with his experiences on the pitching packet-boat, he fell asleep directly the train started, and so saw nothing of the typical English scenery as they made their leisurely way westwards. The shriek of the engine woke him from his uneasy slumber as the train entered Victoria Station, and, cold, cramped, and hungry, he found himself decanted on to the platform at six o'clock of a typically drizzly London morning.

Julius was, however, a stout-hearted lad, and having breakfasted frugally at an adjacent coffee-stall, in the course of which he was handsomely skinned owing to his ignorance of the language, he deposited his luggage in the cloakroom, and after a satisfying wash, made his way with some difficulty to the City, where a stool in the office of a compatriot had already been bespoken him.

What he saw of London on his way absolutely amazed him. The endless array of shops, gradually yawning themselves awake to the day's labour; the increasing crowd of foot-passengers all hurrying eastwards; the unending procession of knife-board omnibuses filled to the brim, with a pair of splendid horses taking their load along as easily as if it were made of straw; the enormous country wagons leisurely wending their way westwards from Covent Garden, their day's work already done—these gave some indication to the boy of the unimagined size and prosperity of the city to which he had come to struggle for a footing.

He had taken the precaution, before leaving

 [*All Rights Reserved.*]

home, of having the name and address of his new employer, Herr Theodor Stresemann, legibly inscribed in English on a slip of paper by the village schoolmaster, and armed with this 'Open sesame,' found himself without much difficulty in a dingy turning off St Mary Axe, where he solaced himself patiently with the company of the office-boy and a couple of clerks till nine o'clock signalled the arrival of Stresemann himself.

'Aha, you are Schneider, *hein?*' asked Stresemann, in brusque Prussian fashion. Then, seeing the boy did not understand, he continued in German, 'I expected you yesterday.' Giving Julius no time to reply, he explained that the new-comer would start at the princely salary of fifteen shillings a week, and adding that further rises depended on his exertions, handed him over to the clutches of the head clerk, and promptly immured himself in a gloomy dungeon to go through the morning's post.

The head clerk, a lantern-jawed individual, who looked as if he never had enough to eat (which, in view of his salary, was true enough), and who had picked up a little German, immediately set Schneider to index a letter-book, and so his first day's work began. At one o'clock the promptings of hunger stirred him, and after obtaining guidance, he made his way to a near-by chop-house, where he was introduced to the English 'bifschteak,' as he termed it, and returning full-fed, settled to further work with ardour.

The question of where to sleep suddenly obtruded itself upon him, and with the thought he approached the chief clerk. 'Sleep where you like, Schneider,' he said in his halting German. 'You 'll have to find a lodging, like everybody else, and be here at half-past eight in the morning;' and turning to the office generally, he asked, 'Would any of you care to help this young chap? He don't know what he 's going to do for a bed.'

''E 'd better come 'ome along of me. My mother takes in lodgers, and one left last week,' said Briggs, the office-boy; 'an' then 'e can see about it.' And with that the subject dropped.

The bell rang from the inner room, and the head clerk looked round. 'Sharp 's the word with those letters; you know what the governor 's like if he 's kep' waiting,' he said, as he disappeared into the lion's den, whence an uproar immediately proceeded.

The door was flung open and Stresemann stalked into the outer office. 'Why de letters not ready, *hein?*' he demanded explosively. 'You do nozzing here but waste your time. I shall get all Cherman clerks if I haf dis nonsense again.'

The unfortunate lads cast their eyes ceilingwards as he disappeared, and a murmured 'Any one can have *my* job' was the only result the outburst provoked.

At seven o'clock their gentle employer exploded himself out of the office, which forthwith closed, and, with much brushing of hats and changing of coats, they sallied forth.

II.

'Come on, Snyder; we 've got a bit of a way to go, unless you 've got yer kerridge waiting,' said young Briggs, as he skilfully piloted the young German, still goggle-eyed at the traffic, over the dangerous crossing at the Bank of England.

A thousand questions rose to Schneider's lips which he could not ask, and he registered forthwith his first wise resolution—namely, to learn English without delay. Tongue-tied by their inability to understand one another, they swam onwards, insignificant units in the stream of foot-folk travelling northwards, and brought up finally at a small stationer's and tobacconist's in Clerkenwell.

''Ere 's a new lodger come, mum, and 'e can't speak no English acause 'e 's a German,' was young Briggs's airy introduction to his mother, a plump person in cap and apron, who stood behind the little counter.

'Give 'im a chair, Charlie, and run across and fetch Mrs Sibley's lodger to 'elp me; 'e 's a German too.'

With the help of the spectacled Herr Strauss, who arrived in response to this solicitation, terms were agreed upon, and Julius found himself boarded and lodged at what, with his German frugality, he considered a scandalous rate; but it would still leave him an inconsiderable trifle of pocket-money each week.

At an early hour next morning he set forth with Briggs for the office, and the only drawback to the exercise of walking down was that it left him with an inconveniently voracious appetite, which he had grave difficulty in keeping under control till luncheon-time arrived. A few days of this routine served to make him feel as much at home in the office as if he had been born there. And meantime he had not forgotten his determination to learn the language. Every single article he saw he asked the name of, and at once wrote down the word in a pocket-book, till Mrs Briggs showed signs of restiveness at being turned into a perambulating dictionary. Thereupon, undefeated, he addressed himself to the spectacled Herr Strauss, who lent him what books he had, the more readily as he foresaw therein a means of getting rid of the insatiable student.

The English Sunday was Julius's greatest stumbling-block. Accustomed at home to a day of simple pleasure and rejoicing, an afternoon in a *Biergarten*, with his mother knitting, and, perhaps, some music to listen to, the austerity and gloominess of his surroundings in Clerkenwell nigh overcame him.

The unnatural quietness of the streets after their past six days' bustle, the shuttered shops,

the absence of all traffic, with only a solemnly pacing policeman to relieve the empty vista, were almost more than he could endure. One Sunday, having departed for his usual lonely stroll, he heard to his surprise the sound of music, and hastening in its direction, expectant of what he mentally described as *militär*, saw to his amazement a motley brass band, clad in red jerseys and blue peaked caps, advancing up the roadway, while behind them marched a mixed company of men and women, the leading pair carrying a banner, while the remainder uplifted their voices in some hearty chorus that to Julius was unintelligible.

As he watched, the procession executed some sort of military movement which brought them into a circle at the roadside, and a service began, punctuated by a good many ribald interruptions from the bystanders, for these were the days before the Salvation Army had established its hold on the public.

Returning, Schneider endeavoured without success to make his landlady understand what he had seen, and therefore sought out the now frankly bored Strauss, who advised him to join the *Deutscher Turnverein* (German Gymnastic Society) recently established in London, if he wanted society and companionship in his spare time.

'That wouldn't do,' said the practical Schneider. 'For one thing, it costs money; and, also, I should speak German there, and I must learn English.'

'Well, don't you always talk German to me?' returned Herr Strauss unanswerably as he closed the door.

The idea, however, took root, and having been some ten months in England, and speaking the language fairly fluently, Julius thought a little relaxation permissible. He therefore approached the *Turnverein*, only to stagger back appalled at the subscription demanded. Nevertheless, being a practical lad, and having a pretty shrewd estimate of his value, he determined to beard the redoubtable Herr Stresemann on the subject of a rise.

'What!' shouted that worthy, on the subject being broached; 'you want more salary, after being here only a few months? Why, you ought to be paying *me* for all the chances of learning you get here.'

'I find it very hard to live in this London,' replied Schneider meekly. 'Everything is so dear.'

'Nonsense!' interrupted the autocrat. 'You are extravagant; and as for salary—pouf! go back to your desk.'

So ended the interview; but it resulted in Schneider searching the advertisement columns of the daily papers till he succeeded in getting another situation at a rise of five shillings a week.

When Stresemann received notice his indignation knew no bounds, and, like the petty tyrant he was, he refused to furnish a character. But Schneider, having put the matter fairly before Mr Watson, his new employer, was absolved from the obligation of producing a reference, and entered on his duties forthwith.

He was now at liberty to join the *Turnverein*, which he did without delay, and found himself in very congenial company. The gymnastics served to strengthen his muscles, rendered rather flabby and atrophied from his long confinement at his desk, while it was almost like a breath from the Fatherland to find himself amongst German-speaking folk again.

It was not long before he began to make friends, and what struck him particularly was the attitude that most of the young fellows there adopted towards England. Like himself, they were almost without exception employed in business houses in the City, either on exiguous salaries, or as volunteers in order to learn English, and while picking up all the hints possible with a view to starting eventually for themselves, openly avowed their intention, when they did so start, of trying to divert their present employers' customers to themselves by rather shady devices. In addition, it grew upon him that a kind of Commercial Intelligence Bureau, very informal, but none the less thorough for that, appeared to exist in the *Turnverein*, for a certain member was noted ('notorious' would perhaps be a better word) as being always ready to pay for items of news that could be turned to account—items regarding a firm's customers, its bank balances whenever ascertainable, its profits, and even intimate personal details of employers' private lives, especially if these were inclined to be vicious or loose.

Such an environment undoubtedly corrupts, none the less surely for being so subtly poisonous, and very slowly, but very certainly, Schneider began to acquire a contemptuous and disparaging opinion of the country that was giving him his daily bread, looking upon the English people as a whole as simpletons only fit to be despoiled, and, according to the estimate drilled into him, unequal to keeping what their forefathers had died to gain.

III.

Some three years thus passed quietly by, Schneider rising steadily in the esteem of his firm through his industry and application, the while he patiently sought to acquire as many of that firm's secrets as came his way. His only official connection with the Fatherland was a visit every May to the German Consulate to know whether his turn for army service would fall that autumn. At the third application he received instructions to present himself in the following August at the recruiting-station nearest to his home for the usual medical examination. He was by this time in a position of some responsibility, trusted and thought well of by

Watson's, and it was with considerable regret they received the news of his impending departure. When the actual time for leaving came, the head of the firm wished him a cordial farewell, and, while unable to promise to keep his berth open for him, professed his willingness to do his best when the young man returned, and concluded the interview with a hearty handshake, in the course of which a five-pound note found itself mysteriously transferred to Julius's palm.

To say that Schneider was glad to go back to his native land would be to understate the case. More than four years had gone by since he had seen his home, and though his pleasure was somewhat damped by the thought of the experiences he was about to undergo, he was unfeignedly happy to find himself in the Fatherland once more.

After a fortnight in the bosom of his family, where he was made much of, he presented himself to the authorities, and his training began. It was then that he first commenced to appreciate the difference between the English character and the German; for, if a worse tyrant exists than the German non-commissioned officer, reinforced and supported as he is by the German officer, he has yet to be discovered.

Up at dawn, bullied and dragooned till nightfall and often beyond, Julius dared not call his soul his own; and many a contrast did he draw between his present experiences and his past four years as he stood, stiff and straight in the ranks, cursed to perdition in the rasping German manner for the slightest mistake, while the ever-ready cane of the drill-sergeant whistled across his shoulders, or brought the smarting tears to his eyes as it descended heavily on his knuckles, did he so much as move on parade. Moments of solace there undoubtedly were, as he sat with his comrades in some pleasant *Biergarten* or homely *Kneipe*, lustily roaring the sentimental choruses beloved of the Fatherland; but they served only to emphasise the distinction between the barrack-square and outside, as the following morning saw his torture recommence.

Let it not be thought, however, that he was entirely unhappy, for a strong spring of patriotism wells up in every German heart, and Julius realised that he was but rendering his country the service due to her, though he wished it were not made so unpleasant in the rendering. Not having had the necessary education, he could not claim to be treated as an *Einjähriger Freiwilliger*, or one-year's volunteer, and his heart sank at the end of his first year as he saw the lucky graduates disappear, and realised that two more years of purgatory would be his ere he could depart.

Schneider was somewhat solaced on being made a *Gefreiter* (lance-corporal), and set to work with hearty goodwill to repay on the new levy of that year something of what he had undergone. He was engaged in this pleasing occupation one fine frosty morning in December, when he was summoned to his major's presence. His knees trembling under him, he obeyed the summons, and found his battalion commander closeted in intimate conversation with a strange major, whom he had never seen before.

Punctiliously saluting, he reported himself '*Zu Befehl*' ('At your order'), and awaited the next move.

'Zo, you are the Lance-Corporal Schneider?' said the stranger curiously.

'*Ja wohl, Herr Major*,' was the reply.

'And you 've spent some time in England?'

'Yes; I was there for over four years, till I was called to the colours.'

'What would you say to going back there now, instead of finishing your time here?'

'I should like it very much,' replied Julius.

'You know, of course, that you still have two years to serve?'

'Yes, I understand that.'

'So that, if you were allowed to go, it would be an act of grace on the part of His Imperial Majesty the Kaiser.'

'God protect him!' said Schneider fervently.

'Of course, if you returned to London, you would be required to render some service in return for this gracious concession; do you understand?' said the strange officer raucously.

'*Zu Befehl, Herr Major.*'

'Very well, I 'll explain matters to you. There is a certain Herr Anton Bassewitz of the *Deutscher Turnverein*, in London, whom you know.'

'*Ja wohl, Herr Major.*'

'*Maul halten!*' ('Hold your tongue!') ejaculated the officer viciously. 'And he has reported well of your capacity and industry there; too well, I should think, from the look of you—but that 's his affair. You would be required to go back to London, establish yourself in business as an agent (for which funds will be furnished you), and carry out this Bassewitz's instructions, which, shortly put, are that you are to ferret out what he tells you regarding your trade rivals, and any other details needed. You can open up communications with your former employer, this Englishman Watson. Tell him you have come into money, or any other lie that Bassewitz suggests, to account for your being back before your three years have expired, and in all things you will obey Bassewitz as your superior. Is that understood?'

'*Ja wohl, Herr Major.*'

'Then,' said the stranger, turning to Major von Stramm, 'I understand you will dismiss the man without delay, and he will report himself to Bassewitz at once.—Remember,' he added, turning menacingly to Schneider, 'all this is secret. You can go.'

Utterly bewildered, Lance-Corporal Schneider saluted and left the room. That afternoon he was sent for again, provided with a civilian outfit, a ticket to London, and a small sum of

money, given three days' leave to see his family, and bidden to report himself to Bassewitz in five days' time.

With his head still in a whirl, Julius arrived at his father's house about nine o'clock that night.

'*Was gehl los?*' ('What's the matter?') was the surprised ejaculation that met him as he entered.

'That I can't tell you,' replied Julius. 'All I can say is that it is nothing disgraceful. I have finished my term of service, and start back for London the day after to-morrow to go into business again.'

The time passed all too quickly, and at the end of the three days the entire family convoyed him to the railway station, which had been established since his first departure, and saw him off.

As an experienced traveller, the journey had neither terrors nor novelties for him, and he arrived in London without incident. He had taken the precaution of writing to Mrs Briggs, and was met, when he arrived at Clerkenwell, with the warmest of welcomes.

'Well, I *am* surprised,' said that good woman, 'but pleased, mind yer. You was allus one of my best lodgers, and it so 'appens I 've got your old room empty, so you 'd best go and 'ave a wash at once. Brekfus 'll be ready in 'arf-an-hour.'

(*Continued on page 809.*)

CONCERNING STATE TRIALS.

MOST people (out of Germany) must have heard with satisfaction that the ex-Kaiser will be tried in London. If one dared mention in connection with such an august and formidable proceeding a certain sound piece of advice of culinary import, it would only be in order to anticipate an always possible disappointment.

Not only all his enemies, but even his few friends, must wish that at last Wilhelm's guilt or responsibility should stand a fair chance of being publicly debated, and that any doubts there may be on the subject should be finally disposed of and set at rest; but the question is most intricate, and bristles with difficulties. Whatever hopes one may entertain, it will not be by any means easy to come to a satisfactory conclusion. Former State trials in London, such as those of Strafford, King Charles, or Warren Hastings, are not of much use as precedents, for the world has become vastly more complicated since then, and far more relevant material, conflicting or otherwise, is now available for the judges to sift and weigh.

With the passing of secret diplomacy, and with the ransacking and spoiling of so many European Chancelleries, more may be revealed than is at present expected or, it may be, desired. We know that in the seventeenth century the Chancelleries of Dresden and of Vienna held compromising and disgraceful documents (forged not excluded) ready to be used for or against as circumstances might require; and with the best will in the world one cannot believe that the Cabinets of the twentieth century are of a more child-like innocence in that respect.

The perversity of our age may not be quite so thorough as that of the fifteenth or the sixteenth century, when most prominent statesmen must have kept private forgers on the premises. Sometimes the work was clumsily done, sometimes so artistically that it has defied detection to this day. For example, of two letters still extant attributed to Mary Stuart, one is admittedly genuine—only, it is impossible to say which of the two it is! Deception can no further go, and, to our credit, we must conclude that we are not so infernally clever to-day — witness the clumsy workmanship of the so-called Anglo-Belgian Treaty which the enemy has not been ashamed to put forward as genuine.

Early in the nineteenth century it was decided not to try Napoleon publicly or privately. It was then already considered too difficult an undertaking. Tolstoi was of opinion that Napoleon's responsibility for the campaign of 1815 was not greater than that of the merest drummer in the army or of the smallest man on the Parisian boulevards. For a clear view of the present question it would repay any one the trouble to reperuse the chapters of Tolstoi's *Peace and War* which deal with this particular aspect of the matter.

We do not always find power where we expect to find it. It is told of Louis Philippe that, driving one day through Paris with his aide-de-camp, His Majesty was annoyed by a disturbance caused by some unruly cabmen, at that time a troublesome class of men. 'If I were Prefect of Police,' said the helpless king, 'I should soon put a stop to all that!' But the king was not Prefect of Police. In like manner, an emperor is not a council of generals. The power of camarillas to stultify or nullify the wishes or the actions of a weak ruler is too well known, and William Hohenzollern is not strong. Bluster, vanity, and a love of theatrical pose are not compatible with real strength. The silent, strong man is proverbial.

Frederick the Great *was* strong. He, and he only, was answerable for the Silesian Wars. He had no Parliament, not even a 'Tobacco' one, like his father; no camarilla would have had a chance against him; he did not allow any

general—not even 'the old Dessauer'—to have one word to say in the matter. His trial, if he had been caught (the Austrians once were within an ace of capturing him alive), could have been disposed of in half-an-hour. But how much do we know of the intrigues, the cabals, and the secret forces at work at the Court of Berlin in 1914?

Theoretically, of course, the Kaiser, as an autocrat, must bear the blame and the punishment; we really cannot go outside this theory without being involved in an inextricable mess. For the same reason we tacitly admit the altogether different theory of Tolstoi by inflicting severe punishment on the whole German population collectively. Where, indeed, should we be without our theories?

The wholesale punishment being now settled and disposed of, what is to be that of the ex-Kaiser, on the admirable principle of making the punishment fit the crime? Not all the judges and lawyers in the universe could make this anything except approximate, falling terribly short of what such a fearful crime against humanity deserves. The Chinese have a genius for inventing unheard-of retribution, but even their fertile imagination would here prove inadequate.

We must dismiss as merely a newspaper *canard* the report that it is the intention of the Great Powers to inflict only a formal reprimand. All the Germans, including the ex-Kaiser, could at a pinch put up with that. At the other end of the scale we are limited by the death-sentence, which is not such a simple matter as the 'Hang the Kaiser!' people seem to imagine. Hanging is ruled out by a number of objections, at which we may give just a passing glance. Such simple, downright, or ignorant people do not take account of the many diplomatic, traditional rules and trammels which perhaps only the College of Heralds could properly explain.

The matter not being yet *sub judice*, we may be allowed to hint at the fact that capital punishment can be inflicted in many other ways, all regulated by precedent, and in this country we are taught to consider precedent as an infallible guide. The most terrible of all is the block and axe, but not everybody is entitled to undergo this dreadful ordeal. It is considered an honour which divests a public execution of the degradation usually attached to it. Beheading is therefore, strange as it may seem, a coveted distinction, in the past eagerly and tearfully implored.

Broadly speaking, it has been considered the legal right of a traitor, on one condition—he must be noble. They were going to hang Chastelard out of hand in 1563, when his justly offended queen, offended in her honour both as a queen and as a woman, gave way, 'tis said, to his entreaties, and at the last moment allowed him the axe, as, though only a poet, he was also a noble—of sorts. The ex-Kaiser, being noble beyond other men—strictly in the heraldic sense, of course—could not, perhaps, be put to death in any other way.

But here again certain distinctions are made, decided by the nature of the crime, which must be of a high-class description—as some of the crimes laid to the ex-Kaiser's charge undoubtedly are not. Lord Lovat was beheaded in 1747 for high treason, and another lord was simply hanged for a vulgar murder—though even in his case he was allowed the singular grace and the sorry consolation of a silk rope instead of the usual vulgar hemp. How any one in such a wretched plight could be, if the expression may for once be allowed, so d—— particular passes comprehension, though the indifference of some criminals in the face of death is certainly remarkable. When the Three Lords were taken from the Tower to be sentenced at Westminster, some discussion arose at the Tower gate to decide in which of the three coaches the dread axe should be carried. 'Oh, put the d—— thing in here,' said undaunted old Balmerino. 'I don't care!' King Charles looked calmly at the fearful blade, and only hoped no one would meddle with the sharp edge—not at all a superfluous anxiety, as many instances have proved.

If on all counts it should finally be decided and deemed expedient to make a striking example, the ex-Kaiser's trial, though inevitably the most impressive of any within living memory, will probably be shorn of that most harrowing detail which was thought necessary at the trial of Charles I. There will not now be an axe placed in sight of, but facing away from, the accused, only to be turned with the sharp edge towards him to denote that the evidence begins to be undoubtedly unfavourable. One cannot help wondering by whom this supreme instance of theatrical display was first invented and legalised.

The ex-Kaiser is said not to be over-courageous, and accustomed though he is to all sorts of military implements of destruction, a sharp naked axe is a nasty thing to consider if one stands in fear of making a closer acquaintance with it; it would undoubtedly unnerve him. Probably there is still a serviceable axe in the Tower of London, but is there a man who would now care to wield it? Even the executioner of former days, using the instrument almost daily, often bungled dreadfully with it. Monmouth, on the scaffold, gave the man a handful of gold to ensure his doing the business at one blow; but the precaution did not help him, for the executioner had to hack several times before the head came off!

Our forefathers took all this quietly, much as a matter of course. There were no evening papers at that time to tell the public how dreadful it all was. The callousness of former ages is almost beyond belief. Mary Queen of Scots, so the story goes, looked from her window at the

execution of Chastelard; and Darnley, who rode into Edinburgh that very day, reined in his horse to look at the gruesome spectacle, and only asked in a casual way 'who the fellow was.'

Students of human nature and of history must look forward to the coming trial with intense interest. Do eminent and great men, fallen from their high estate and tried for their lives, display this greatness by any special composure and dignity? In very many cases this has been so. King Charles was a gentleman always, and never more so than at his trial. The same may be said of Louis XVI. The trial of the French king and queen does not deserve the august name of a State trial; but the answer of Marie Antoinette to the scoundrels who sentenced her to death was simple, courageous, and thoroughly queen-like. With the immeasurable contempt of an aristocratic woman, a haughty daughter of an empress-queen, for the rough, ill-clad rabble into whose hands she had fallen, she did not deign to discuss their right to judge her or the validity of their verdict. In six short, stinging words she told them what she thought of them. '*Vous êtes tous de profonds scélérats!*' ('You are nothing but a lot of scamps!') And with this, without another word, she swept out of their presence.

Mary Stuart, always vehement, quick, and passionate, but now aging, gray-haired, met her doom calmly, quietly answering and herself interrogating her judges. Was her dignified conduct a proof that she felt herself to be innocent? Hardly that; but women have a wonderful power of deceiving themselves, and as twice a queen she denied to any one on earth the right to judge her. Charles Stuart and Louis Capet made the same ineffectual protest. Without doubt William Hohenzollern must honestly be of the same opinion, and, contrary to the general idea, he would have some right on his side. Human wisdom, for what it is worth, has for ages past invested royalty with an inviolable sanctity, above all laws. And the Kaiser could go even a step further — he could advance the plea of his vaunted partnership with the Almighty, which (if admitted) should absolve him of all blame. This claim may have had its use where, and as long as, the imperial *ipse dixit* was accepted as final; but a court of law is the most sceptic of bodies, and, as William will find, does not accept unsupported testimony.

THE BROWN NABOB'S MONEY.

CHAPTER III.—HIGH SPHERES.

WHEN Bellamy had left him, Petherfield carefully fitted a cigarette into the long holder which he always affected, smoked thoughtfully for a moment, exclaimed, 'God bless my life and soul!' once or twice, and then, putting on his overcoat, went quietly downstairs and slipped across the street to Haddlesey's office. With the freedom of old acquaintanceship, he walked straight into his fellow-practitioner's private room. Haddlesey, hatted and overcoated, and evidently about to depart, was drinking a glass of sherry. Without a word, he pushed the decanter towards Petherfield, and took a glass from a cupboard in the corner.

'Thought you'd be coming in,' he remarked laconically as he set down the glass before his caller. 'Of course, he's told you?'

Petherfield poured out the sherry and took a thoughtful sip. 'No mistake about it?' he asked. 'No possibilities of anything arising to upset it, eh? No relations likely to turn up, you know?'

'So far as I'm aware, the will's as sound, and your clerk's as safely established, as St Eanswythe's Church,' answered Haddlesey. 'I'd some sort of notion this was going to happen. The old man kind of hinted at it when he gave me the will. He'd already made provision for the housekeeper and the servants—gave 'em their little bits in cash, a fortnight ago, when he was taken ill.'

'Much?' inquired Petherfield.

'Gave the housekeeper a thousand, the two women two-fifty each, and the boy fifty pounds,' replied Haddlesey. 'The housekeeper, who'd known him many years, says it's a fact he hadn't a relation—even distant—in the world. No; young Denton's safe in the saddle, my lad!'

'And the amount he mentions is right — a hundred and sixty thousand?' asked Petherfield.

'Under the mark, if anything,' said Haddlesey. 'Nearer one hundred and seventy. Shillito has the whole lot—first-rate securities: Indian railways, Home railways, Government stock, and so on. Nice thing, Petherfield! And—what's he going to do?'

Petherfield set down his empty glass. 'We must make something out of him,' he said. 'He's raw and simple. He'll want coaching.'

Haddlesey winked. 'Well,' he observed, 'there's nobody better fitted to play that part than you! He's been with you—how long?'

'Took him in as office-boy ten years ago,' answered Petherfield. 'He was fifteen then—came out of the Board school. He's like the old man—no family to worry him. Don't know of any relatives of his.'

'Ay, well, he's one of the richest men in Normansholt now,' said Haddlesey, picking up his umbrella. 'Strange change — from a few shillings a week to six thousand a year!'

The two men parted outside Haddlesey's door, and Petherfield turned off in the direction of Hedgwick, a tiny hamlet on the borders of the town, where he had a villa residence, in which it rejoiced him to keep a certain amount of pretentious state. Kittie Parker had only voiced prevalent sentiment when she referred to the Petherfields as snobs. There were four of them—father, mother, a daughter, a son. Petherfield himself was a person who had sprung from obscurity. He had come to Normansholt as managing clerk to an old solicitor, whose daughter he married, and had done very well for himself. He was naturally inclined to grandeur; and his wife was an able second to him. As for his daughter Edytha, famed as the prettiest girl in Normansholt, she was one of those young persons who measure men by their bank balances. The son, Norman, was of like sentiments, and thanked his stars every day that to belong to the professional classes is next door to kinship with the do-nothings. Norman, at nineteen, sported a dinner-jacket every evening, and if he met an acquaintance at five o'clock in the afternoon bade him 'good-morning'—thereby signifying that he was not one of those who commit the unpardonable sin of dining in the middle of the day.

Mrs Petherfield and Edytha were already in their dinner-dresses when Petherfield walked into the drawing-room at The Acacias. Edytha, a willowy blonde, whose prettiness would have been remarkable if she had possessed any character or intelligence, was lazily turning over sheets of music strewn about the top of a grand piano; her mother, a little, sharp-featured woman, was trifling with some fancy-work near the fire. Pretentious as it was, the house was not too big, and a smell of roasting game floated from the kitchen. In ordinary circumstances, Petherfield would have sniffed and approved; as it was, he shut the door carefully behind him, tiptoed across the room, and drew his wife and daughter together with a glance.

'Whatever do you think's happened?' he asked with a knowing wink. 'You heard that the old man they called the Brown Nabob was dead—old Farmadale? Do you know?—God bless me!—I never heard of anything like it!—he's actually left that clerk of mine, Bellamy Denton, all his money! Every blessed penny of it!'

Edytha's apathetic eyes gleamed curiously as she suddenly turned on her father; as for Mrs Petherfield, she dropped her work on the floor, with a sharp exclamation. 'Tot!' she gasped, using a curiously inappropriate but well-known pet-name. 'You don't mean it! How much?'

'Getting on for two hundred thousand pounds,' replied Petherfield, who knew the charms of slight exaggeration. 'Every penny his! The fellow'll have—no, has!—some seven thousand a year!'

'At his own disposal?' asked Mrs Petherfield.

'All's his—lock, stock, barrel,' declared Petherfield. 'That fine old house—everything in it—and all the old chap had to leave. He's whole and sole master. And, by-the-by, he's coming to dinner. Be good to him! Two hundred thousand pounds—who wouldn't be good to it?'

Mrs Petherfield rose, laying her fancy-work aside. 'Cook's got two pheasants,' she said musingly. 'But there's another in the larder—there's just time. And we've soup and fish. I think we shall manage.'

'Manage!' laughed Petherfield. 'Do you suppose he ever sat down before to anything but plain roast or boiled? We'll manage!'

Mrs Petherfield left the drawing-room, and Petherfield glanced at his daughter. 'Two hundred thousand!' he repeated, with a wink. 'Case for your best bib-and-tucker, miss.'

Edytha, however, was already looking over herself, with the aid of the mirror.

'Not at all a bad sort of chap either,' remarked her father. 'The sort that a pretty woman could twist round her little finger.'

'You said you preferred me in pink the other night,' suggested Edytha. 'I've time'——

'Fair-haired women always look best in pink,' said Petherfield. 'Get into it! By-the-by, where's Norman?'

'Gone over to Silbridge,' replied Edytha. 'He'll stop the night there.'

'Thank the Lord!' remarked Norman's father. 'Denton'll feel more at home with us than with Master Norman's supercilious airs. Make yourself agreeable, my girl—to seven thousand a year!'

He went off chuckling, and vanished into his cellar as his daughter turned up the stairs to her room. Petherfield was famous as an epicure, and as a judge of wine. He was going to find some wine now that would warm Bellamy Denton's heart without getting into his head. Presently he emerged, carrying various bottles, and he had just set these on the sideboard in his dining-room when the parlour-maid brought Bellamy into the house.

Petherfield welcomed Bellamy as unconcernedly as if he had been used to seeing him in evening-clothes every night for a year. Secretly, he was amazed at the transformation, and at Bellamy's improved appearance; he was glad, too, to see that the young fellow was too genuinely innocent to betray self-consciousness. He shook him warmly by the hand and drew him into the dining-room. 'Glass of sherry after your walk, my dear fellow!' he said hospitably. 'Just time before I go up to change. Fine old stuff this; but,' he added, with a wink, as he thrust a glass into his guest's hand, 'I reckon there'll be some better in the cellars at Friargate House, eh?'

'There is some there, Mr Petherfield,' answered Bellamy. 'Yes, Mr Farmadale used to give me a glass or two of his old brown sherry when I

went to play chess with him. He said it was such as you couldn't buy nowadays.'

'Well, I shall be glad to try it with you, my boy,' said Petherfield, and raised his glass. 'And once more, my dear friend, a thousand congratulations, in which,' he continued, as Mrs Petherfield came swiftly in, 'my wife—and all of us—join heartily.'

Mrs Petherfield had hold of Bellamy's hand and was flapping it mildly before he fully realised that she was there. She smiled all over her face at him, and Bellamy grinned widely at her. 'My dear Mr Denton!' she gushed. 'As Mr Petherfield says, a thousand congratulations—from all of us, of course. So nice for you—so kind of the poor old gentleman! You must be so pleased!'

'Yes, ma'am—thank you, ma'am,' said Bellamy. 'Yes, I suppose so, Mrs Petherfield—I—I—the fact is, I don't quite realise it yet, ma'am.'

'Doesn't know whether he isn't dreaming,' said Petherfield. 'Very pleasant reality, I'm afraid, my boy. Take him into the drawing-room,' he went on, giving his guest an affectionate push towards the door. 'I must change.'

Bellamy followed Mrs Petherfield into the drawing-room with fear and trembling. He was mortally afraid of Edytha. Since her return from fashionable schools in London and Paris, three years before, he and Herbert Judd had looked upon Edytha as something utterly beyond their reach—a young goddess upon whom it was almost sacrilege to gaze. And now, as Mrs Petherfield graciously conducted him drawing-roomwards, he was remembering that Miss Petherfield had never given him more than a cool nod when he opened the door of her papa's office to her, and that she invariably cut him and Judd dead in the public street. Now he was actually going to sit at the same table with her; perhaps to pass the salt to her—he might even sit at her side.

'Of course you know my daughter,' Mrs Petherfield said off-handedly. 'All old friends, to be sure. Consider yourself entirely at home, my dear Mr Denton—so pleased to see you.'

Bellamy found Edytha's hand in his, and he held it for a moment as if he scarcely knew what to do with it. He heard Mrs Petherfield murmuring something about the cook, and saw her slip from the room, and then—then he suddenly discovered that Edytha had somehow steered him into a lounge close to the fire, and was sitting by him and talking.

'. . . . Such a delightful surprise it must have been for you!' Edytha was saying. 'And such a kind old gentleman! I suppose you'd been kind to him, of course—very nice of you.'

'Well—er—ah—I don't know,' replied Bellamy. 'I—I hadn't thought of it in that way, miss; I only used to play chess with him now and then.'

'You play chess?' said Edytha, throwing a world of admiring awe into her violet eyes. 'Oh, how very clever of you! I should love to play chess—but I fear it's beyond me. Only very clever people play chess.'

Bellamy was wondering if it would be polite manners to offer to play tutor, when Petherfield bustled in, having effected a lightning-artiste change in his dress. He caught his daughter's last word.

'You must teach her,' he said to Bellamy. 'You'll have lots of time on your hands now, my boy—lots. Unless, indeed, they persuade you to go into Parliament!'

'Parliament! Me, sir!' exclaimed Bellamy. 'I'——

'Ah, don't you make any mistake, Denton!' interrupted Petherfield. 'You'll soon find it out, my dear sir. The town will expect great things of you—now. Young man—ample, nay abundant, means—leisure—talents—abilities—oh, of course, Parliament! I see you, my dear young friend, on the very edge of a career!'

Five minutes later, however, Bellamy found himself on the edge of a chair in the dining-room, very bolt upright, and endeavouring to be very proper. He had never been in such company or surroundings in his life. Mrs Petherfield had inherited fine stores of silver, glass, and linen from her father; Edytha had a pretty taste in table-decoration. Bellamy found himself gazing at her across a mass of flowers. His own and Petherfield's glossy linen helped to give an air of brilliancy to the scene which confused him. Nor was he accustomed to eat his meals in a succession of courses, with an amazing multitude of knives, forks, and spoons, and a small array of glasses as weapons, and with a couple of deft parlour-maids dancing attendance upon him. But Petherfield cleverly kept him at his ease by a flood of small-talk and a constant supply of jokes and stories, and Bellamy began to feel that there was not so much stateliness and ceremony in these grand affairs as he had feared. Yet, would he be expected to do all this sort of thing in his newly acquired house? Would he have to dine in state every night, with a parlour-maid at his elbow watching every mouthful? Well, if so, he would take care that he always had company. But, even then, the irksomeness of having to do it every day would be awful. Why, on hot days in summer Mrs Parker and the Misses Parker made no objection if he and Bert Judd ate dinner in their shirt-sleeves!

The dinner came to an end at last, and Mrs and Miss Petherfield gracefully retired. The handmaidens drew the cloth, and solemnly placed before their master a decanter of port and a bunch of glasses.

Petherfield gave his guest a knowing look. 'I'm an old-fashioned fellow, Bellamy, my boy,'

he said. 'I like my port! And I've never had a suspicion of gout, either. This is some of my old '42. Try it.'

He had been careful not to press his claret on Bellamy at dinner, not being certain what the neophyte could stand. He put more faith in the port for warming Bellamy's heart.

'What do you think of that, now?' he asked as Bellamy sipped. 'Like it?'

'Seems beautiful, Mr Petherfield,' said Bellamy. 'But I'm no judge.'

'That'll come,' remarked Petherfield. 'I dare say you've some fine stuff at Friargate House. Ah, what you want to do, my boy, is to feel—already—that you've been in possession of that desirable residence, and its contents, and of your fortune all your life, eh?—to feel—yes, accustomed. You'll soon get into that feeling! Realise your luck, my boy—and live up to it! Of course, you'll want a few tips. Well, you know where to come. Myself—and my son Norman—are at your service—any time, Bellamy, my friend.'

'Thank you, sir; it's very kind of you,' responded Bellamy. 'I—I don't think I should like the Parliament idea, though. I'm—I'm all for a quiet life, Mr Petherfield.'

Petherfield laughed, and refilled his glass and pushed the decanter across.

'With your means, my boy,' he said, 'you can be for any mortal thing you fancy! A quiet, gentlemanly life, then—nice old house, a few thousands a year; ah, you'll do very well, my friend. When you get a wife, of course!' he added with a wink. 'And—mind what you're about in that way. You want a lady, you know—something to befit your position. Responsibilities of wealth and station, my boy, can't be avoided!'

He saw a slight look of alarm pass over Bellamy's freckles at this suggestion, and hastened to change the subject. And after the second glass of port he proposed the drawing-room, and music. Bellamy followed meekly—to hear Edytha sing French songs and play things that he didn't understand. And so the evening passed, and at ten o'clock he went home, warmed by a parting glass of Petherfield's very old whisky, and sucking absent-mindedly at one of Petherfield's best cigars. He was still in a whirl of wonder when he reached the Parker house and quietly let himself in—to find Evie, all alone, in the homely little living-room.

(Continued on page 804.)

MODERN METHODS OF RAILWAY ROBBERS.

By S. T. James.

I.

A SERIOUS item on the debit side of the balance-sheet of all big railway companies is the amount paid out to the public as compensation for the loss or the pilferage of goods whilst in transit. In addition to these amounts paid out in hard cash, the railways have to maintain a numerous and costly staff of clerks and inspectors for the investigation and settlement of merchandise claims.

This is an item of expense which might be very materially reduced if the demands sent in were as a rule just and reasonable ones, or if they were not in many cases actual breaches of commercial morality. For even if we set aside such claims as are made by people who live by their wits, and constantly infringe the Eighth Commandment in doing so, it would really seem that many persons who would scorn to rob their neighbour of a penny become strangely perverted in their views when dealing with a corporate body like a railway company. It is an old saying that a Board has no conscience; but there are many thousands of business people who appear to think that a railway company has a purse, and a long one, too, and that if they can succeed in putting their fingers into it without detection, they are to be congratulated as having done a smart thing for themselves without any one being the sufferer.

The trickery resorted to is astounding. There are various multiple firms who, two or three times weekly, forward large consignments of eggs by different railways to their branches all over the country. At one of these branches there are received, say, three consignments, each delivered by a different railway company. From one consignment perhaps twenty, maybe fifty, broken eggs are taken and put in a bucket. Then the manager adds to the bucket all his accidental breakages during the week, and presently rings up the London and North-Western Railway Company to tell them that a hundred eggs in the consignment just delivered are broken. Soon the London and North-Western claims inspector arrives to see the breakage. He is shown the bucket, and retires. Then the Midland Railway people are telephoned by the branch manager: 'Your drayman delivered us six cases of eggs yesterday from Brigg.' 'Yes!' 'There are a hundred of them broken. Will you send round to inspect them?' So the Midland claims inspector comes and sees the bucket. After he has gone the Great Western Company are communicated with in like manner. In due course the firm will receive settlement of three claims!

The railway companies have discovered, by co-ordinated tests, that when consignments delivered are unpacked in the presence of their representatives the claims are reduced to about a fifth; but, of course, it is impossible to have a railway representative present every time eggs are unpacked. This remedy would prove more expensive than the disease it cured, so that the 'inspection' method can only be resorted to periodically, when a particular firm's breakage claims become too frequent and outrageous. One Yorkshire firm was found out quite by accident. The railway claims inspector and the manager came to high words, and the railwayman, getting the worst of it, vented his rage on the bucket of broken eggs. Taking a kick at it, he upset the contents. Instead of a bucketful of broken eggs rolling on the floor, there fell out about twenty — and quite a lot of straw from underneath!

Many false claims are made for damage to castings and machinery. A firm of manufacturers making a piece of machinery find that during the process some crack or flaw has developed. This means a good deal of extra expense, and in addition will cause delay, and consequently annoyance, to their customers. So they seek a way out. The machinery is completed and loaded into a railway wagon, a consignment note is handed in to the station agent, and the traffic goes forward. The crack has been covered up so that it is indistinguishable to the unexpert eyes of a railwayman. The probability is that the railway journey enlarges the crack or makes the flaw more apparent, but whether it does or not, the consignees' experienced buyers soon see that all is not well; the railway company's delivery-sheet is endorsed accordingly, and afterwards a claim for the damage is sent in. The railway company have to admit that they noticed nothing wrong when the casting was accepted at the sending-station for conveyance, and as it was undoubtedly cracked on delivery, they have no alternative but to pay the sum demanded.

Another trick of a somewhat similar nature, and one that is often resorted to, consists in placing broken or defective articles in cases or boxes—anything to hide them from sight. Then, after delivery to the consignees, the damage is discovered, and the senders say it must have taken place during rail transit, as the article was certainly in good order when despatched. Railway companies have the right to open and examine any receptacle, and do so in dealing with 'suspects;' but obviously they cannot afford to break open every case or box handed to them for conveyance, as, besides the expense, there would be also the time and the trouble involved, and the annoyance caused to innocent firms. So, although breakages are occasionally discovered, detection does not do much good, since the railway authorities are quite unable to prove intent to defraud. The senders can always allege that they were unaware of the damage, and blame the carelessness of one of their employees.

II.

A trick which is often tried, and which sometimes, if not always, succeeds, is that of the rogue who addresses his goods to one place and consigns them to another. The consignment note is dealt with by clerks in the office; the goods are dealt with by loaders in the goods-yard; and although the two should be compared by the checker, this is often done very perfunctorily and carelessly, particularly at big depots where hundreds of consignments are handled hourly. Railway checkers have always been overworked, and until recently were badly underpaid, and it is not surprising to find that they often slip through their duties in the easiest possible manner. There is thus good chance of a discrepancy between the label and the consignment note passing undetected. Then, of course, the goods are sent to the place to which they are addressed, and are delivered there. After a little time the sender complains to the railway company that they have not delivered the goods consigned to So-and-so on such a date. The railway company turn up their consignment note, obtain reference to their invoice, and in due course find out that the goods have not been delivered to the address to which they were consigned. So they are called upon to pay the value. Even if they are suspicious, it is impossible to expose the trick unless the trickster can be trapped into supplying the evidence of his own guilt. If the sending-station checker discovers, on the goods being tendered for conveyance, that the address on the consignment note differs from that on the label, even then it is impossible to prove conspiracy to defraud, for the sender simply pleads that it is a *bona-fide* error!

A typical instance of the roguery that is rampant to-day was exposed recently. A trader had an empty wagon put into his works for loading, but asked for the wagon to be tared first; and this was done. When the vehicle was loaded up it was again weighed, and the tare previously obtained being subtracted from the gross gave the net weight of the contents, on which the trader demanded payment for the goods. He was selling sand to the engineer of the railway company. It happened that there was already grave suspicion in the minds of the railway people as to the honesty of this trader's dealings, and on close investigation it was discovered that he had been systematically loading up wagons with a greater tare than those weighed empty for him to load. In the instance which led to the discovery of the trick, the empty wagon placed at his disposal for loading had a tare of four tons. He had put the sand into a truck with a tare of five tons. The gross being fifteen tons, he thus obtained credit for eleven tons, whereas there were only ten tons in

the truck! Of course, there had been considerable laxity on the railway company's part to allow such a swindle, for, had they recorded the number of the wagon they tared, no such trick would have been possible.

When a railway wagon is first put into commission it is carefully weighed, and the tare is painted on the side. This is to obviate the necessity for weighing the empty truck every time before it is loaded. It has been found that privately owned railway trucks have for years carried a painted tare nearly a ton different from the actual. Carriage is, of course, charged only on the net weight of the goods contained in the wagons, and by making the painted tare a ton more than the actual, the trader gets a ton of goods carried free on every journey the truck makes.

III.

Even more amazing are the tricks resorted to by people who desire their goods carried free. They seem to think that a railway company is a philanthropic institution which should require no payment whatever for services rendered, and since the railway companies cannot agree with them, they seek to do by stealth what it is impossible to do openly. A favourite trick of a certain dishonest section of the community is to bring their goods to the depot fully addressed to the customer, with a carriage-paid label, but they take care that no sender's name is shown, and no consignment note is handed in. If any one asks for a consignment note, some excuse is made—'left it at the office,' or 'given it to another man.' The goods are duly sent forward, but through the absence of a consignment note, no charge is made for carriage. The paid label prevents consignee having to pay at the other end, and the result is the goods are carried free. The only way to expose this trick is to enlist consignee's help, and obtain from him the name and address of the sender; but naturally the consignee is not often willing to help in this way, since to do so would be to endanger trade relationships.

Owing to the carelessness of carters in delivering goods, it very often happens that no signature is taken admitting receipt, as should always be done. This gives the dishonest person a further opportunity. In a few weeks' time he will call at the railway station and say he has not received his box or his bag, and when the railway company turn up their delivery-sheet, they find themselves quite unable to prove that the box or the bag has been handed over to him. Accordingly he declines payment of the carriage; and although the railway company may be morally certain they effected delivery, they cannot prove it, and so dare not take action to enforce the payment.

Where traffic is carried at station to station rates, and has to be fetched from the depot by consignee himself, a slightly different method is adopted. On hearing that his goods have arrived, the swindler goes to the station and fetches them away unostentatiously, and without calling to sign for them. At a big goods depot this is not too difficult, for there are several entrances and exits, often with no check whatever on comings and goings. A few days later he goes again, and this time calls at the office, produces his letter or card of advice, and asks where the goods are. Naturally they cannot be found. If any one happens to remember seeing them fetched away, the caller is reminded of the fact. Then he makes a plausible excuse. 'I thought it was another lot,' or, 'My man must have fetched them away and never told me.' Only too often everything passes off favourably, and the trick remains undetected, or at any rate unproved. The rogue can safely decline payment of the carriage charges, and probably gets partial payment of a claim for the value of the goods.

There are other people who, whilst not denying the right of railway companies to payment of a carriage charge, consider that those made are too heavy, and seek to obtain some rebate. A favourite dodge of theirs is to put various commodities in hampers, bales, or baskets—anything to screen them from sight—and then declare them as something for which the rate will be less; for, of course, different classes of goods are carried at different rates, and for an equal journey a box of straw paillasses would cost less than a box of equal weight containing straw hats.

Another little trick practised as often as is consistent with safety is that of the man who fills in a false name and address on the consignment note, carriage to be paid by the consignee on application. When the collector calls for the money, it is found that there is no such person at the address given.

The 'part lot' trick is one adopted chiefly by large firms. Let us suppose that a Birmingham firm have thirty small consignments, each weighing one or two hundredweights, for delivery in different parts of London. Each is fully addressed, and each should, of course, be consigned to a different London station — the one nearest the address. If this is done, carriage on each is charged separately; and as the rate per ton for a small weight is larger than that for a big weight, it will be seen that the thirty separate consignments will cost more than would one large lot. The Birmingham firm would, therefore, like to send the goods in one lot so as to take advantage of the cheaper rate, but if they do this they must consign all to one London station, which may be many miles from the addresses to which some of the lots have to be delivered. This means that extra charges would be incurred for cartage across London, and these would amount to more than had been saved in carriage. The way in which the difficulty is overcome is as ingenious as it is unfair. The senders simply consign all the goods to London, and throw upon the railway the onus of selecting a station or stations in London. If

all the consignments are sent to one station and charged at the cheaper rate, the firm decline to pay cartage and delivery charges, alleging that the railway people should have sent each consignment separately to the nearest London station, when no such charges would have been incurred. On the other hand, should each consignment be forwarded to the station nearest the address, the senders decline to pay the higher rates on each separately, holding that all the goods formed one consignment and should have been forwarded to one station, being charged at the cheapest rate. So that, whatever the railway people do, they are wrong. The obvious and only remedy is for them to insist upon each consignment being separately ordered to a particular London station; but unfortunately this may not be practicable, for each day there are certain restrictions on the forwarding of goods to London stations, some of which are always closed owing to congestion.

These tricks and dodges, both to obtain payment of false claims and to obtain free conveyance of goods, are especially easy to private-siding firms. Such people load and unload, sort and count, everything that goes into or comes from their works. The railway company very often do not even see the goods, and have to rely solely upon the firms for a list of what is put into or taken from a truck. Thus they are entirely in the hands of the traders, and unless the latter are absolutely honest the railway company can be defrauded to an unlimited extent.

IV.

Turning from the railway swindler to the railway thief, we find that there is equal difficulty in operating against dishonesty. There is a whole army of railway police and detectives employed against the pilferer, but still the losses go on to the extent of thousands of pounds annually, for fully three-quarters of a railway company's staff are employed in handling goods and merchandise, so that the temptation to steal is constant.

Cases that should contain beer, wine, and spirits arrive, with depressing frequency, containing nothing but empty bottles. Eatables of every kind disappear with a regularity that becomes monotonous. Chocolates and confectionery always suffered a high percentage of loss, but since women became employed as goods porters the percentage has increased! Such thefts as these do away with the necessity for 'lifting' the spoil, and are therefore less risky, and, in consequence, much favoured.

Many robberies are perpetrated at sidings and junctions where trains are stopped for shunting purposes. The *modus operandi* of the thief is to cut a slit in the sheets covering the truck, and creep through. Once he is inside, the contents of the vehicle are ransacked and such articles selected as are likely to be of some value and yet are not too bulky to be carried away. These are pitched out of the wagon, and the thief follows, readjusting the sheet so far as possible. Afterwards the stolen property is rolled down the embankment and hidden in some dry ditch or hedge-bottom until it can safely be taken away. Despite the watchfulness of guard and driver, innumerable robberies of the kind are committed at lonely sidings, especially during the long, dark nights of winter.

A short time ago, at a large goods depot in the north, the mysterious disappearance of various goods became almost a daily occurrence. Each lot was received at the depot, checked, and placed in the shed, being left there for a few hours whilst waiting to be loaded into the wagon, or, in the case of received traffic, awaiting loading on the drays for delivery. When the time for loading came, parcels could not be found. At length the losses became so serious that watchmen were set day and night, but still the pilferage went on. Although extra watchmen were placed in hiding behind large piles of goods conveniently left for the purpose, it was all without avail. Whilst walking about the goods-shed one day, a police-officer noticed that in a certain place some of the planking which faced the space between the ground and the floor of the platform looked loose, as if it had recently been disturbed. On trying the planks he found that he could move them aside without difficulty, and there was revealed to him a dark cavity between the ground and the floor of the platform. He crawled in, and found several recently stolen parcels. Late that night the policeman secretly crept into the cavity, and in the cramped, confined space spent the most uncomfortable night of his life. But between three and four next morning, when the first signs of the coming day's work were beginning to be heard, his patience and suffering were rewarded. Footsteps approached, and stopped outside the hiding-place. There was a moment's pause; then the loose boards were pulled aside. Hands holding a stolen parcel were thrust inside the hole. Already the policeman had his handcuffs out, and knocking the parcel aside, he put on the bracelets in a twinkling. The thief turned out to be a man who came on duty early to help with the fish, &c. He had taken the parcels whilst the watchman was absent for a few minutes opening the offices.

PEPITA.

A DAUGHTER OF THE PAMPAS.

By H. HUNTER.

PART I.

I.

'HOW late the men are!' said Pepita, turning from the window; and Tonia Perez, smiling a crafty smile, chuckled to herself.

The window overlooked the trail to the nearest town—San Gregorio; and Pepita, if she had gone to it once that afternoon, had gone twenty times.

'The men!' exclaimed Tonia, a leer on her lips. ''Tis only of one man you are thinking, my dear Pepita—Don Jamie, the young *caballero*, with eyes blue as the heavens, teeth whiter than milk, and a smile always on his lips. He loves you, and'——

'How dare you?' broke in Pepita, her face scarlet.

'Tut-tut! Haven't I eyes in my head? And a fine, handsome husband he'll make, as well as a rich one. But don't forget that his father, the old Don, is said to have a wife already picked out for him.'

Biting her lip, the girl turned again to the window. 'What can be delaying them?' she said. 'They should have been back this morning. Señor Liddell has asked about them quite a dozen times.'

'Been robbed, p'r'aps—robbed and murdered,' suggested Tonia, who knew that Don Jamie would be bringing back with him a heavy sum from San Gregorio. 'Been met by Black Michael and his band of desperados.'

A shiver ran through Pepita, who started at the mention of the name; while Tonia curled her lip. There was no love lost between the rough, coarse woman and the pretty, dark-eyed girl who managed the rancher's household; and the woman was wondering what Don Angus would do when she told him something she had heard on a recent visit to the town.

'But Don Jamie took five men with him,' said Pepita.

'Ah! but San Gregorio is a three-days' journey with the cattle; and there are places on the road where one determined man could easily hold up twenty.'

'Hark!' The girl ran eagerly to the window. 'Yes,' she cried, clapping her hands, 'they're coming. Hurry with the supper, Tonia.'

'Pepita!' roared Angus Liddell, a great, shaggy Scot with the frame of a giant. 'Did I hear you say they were coming?'

'Yes, señor. They've passed the turn in the trail, Don Jamie leading, and the five *gauchos* strung out behind him.'

A few minutes later the men had pulled up; and Pepita, flinging a shawl over her shoulders, went out.

'Hello, little one!' said young Liddell, laughing.

'How late you are!' she said. 'It's nearly dark. Don Angus has been worrying about you.'

'And my little girl? Hasn't she?'

'Yes,' she answered simply. 'I went to the window so many times that Tonia'——

But James Liddell had slipped his arm round her slender waist, drawn her to him, and was searching for her lips.

'And what did you think?'

'That you had been robbed—killed.'

'My poor, dear, sweet, gentle, soft-eyed Pepita, however came you to get such a ruddy-coloured idea into your pretty head?'

'Well, Tonia kept on talking about Black Michael and the awful things he had done. But what did make you so late? Something, I'm sure.'

'Our horses strayed from camp last night, and we had a long search for them.'

She was trembling; and drawing her closer to him, Liddell was about to kiss her again, when she twisted round in his arms, holding herself away. 'Don't, please! Don't, Jamie!' she whispered. 'Let me go.'

But he held her the tighter. 'Why? Haven't I told you many times that I love you—that'——

'Yes, but'—she drew a long breath—'your father! I am only his servant; and you'——

'I am his son. But he must give his consent, or I'll marry you without it.'

The men had gone to their quarters. The two were alone under the vast dome of the dark blue heavens dotted with silvery stars. For a moment James Liddell—Don Jamie—regarded her in the uncertain light. Then he crushed her in his arms, his face working with conflicting emotions, his cheek laid against hers. And this time she made no struggle. Something primal and compelling stirred within her, and with a sob she clasped her arms tightly about him.

'Core of my heart—my other half,' he murmured as he covered her burning face with kisses, 'say you love me. Say you love me, Pepita.'

'Love you! I would die for you, Jamie,' she sobbed. 'I've nothing to give you but myself; while you—if you don't anger your father—you'll have money and land, flocks and herds.'

'Money and land!' he scoffed. 'And what good will they be if I haven't got you? Do you

think I value you less than the horses and the cattle? No; I can rub along without them if need be, same as dad did when he first settled out here. But you I must have, or go to everlasting smash. Now, will you be ready to come with me if I have to leave here?'

'Don't ask me, Jamie. It would break my heart to part with you, dear; but I could never be happy if I thought that I'd separated you from your father.'

'But you wouldn't be to blame,' he insisted. 'It would be his fault.'

'Jamie!' she exclaimed hurriedly, 'there's Tonia at the door. She's missed me. If she sees us together she'll tell the master. Go into the house, quick!'

'Well,' he said, his jaw grim with determination, 'I'll go now; but I'll have it out with the old dad before I sleep.'

II.

Supper was over, and the ranchero, Don Angus Liddell, had withdrawn to the room where he spent most of his time indoors, to indulge in an hour's meditation, &c., before retiring.

The meal had afforded Don Jamie no opening for broaching the subject nearest his heart; and, after soothing his nerves with a cigarette, he sought his father to pay over the money realised from the sale of the cattle.

'You ought not to keep your money in the house, father,' said Jamie, when the old man, after examining each note and testing each coin, had locked them up in his strong-box.

'Why?' snapped Angus, who was evidently in a surly mood.

'Well, nobody else does. Banks are the places in which to keep money.'

'Are they? Dinna ye ken that I've had ma fill o' banks?'

He had lost heavily through a bank failure some years before.

'Anyhow, it's bad to have it known that you keep large sums in the house,' persisted Jamie.

The old man frowned at the young one for a moment without speaking, and then abruptly changed the subject. 'What made ye so late in getting back, Jamie?'

'You asked me that half-a-dozen times at supper,' said the young man irritably. 'The horses strayed. Don't you believe me?' he said, flushing under the sharp look directed towards him by his father.

'It's queer how them horses could have strayed, if'——

'Tell me I'm lying, then.' Jamie's own mood was not conciliatory.

'It's easy to blame the horses. I hope ye hanna been wastin' your time and injurin' your health in them low roadside groggeries which are the curse o' the country. Remember, Jamie, remember'—a stern lecture in his eyes and in the lines of his rather thin lips—'what I'm feart you sometimes forget—that you come of a respectable Scots family; and'——

'Look here, dad!' cried Jamie, who guessed that Tonia's tongue had been running, and whose temper was now properly alight. 'I may as well tell you here and now that I'm fairly fed up with being treated like a brat in short breeches. I've had enough of it, and I'm not going to stand it any longer. I'm a full-grown man, and the manager of this ranch; yet you bully me as if I was the stupidest *gaucho* on the place. Well, understand, this is the end of it.'

For the moment Don Angus was so astonished that he was bereft of speech. The next he had jumped to his feet, and pointing at Jamie, 'Man!' he roared—'man! you're naught but a moonstruck calf hanging on to the skirts of yon Argentine co'——

'Father!' For a full minute the two men stood glaring at each other like tigers about to spring. 'Remember Pepita's in the kitchen, and may hear you.'

'I hope she does,' exclaimed Don Angus. 'Anyway, I'll make sure.' And raising his voice, he continued: 'To-morrow that scheming hussy—that dirty Mexican cat—clears out of here, bag and baggage. Now, I hope she's heard that.'

Something like a spark flashed in James Liddell's grayish-blue eyes, and then was gone. 'Father,' he said quietly, 'Pepita has promised to be my wife.'

'Eh?'

'Pepita has promised to be my wife.'

The old Don looked as if he was going to have a fit. He turned purple in the face. The veins at his temples swelled. He frothed at the mouth.

'W-wife!' he stammered, an ugly sneer on his lips. 'Wife! A girl of the pampas! A'——

'Stop!' thundered Jamie, clenching his fist and advancing a step. 'Stop! before I forget you're my father, and remember only the insults heaped on the woman I love.'

'Marry her, and I'll cut you off with a *peso!*' Jamie shrugged. 'Going in for melodrama, eh? Going to play the faithful unto death stunt. Well, you won't get a cent of my money, or a foot of my land. You ought to go on the stage.' Jamie stood motionless, his arms folded, and a scowl in his blue eyes. A black anger overwhelmed him. 'Nothing more to say?' The tone was exasperating.

'Yes. You can keep your money—and your land too; and I'll keep Pepita. I wonder if you ever loved my mother.'

The old man's head went up, and fire flashed from his eye. Then his mood changed abruptly. 'Jamie, lad,' he said wistfully, 'you wudna lea' your old father for yon slip of a girl? Tell me you wudna.'

'Not unless you force me.'

'Ah!' And Don Angus sank down in his chair, stern-faced and angry. Was this strong, bronzed six-footer, with the square jaw, firm mouth, and steady eye, really his little Jamie—the bairn he used to carry on his shoulder and toss in the air?

Don Angus glanced up at him furtively. Then suddenly he flung down his trump card. 'Marry her, and you marry into a family of thieves, cattle-lifters, and cut-throats. If that's the kind of folk you want to mix up with, do it; but out of my heart and home you go for ever.' Jamie was silent. 'Do you know who she is?' barked Don Angus, a marrow-chilling smile creeping over his face as he watched the face of his son. 'The sister of that bluidy murderer, robber, and ravisher, Black Michael—an outlaw with a price on his head. And that's the woman ye want to gie me for a daughter, is it, boy? Shame on ye, lad!'

Jamie paled a little. His amazement was genuine. The old man laughed derisively and reached for a cigar. The laugh maddened the 'boy.' He shot a short, sharp question. 'Who told you that?'

'Tonia!'

Jamie struck the table with his clenched fist. 'It's a lie! Do you hear, father? It's a lie! That woman 's been jealous of Pepita ever since the girl came here.'

'Well, some of the *gauchos* have been saying the same thing.'

'The *gauchos!* Tonia and the *gauchos!*' said Jamie scornfully. 'And you stoop to listen to the scandal and gossip of the ranch!'

Don Angus's nose twitched slightly. 'Well, anyway,' he snarled, 'understand that no sister of Black Michael stays under my roof, either as servant or—otherwise. I may think mysel' lucky that I hanna been robbed and murdered in my bed before this. But I'm taking no more chances. She shall clear out to-morrow.'

His teeth clenched on his cigar till it was bitten in two. He threw the ends into the fireplace, slewed round in his chair, and turned his back on his son.

'Then—you'——

'I'll listen to no more love-twaddle.' The old man threw the words over his shoulder. He had hardened again. 'The girl goes to-morrow—sure! And if you *will* tie yourself up to her tail, you can go with her. But you'll take my curse wi' you, lad, instead o' my blessin'. I'll nivver forgie thee, Jamie,' he cried, suddenly swinging round, his strong face set in hard lines, 'Nivver—nivver! To lea' me to go with that'——

But it was a face as strong and stern as his own which confronted him. If anything, the corrugations were deeper, the powerful features more rigidly set. A rush of righteous anger swept over the younger man; but with a splendid effort he checked its expression.

'I have made my choice,' he said quietly, and slowly left the room.

. . . . . .

In the kitchen he found Pepita bent over the table, her head resting on her arms. She trembled when he touched her.

'You heard?' he said briefly.

'I couldn't help hearing. Oh Jamie!'

'There, don't cry, Pepita—don't cry! I'm through with him, anyhow. I shake the dust of the ranch off my feet to-morrow. We'll go down to San Gregorio, you and I, get married, and start'——

'Married!' She looked up quickly. 'The son of Don Angus to the sister of Black Michael!'

'I don't care whose sister you are. But I know you're the woman I want—the woman I love; and—we can cut out Black Michael, anyway. Will you marry me, Pepita?'

He moved to take her in his arms, but she held up her hand. 'Leave me now, please, Jamie,' she urged. 'I'm glad you came in—that you didn't go up to your room without—without coming in.'

'I love you, Pepita,' he said, stooping and kissing her.

'Yes; but I want to be alone for a while to think this matter out.'

'Well, don't forget,' he urged, grasping her hand and squeezing it till her fingers cracked, 'that I'm ready to marry you as soon as we can find a padre to tie the big knot. You'll give me your answer in the morning, girlie? Sure?'

'Yes, in the morning, Jamie'—she turned away her head so that he did not see the quiver of her underlip—'you'll get it in the morning.'

(*Continued on page 814.*)

BOGLES.

THE bogles that they tell us of lived very long ago;
So when our cousins come to stay we take them out to show
The standing-stones where warlocks danced, where roared the water-bull,
The Ghaistie's Mill, the Bodach's Road above the Witches' Pool.

That is by day. Indoors at dusk the passages and stairs
Seem full of shadows, strange and grim, to trip one unawares;
And later, when we are in bed and nurse puts out the light,
The fire then shows us curious things—they only come at night.

Dark shapes keep moving on the walls; some spring, some dance, some creep;
And many eerie sounds are heard. How can one go to sleep?
It would be very easy if one really just could *know*
That wraiths and kelpies and such things lived only long ago!

THE SINGAPORE MUTINY AND OTHER WAR EXPERIENCES.

By E. D. Ward.

I.

ON 4th August 1914 I was employed with a firm of merchants in Singapore and leading an ordinary civilian life. By 5th August I had been caught up in the cogs of the military machine, from which I was not to be released for four and a half years.

The most striking aspect of those early days in Singapore was the prevalence of rumours—I understand that we were not unique in that respect. Regularly every few days the German Fleet was destroyed; occasionally it was the British Fleet that suffered. For the first week or two our duties were mainly composed of manning the forts, guarding cable-ends, &c., and very dull it was, but at least we were able to visit our offices occasionally and make up arrears of work.

Later on the regular battalion stationed in Singapore—the King's Own Yorkshire Light Infantry—was sent home, and almost simultaneously it was decided to intern all Germans in the colony; consequently we had far less time on our hands. The Germans were interned on the quarantine island, St John's Island, which lies about three miles out of the harbour.

It is a delightful place, and was entirely uninhabited except for our prisoners and ourselves. There being no means whatever of escape, strict guard was unnecessary. We all remained on the island until December 1914, when it was decided to move the internment camp to the mainland, and utilise for the purpose the barracks vacated by the K.O.Y.L.I. This was a very unwise move, as events were to prove.

On 15th February 1915 the 5th (Native) Light Infantry, who had been sent from India to assist in guard duties, mutinied, and one of their first acts was to release the German prisoners, a number of whom got clear away to Java and other Dutch islands. It has since been definitely established that the prisoners had in some manner contrived to 'get at' the native regiment, and had, in fact, engineered the whole business. The matter was the more regrettable in that the regiment was one of those that remained loyal during the Indian Mutiny of 1857.

Very little is known in Britain about either the causes or the events of the Singapore mutiny; indeed, there are many points about it that will not bear very close investigation if reputations are to be saved.

As has been said, the affair started on 15th February—a date carefully chosen because it was the Chinese New Year and a general holiday, and the European population would certainly be scattered at golf, tennis, and the like.

The mutiny broke out in the early afternoon at the native barracks, and the first move of the mutineers was to shoot down such of the British officers as were on parade, and seize the ammunition store. The alarm was promptly given, and a scratch force hurriedly got together. By a stroke of good fortune two organised bodies of troops were immediately available. A river gunboat—H.M.S. *Cadmus*—happened to be in port, and by utilising every available man was able to provide a force of about a hundred trained men, with two Maxim-guns. It also chanced that the Machine-Gun Detachment of the Singapore Volunteers was doing a field-firing test on one of the islands in the harbour, and was able to furnish about forty trained machine-gunners, with two guns. It was largely due to the prompt action and the skilful handling of these two units that a very serious disaster was averted.

The composite force assembled at the P. and O. wharf at the west end of the city, and immediately pushed out strong patrols to establish touch with the mutineers, whose barracks were about two miles farther west. Prior to this offensive movement a party of mutineers had made their way to the internment camp, which lay to the north of the city, had shot down the guard, and—as has been told—released the Germans interned there. Another party went over the Straits into Johore, but they were dealt with by the troops of the Sultan, and had no influence on the operations in Singapore.

It should here be noted that no Germans actively sided with the mutineers or bore arms against us. Whether they had sufficient delicacy of feeling not to side with mutinous natives against white men, or whether they feared the ultimate consequences, history does not relate.

It was during the first few hours, and before a sufficient force could be assembled, that most

 [*All Rights Reserved.*]

of the British casualties occurred. The mutineers indulged in an orgy of murder, and about forty unarmed civilians were, at various times and places, shot down in cold blood.

On the night of the 15th-16th a strong defensive line was formed between the city and the native barracks. Had an attack in force been made the situation might well have been critical; as it was, we were left in comparative peace. During the night the British force was considerably augmented; most of the remainder of the Singapore Volunteers were able to make their way up, a few regular gunners and sappers were drawn from the forts, and a number of armed civilians reported for duty. Meanwhile the authorities in the city had not been idle. All the women and children were put aboard such ships as were available and were sent out to sea, wireless S.O.S. messages were despatched broadcast, and the principal entrances to the city were barricaded and guarded by 'The Veterans' (men over military age).

At daybreak the force numbered about 350, and a forward move was made, mainly with the object of relieving the commanding officer of the native regiment, who, with several ladies, some other officers, and a party of about twenty of the Malay States Volunteer Rifles, had been besieged all night in the C.O.'s bungalow.

The action became general, and was entirely successful. It was, indeed, the only severe fighting that took place. The mutineers were driven back in disorder, and split up into scattered parties. Several hundred surrendered without further ado. The British casualties were light.

In the course of the next few days help arrived from all quarters. A half-battalion of the King's Shropshire Light Infantry (T.) was sent down from Rangoon, and French, Japanese, and Russian warships arrived and landed parties; while the Sultan of Johore sent over some of his personal troops. It is interesting to note that the Russian boat was that five-funnelled cruiser afterwards so well known in the Dardanelles under the sobriquet of 'The Packet of Woodbines.'

Although these units were too late for the heavy fighting, their assistance was invaluable in rounding up the scattered parties of mutineers. It would have been an impossible task for 350 men.

II.

The rounding-up was a most unpleasant business. The island—as distinct from the town—of Singapore is largely under cultivation for pine-apples. For the benefit of the uninitiated, it is permissible to explain that the pine-apple grows on a shrub similar to those one calls in England by the generic name of *cactus*. It can well be imagined that to walk through a cactus plantation in thin drill shorts, with bare knees, and with the chance of a desperate native with a loaded rifle suddenly bobbing up, is *not* an enjoyable experience, either physically or mentally. Such parts of the island as are not under cultivation are still jungle, and abound with leeches and mosquitoes, and occasionally snakes—again not a region one would explore for pleasure.

By the middle of March all the parties had been accounted for, and after the necessary court-martial proceedings, about fifty mutineers were sentenced to be shot in public.

The memory of those executions will always remain with me. They took place outside the jail, the wall of which made the background, while every point of high ground in the vicinity was crowded with spectators. It is estimated that 50,000 natives were present at the first execution. The usual hollow square was formed, with the wall as the fourth side, and the firing-party in the foreground. The prisoners were led out, and placed at regular intervals along the wall. Their hands and feet were bound, but, at their own request, their eyes were left unbandaged; nor were they supported by chains or other means. Cold-blooded murderers though they were, they died bravely. The provost-marshal read out the sentences in various native dialects, and finally in English, ending with the fateful words, 'Thus justice is done.' The officer in charge of the firing-party then proceeded with the execution. In this connection it may be noted that there were five rifles—all loaded—to each mutineer. The prevalent idea that only a certain proportion of the rifles of a firing-party are loaded is, I believe, a popular fallacy. When the volley had been fired there was a pause of a minute, after which the medical officer, accompanied by an officer with a loaded revolver, visited each body. In the unlikely event of any body showing signs of life, it was the duty of this unfortunate officer to administer the *coup-de-grâce*. I am thankful to say that his services were not required at any of the four executions at which it was my lot to be present. Finally the bodies were removed on stretchers by those mutineers who had received terms of imprisonment only.

Thus ended the Singapore mutiny—a very small event, as it happened; but had not H.M.S. *Cadmus* been in port at the time of the outbreak, it is impossible to say what the consequences might have been, not only in the Straits Settlements, but also in India. It is much to be deplored that the War Office do not recognise Singapore as a 'theatre of war,' as the troops engaged in the suppression of the mutiny are, therefore, not entitled to wear the 1914–1915 star, nor does their service count towards the award of a war chevron.

III.

To those of us who were anxious to tackle the Hun in Europe the mutiny came as a great setback. The authorities very naturally were averse

to men leaving the country, preferring to retain them for local defence in case of further need; and so the old routine of guard duties continued for another year.

In the spring of 1916 the situation was much easier, and I managed to get permission to leave, and reached England without mishap. Whilst traversing the Mediterranean each man on board was made personally responsible for a lady—to put on her life-belt, see her into a boat, and so forth, in case of accidents. The particular lady who fell to my lot had passed the first slimness of youth, and I can recall to this day the trouble I had, at a dress rehearsal, in finding the suitable words in which to tell her that the tapes of her life-belt would not meet at the back.

After a few months' training in England I was sent on draft to Salonika, much to my annoyance, since in my ignorance I hankered after France. The Salonika front in those days was not very exciting; in fact, it never was until towards the end.

The ordinary Bulgar soldier (as distinct from his officer) is, on rare occasions, not a bad sportsman at heart.

In order to understand the following story, it must be borne in mind that the trenches in Salonika, unlike those in France, were often as much as a mile apart, sometimes more. Consequently raiding on a small scale was never so popular as in France; large raids, with considerable artillery preparation, were more in favour. It was after one of these raids that a certain artillery officer, searching the landscape with his glasses for evidence of the damage done by his guns, noticed a conveniently large and deep shell-hole within a few hundred yards of the Bulgar lines. The idea immediately occurred to him to run out a telephone-wire by night, and lie 'doggo' in the hole by day, the while directing his guns with accuracy on suspected M.G. emplacements, &c. The scheme naturally involved some risk; the hole was over a mile off, and he might easily bump into a patrol, in which case, encumbered with the necessary apparatus, he stood a poor chance of getting away. Even when safely established in the shell-hole, he might be spotted during the day. Eventually he obtained permission to go alone and take his chance.

He decided to make two journeys—the first to pay out the reel of wire, the second to carry his instrument, rations, and other things. The night was luckily dark, and forth he sallied, paying out the wire on his way. All went well, and he arrived safely at the shell-hole, dumped the reel, and went back for his second burden. On setting out again from his own trench he naturally let the paid-out wire run through his fingers to guide him. He had gone only a few hundred yards when, to his utter astonishment, he encountered his original reel of wire. When he stooped down to examine this remarkable phenomenon, his eyes were attracted by a notice, written in good English and fastened to the reel: 'With the compliments of Bulgaria'!

The solution of the mystery was then obvious. A Bulgar sentry had seen or heard him on his first trip out, had found the wire, guessed its meaning, and rolled it up again behind him as he went back. Nothing would have been easier than to have ambushed the unfortunate officer on his return and shot him down. But nothing so banal appealed to this sentry. From his knowledge of English, it would appear that at some time he had had the opportunity of appreciating and cultivating an Englishman's sense of humour.

The shell-hole remained unoccupied!

A further instance of Bulgar methods shows considerable traces of German training. A characteristic of Macedonia is the number of tortoises to be seen. During trench-raids, what were apparently tortoises were frequently to be found in the bottom of the enemy trench. No man likes to tread on an animal, and the natural instinct is to kick it aside. Unfortunately numbers of seeming tortoises were merely painted metal caps of cylinders of poison-gas. An ingenious trick, but one which was soon guarded against.

IV.

In March 1917 the powers that be decided to send me home to take a commission, and I shook the dust of Salonika—it was dust by that time—from off my feet with thankfulness. I say thankfulness advisedly. While we were waiting at Summerhill Camp for embarkation it was heavily bombed by enemy aircraft, and over 150 casualties resulted. Once again I reached England without mishap.

After the usual cadet training I was sent on draft to Palestine, again to my great annoyance, as I was still pining for France. Let me here confess, however, that of all my campaigning the period spent in Palestine was the most enjoyable—if such an epithet may be used of war. There was none of the forced inactivity of Salonika, and none of the organised murder of France. It was a soldiers' campaign—a campaign of movement and tactics.

I joined my unit just before the final attack on Jerusalem. The night before the assault I was bivouacked on the very spot from which Richard I. is said to have looked down on Jerusalem and then turned away, saying that his heart was broken because he could go no farther.

Jerusalem looks beautiful from a distance with its white domes and towers silhouetted against the green of the Mount of Olives, but it is only too true in this case that distance lends enchantment. On closer inspection, the city is, or, rather, was—we have cleaned it up considerably—every bit as dirty and squalid as any other Eastern town. To the antiquary and the parson it may indeed be a city of gold, but to the commonplace British soldier it is a town of

dirt and smells, inhabited by thieves with a marked German accent. As for milk and honey—well, in December 1917 the only milk available was that put up in tins by Messrs Nestlé and Co. for the use of the British Army; while the honey had been made in Germany, and each pot had a bee floating in it as a guarantee of good faith!

Not only was the campaigning in Palestine interesting, but leave in Cairo was probably more keenly appreciated than even Blighty leave by those in France. There were no restrictions at all as regards light, food, or drink, except that, officially, no intoxicants could be sold before midday or after 9 P.M.—but I never heard of any one being seriously inconvenienced by this regulation. For those on pleasure bent there were the weekly dances organised by Lady Allenby, the races at Ghezireh and Heliopolis, and any amount of theatres and cinemas; for the sight-seer the Pyramids, the Sphinx, the Citadel, and the various mosques and bazaars; while those with more energy and money could go up the Nile to Luxor and the temples of Philæ.

My abiding recollections of the Palestine campaign are the first sight of Jerusalem; Christmas Day, 1917; and 'Hannibal' of Shepheard's Hotel. Any member of the E.E.F. will understand the allusions.

V.

The big German push in France began in March 1918, and my stay in Palestine was abruptly cut short, as the division to which I belonged was moved over as reinforcements. For the fifth and last time during the war I traversed the Mediterranean unharmed, although one of the other boats in the convoy was torpedoed. Luckily she made the coast of Africa and ran ashore without loss of life.

In France we did our part in repelling the push, and finally in pushing forward ourselves until the Armistice saved Germany from complete military disaster. From my own observation, I do not think that the news of the signing of the Armistice was received with any great enthusiasm by the British troops in France, tired of war though we were. We all felt that at last we had got the Hun on the move, and that trench warfare was finally ended, and it seemed cruel indeed to dash the cup from our lips after over four years of weary waiting. On 11th November we were marching along the usual French road in column of route, when a staff officer galloped down the line, shouting out that the Armistice had been signed.

Not a cheer, not a smile, greeted him. It was not apathy; it was sheer disappointment. It is popularly reported that at 11.10 (the Armistice was signed at 11) on the morning of the 11th a patrol of British cavalry under a sergeant met a German patrol similarly commanded. After consultation the two sergeants both put their watches back fifteen minutes and fought it out. A pretty story, but probably untrue; one cannot imagine a Hun doing anything of the sort.

Now that it is all over one is apt to forget the horrors and the discomforts of war and remember only the brighter side—the good times one had in rest and on leave, and, above all, the good fellows one met. In civilian life a man knows just as much of his fellow-man's real qualities as is apparent on the surface; in war, when men live in the very closest proximity and under the common risk and fear of death, a man's character is an open book, and his friends can sympathise with his weaknesses and appreciate his strength. Courage and unselfishness are the qualities that really matter. When all is said and done, those who have passed over may well be considered fortunate in the manner of their death. Major Hesketh Pritchard wrote very truly in a recent article where he told of a friend who died, 'as in a few years, at any rate, all of us will wish we had died, a man's death in the full tide of our strength and in a great battle.'

THE BROWN NABOB'S MONEY.

CHAPTER IV.—TERROR.

EVIE stood in the middle of the room, with a candle in her hand—the only light that was there, save for a faint gleam from the dying fire. She gave Bellamy a curious, half-appealing look, and he pulled himself up on the threshold and gazed questioningly at her. She moved away at that, and going to a shelf, took down another candlestick and handed it to him in silence.

'I'm back,' said Bellamy. 'Not so late, either. Where's everybody?'

'They've all gone to bed,' replied Evie. Do you want anything?'

'Me?' exclaimed Bellamy. 'Lord, no! Had enough—there—to last me a week.'

Evie lighted his candle and turned to the door.

'I hope you enjoyed it,' she remarked dully.

'Oh, well,' said Bellamy, 'not exactly my line, you know. I say!'

'What?' asked Evie.

Bellamy drew nearer, watching her.

'Haven't you a word for me, Evie?' he asked anxiously. 'We—we haven't had a chance'——

'You went off—there,' she murmured.

'Had to!' said Bellamy. 'I couldn't refuse Petherfield, could I? But, Evie, what d'you think about it all? Say! Haven't you anything to say? Because—Lord!—I've been

wondering—off and on—all night—what you would say.'

Evie's candlestick began to waver in her hand, and she looked at Bellamy out of eyes which were more sorrowful than otherwise.

'What is it?' demanded Bellamy.

'Oh, I don't know,' said Evie. 'It's—it's awful! You can't be what you were any more, Bellamy—you know you can't! You're a rich man—and you'll go amongst rich people—and it 'll all be different—and'——

Bellamy thrust his hands deep into his borrowed trousers pockets and set his jaw. 'Look here!' he said in a low voice. 'Aren't we—you and me—going to be as we have been? Aren't we—oh, hang it, Evie, ain't you going to marry me?'

Evie backed away from him, staring. And Bellamy made no attempt to follow; he stood fixed, also staring. Suddenly she retreated to the door. 'Oh, Bellamy!' she whispered. 'I—I couldn't live up to it! All that money—oh!'

Bellamy made a dart at her then. But Evie was too quick for him. She slipped quickly through the door and up the stairs; he heard a faint 'Good-night!' and she was gone. And presently Bellamy picked up his candle and climbed to a higher region of the house, where he and Bert Judd shared a big bedroom.

Bert was already in bed. But he was awake, and lay on one elbow, reading the evening newspaper and smoking a cigarette. He looked up as Bellamy entered, and tossed the paper on the floor.

'Hullo, old man!' said Bert. Then his mouth opened and his eyes widened as he realised Bellamy's grandeur. 'Gad, you are a toff, old man!' he cried. 'Shouldn't ha' known you!'

Bellamy took off the dress-coat and flung it aside. His gesture suggested that he was discarding something other than the coat; but, suddenly remembering that that article belonged to Mrs Parker, he picked it up again and tenderly hung it on one of a series of pegs by the side of his bed.

'Where did you land all that finery?' demanded Bert.

Bellamy nodded at the door. 'Mrs P. dug it out,' he answered. 'Belonged to the old man. She said I'd have to go like that. So I did. Of course, they were all togged up. Always are—so Kittie says. Do it every night. Lord!'

'Well?' asked Bert.

Bellamy continued to undress. 'Seems to me I shall have to spend half my time getting in and out of suits,' he grumbled. 'Norman—if he's anything to go by—generally appears in three a day.'

'Norman!' sniffed Bert. 'Lawks! Norman's nothing to go by. Where he's one suit, you can have twenty. You'll have to spend a few hours with the tailor to-morrow, old man. Makes a difference! What?'

Bellamy pulled off his trousers, carefully folded them over a chair, and growled. 'Difference!' he muttered. 'Should think so! I'd a word or two with Evie downstairs. *She* sees a difference—already. Here! I'll tell you, Bert. I said we'd be married. And—she hooked it!'

'No?' exclaimed Bert. 'What! without a word?'

'Well, she said she couldn't live up to it,' replied Bellamy. 'The money, she meant. Money! I didn't ask her to marry the money! I asked her to marry me. I ain't no different.'

Bert carefully dropped his cigarette into the fireplace and watched its spark die out before he spoke again. 'Yes, you are, old man,' he said at last. 'Oh yes, old man—you aren't what you were at four o'clock this afternoon. You were Mr Bellamy Denton, Petherfield's second clerk, then; now you're B. Denton, Esquire, of Friargate House—a big, a very big, pot. Lord, old man, you don't know what you are, nor what's in front of you!'

What was immediately in front of Bellamy at that moment was an old-fashioned nightgown, and he presently got into it and into bed, where he sat with his knees drawn up under the clothes and his chin resting on them. 'I ain't going to alter myself,' he said defiantly. 'A pound or two more or less isn't going to alter *me*!'

'Can't be done, old man!' replied Bert. 'Ain't a question of a pound or two; it's tens o' thousands. Lord! do you suppose Petherfield 'ud have asked you there to-night if old Farmadale hadn't left you that fortune? Not likely, old man!'

Bellamy made no answer, and Bert turned on his pillow and blew out the candle. Silence reigned for a time in the ensuing darkness; then Bert spoke again, in a whisper.

'Old man!'

'Well?' demanded Bellamy.

'Very likely Evie was upset because you spent your first evening at Petherfield's,' suggested Bert.

'Had to!' growled Bellamy. 'Couldn't refuse.'

'There's Edytha, you know,' said Bert. 'She's a girl. So is Evie. Girls are girls. Kittie'd ha' had the hair off my head if it had been me. Besides'——

'Besides what?' asked Bellamy.

'Girls,' continued Bert, 'are rare and sharp. Evie's a nice, slow-going, comfortable sort; but she's brains. She can see ahead. Evie sees that Petherfield's after you for Edytha.'

'Rot!' snorted Bellamy.

'Straight tip, old man,' said Bert solemnly. 'Correct card! Don't we know Petherfield, you and me? Lay you a fiver Petherfield's married you to Edytha within six months. Stylish lady she'll make for you, too, old man. She'll show you how to spend the money!'

Bellamy rolled into his pillows and his voice

came muffled from beneath the counterpane. 'I ain't going to marry no Edythas,' he announced. 'She 's not my sort at all!'

'She may marry you,' retorted Bert. 'A fellow hasn't much chance against a family like that. Lawks, old man, do you think Petherfield 's going to let the chance slip? A son-in-law with six thousand a year! He 's no fool, our guv'nor!'

Bellamy made no answer. He was thinking. He was quite sure that he was the same Bellamy that he had always been—not one whit different from what he had been yesterday, and the year before. Now, yesterday Edytha had passed him in the street with her pretty nose in the air, and had taken no notice of his humbly raised hat; to-night she had been all smiles and sweetness. Why? Was it really because of his suddenly acquired riches? And certainly Petherfield had never as much as asked him into his house before. As for Norman—well, Norman invariably bullied his father's clerks as if they had been slaves.

'Oh Lord!' he groaned suddenly.

'Yes?' said Bert sleepily. 'What is it, old man?'

But Bellamy said no more. Bert presently snored. Bellamy lay awake and heard St Eanswythe's clock strike midnight. It had struck again before he slept; and when he slept it was only to dream that he was struggling for life in a stormy sea, the waves of which were made of money—gold sovereigns, beating him down, stifling him. . . . .

Next morning Bellamy was fast asleep when Bert got up at the usual hour. Bert left him sleeping. A man who is worth a hundred and sixty thousand, said Bert, can sleep the clock round if he likes. And it was past ten o'clock when Bellamy went down. The girls had gone to their school long since, and Mrs Parker had kept his breakfast hot.

'I expect it 'll be the last you 'll eat here,' she said mournfully, as Bellamy sat down. 'You 'll go into your new home at once, of course?'

Bellamy made a non-committal reply. He hurried over his breakfast and hastened to the office, half-expecting to be blown up. But Petherfield waved him away with a laugh.

'Your job 's across the street, my friend,' said Petherfield. 'Haddlesey 'll have plenty for you to do—probate, and all the rest of it. Go and attend to your affairs. Never mind us.'

'I 'd like to have attended to one or two things, Mr Petherfield,' said Bellamy, to whom work was second nature. 'There 's no hurry'——

But Petherfield motioned him off, and Bellamy went across to Haddlesey. Haddlesey first talked to him in private; then he dragged him across to the bank. Before noon Bellamy's head ached with the new burdens heaped upon his brain. And then, Haddlesey insisting, he had to take formal possession of his new abode.

Bellamy was afraid of all the grandeur that had come upon him. He found himself wondering whatever old Farmadale had done with all those rooms, through which he and Haddlesey wandered. It was a somewhat gloomy old house, heavily furnished. The idea of having to live in it, doing nothing, struck Bellamy like a sudden chill.

'You must settle down at once,' said Haddlesey. 'Start out as you mean to go on. You 're Mr Denton of Friargate House now.'

And presently Bellamy found himself alone with the housekeeper, a very grand person whom he had feared greatly in the past. He had to go into all sorts of details with her, and he quickly recognised that he was going to be part of the furniture. She fixed all his arrangements for him—breakfast at one hour, lunch at another, dinner at a third; he foresaw that, for a few days at any rate, he would have to borrow the deceased Parker's dress-clothes. It was all going to be ceremony and grandeur and loss of the old, careless, happy liberty. And what on earth was he going to do with himself when he was not breakfasting or lunching or dining?

But he got over that afternoon fairly well. Norman Petherfield came in, and dragged him out to the tailor, and the hosier, and the boot-maker, and the hatter; it seemed to Bellamy that he was a sort of lay-figure which Norman was carting round to be dressed up. He had little to say in matters himself; Norman, who was one of the ultra-fashionables of the town and neighbourhood, simply gave orders right and left as he pleased. Bellamy, on reflection, could not recollect that he had chosen one cloth or selected one necktie. But he was very sure that the bills would run into what he would once have considered vast amounts. Nor did Norman stop at clothing. He led Bellamy to the jeweller's shop, remarking sententiously that there was nothing by which a gentleman was known so much as by his jewellery. And here again he treated Bellamy as a nonentity and bought just what he fancied, merely telling his companion that he must have this, that, and the other. So went two or three hundred pounds more.

Norman Petherfield was in high feather when these commercial transactions were over. He told Bellamy they had done a fine afternoon's work, and suggested that they should return to Friargate House and crack a bottle of champagne. Bellamy dared not refuse, but he asked for the wine with fear and trembling, not knowing if the stern-eyed housekeeper would think it proper. The champagne came up at once, and Norman grew joyous over it. He would introduce Bellamy to some rare good fellows; they would have high old times within those walls. And he would put him up at the club, too—Bellamy should be elected next week, by gad, or he 'd know why! He swore eternal friendship to Bellamy; and Bellamy, after two glasses of champagne, asked him to stop and dine.

Norman's face fell. 'Wish I could, old chap,' he said. 'But—impossible! We 're booked, all four of us—pa, ma, sister, and self—worse luck! Got to dine at the Vicarage to-night. Rotten do—lukewarm food, sour wine. But, by gad, I 'll come another night—lots of nights! Whenever you 're wanting me, old chap, say the word.'

In his heart of hearts Bellamy knew that he did not want Norman. He heartily disliked Norman; he had wit enough to see that Norman was going to be a parasite and a toady—to six thousand a year! But he wanted somebody. He wanted somebody more than ever when, Norman having gone, the second parlour-maid entered the gloom to light the gas, and turned to him after its glare was fully on.

'Shall I lay out your dress-clothes, sir?' she asked. 'Mr Farmadale never kept a valet, so I saw to his things for him.'

'Oh—er—I 'll—I 'll see to it,' answered Bellamy. He snatched up his hat, which lay where he had thrown it on entering with Norman, and rushed out, red and ashamed. He knew that the Brown Nabob had always put on old-fashioned dress-clothes and a clean shirt every night; he also knew that the demure parlour-maid probably wondered if he, her new master, possessed such things. 'Damn!' he growled as he fled towards Trinity Terrace. 'It 's like a blooming play!'

He besought Mrs Parker and the girls to return and dine with him—almost with tears in his eyes. Ladies, said Bellamy oracularly, were dressed for dinner if they wore nice blouses, made high. Mrs Petherfield had something of that sort on. Let them come for love of him—to have a house-warming. But Mrs Parker thought not, Evie gently shook her head, and Kittie said it was much too early to give dinner-parties; and Bellamy, having once more arrayed himself in the deceased Parker's dress-clothes, went forth alone, sad at heart, and nervously afraid of dining all by himself in that big room with two women servants to stare at him—perhaps to wink at each other behind his back.

In the street he met Bert Judd, and seized upon him, insisting that he should go back to Friargate House. But Bert shook himself free.

'Can't be done, old man!' said Bert. 'Don't you remember? It 's the cricket club dinner at the "Dog and Pie." I 've only just time to do myself up and get there. Some other night, old man—if such a humble individual'——

'Don't talk bosh!' growled Bellamy. He stood for a moment looking after Bert's retreating figure. He was longing to go back to Mrs Parker's, change into his own old tweeds, and go with Bert to the 'Dog and Pie.' But a cold thrill ran down his spine. What had occurred had cut him off from all 'Dog and Pie' meetings and convivialities. He was no longer plain Bellamy Denton; he was B. Denton, Esquire, of Friargate House.

And to Friargate House he went, and ate his fine dinner in solitude, and passed a lonely evening. It was no use going to Mrs Parker's; Evie and Kittie had gone to a concert, and Mrs P. was in one of her lugubrious moods. So he sat and smoked and sipped port—Petherfield having advised him to cultivate a taste in that way, in moderation; and now and then he looked at a picture of the Brown Nabob which hung over the fireplace, and wished that Mr Farmadale had lived twenty years longer.

(Continued on page 820.)

SOME ODD THINGS ABOUT LONDON.

I.—THE CITY.

By C. G. Harper.

PERHAPS the oddest thing about London is that this great imperial city, capital of the world's greatest Empire, is not the capital (or 'county town,' as the school-books would say) of the county of Middlesex, in which it is chiefly situated. That distinction belongs to Brentford. Thus we have the quaint fact that, while the London County Council is the chief authority, and after it the County Council of Middlesex (whose Guildhall is at Westminster), Brentford has a 'capital' dignity all its own.

But any one familiar with Brentford will readily acknowledge that the place does not wear that dignified air we associate with a county town. In fact, Brentford has always been associated with dirt and squalor, and the road through it (which is the great western highway out of London) is notoriously narrow, and more like a lane through an obscure provincial town. Among the reasons given for Brentford owning its 'county-town' status are that it is the oldest place in Middlesex, that it was from 1700 the polling-place for the Middlesex elections, that it has a very old-established trade, and that the markets date back to 1307.

For dignity one must look to the City of London—'The Square Mile,' as it has been termed, from the extent of the City area proper. Do you know which is the most dignified and beautiful view of it? It is from outside the City itself, and may be obtained by standing by the Thames on the south side, between Blackfriars and Southwark Bridges, or between Southwark and London Bridges. Few ever go to see the City from thence, but it is one of the most inspiring views in the world, with St Paul's rising

grandly above the wharves of Thames Street, and the many spires and towers of the City churches clustered round about.

The Tower Bridge itself is a great spectacular sight, particularly when the hinged leaves of the roadway ('bascules' they are technically called) are opened by the hydraulic machinery to permit the passage of tall-masted ships. The annual cost of maintaining the Tower Bridge is about £17,000, and each time the bascules are raised and lowered, the cost is over £2. Dogs sometimes find themselves on the roadway when it begins to rise, and generally exhibit every sign of terror, making a panic-stricken rush to the rising end, only to find themselves rolling back as the gradient becomes too steep. But a tale is told of a fox-terrier which succeeded in reaching the edge of the rising bascule, and sat there shivering with terror until the bridge was sufficiently lowered to permit of its walking down again.

Pigeons make their nests and rear their young at the very points of the bascules—building their nests in such a manner that neither the eggs nor the young birds fall out, even though these ponderous iron leaves work through an angle of 81 degrees.

But, after all, the most curious thing about the Tower Bridge is perhaps the claim made by the Germans to have destroyed it in a Zeppelin raid. A medal was struck by the Huns illustrating this highly imaginative exploit, of which nothing is known by the Bridge Estates Committee, who have the great erection in their charge.

The City itself is a place at once of the infinitely great and the insignificantly small, often in the closest relation. In the courts and alleys round about where the banks and the financial houses may be found, you may in the same glance perceive some money-magnate passing, his thoughts immersed in vast operations, and a street-merchant on the kerb, peddling pennyworths of toys, collar-studs, or such cheap delicacies as office-boys love. And the world is of an equal seriousness to the financier and to the hawker on the kerbstone; and success or failure in his operations to the one is exactly on a par with success or failure to the other.

Which is the oldest-established shop in the City? Many would declare it to be the confectioners', Birch, Birch, & Co., in Cornhill; but they would be wrong. The oldest is that now bearing the name of Davidson, Newman, and Co., in Leadenhall Street. The business was founded so long ago as 1650 by Daniel Rawlinson, the first English grocer to sell a pound of tea. The existing shop is by no means of that age, but still above the entrance hangs the original sign of three sugar-loaves, while within are Rawlinson's old canisters and scales, and the oak counter at which he stood. An old business indeed, and with some old customers. The London Hospital has dealt here since 1754.

The shop-front of Messrs Birch on Cornhill looks older than it really is—a charming old front, its three heavily framed windows surrounded by carvings in wood of festooned fruit and flowers. This eminent confectioners' and caterers' business was founded in the reign of George I. by one Horton, who was succeeded by Lucas Birch, whose son, Samuel, became Lord Mayor. 'Mr Pattyman,' as he was irreverently called, died in 1840. For a very long time Messrs Birch were almost exclusively the Mansion House caterers.

The Monument! Where is the 'country cousin' who does not, on arriving in London, expect to be taken up to the summit of that tall landmark? No need to ask, 'What monument?' for where London is concerned there is only one possible monument meant—although there are thousands of others! I mean (and you mean, too) that Monument in the City erected to commemorate the Great Fire of London in 1666, and the rebuilding of the City.

In normal times the Monument is open between 9 A.M. and 4 P.M., and the small sum of threepence is (or was) sufficient to provide the visitor with the liberty of ascending its circular stone staircase of 345 stairs. It is an ugly interior and a weary climb, in semi-darkness; and as you climb up and round and round those clammy walls the idea haunts the mind, with a dreadful fascination, that between the clumsy cork-screw railings there yawns a pit so deep and horrible that it may well be compared with the bottomless one of Scripture. Nerves! Yes.

And then the gallery on the abacus of the proud pillar, the 'tall bully' of Pope, rising 202 feet. Ere you reach it, you agree with the keeper quoted in *Martin Chuzzlewit*, that visitors 'don't know what a many steps it is. It's worth twice the money to stop below.' Yet the City accounts show the Monument to be a source of profit. In 1910, for example, its income was £660, as against £590 the year before, derived from visitors' fees.

There is an iron cage enclosing the platform on the summit, placed there many years ago to ensure that would-be suicides or people overtaken with an irresistible impulse should not leap over. The last suicide from this place was in 1845.

'Many visitors?' said the keeper, in answer to an inquiry. 'Yes, a good few on fine days. Dull ones—well, what do you think? A good many ladies and children go up. Sometimes a woman faints coming down. She sits down here, and I bring her to. Don't get much thanks for it, though.'

The site of the Monument was determined by the proximity of Pudding Lane, where the Great Fire started. The cause of the fire was at the

time said to be a popish plot, and when the Monument was completed—after six years' work on it, between 1671 and 1677—an inscription to that effect was cut on the plinth. It was erased in the reign of James II.; recut, deeper, in that of William III.; and again erased in 1831. The column is crested by a metal vase from which issue flames. In the course of repairs undertaken in 1905 the flames were regilded.

The figures relating to the income of the Monument are set forth in the City of London accounts, known as the 'Private Purse' of the Corporation. These accounts themselves contain some quaint items. For instance, in recent years is a credit of 2s. 6d. for the loan of committee-rooms at the Guildhall, and £479 for 'Key Register Suspense Account.' This item represents the sum received from City firms who deposit with the City police keys of their premises, to enable the buildings to be entered in case of necessity. This, of course, is a practice largely followed, the City being a region very little inhabited after business hours. A strange item is that of £245 paid by omnibus companies for the privilege of pulling up at the Mansion House to set down or take up passengers.

Further, the supply of 'livery cloth' to officers of state—a custom centuries old—costs annually about £119; and the Corporation, it is found, contributes £123, 14s. 3d. towards the fees of preachers at St Paul's Cathedral. The salaries of the Ale Conners come to £40; and the cost of the private vestry allotted to the Lord Mayor in the Cathedral is £5, 8s., with an additional rate of £8 to the chief verger.

A long story might to written about the curiosities of St Paul's Cathedral alone. The cost of building it was largely defrayed by a tax on coal entering London, and it has wittily been said, seeing how blackened is a large part of the exterior, that in this way the taxed coal has had its revenge. The late Dean Milman carefully calculated the cost of St Paul's, and found it was exactly £736,752, 2s. 3½d.

St Paul's, now freely open, was not so until after 1841. The proposal to open it was then opposed by Canon Sydney Smith, who was of opinion that in such an event it 'would become, as it had been in times past, a place of assignation for all the worst characters in the metropolis; it would be a Royal Exchange for wickedness, as the other Royal Exchange is for commerce.' But his views did not prevail, and his fears were not realised.

Among the odd things about St Paul's, the story told by Sir George Birdwood is perhaps the oddest. In September 1907 he observed a group of women rubbing their backs against a pilaster in the nave. A lady, among a number of interested spectators of this singular act, asked the reason. 'Lor', ma'am!' replied one, 'don't you know that if you don't come up to London at least once in your lifetime and rub yourself against St Paul's, you'll live childless and die a fool!'

According to Sir George, a very similar popular rite is observed in the Saiva worship of western India, and he assumed the St Paul's superstition to have been transmitted from the days of the very earliest pagan temple on this site, and perhaps of a still earlier pillar.

Before we leave St Paul's, it is to be noted that St Paul's Churchyard is easily and notoriously the windiest place in London.

BRASSFACE AND SILVERTONGUE.

PART II.

IV.

WITH caution quite foreign to him, but induced by his recent interview with the ferocious major, Schneider judged it wiser to keep out of sight till he had seen Anton Bassewitz, and therefore spent the day at home till evening opened the doors of the *Turnverein*.

'*Ach ja*,' said Bassewitz as Schneider introduced himself. 'We are going to work together, *nicht wahr?* Well, nothing now. Amuse yourself, and come to my office'—giving him the address—'at nine o'clock to-morrow morning.'

With somewhat mixed feelings Julius presented himself in Moorgate Street next morning.

'Well, do you know why you are here?' queried his new master.

'No, *mein Herr;* the major told me only that I should be set up in business, and that I was to obey you as my superior officer.'

'That's well,' replied Bassewitz. 'What I am going to do is this. I shall open a credit of £500 with the Deutsche Bank for you here, and hire you an office in Cheapside, where you will start as a commission agent for German merchandise. You will push various articles, effecting genuine sales whenever possible, and building up the nucleus of a respectable business, while at the same time you will spend frequent week-ends for your health at places I shall indicate. For the present, they will be Dover, Folkestone (which is near Shorncliffe Camp), and Chatham. You can push your wares in those towns as well. Business is important, but more important still is it to make an impression as a respectable young business man, in order to be unsuspected when I send you to ferret out other points, such as the number of troops at these stations, the ships in dry dock or building, new steam trials, gunnery results, and so forth.'

'But this is spying!' exclaimed Schneider, horrified.

'Exactly, this is spying, as you say, though I prefer the expression "secret service" myself; but'—and here Bassewitz leaned forward, waggling impressively to and fro a fat forefinger, which eventually came to rest alongside his nose—'never forget, this is work for the Fatherland.'

'But to what end?' asked Schneider.

'That is not your business,' Bassewitz rapped out. 'Well, what do you say? Are you going to do it or are you not? I warn you, if you don't, you can never go back to the Fatherland again; and you might find England very unpleasant,' he added with a leer.

'All right, I'll do it,' said Schneider desperately. 'But what about my prospects? I sha'n't be building up a business if I run about like this.'

'Oh yes, you will; all the profits of the business you do will be yours, and when you want more capital, I shall advance it, subject, of course, to an inspection of your books.'

'Very well, I agree; but I wouldn't consent unless it were for the Fatherland.'

'No, of course not; I understand that,' replied Bassewitz soothingly. 'Now, the first thing you have to do is to go and see that Englishman Watson. Tell him you have come into money, and have come back to set up for yourself, and would like any business he can put in your way. Say that the reason you are back so soon is that you were discharged, medically unfit, owing to the strain of soldiering. He won't know any better—these English never do—and it will dispose him in your favour. Say it 's your heart,' he added cynically, as they said good-bye.

One lie (like one fool) makes many, and at the end of the day Schneider had involved himself in such a maze of falsehood that it severely taxed his mental powers to remember what he really *had* said. He solaced himself, however, with the recollection of the friendly reception he had had from his old employer, and started work the following morning at his new offices in Cheapside.

Thorough and persevering as the German undoubtedly is, particularly the German struggling for a foothold, it was not long before Schneider had commenced to build up the framework of a business connection. In every direction in which he thought his business interests pointed he wormed his way, and with the hide of a buffalo, impervious to snubs and rebuffs, he began to be known in his immediate entourage as a pushing business man. The Deutsche Bank had instructions to refer to Bassewitz before refusing a cheque, even if the £500 account were overdrawn, and Schneider therefore figured as something more than the man of straw he really was.

Directly Julius began to be better known, Bassewitz urged upon him the desirability of moving to a lodging slightly more in accord with a rising business man than Clerkenwell, and in due course apartments were taken in Highbury, and Mrs Briggs was ruthlessly jettisoned.

Schneider also paid his first week-end visit, which was not a success from his standpoint. Hopelessly out of touch as he was at that time with English life, apart from the commercial side, he put up at a boarding-house in Sandgate, thinking thereby to scrape acquaintance with the officers from Shorncliffe Camp staying there. To his surprise, he discovered that the guests were of much the same social stratum as himself.

Meantime his English improved, and with it his knowledge of English life, so that when he visited Folkestone the following year he made no mistake, selecting for his occupation one of the biggest and best hotels on the sea-front. He was very free with his money both in the bar and in the billiard-room, but hardly achieved his object, for the individuals who so readily responded to his generous invitations could scarcely be described as officers, or even as of the officer class.

It was then that Schneider made his first serious mistake, for, strolling on the Lees after listening to the military band playing there, he ran across the bandmaster sunning himself in all his glory, and accosting him with rather a fulsome compliment, made acquaintance. Followed naturally an invitation to dinner; and eventually, in return, Schneider found himself a guest in the Sergeants' Mess of the 100th Dragoons; for the bandmaster in the British Army does not, except in certain well-defined instances, hold a commission, whatever he may do abroad. Julius's questions here, however, were so pointed and tactless that they awakened the suspicions of the regimental sergeant-major, who, after a quiet talk with the adjutant, dropped a hint that Schneider was not to be invited inside barracks again.

With the naval officers Schneider was to a certain extent more successful. There is something breezy, unsuspicious, and open-hearted about a sailor, due perhaps to his spending so much of his time afloat, and at Chatham, where he began to be quite well known, Julius numbered many friends among the cheery crowd using that port.

He gave excellent dinners at the best inn in the town, beloved of Dickens, and in return was asked off to a good many ships, till his unfortunate propensity for asking questions began to betray itself, and his hosts here, too, received quiet hints to drop him.

A worse handicap, also, came into existence, for he was very unobtrusively shadowed back to town by an un-uniformed member of the Metropolitan Police attached for duty to Chatham Dockyard. But here the far-sighted cunning of Bassewitz showed itself, in that the particulars gleaned by the City Constabulary for their

Metropolitan confrères were so uniformly consistent regarding Schneider's respectability and business standing that the force was fain to put him down as a harmless Paul Pry. Nevertheless, with a caution for which that much-maligned department is not always given credit, they allotted Julius a number, a page in a big book, and added, for decorative purposes doubtless, the distinguishing insignia of a cross in red ink.

V.

So the years passed, Schneider growing ever in importance and worldly wealth, and becoming ever more barge-built in appearance as his girth increased, till the fatal 4th of August broke that ushered in a madman's bid to dominate the world.

Needless to say, the shock that surprised humanity was no shock to either Bassewitz or Schneider, who had been expecting the storm to break every summer since the Agadir incident in 1911, and who had heaved a sigh of heart-felt relief as each succeeding autumn sank quietly to rest. It was now a time of great and disturbing energy for these worthies. Schneider, a naturalised Briton, was despatched to Chatham, and thence to Dover, till a hint from a member of the Criminal Investigation Department who had quietly arrived from London caused the hotel-keeper to inform Schneider that he would have to vacate his room, as the whole hotel had been requisitioned by the Admiralty for naval officers.

With an inward curse upon the policy of Britain, which could not let a simple nation, allied to her in blood if not by treaty, work its will upon Europe without interference, Schneider shifted to another hotel, only to be met with the same excuse; whereupon he decided to return without delay to Chatham, where he was better known.

He was now sending daily reports to Bassewitz of all facts he could glean, cunningly disguised as commercial letters under a code which he carried in his inside pocket; and his notification of his having had to shift back to Chatham, and of his reason for doing so, was conveyed on the under-side of the postage-stamp affixed to the envelope, a little device that had hitherto escaped the notice of the authorities.

Bassewitz, undaunted, and entirely deceived by the turn of affairs, directed him to continue his daily reports from Chatham, and sent another fly from his great web to Dover. All continued to go well till Schneider was notified to bring his next report to London in person, in order that certain instructions might be given him by word of mouth. He duly arrived, and shaking hands with Bassewitz with a hand that felt more like a slice of Turkish delight than human flesh and blood, stated that the strain was telling upon him, and that, dearly as he would love to continue a member of the German Secret Service, he could no longer do so, for he feared the future more as every day went by. He was, moreover, strengthened in his attitude by the knowledge that his business was now on a firm footing, war risks apart, and when the war closed victoriously, as he fully expected it would, in a few months' time, he desired to be rid of the inconvenient curiosity of Bassewitz prying into all his affairs. This, however, he was canny enough not to commit to words.

Bassewitz, seeing his plight, and deeming the occasion a suitable one for a dose of his soothing syrup, fully sympathised with him, and sending him out on some unimportant errand, made a copy of the latest report. When Schneider returned, Bassewitz handed him the copy, carefully folded, and remarked, 'I 've been thinking over what you have been saying, my dear Schneider, and perhaps you 're right. You don't seem to have the nerve requisite for these undertakings in a time of such danger as this; so, on the whole, it would be as well to withdraw. Here is your last report'—handing it over—'and perhaps it might be as well to destroy it, for, should the code ever come to light, it is pretty compromising, as you are aware. For safety's sake you had better burn it, and I will tell off some other man to undertake the business I was going to give you.'

Schneider, rather surprised at the turn of events, but extremely relieved, willingly consented, and burned the compromising document on the spot; whereupon Bassewitz, changing his tone, exclaimed in a rasping voice, 'Now, *du Schweinhund*, I 've got you! What you have just burned was not your report, but a copy of it. The original is now locked away in my safe, and if I have any more of your damned nonsense, I 'll send your name, this report, and a copy of the code under registered cover to Scotland Yard, and then we 'll see what will happen!'

'That cuts both ways, *mein lieber* Bassewitz, for I should at once denounce *you*.'

'Yes, no doubt; but you forget that these reports were never made to me by name, whereas yours are signed. Likewise, you have nothing of mine in writing, but I have a good deal of your stuff. However, if you care to risk it, try it by all means; if not, go back at once to Chatham and wire me your arrival. Go, you dog!' he added fiercely as Schneider still hesitated. The discomfited rogue turned pale, and went.

VI.

Unobtrusively though he alighted from his carriage, chewing the bitter cud of the day's events, Schneider was none the less met, and, strange to say, by that quiet member of the C.I.D. who had had him under observation on many previous occasions. 'Good-afternoon, Mr Schneider,' he observed cheerfully as he edged up close to him. 'Could you spare me a minute?'

'No, I can't; and I don't know you,' was the reply.

'Never mind; I'm a detective, if you want to know, and I hold a warrant for your arrest. Shall I read it here, or will you come to the station to hear it read? I've got a cab outside,' he continued persuasively as he slipped his hand inside Schneider's arm and started for the exit. And for the second time that day the miserable wretch turned pale, and went.

Thereafter the fog of war closed over him, and he was seen no more. Bassewitz, not really quite at his ease as regards the day's events, though outwardly he appeared so, considered the situation in the light of a good cigar, and deciding the game was up, so far as he was concerned, made a careful copy of the documents most compromising to the wretched Schneider, and sealing them up, directed them to the Criminal Investigation Department at Scotland Yard; then, pocketing his code-book and two small sheaves of papers, strolled out through the outer office, remarking as he did so to a clerk that he would be slightly later next morning, as he had to see his dentist.

Calling a taxi, he drove to Holborn Viaduct, and, after a copious meal, leisurely boarded the Continental night express for the Hook of Holland. Harwich was reached without incident; but the boat had only half-completed her journey when she was hailed by a venomous-looking destroyer, who, turning her searchlight on, bade her heave-to, as a boarding-officer was coming aboard.

Within ten minutes a cheery, light-hearted 'sub' tumbled aboard, followed by a couple of armed seamen and an unobtrusive person in mufti. In the light of the destroyer's rays, the passengers were mustered on deck, and an inspection followed, as the result of which the dinghy returned to the destroyer with one more person aboard than when she pushed off. Those previously acquainted with him would have had some difficulty in recognising in the perspiring extra passenger the erstwhile debonair Bassewitz.

A week or two later the papers contained the following pithy announcement: 'The Press Bureau is authorised to state for general information that two spies, X and Y, of German extraction, were tried on the 29th ult. at the Middlesex Guildhall on a charge of espionage, and were sentenced to suffer death by being shot. The sentence has been confirmed, and was carried out on the 31st ult.'

THE END.

SOME RUMANIAN CUSTOMS AND SUPERSTITIONS.

By R. CARNEGIE.

IN no country of the world, perhaps, is superstition so rife as in Rumania. This may be on account of Rumania's geographical position, 'not quite far enough east, not quite far enough west,' as one writer hath it. Through Rumania, in earlier times, ran the most direct land-route to and from the Orient, and consequently many superstitions have, from time to time, been introduced, for no disease is so contagious as superstition. The majority, however, seem to be of home origin.

From the moment a Rumanian enters this world until he finally leaves it he suffers from the ailment. It is the first duty of the midwife to attach to the infant's hair a piece of red ribbon or tape, according to the social status of the parents. Red is always supposed to guard against evil. Nor is it only in the case of humans, as our cousins across the Atlantic would say, that this custom is practised. Every horse displays its red rag in the hairs of its tail or mane. Foals and calves, when not similarly decorated, wear the bowl of a wooden spoon suspended round their neck, though whether this is merely for luck or as a safeguard against the evil eye the writer has not been able to discover. Indeed, it may here be remarked that Rumanians of all classes show a curious indifference as to the origin of their many most interesting superstitions and customs.

In the Dobrudja blue beads in the form of necklaces and collars are often worn instead by animals and persons alike, this custom having been imported by the Turks and the Tatars, who constitute a large portion of the population of this district.

At a christening the mother must not be present; she retires to an adjoining room during the ceremony.

A general custom or superstition (it is difficult at times to know under which head to classify such things) is to avoid speaking too well or complacently of anything or anybody, lest conditions be changed thereby for the worse. A stranger within the gates may quite unconsciously bring odium on himself on this account. It is for this reason that the invariable reply to the greeting, 'How are you?' is a simple 'Thank you.' To say that you or yours are well might easily bring about the very opposite. The response to inquiries as to the health of friends or relations is a species of grunt, or the word '*Asa*,' which is best translated by our expression 'So so.' When you speak to a baby you call it *urîtului* ('little ugly'), and when you look at one an imitation of a spit is made, all to guard against evil results. Indeed, in an otherwise highly educated family of good social standing, the writer was witness of the performance of 'heap big medicine' when a child was somewhat

peevish on returning from its daily outing. The cook, versed in such rites, officiated. Cloves were burned over a glass of warm water and dropped into it whilst an incantation was chanted. The sputtering of some of the burning cloves on contact with the water was taken as proof that the child had been 'evil-eyed' by some passer-by. No one thought of holding the intensely hot sun responsible for the child's condition. Finally the boy was given a little of the water to drink.

On any one's sneezing, everybody present chorusses, '*Sanatate!*' ('Good health!'), for which thanks are politely returned. This superstition may be borrowed either from East or West; it is very common in Germany, and has (or had in the writer's early-Victorian childhood) its counterpart in nurse's 'Bless you!' when a child sneezes.

Household superstitions are very numerous, and some of them are most amusing. At table on no account may a loaf be laid on its back. It is unlucky to spill wine or coffee—unless the liquid falls straight towards the spiller, which betokens the best of fortune. To hold a bottle from underneath or away from one in pouring out its contents is very terrible. The writer first learned this by seeing two women and one man dash at an unfortunate Britisher who, for want of elbow-room at a crowded table in a station restaurant, was pouring out wine in this manner for a companion. One of the ladies, a stout and perspiring Jewess, presented the much-mystified Englishman with a pin, so that no evil should result from his rash act!

Tuesday is generally considered the unlucky day in Rumania. This is undoubtedly borrowed from the Greeks, and had its origin among them on account of Constantinople being said to have fallen on a Tuesday. On no account will any one commence any business undertaking on this day, nor must a betrothal or a marriage take place on a Tuesday.

It is most unlucky to sew on a loose button for any one unless he removes it himself. The sewer may, indeed, go blind! The sure antidote, which eye specialists at home might note, is to eat a bit of the cotton employed. To sew on a button for one's self with the garment on will cause the sewer to forget all he has ever learned.

A certain charm against being struck by lightning is to think immediately of seven male acquaintances who are bald.

Hens are never put to sit on an even number of eggs, nor must one speak whilst a hen is being placed on eggs, otherwise no chickens will be the result.

It is very bad to hand any one a piece of soap. It must be placed on the table by the one person and taken up by the other. When two people wash in the same water or use the same towel, the sign of the cross is made over water or towel. A child must never be lifted through a window, or an umbrella opened in a house. It is very unlucky to stand on the threshold of a house—one must step right out before speaking to anybody. It is an evil omen to meet a priest first on going out, and people seeing one coming will turn back again. Where the meeting is unavoidable, the remedy is to scratch that portion of the anatomy immediately below the back!

Never more than two cigarettes should be lighted at the same match. This superstition, which since the war has taken root in Western soil, is an illustration of how intensely ridiculous all superstition is, since, except in countries of the Orthodox Greek religion, it is wholly inapplicable, as it has its origin in the fact that when a body in these countries is laid out, three candles, representing the Trinity, are placed round the head, these being lighted with one taper.

Naturally death is a subject for superstitions and customs innumerable. The house must not be swept nor linen washed whilst the remains are lying in the house. As the corpse is carried out of the house a plate is broken—reason or origin obscure. A large cake, made from buckwheat and poppy-seed, is carried before the hearse—food, doubtless, for the long journey to the next world. In those towns where no more modern system of water-supply exists the water-carts meeting a funeral are emptied in the road as the *cortège* passes, with the same idea of not letting the traveller want for refreshment. The water-carters present themselves the next day at the house, to be liberally rewarded.

Boots must never be placed on a table, otherwise very shortly another pair will be there—on the feet of a dead person. The only way to avert the evil is to knock, not lift, them off.

It is very general in Moldavia for servants to keep a stick across the water-tub or bucket, possibly from the idea of the cross, or to bless the water, there being a very important religious festival each January in the Greek Church, when water in general is blessed.

Charms and incantations are firmly believed in among the peasantry and the lower orders. Fortune-telling by cards is a regular and recognised means of livelihood, and even in the largest towns those practising the craft advertise freely. One may often observe, in passing through some side-street, a notice and a crude painting of three or four cards. The Gipsies naturally drive a very thriving trade in fortune-telling in various ways. Every village boasts its wise woman, who is always called in in cases of sickness in preference to a doctor, and to this fact may be ascribed the appalling death-rate among children in the agrarian districts of Rumania.

Of customs more (if not always) apart from superstition there are a great many, and to enumerate and describe all these would take far more space

than can here be spared. The prettiest, perhaps, is that of the *Martzirhoare*. At the commencement of the month of March one exchanges with girls and ladies little gifts in the way of charms suspended on little red-and-white cards. These in former times were of the most simple form and pattern; but of late years, with the march of 'civilisation,' they may be anything up to a small gold plaque inset with brilliants. They are supposed to have the effect of keeping off freckles. The string, after being worn for some time, must be attached to a rose-bush, so that the late possessor's complexion shall become 'as white-and-red roses,' like the colour of the card.

Christmas and New Year naturally are well favoured as regards customs. It is usual for poor children and Gipsies to throw rice after one in the streets for luck. (In place of rice, beans are thrown at marriages in Bulgaria.)

Whip-cracking and bell-ringing, with pistol-shots, herald the advent of the New Year; whilst ploughs drawn by teams of oxen, both gaily decorated with fir-branches and coloured-paper streamers, are driven into the courts of the landed proprietors amid much whip-cracking and jangling of cow-bells, this to ensure a good harvest to the cheerful giver of backsheesh.

Gipsies carry round a boar's head, decorated with rosettes and with an apple in its mouth, and one is asked to give something for 'Little Basil.'

Is it not very probable that these two customs have the same origin as our Plough Monday, now practised in certain districts only, and as the boar's head which a century ago formed one of the principal dishes at Christmas in England? Rumania was 'discovered,' conquered, and occupied for a long period, just as Britain was, by the Romans, and these customs may well have the same origin, having been introduced by the soldiery of Trajan in the one case, and of Cæsar in the other.

A third custom which has its prototype in England is that of the Calushar dancers, who come down annually from the mountains to perform in the towns. They are dressed in white, with coloured ribbons on their headgear and at their waists, wear bells on their ankles, and have the same dances as our Morris-dancers at home, even to the handkerchief figure.

The origin of one, if not both, is the ancient Phrygian dance of the Romans, and the figures originally were meant to portray the flight of Rhea from Cronus when the latter wished to devour their son Zeus. The shouting which accompanies the figures in Rumania simulates the cries set up to drown the noise of the weeping of the child, and lead the mythological food-hog astray.

PEPITA.

PART II.

III.

FLIGHT was the only way out that Pepita could see to save Jamie, and escape herself from the brutal humiliation which threatened her. It would be hard for him, but harder for her. Yet her love was of too fine a texture, too pure a nature, to allow her to let him imperil his future for her sake—a girl of the pampas. No, she would go.

Half-an-hour sufficed to make her preparations. There only remained for her to pick a horse out of the home paddock.

It was a moonless night, and the stars were few and scattered. A pang of fear shot through her as she stepped into the engulfing darkness; but, her bundle under her arm, she held on her way. She had almost reached the paddock, when a strong hand seized her roughly by the shoulder, jerked her round, and she found herself facing a tall figure wrapped in a heavy poncho.

'Who are you?' she managed to utter. 'If you belong to the *estancia*, it 's only me—Pepita.'

The figure gave a low chuckle, and at the same instant the girl felt a knife at her throat.

'Pepita! Sancta Maria! But this is my lucky day. Squeak, and I 'll rip you from ear to ear, my beauty!'

'Michael!' she gasped, trembling with terror.

'Yes, my sweet sister—Michael. Aren't you glad to meet your loving brother?'

'What brings you here?' she asked swiftly.

'To see you, my pretty.'

'What business can you have with me?' she demanded sharply. 'And why are you wearing that old black veil tied across your face?'

'Best not to ask questions,' Michael said sullenly. 'Sit down,' he commanded. 'I want to have a talk with you. When I found that you 'd quit Gallegos, I thought that I 'd seen the last of my dear sister. Then I heard that you were here—housekeeping for that rich old skinflint, Don Angus. Yes, and I heard something else, too—that you and the old chap's son are hand-and-glove.'

He struck a match to light a cigarette, and by the feeble flame she could see the lean, dissipated face, with its restless, wicked-looking eyes. A shudder ran through her.

'Where does the old boy keep his pile?' he asked presently.

'Is that why you 've come here—to rob Señor Liddell?'

'If you like to put it that way, sister. But, put my way, I've come to ask for a little assistance to leave the country. They're crowding me, Pepita, and I must get out. I want you to help me—to tell me where the stuff is. I bet you know. The old Don keeps it here for safety—won't trust the banks; and the youngster brought back quite a nice little toothful to-night—from San Gregorio. I'd a thought of holding him up on the road; and one of my fellows did manage to scare away the horses, but there was nothing doing. However, I'm not sorry—since it's brought me the pleasure of seeing you. And now, with a little sisterly assistance, I can clean up the lot.'

'And what am I to do?'

'Now, that's business,' he gurgled a little thickly. 'Business! What can you do—eh?' and Black Michael muttered something about 'that fox-eyed old skinflint.'

She was to go back to the house, signal to him by three flashes of a lamp, open the door, and indicate in which room, and where, the money was kept.

'But if you are caught?'

'Caught!' he shrilled, leering horribly. 'It's never been healthy yet for the man who's tried it. And it won't be healthy to-night—for the man, or—woman,' he concluded, with a meaning nod and a wry grimace.

Involuntarily she shrank away from him.

'Now, what say?'

'Well, if you will promise really to go away, and never try to see me again, I will do what I can to help you—to help you to get out of the country.'

'Shake, if you mean it,' extending his hand; 'but if you play me false—beware!'

IV.

Back in the kitchen, Pepita took down a lamp, lighted it, and shading it with her hand, looked into various rooms, and listened at sundry doors, her temples throbbing and her heart beating furiously.

Everybody was in bed and asleep—even Don Angus, invariably the last to go, for the door of his private room was ajar, as he always left it on going aloft.

Satisfied that she was the only person awake in the house, Pepita stepped into the deserted sitting-room. On the table lay Jamie's cartridge-belt and revolvers. First making sure the weapons were loaded, she took them back with her into the kitchen, unaware that another member of the household was up and awake besides herself, and that he had been spying on her from the moment she lit the lamp—Don Angus.

He was in his den, the only room on the ground-floor into which she had not peeped. Nodding over his accounts, and hardening his heart against his son, he had fallen asleep. Waking, he had found his lamp burnt out, and was on the point of going to the kitchen for a light when Pepita struck her match. Wondering, he had waited—seeing, without himself being seen.

When Pepita stepped into the sitting-room he had clenched his teeth. The look in her face told him something was wrong. When she took Jamie's revolvers, the old man had reached for his own, which he always kept loaded in his own room, taking them up to bed with him every night.

Fully persuaded that the girl, in conjunction with her brother—Tonia had told him that Michael was believed to be somewhere in the neighbourhood—was planning to rob the house, Angus levelled his own pistol, intending to shoot her dead where she stood. But before he could get a line on her, through the partly opened door, she had left the room and gone back to the kitchen.

Wondering more than ever, the old ranchero, waiting and watching, saw her sit down at the table, take something from her pocket, tie it up in a handkerchief, and put it on the table. A few minutes later she walked to the door, unlocked it, returned to the table, and picking up the lamp, flashed it three times in front of the window. When she sat down again she had a revolver in each hand, concealed under her cloak.

Breathlessly Don Angus waited for the next move. It came almost directly—a slight sound at the outer door. Then the door of the kitchen was slowly pushed open, and a masked face took a rapid survey of the room. Cautiously the body followed, and Black Michael stood revealed.

'Close the door,' said Pepita.

As he turned she drew out the revolvers, and when he turned again she had him covered. Rapping out an oath, his hand went to his knife.

'Pull it, and I'll shoot. Sit in that chair,' she commanded, 'and keep your hands on the table.'

'You'—— he hissed.

'Sit down quick, unless you want to have lead pumped into you. These pistols are automatics, and each fires eight shots.' Spitting out a curse, Michael sat down. 'Do you realise what it has cost me to be known everywhere as the sister of the outlawed murderer, Black Michael?' Every word, spoken clearly and distinctly in the dead silence of the sleeping house, and vibrant with the ring of honest indignation, was heard by Don Angus, listening with every sense alert. 'I've stayed here longer than anywhere because you lost track of me. But not a place I've ever had but I have lost through you. When I've refused to turn thief at your bidding, you've claimed me for your sister—started the lie running. For that's what it is—a lie! Coward and blackguard! You reckoned the mud would

stick, as mud always does. You guessed people wouldn't stop to inquire—to find out that my father and mother were not your father and mother—that you are no relation to me at all except by the marriage of your father to my step-mother. Yet from here, too, I was to be driven, because of my supposed relationship to the man with the vilest record in the land.' He made a show of speaking, but she menaced him with the revolvers. 'I've always had to listen to you before; now you've got to listen to me. To-night Don Jamie told his father that he wanted to marry me, and Don Angus, flying into a passion, denounced me as the sister of Black Michael, threatened to cut his son off with a *peso*, and said he would not have me on the place any longer. He would pay me off in the morning. Afterwards Don Jamie found me in here, and begged me to run away with him. I told him that he would have my answer in the morning. And I was running away by myself when you stopped me. I couldn't bear that the young *caballero* should suffer on my account, or that the old Don should feel disgraced because of his son's alliance with me. What you have done has made me an outcast, like yourself, with no resting-place for the sole of my foot. Before daylight I must be off the ranch. But I must see you off first.'

'Why not get the chips and go together? And for the insults the old skinflint heaped on you—say the word, and I'll'——

The devil peeped out of his eyes, and his fists clenched.

'No, Michael,' she said firmly, 'there'll be no robbery or murder done in this house. Move from that chair before you have my permission and you'll never move again. But I promised to help you, and I will. In this handkerchief you will find money enough to take you to Monte Video. It is my own. Take it and go. You have two minutes to make up your mind. If you're not outside by then, I will fire and rouse the men.'

Black Michael's face was haggard, and the look he darted at Pepita was full of hatred. His chagrin and disappointment were manifest in every feature.

'Oh!' he said peevishly. 'Well, sis, I guess I'll just jog along.'

He rose slowly, his left hand stretched out for the money in the handkerchief. Then, whirling round suddenly, he aimed a blow at her with his right, which held a long, keen, thin-bladed knife. Caught off guard, she yet managed to push the table against him; but her cheek was badly scored, and with a cry she fell to the floor. His arm was raised for a second blow, when there was a flash in the dark, followed immediately by the report of a pistol. The knife fell from his fingers, and Michael himself sank to the floor, a bullet in his shoulder. At the same instant a great, shaggy-bearded man burst into the kitchen, a smoking weapon in his hand. It was Don Angus.

Snarling like a dog and fumbling for his knife, Michael felt his fingers close on the hilt. If he could only plunge it between the shoulders of this man who was kneeling on him, pressing his knee into his chest and pommelling him! But the old Scot, seizing the other's wrist, wrenched the knife out of his hand and flung it across the room, narrowly missing Jamie, who, roused by the noise, had descended the stairs.

'What's afoot? What's happened? What does it all mean?' asked Jamie excitedly, staring at the now unconscious figure on the floor.

'Black Michael wanted to rob and murder your father!' panted Don Angus. Then, remembering Pepita, who lay on the other side of the table, 'Look after that poor lass, Jamie,' he said —'after Pepita. Lord forgie me for abusing her. 'Tis she has saved us the nicht—the siller, and both our lives forby. She prevented him.'

Pepita's injuries were not serious; but the girl had swooned, and the young man held her in his arms while his father went for water to wash the blood from her face.

'I saw and heard the whole thing,' Don Angus explained. 'The door of my room was ajar; and when he sprang at her, I shot him.'

Slowly the girl opened her eyes, and feebly glanced up at Jamie.

'It's all right, Pepita *mia*—all right, little girlie.'

A smile broke over her face, and with a sigh she closed her eyes again.

'Jamie, lad,' faltered the big man, 'I was wrong—dead wrong—aboot the girl. She's no relation whatever to this scoundrel. All that I said aboot her in ma haste I tak back—tak back, lad, and ask pardon for. The girl's as good as gold! True metal, boy, right through. And gin ye want her, Jamie, why, tak' her—tak' her, lad, wi' my blessing!'

THE END.

A SOUTH-WEST BREEZE IN LONDON.

HERE, mid the tumult of the city square,
A south-west breeze has caught me unaware,
And filled my heart with memories of home.
I know the loch is all a-ripple there;
The sea still rages, though the day is fair;
I hear the curlew call across the foam.

Not that the London streets have lost their lure—
They charm me still, my restless moods they cure;
But memory whispers in the breeze and thrills
My list'ning heart with fragrance fresh and pure—
The voiceless magic of the wide, wide moor,
The high, blue splendour of the silent hills.

Grandly the day begins on Suilven's ben;
The wild mist-fairies frolic in the glen,
And, passing, touch the sombre crags with rose.
My soul forsakes the crowded ways of men,
Seeking the sunlit spaces once again.
Oh, blessings on each south-west breeze that blows!

THE HEART OF THINGS.

By HENRY LEACH.

LONDON, *Yesterday.*

THE year nearly ended appears to have given disappointment in many quarters. Being a year of peace—or the peculiar nominal kind of peace that is delivered to the nations as the real thing by the conferrers at Versailles—more was expected of it. Some men and women, ignoring all the signs, and particularly that labour, having won the war, as it was said, would proceed to ask questions and demand replies, seemed to consider that now, as a victorious nation, we should advance smoothly towards a state, a little rough, perhaps, and not well garnished, that should serve as preliminary to an approaching millennium. Somewhat inconveniently for the leaders of the people, they persisted in remembering what was said in 1914 and the following years about 'the war that was to end war,' the land that should be 'fit for heroes to live in,' the right of small nations to determine for themselves, and the glowing words of love and praise that were lavished by Authority and the propagandists on the soldiers making such free sacrifice of their lives, the heroes being assured of the care with which a grateful people would attend to their future needs. But the war being won, Authority abandoned ideals and ransacked its stores for instruments of materialism, discovering first of all, to the country's misfortune and the astonishment of foreign states, a General Election. Followed an orgy of politics on the higher scale at Versailles, wrangles and disputes, territorial greed, imperial schemes, the putting of the screw on the little nations, the French temptation to give fallen Germany something to make her remember even more her wickedness and stupidity, and the disposition to inform the advocates of the League of Nations that the League was a scheme produced and praised during the horrors of war, and that, these being removed and substituted by the blessings of peace, there was no longer need to pay tribute to such a fancy ideal. As for 'the war that was to end war,' and the squashing of militarism that was declared to be a chief object of the grand struggle, the War Minister at once declared for a vastly larger and more expensive army than was ever maintained before in peace, and France decided to go on with conscription. Only Germany was to be shorn of militarism. At the same time more troops were despatched to Ireland, and a big army to Russia to conduct a new war about which little or no information was given to the people. Then in due course the Germans, feeling themselves coming to life again, started upon the Russians, and, a pianist having become the ruler of Poland, a poet took possession of Fiume, while peoples that had been allies and had proclaimed common ideals (including the abolition of war), under the banner of freedom, became enemies, sharpened their swords again, and drew blood. There was the rustle of a movement for the restoration of some old autocracies. And so on in the way of topsy-turvy. When it was realised that Europe was not only in a condition of wild disorder, but that every state in it, including the quondam richest—which was ours—was moving fast towards bankruptcy, Authority appealed frantically for private economy, and for itself, having established a magnificent bureaucracy, proceeded to practise prodigality on a scale so vast that it would have been beyond the imagination of Britain in her days of calm prosperity.

* * *

Then the people likewise; and in their delirium they donned strange garments and danced wild dances copied from savage tribes, making appropriate music with pans and kettles. Their manners and their habits were as those of people who cared not. The profiteers waxed richer, and the soldiers asked for simple justice. Demanding that all the people should work and restore industry, Authority advertised on all the hoardings for more soldiers of every description. It presented highly coloured pictures of men in the British services strolling in golden sunshine through Eastern cities—smoking the pipes of peace—gambolling in all the most delightful places, and pointed out to those attracted by these pictures that such a life was much to be preferred to that of the poor civilian grinding away at his dull duties to set industry going again. Authority invited the young men to see the world at the country's expense, asked them how they could be men of the world if indeed they did not see it, and urged strenuously on these brilliant placards that the service life was the best of all. Then it was said that, so much having been spent on war, less must now be spent on education, and there was a movement

 [*All Rights Reserved.*]

to house the nation in wooden huts instead of dwellings of brick and stone. Retrenchment being insisted upon, the War Minister's motor-car was put up for auction, and was seen to be the largest and most expensive possible, a most luxurious car, fitted in mahogany and silver. Not liking the appearance of things, some units of Authority went for holiday to a French resort which had earned the reputation of being the giddiest and most expensive place on earth. The people, feeling that Authority failed them, and was lacking in ideals, sincerity, and action, with a sigh concluded that an anodyne of irresponsibility would soothe their sorrows, and adopting the system of joyous materialism, laughed away the day and the night in folly, for in the morning they were to die, they said. Every form of gambling increased; sad and shameful was the decline of public morals. Art and culture generally seemed to have collapsed, though a few brave efforts were made by literature and the drama. The people felt also that the Churches —or, at least, the official Church, the Church of Authority—had failed, and did not patronise them more. Yet those who had lost their beloved in war cried for some consolation, and distrusting the Church, turned pathetically to voices and visions in the air, to imagined visitations from the Beyond, to 'spirits;' and in their belief in spiritualism they seemed to converse with their dear ones and be consoled. Great authors and most distinguished men of science supported these suppositions. It was a further sign of desperation and the failure of Authority—hiding things from the people and deceiving them—that many gave a new and earnest attention to clairvoyants, fortune-tellers, and seers of all sorts. It was declared that occultism had never had so many fervent disciples. It was announced that there were thirty-five thousand professors of this sort of thing in Paris. The Church, which had already begun to entertain certain doubts upon its own sincerity and worth, became alarmed, imagining that a finger of fate was being pointed at it. Something like a panic seized it, and in congress it devoted itself to this question of spiritualism, since it was declared that the mass of the people evidently no longer believed in God—or the God of whom the Churches taught. The serious consideration by the Church Congress of the question of what some who treat the subject very lightly call 'ghosts' or 'spooks,' and the feeling of some high clerics that there might be something in it, and that there should be an inquiry, were not the least extraordinary features of the general chaos and upheaval. But, more than that, the bishops and the parsons, profoundly stirred in their apprehensions, applied themselves also to the consideration of points regarding the birth-rate, and to debating extremely unpleasant problems of a sexual and a medical character. Parsons were feeling that their stock advice to people had been a failure, and that something would have to be done. Stern injunctions, cold commands, and soft nothings had lost their effect; the people preferred to attend jazz dances and bridge clubs. The most popular, most expensive, and most advertised entertainments were the prize-fights. The best newspapers praised them; described in close and affectionate detail the blood that was spilled, and how; said it was magnificent, the utmost art, and advocated the attendance of ladies.

* * *

At their best the people determined to make some new and free and good thing of their own lives on independent lines, disregarding the insincerities and the opportunisms of Authority, and submitting only to their own thought, reason, and conscience. For hope and protection they turned in upon themselves. They found this to be the only way to peace, and to any sort of harmony between their own existence and the eternal question of the 'why' of life and the 'whither' of the soul. Some, taking the lighter form of the new and yet thinking freedom for their principle, agreed with John Galsworthy in his autumn novel, saying, '*Life's* going to be the important thing in the future; not comfort and cloistered virtue and security, but *living*.' All the old traditions and drags on life are in the melting-pot. Regrets and repinings and repressions are going out of fashion. We shall have no time or use for them in the future. A parson in sore domestic distress gave up his parish, and besides the love of his children it seemed to him that Beauty was the only comfort left to him in the world. 'God has so made the world,' he said, 'that, no matter what our struggles and sufferings, it's a joy to live when the sun shines or the moon is bright or the night starry.' And in that was he not spendidly right; for is there not always the consolation that we seek in Nature, which is the visible God? Here at last is truth, sincerity, freedom, promise, and effort. Here is nothing little like the peddlings of Authority, which, with all its Ministerial blasts and speeches, cannot for one moment or by one compass-point move the direction of the wind that fans our face when we stride in freedom over the heath. 'There's night and day, brother—both sweet things; sun, moon, and stars, brother—all sweet things. There's likewise a wind on the heath. Life is very sweet, brother; who would wish to die?' And from the elementary enunciation of George Borrow give heed to Wordsworth's appeal, listen to the throstle singing and being preacher too, and 'let Nature be your teacher.' Go and look at a silent pool with trees around and masses of undergrowth, with all manner of living things about. Truth and freedom here, if not in Whitehall! Take a fishing-rod to the river, drive a golf-ball over the links—truth and freedom again. Stand by a stream, see the sparkle of water on the stones, and hear that plash of the rill, perfect music,

that Mendelssohn tried to capture in a wordless song. Take some paints and paper and catch shadows in a lane. Man, with an exaggerated idea of officialdom, which is essentially unidealistic and materialistic, has been misled by Authority gone mad; he is lost amid complications and negations, and in his own soul he must go back to his base for a new beginning—the base of Nature. There he will find a safe foundation and sure hope. He is given the hint of it every day and night.

* * *

Some of the skies o'er southern seas are wondrous in their colouring; some sunsets one recalls by the North African coast which by their transcendent beauty seemed to make one's spirit flutter; but yet in London in the autumn there are glorious skies just as the light of afternoon is fading. Look at them across the Park towards Westminster, or, better, perhaps, up from Westminster itself along the deep shaft of Victoria Street, with—by a rare architectural cunning—the Byzantine dome of the Roman Catholic Cathedral commanding the bend of the street where it turns away from view. On most afternoons at three or four Nature brings her sky paints along this way and blends us a great effect—always one of sombre strength and depth. Pretty dapplings she keeps for the hills and the seas; here with the atmosphere of the ancient city she lays broad imperial tints. Last night she chose a favourite effect, and through strong grays and an intermediary of siennas she led to a majestic horizon laid out in deep imperial Venetian red, with the thin mist of the town washed lightly over to yield an opalescent and smouldering impression. It was a masterpiece. Now, if Authority could but emerge from its cells in Whitehall, look upon these things, and really understand them, the tremendous moral of them, how much nearer might we not approach to truth and sincerity? 'Give me the sky if I am to see God,' said Jack Senhouse in Maurice Hewlett's *Open Country*, and there is not to be found anywhere much better philosophy of the simple kind than that of this splendid cultured vagrant. One has been tempted in these last moments to reach a little volume from an adjacent shelf, and surely here are spirits doing their suggestive business, for it flies open at a page where Senhouse at Land's End writes to Sanchia about matters of civilisation, and upon the dear girl he flashes such thoughts as these: 'Are we civilised, by the way? Are we getting civilised? Are we more civilised than the Greeks were in Socrates' time? Or the Romans in Cicero's? Or the Italians in Leonardo's? Or the English in Sir T. More's? Are we more humane, you might say? We are told so, I know; but between you and me and the Atlantic, I doubt it profoundly. Individually, we certainly are not; collectively, not one atom. If we act individually like maniacs, as I've been telling you we do, we act in the mass like the hosts of Midian. Until war—to name but one public vice—is spoken of in the terms we now use to reprobate drunkenness, or gluttony, or the drug habit, I decline to recognise that we are civilised at all. But, so far from that, we devastate the heathen; we exhaust ourselves in armaments; we cause the flower of our youth to perish for all-red maps; we still teach diplomats to lie and politicians to cadge for votes like the street boys for coppers; we thieve at large, brag the great year through, bluster, howl at other people playing games for us; lift pious hands (to a heaven we don't believe in) at our rival's enormities; we cant and vapour—out upon us!—and what for? For two things only, Sanchia; for two things which are fatal to real civilisation—that money may be easy and that labour may be saved. If you will mention to me one public act of the last fifty years which has not been directed to the acquisition of money, or one mechanical invention which has not aimed at the saving of labour, I'll throw up the sponge and commence stockbroker. Now, money, I say, is the one cause of slavery, and work the one hope of salvation. Therefore our civilisation, as they disastrously term it, is a condition of acquiring slavery easily, and of obliterating the hope of civilisation. Pretty, isn't it, when you take the clothes off?' Old Jack, of course, wrote these things long before 1914. His author should tell us something of Senhouse's actions and thoughts—and Sanchia's—since then. Hewlett and Wells and Galsworthy among the tale-tellers have done the sincerest thinking in recent years.

* * *

So it seems that this expiring year has been something of an entangled disappointment. As a year of peace, of honest rejoicing, and as the beginning of a healthier and happier era, it has been a failure. There is the consolation that in national and Governmental folly we should now have 'touched bottom,' and unless human life is a creative blunder we may with confidence look forward to better things. It is necessary to be sincere, to be an optimist, and to think. Then look at the flowers, the fields, the mountains, and a little child, and you know that though gross and pagan Authority may depart, there is a Good that will for ever work its eternal way. The conscience of Authority is obviously bankrupt, and so man must turn in upon himself. Remind Authority now of its insincerities, and it merely, like a vulgar boy, puts out its tongue, and asks what you might have expected. Tell it that it promised there should be no more war and no more militarism, that life should be clean and pure and good, that the Kaiser should be hanged, that the Germans should pay for the war, and that there should be no trading with them. Authority, laughing, will tell you

that any fool could see long ago that Germany could not pay for the war, and that it would be absolutely necessary to trade with her as soon as possible. 'But why, when you promised?' murmurs John Innocent, choking back a mixture of disappointment and disgust. Authority grins more scornfully, saying that then it wanted something. If the people were fools, that was their affair. Thomas Carlyle, his works, had a bad time during the war. The class of patriots who gave a dachshund a kick whenever they saw one, and drove the poor beggar almost out of British existence (I dislike their lengthy bodies, but they have fine eyes—and all dogs are good, differing from men), grumbled that the old sage was pro-German (like Queen Victoria, though they did not mention her), but he wrote one simple thing which is the most obvious truth of modern application—about us people being 'mostly fools.' Authority holds us in the utmost contempt. Politics, insincerity, and opportunism have placed it in command, and now it could not escape from its position, built upon insincerities, if it chose. But all this could last only if it were surely believed that Antichrist would reign in the world for ever on. As we are certain that that is not the case, Authority (as we know it) will end, and happy men and women, no longer labouring half their day to support the waste of Authority and its pet bureaucracy, will lay an epitaph upon its resting-place to read: 'O what a tangled web we weave when first we practise to deceive!'

* * *

But the signs are good. The year which has so much disappointed and yielded so much evil has taught hard lessons, and helped earnest men and women to find themselves. There is heavy work to be done in the near future, but the world is really getting on. We see proofs of goodness and greatness about us. He who doubts should take a walk down Whitehall—which is the home of the politicians and the bureaucrats, though not for that would we walk this way. But raised up in the middle of Whitehall is the grandest thing in London now, grander in its meaning and solemnity than the adjacent Abbey, more potent for influence than Downing Street that comes out upon it, or the great Government departments all about and everywhere. It is *The Cenotaph*. This plain, tall pillar of stone—it will be stone—with the flag laid over it, others drooping by, the simple wreaths upon the sides, those impressive words, 'The Glorious Dead,' and, above all, the masses of tokens of remembrance from the bereaved, is the most awful, most terrible, thing in England now. I cannot walk down Whitehall without feeling an enormous pressure upon my spiritual being, a sense of mysterious forces acting, as if all the human spiritual strength that was exerted there in France and Flanders—and other places—is here massed in this solemn Cenotaph as heat is concentrated in the sun. If you have sense and sensibility, you will find that it both hurts and helps to walk down Whitehall in these times. It is a tremendous experience. Here is the monument to Sacrifice when the world was in doubt and agony. It is proof of the good of man. In the quietness of the night, when most of London sleeps, even now in winter, you will find some lonely, sorrowing soul wandering about the base of this great work of Lutyens, touching again with reverent finger a wreath laid there among the great mass of others that surround the pillar. Always green are these leaves and always fresh the flowers, like the memories they represent. Look at the labels. Passing by on one of these nights, I lingered a moment there, as is almost a custom with many of us. The little card attached to one of the wreaths had a plain inscription in just the same terms that many others had borne, and these were the words: 'In loving memory of my dear daddy.' Listen, people and Authority, to that holy, loving whisper. 'Daddy!' One thing I wonder: Why did Authority, knowing its insincerity and its many errors, permit this glorious, this terrible, Cenotaph to be erected in its own street, its own Whitehall? The answer is that Authority could not help it, and never thought of it. This was a grim, inevitable affair of Fate. It is there for a warning. Above all, it is there for a *Guarantee*. The peace celebrations were a foolish stupidity, but the raising of this Cenotaph in Whitehall was an inspiration from the soul of a great people. Amid the confusion of this year this is one thing done that gives great hope for next year and all to follow. It seems to stand in solemnity, above all the rest of London. The children's wreaths in memory of their daddies give the poignant, tremendous, the warning finish to the memorial of a nation. Yes, this Cenotaph is a Guarantee. Looking upon it, we feel, we know, that there is good to come—'at last—far off—at last, to all.'

THE BROWN NABOB'S MONEY.

CHAPTER V.—A MASTERPIECE OF STRATEGY.

BELLAMY passed a bad night in a big bed in a cavernous room. He revolved various ideas. In such fitful sleep as he got, his ideas mingled curiously with dreams. The Petherfields were in all those dreams. He saw himself captive amongst them. He was a mere nonentity in

their hands. Petherfield was his master in quite a new fashion. Mrs Petherfield presented him with a book on etiquette and gave him private lessons in deportment. Norman drank his champagne and borrowed his money. As for Edytha, in all his dreams he saw himself attached to her willowy figure by a chain, the weight of which he had to support, the links of which nothing could snap. In every phase of his dreams the Petherfields waxed bigger and bigger, while he shrank and shrank until at last he was a pitiful little atomy trembling in their midst. He woke to contrast the dreadful fancies of this dream-world with that old world in which his greatest ambition had been to get three pounds a week and marry Evie Parker.

Eight o'clock struck as Bellamy descended the stairs of his big house. The front-door was open. One of the maids stood there laughing with the postman. She had a big silver tray in her hands; the postman was piling letters upon it, not in twos or threes, but in stacks.

As Bellamy slowly reached the hall the postman went off, and the girl turned to her new master with a coy glance at her burden.

'Your letters, sir,' she said.

Bellamy's mouth opened, and his face puckered into perplexed lines. He followed the girl into the dining-room and motioned her to set the tray on a side-table. When she had gone, he plunged his hands in his pockets and stood for a full minute staring at his correspondence. He had never received more than one or two letters at a time in his life; before him lay at least a hundred. At last he began to open them.

During the hour which elapsed between that moment and the announcement of breakfast, Bellamy realised what it means to be the possessor of riches. It seemed to him that everybody in Normansholt wanted something out of him. Church funds—chapel funds—school funds—the dispensary—cricket clubs—football clubs—societies for providing coal—societies for distributing blankets—not one day had those behind these things allowed to slip before pestering him for money. He counted forty-three applications of this sort, and set them methodically aside. And likewise he put aside twenty-seven pure and simple begging-letters. Some were sent by folk who considered themselves to have claims on Farmadale, deceased; some appealed to Bellamy on the score of acquaintance. Then came suggestions, not for giving money, but for making more. Every stock and share broker in the town had sent him circulars and lists. Several individuals with ideas about patents had written to tell him that if he would invest a thousand or two with them, he would reap a reward of three or four hundred per cent. More innocent matters were catalogues and price-lists from every tradesman in the neighbourhood who had anything to sell. And Bellamy saw himself as a treasure-house, out of which hundreds of grasping and rapacious hands were eager to snatch something.

Then, right at the bottom of the heap, he saw two letters which, somehow, seemed to be of a private nature. One, indeed, he at once saw to be in Evie's rather big, rather unformed, handwriting; the other, a dainty affair in china-blue stationery, was addressed to Bellamy Denton, Esqre., in a delicate Italian style of calligraphy, with long loops and terminals. He turned it over, and saw the Petherfield crest on the back.

Bellamy opened this first. The letter inside was signed 'Edytha,' without any addition of surname. He groaned as he saw it.

'Dear Mr Denton,' ran this missive, 'we shall *all* be *so* pleased and *delighted* if you will come to dinner to-morrow evening—the usual time, of course. Perhaps you will come early, and then you can give me a lesson in *chess*, which I am dying to learn. I am sure you will be very, very *patient* with me! Be *sure* to come.'

Then overleaf, and after the signature, came a postscript: 'Come at five-thirty *if* you like. I'm always *alone* for an hour then.'

Bellamy groaned again and crumpled the scented lure into his pocket. More slowly, and half-afraid, half-hopeful, he opened the letter from Evie. He groaned worse than ever as he read. 'Dear Bellamy,' wrote Evie, 'please, *please* don't ask me again—what you asked me last night. Once, perhaps, I might have said something different, but now it's all so altered, and I'm afraid. You'll have to be such a big man with all that money, and we are humble people, and I'm not equal to such fearful responsibilities. And I am sure Miss Edytha Petherfield will be much more suitable, and will know what you ought to do with your money. And perhaps it would be best if you didn't come to see us again. And, oh, Bellamy, I hope you will always be happy!'

A gong rang somewhere in the hall as Bellamy finished reading this pathetic epistle, but it rang unheeded. And presently, when the parlour-maid looked in, she saw her master standing in the middle of the room, ruffling his red hair with one hand, while he violently clenched a letter in the other.

'Breakfast is ready in the morning-room, sir,' she announced.

Bellamy came to his senses with a violent start. He made a dramatic gesture in the direction of the trayful of letters and circulars. 'You see that lot!' he exclaimed. 'Take 'em away! Burn 'em! Throw 'em on the dust-heap! Do anything with 'em! And if the postman brings any more, tell him to save himself the trouble. I want none of that sort of rubbish here.'

'Yes, sir,' answered the parlour-maid. She seized on the offending papers, and Bellamy

stamped out of the room. But at that moment the second, or extra-local, post arrived, and the parlour-maid had to set the tray down and take in a second consignment of correspondence. 'There are more here, sir,' she said.

'Burn 'em with the rest!' growled Bellamy. 'I won't be pestered with 'em.'

Then he went in to breakfast. Now, the Brown Nabob had been a man of mighty appetite, and the table offered Bellamy a wide choice. There was a game-pie, and there was fish, and there was a dish which the deceased Farmadale had particularly affected—a certain Indian curry which would have caused the tears to flow down Bellamy's cheeks had he tasted it. But Bellamy scarcely tasted anything; he gulped down a cup of coffee, bolted a mouthful or two of toast, and then, seizing his hat, rushed into Friargate and slipped into Haddlesey's office.

Haddlesey was an early bird, as Bellamy well knew; he was always in his private room, ready for business, by nine o'clock. Bellamy, as a client of vast importance, was shown in to him at once; and thereafter strange things occurred, so Haddlesey's clerks thought. First of all, they heard what seemed to be a heated altercation between Haddlesey and Bellamy; anyway, Haddlesey's voice was heard as if in protest, and Bellamy's as if in insistence. At the end of half-an-hour Haddlesey rang his bell, and sent the clerk who answered it across to the bank for Mr Shillito. When the banker arrived there was evidently a renewed conference, which was prolonged for some time. But matters did not end there. At eleven o'clock Haddlesey himself emerged, went into the town, and came back with the mayor and the vicar. He took these gentlemen into his private room, and told his head clerk in a whisper that he was not to be disturbed by any one or for anything. And having reached the door of his room, he turned back as with an afterthought.

'If Mr Petherfield or Mr Norman Petherfield should call and ask for either me or Mr Denton,' said Haddlesey, 'you'll say that it's absolutely impossible to see me for some time—utterly impossible! Mr Denton and I have business of the utmost importance.'

Then he disappeared into his room, and his clerks heard nothing but subdued murmurs therefrom for the rest of the morning. At one o'clock the vicar, the mayor, and Mr Shillito emerged, and went out in close and whispered conversation. The senior clerk, inspecting them from his eye-corners, opined that they appeared to be in a high state of satisfaction about something or other. Then Haddlesey and his client came out and walked along to Friargate House. Evidently they lunched there. At two-thirty they were in the office again; so, too, were the other three gentlemen. The conference appeared to be resumed. The clerks outside waited and wondered, but heard nothing until four o'clock had passed and the dusk was gathering. Then Haddlesey emerged and beckoned to two of his myrmidons.

'Stephenson,' he said, 'go down to Mr Petherfield's and ask him if he and Mr Norman Petherfield will oblige me by coming here for a few minutes. Tell him who's here, Stephenson.—You, Jones, run up to Mrs Parker's, in Trinity Terrace, and tell her that the presence of herself and her daughters is most urgently requested at Mr Haddlesey's office at once. Bring 'em with you, Jones—all three. Say Mr Denton's affairs—most urgent.'

The clerks sped off. Stephenson returned with the Petherfields within two minutes; Jones, with the hastily attired and somewhat alarmed Parker family, within ten. Haddlesey, awaiting the last arrivals at the door of his room, ushered the widow and her daughters inside with a confidential smile and whisper.

'Nothing to be alarmed about, ladies,' he said. 'Merely a little announcement which his Worship wishes to make. Come in.'

Evie Parker, looking round as she entered the room, caught Bellamy's eye at once. Bellamy sat at one end of the centre table; next him on one side sat the mayor, on the other the vicar; close by was Mr Shillito; standing near the hearth were the Petherfields, father and son, each wearing a puzzled expression.

Haddlesey shepherded Mrs Parker and her daughters to chairs, and rubbing his hands together, and with a sly glance at Mr Petherfield, turned to the most important personage in the room. 'Now, Mr Mayor,' he said. 'If you'll just'——

The mayor, a rotund and somewhat pompous person, whose fat hand, as he rose, wandered upward as if in search of his chain, gazed round the room comprehensively. 'Ahem!' he said. 'Mr Vicar, ladies and gentlemen, I—this is a somewhat unusual and informal gathering of—er—let us say, Mr Denton's friends. Those of us, I am sure, who were Mr Denton's friends before will hope to remain so; those of us who have become—er—better acquainted with Mr Denton to-day will hope, I am certain, to know more of a thoroughly estimable young gentleman.' ('Hear, hear!' from the vicar.) 'The fact is, ladies and gentlemen, I have the pleasure, and indeed I may say the honour, to make an announcement on behalf of Mr Bellamy Denton. We are all aware that by the will of the late Mr Farmadale, Mr Denton, two days ago, came into a very handsome property, worth, Mr Shillito tells me, some one hundred and sixty or seventy thousand pounds. A serious responsibility, ladies and gentlemen! So serious, indeed, that Mr Denton—very wisely, in my humble opinion—feels it far too much for him to bear. He has discussed this matter all to-day with his solicitor, his banker, our worthy vicar, and myself, and,

remaining fixed in a certain intention with which he came into this office this morning, he now wishes me to make an announcement—semi-public now, fully public to-morrow. Ladies and gentlemen, Mr Bellamy Denton, in a fine, broad, handsome spirit of public benefaction, has decided to give the fortune left him by the late Mr Farmadale to the Mayor and Corporation of Normansholt in trust for the building and endowment of a modern school whereat the youth of the neighbourhood will receive, freely, the advantages of a most excellent education. Ladies and gentlemen, I most heartily thank this fine-spirited young townsman of ours for the goodness of heart and sentiment and feeling which has prompted him so generously to benefit his native town. His name will be remembered in Normansholt for ever as that of a great benefactor!'

'And as that of the most consummate ass that ever trod its pavements!' exclaimed Mr Petherfield as he snatched up his hat and turned to the door. 'A perfect fool! And I should like to know what influence'——

'Ahem!' said the mayor loudly. 'I think, Mr Petherfield'——

But Norman Petherfield was already hustling his father through the door. He, Norman, was sharp enough to know that Petherfield, senior, if chagrined, was not proof against using actionable language. Besides, the thing was done.

Ten minutes later Bellamy, pale, worn, and meek, escorted the Parker ladies into their little living-room.

Evie turned on him like a flash. 'Bellamy,' she said, 'you've given up that money because of what I said! I've robbed you! Oh, Bellamy!'

Bellamy lifted a hand—like a signal. 'Er—the fact is,' he said—'the fact is, Mrs Parker, and Evie, and Kittie, I—well, you see, the mayor omitted—or, rather, I didn't wish him to mention—one little fact. I—I—well, I haven't given up *quite* all the money. I—didn't see that I need do quite *that*, you know. The truth is, I've given the town about a hundred and fifty thousand. The rest—well, I felt justified in keeping that for myself. I've fixed things in such a way with Mr Haddlesey and Mr Shillito that I shall always have some twenty pounds a week literally fastened on me, so that no one can ever touch it; and, Mrs P. and Kittie, you'll excuse me, I'm sure, if I say that—er—perhaps you'll leave me and Evie for—er—two minutes?'

Whereupon Kittie discreetly drew Mrs Parker from the room, and Bellamy and Evie fell into each other's arms.

THE END.

SOME ODD THINGS ABOUT LONDON.

II.—THE WEST END.

HOW many Londoners of to-day know why the road past St James's Park, between Buckingham Palace and Great George Street, Westminster, is called 'Birdcage Walk'? Few know more about it than that Wellington Barracks are situated there. Here, in the time of Charles II., the royal collection of birds was kept, and Master Edward Storey was the Keeper of the King's Birds. To this day the entrance to the Park from Great George Street is called 'Storey's Gate.' There he had his official residence. It may not be generally known that 'Birdcage Walk' was not open to the public until 1828. Before that date it was used only by members of the royal family and the Hereditary Grand Falconer, whose office has long since been abolished.

For St James's Park was, until years comparatively recent, a 'royal' park in a very real sense, and by no means a democratic one. The exclusive and fashionable resort of an age that stretched from the days of Charles II. and Nell Gwynne to those of George IV. and Mrs Fitzherbert, where impromptu dances and concerts took place, where Bolingbroke and his friends won wagers by walking down the Mall in what Trilby would have called 'the altogether,' is now, of course, free to all. But, even after the Park was thrown open to the public, the authorities, in their peculiar way, were particular, and it is curious to note that until the year 1845 any person in the attire of a workman, or any one carrying a parcel, was not permitted to enter.

'Queen Anne's Mansions,' the first block of flats to be built in London (and very lofty and very ugly they are, too), stand just off Birdcage Walk. They are the place to which the cabman drove the unsuspecting fare who required to be taken to Hans Mansions—which, as Londoners well know, are off Sloane Street, and are named, with the street, after the famous Sir Hans Sloane.

'Queen Hanne's Mansions, you mean, miss,' replied the cabman, and she was driven off to Westminster instead of to Chelsea!

London streets were once a very forest of signs. Those were the times before the houses were numbered. The sign system must have been extremely cumbrous, as we may judge from the advertisement of Dr James Tilborgh, a German doctor, who, in the eighteenth century, advertised that 'he liveth at present over against the New Exchange in Bedford Street, Strand, at the sign of the "Peacock," where you shall see at night two candles burning within one of the chambers before the balcony, where he may

be spoke with alone, from eight in the morning till ten at night.'

The *Daily News* in November 1762 announced that 'the signs in Duke Street, St Martin's Lane, are all taken down and affixed to the fronts of the houses.' The City soon followed suit. But it would seem that the first idea of numbering houses arose from the practice of numbering the staircases in the Inns of Court, which were all alike, and not easily distinguished otherwise. In June 1764 the numbering system was introduced, beginning with New Burlington Street, Piccadilly, followed by Lincoln's Inn Fields. A relic of the days before numbers identified houses is found on the door of No. 45 Berkeley Square, long the residence of the Earls of Powis. There will be seen an oval brass plate (looking very professional, as though it might be that of a doctor or a surgeon) inscribed 'Earl of Powis.' This generally seems to uninstructed observers an eccentricity, but it is merely a survival of a custom once generally followed.

The 'shortest street in London' has recently been incorporated in St James's Square. This was 'John Street,' leading into Pall Mall. It had only one small house, which was, and is, the Duke of Norfolk's estate-office.

One of the broadest thoroughfares in London is that truly noble avenue, Portland Place, north of Regent Street, built by the brothers Adam in the second half of the eighteenth century. It is a retired and quiet street of noble mansions (except for those built of brick instead of stone), reminding one rather of the best parts of Bath than of London.

The roar of London's streets, so often referred to by old writers, is not what it was. The noise is perhaps less in volume, although the traffic is greater, and the sound has certainly a different note. This is because the old granite setts in the roadways have given place to wood and asphalt. Some imaginative writers have had fantastic ideas about London's traffic. Samuel Taylor Coleridge, when a youth, walking along the Strand, could imagine himself Leander swimming the Hellespont. Nothing so fresh as the open sea about the Strand to-day, now that the motor-omnibuses and the taxis rage and the scent of combusted petrol fills the air! The idea of tides, if not of the sea, was expressed by Dr Johnson in 1775 in the well-known phrase reported by Boswell: 'Why, sir, Fleet Street has a very animated appearance, but I think the tide of human existence is at Charing Cross.'

London streets have not been without their poets. Tennyson, in *In Memoriam*, is not complimentary:

> Dark house, by which once more I stand
> Here in the long unlovely street,
> Doors, where my heart was used to beat
> So quickly, waiting for a hand.

He refers to Welbeck Street, Marylebone.

But there are streets unlovelier by far than that. Gower Street, for example, is a prominent specimen of dull, drab uniformity. Ruskin, given to violent expressions, thought it like a street in hell. Since then there have been attempts (with but indifferent success) to modify this alleged satanic, but highly respectable, thoroughfare.

The why and wherefore of many things escapes notice. If you ask why the great bell of Westminster is called 'Big Ben,' most of the people who have any idea at all about it will say it was named after Benjamin Disraeli, Earl of Beaconsfield. But it was not. It was so called because Sir Benjamin Hall was Chief Commissioner of Works when the great bell was cast. A crack in it necessitated a recasting (10th April 1858). It weighs nearly fourteen tons, and is again cracked, which accounts for its peculiar tone.

The lamp-posts of London would not seem to be a very interesting subject, but there are some quaint and curious specimens. In St James's Square, in front of No. 2, Lord Falmouth's house, are two which are fixed in the muzzles of old cannon, planted upright on the kerb. These were French guns, captured by Admiral Boscawen, Lord Falmouth's ancestor, in that naval action off Finisterre in 1747 in which the French lost the *Sérieux*, *Invincible*, *Diamant*, *La Gloire*, *Jason*, *Rubis*, and six Indiamen. The French admiral, in giving up his sword to Boscawen, evidently had not entirely lost his spirits, even though he had lost the day; for with ready wit he complimented the victor, in the brilliant, if ill-timed, jest: '*Vous avez vaincu l'Invincible, et La Gloire vous suit.*' Three of the captured cannon perform a useful part as kerbstone-posts, and are tampioned with shot. All five thus utilised are buried up to their trunnions. Leading out of Piccadilly is Sackville Street, supposed to be 'the only street in London without a lamp-post.' This seems a hard saying, but it is true that there are no lamp-posts there, because, although the street is lighted, the lamps are all bracketed out from the walls of the houses.

London has among its other innumerable curios two unique tavern signs. The first is that of an otherwise quite unremarkable public-house in Oxford Street, near Bond Street—the 'Green Man and Still.' There are, of course, many 'Green Man' signs all over the country, but there is only one 'Green Man and Still,' once literally translated by a Frenchman who had never heard of such a thing as a 'still' into '*L'Homme Vert et Tranquil.*' The other sign is the 'Running Footman,' a little house on Hay Hill, at the back of Berkeley Square. The old picture-sign displays a gaily uniformed man running, with a wand of office in his hand. The inscription beneath declares, 'I am the only Running Footman.' This is a reminiscence of the middle of the eighteenth century, when it

was as much the 'correct thing' for noble families to maintain a 'running footman' to precede them on their journeys as it was for their Dalmatian dogs to trot beneath their carriages. Those 'plum-pudding dogs,' as they were called, from their black-and-white-spotted coats, disappeared as escorts about fifty years ago; but the race of running footmen became extinct half a century earlier. 'Old Q,' the reprobate Duke of Queensberry, who lived in Piccadilly, is supposed to have been the last person to employ a running footman.

Piccadilly suggests something that many Londoners never notice—the distinct dip and rise in it, very remarkable in a London thoroughfare. What is the cause of this feature? It marks where the old Tyburn stream crossed on its way to the Thames. That stream, long since for the most part thrust underground in pipes and mains, rose in the north, in St John's Wood, and crossed Oxford Street by Stratford Place, where there is a similar dip in the roadway (where the 'street-ford' used to be). Marylebone Lane, hard by, a singularly tortuous thoroughfare, owes its windings to having been originally a country lane beside the meandering Tyburn stream.

The Westbourne stream, once crossing the Bayswater Road, was finally diverted into a sewer in 1834. This presented an engineering problem when the District Railway was made and Sloane Square station was built. Frequenters of that station will notice a very large iron pipe running obliquely beneath the roof, and forming an extremely prominent and ugly feature. It is the main in which the unfortunate Westbourne is piped.

The region of Pall Mall is Crown property, but there is in that stately thoroughfare one plot of freehold. How it came to be such is an interesting story. On it in the seventeenth century stood a house in which resided the famous Nell Gwynne. It had a garden which then ran back to the Mall of St James's Park, and over the garden wall Mistress Nelly leaned to converse with her royal lover, Charles II., just as pictured in Ward's painting, which is based on a passage in Evelyn's Diary.

Charles, thinking himself to be generous, handed her, as a present, a Crown lease of house and garden; but this did not suffice the lady, who threw it back at him, demanding a freehold —and a freehold she obtained. The modern building of the Eagle Insurance Company stands to-day on that site.

There are many quaint and interesting things about 'the old Court suburb,' the present 'Royal Borough of Kensington,' so called because Queen Victoria was born in Kensington Palace; but we must here be content with one. The visitor who enters the reading-room of the public library in High Street will find on the wall, in a glass case, an old flint-lock blunderbuss, to which belongs a curious history. For many years it was the custom for a watchman to patrol the grounds of the neighbouring Holland House at night with this weapon. At last a night came when he forgot to load it, and that night he was attacked, and being unable to defend himself, he was murdered. His successors were strictly enjoined to fire off the gun every night in front of the mansion at eleven o'clock, and to reload. Thence arose the custom, well remembered by some of the older residents, of nightly discharging the firearm. It was not finally discontinued until 1874.

AN IMMORTAL VAGABOND.

By Arthur L. Hayward.

I.

THE great and noble family of Harlequin had for many years been tumbling and rioting on the Italian stage when, on 7th November 1608, was born Tiberio Fiorelli, one day to be the greatest of Scaramouches. Turned into the streets of Naples in early youth, he and his brother Trapolin soon picked up the dissolute ways and ragamuffin ideas of that most ragamuffin of cities. With the art and training thus acquired in the gutter, Tiberio Fiorelli went out into the world and became a successful vagabond.

Of the first portion of his amazing career the narrative is apocryphal. Young Tiberio, we are told, lost his mother at a very early age, and from that event his wanderings may be said to have begun. His father, a hot-tempered captain in the Neapolitan cavalry, vainly seeking a dispensation to marry his cousin, a union within the proscribed degrees of affinity, lost his temper with one of those responsible for the refusal, and ran him through with his sword. As his victim was no less a person than the bishop's brother, nothing was left for the captain but immediate flight, and having no other belongings besides his two children, he forthwith vanished from the world of Naples.

Even at that tender age Tiberio possessed the more than hearty appetite and the exceedingly expensive appreciation of good things which characterised his long life. The family finances demanded a strict rationing, a state of affairs insupportable to such a lad. Money had to be made somehow, so he conceived the notion of stealing drugs, which his father was at that time selling, and disposing of them on his own account at half the price his father charged. Such a

trade soon thrived, and Tiberio was at the height of his success, having no expenses and making all pure profit, when his father discovered the deficit and gave him a well-merited kick out into the world. So it came about that in the winter of 1626 the promising youth, eighteen years of age, found himself, penniless and famishing, wandering in the direction of Rome.

The glories of the Eternal City appeal but little to a hungry man. Shivering in the icy wind which so often shrieks round the corners of the Roman streets in winter, Tiberio was gazing disconsolately about one day when a snuff-box was suddenly thrust in front of him. At the pressing invitation of a well-to-do citizen Tiberio took a pinch, and in doing so conceived an idea which might make him rich. Taking up his pitch outside a tobacconist's shop, he accosted every customer who issued. It was 'Captain' to each soldier, 'Your Reverence' to every monk, and any shopkeeper's wife became 'Most noble lady.' With outstretched finger and thumb—nay, rather, with all four fingers and thumb—this cunning lad helped himself from every proffered snuff-box. In this way he soon filled a large empty pocket in his jacket. By the time evening fell he had collected a wonderful mixture of snuffs of every description and quality, for which he found a ready market under the name of *Tabacco a mille fiori.*

He had been driving this trade for some days, when one morning a burly Swiss, one of the Pope's guard, from whom Tiberio had begged the customary pinch, became so enraged at seeing a whole hand thrust into his snuff-box that he seized the young man firmly by the shoulders, shook him like a rat, and concluded with a mighty kick that carried Tiberio well on his way toward Civitavecchia.

Once again penniless, Tiberio was wandering along the quays of that seaport one day, when he espied two coloured slaves huddled together, passing coins from hand to hand. This was too much for the Neapolitan. That unbelievers should possess what he so sorely lacked offended all this worthy fellow's sense of propriety. It was a state of affairs which could not be allowed to continue. His unfailing wits came to his aid in a flash. Unobserved by the absorbed couple, he snatched away the piece of rag in which they had been carrying their money and quickly substituted for it the tail of his shirt, which he had ripped off for the purpose. Then he awaited the development of the plot.

As he had expected, no sooner was the counting finished than the slaves rolled the coins up in what they imagined to be their rag, and began to hurry away. Immediately Tiberio raised a hue and cry. Who so aggrieved as he? Robbed, cheated—indeed, nearly murdered—by the two black villains who had torn the very shirt from his back to get away with their booty! Was it not scandalous? Hard that a man could not take his siesta in a sunny corner without being robbed of every penny by a couple of rascally slaves! Burning with a sense of his wrongs, Tiberio declaimed so passionately before the magistrate that the slaves, after surrendering all their money to Tiberio, were flogged within an inch of their lives; whilst that scamp, in a very short time, was on his way to Ancona, richly dressed as a gentleman of fashion, and accompanied by a servant, as befitted his new condition.

II.

Tiberio was now in the happy position of being able to eat as much as he wanted. At the first good inn they came to, he took the opportunity of ordering such a feast as hitherto he had but eaten in his happiest dreams. The best of the whole country-side, both in food and in wine, was placed before him, and when, at last, thoroughly replete and more than half-drunk, he rolled to his bed, he began to set up such a snoring that the whole inn was kept awake.

Indignant at losing a night's repose, Tiberio's servant softly arose, crept into his sleeping master's room, and emptied his pockets of everything of value. He then donned the stylish attire, unostentatiously made his exit from the inn, and quitted the town in search of rest and quiet!

Now, if Tiberio asleep was noisy, conceive of the hubbub and din of Tiberio awake when his loss was discovered! Amazed, stupefied by the uproar in the chamber above, the landlord dashed upstairs, to find his honoured guest naked and penniless. What was far more serious, he owed the bill for a dinner which four cardinals might have been proud to eat.

Finding his house more like to become a bedlam than an inn, the worthy host forgave Tiberio his bill—indeed, he could hardly do otherwise—clapped a few rags on his back, and packed him off as expeditiously as could be. Weeping at such generosity, and covertly slipping, by way of souvenir, a handsome silver tankard into his pocket, Tiberio took the road to Fano, where he soon converted his spoil into a decent suit of clothes.

A troupe of wandering players now attracted his attention. He knew absolutely nothing of acting, but with all the assurance in the world he announced himself as a well-known comedian, ready to take on any part that might be required of him. His first appearance was in a harlequinade called *La Festa di Pietro.* Tiberio chose this on account of the huge meal which is served up during the course of the play, and which the actors have to eat.

Needless to say, his success at this was great. The villagers flocked from distant parts to see him put away with placid content a mighty turkey, a brace of partridges, and an enormous

pigeon-pie! The little troupe had never made so much money before, and, emboldened by their success, they moved from Fano to Mantua, where the young duke conceived a violent admiration for Tiberio, whom he loaded with favours and gifts. The wily rascal was now in his element. He could eat well, he could dress well, and numberless opportunities arose for that type of swindling which appealed to him so strongly, and in which he was so proficient.

Upon one occasion he borrowed from the duke a magnificent black cloak, embroidered with pearls of the finest water. This was for use on the stage, and Tiberio duly made his appearance in the priceless garment. Immediately one of his brother-actors began a prearranged gag.

'Some great and illustrious prince must have lent you that splendid cloak,' said he.

'What do you mean by saying "lent"?' demanded Tiberio. 'Do you think our prince is a miserable old-clothes dealer? If you were to say a great prince *gave* it to me, you would be nearer the mark.'

The hint was not lost upon the duke, who laughed immoderately, and never asked for the return of his cloak.

By such cheery rascalities Tiberio made his sojourn at Mantua pleasant and profitable. When his ineradicable wandering instinct led him once more to the road, it was with sincere regret that the duke bade him farewell.

III.

Tiberio Fiorelli struck Bologna during Lent when all the theatres were closed. Having nothing better to do, he occupied his time with gallantries. His methods of courting, however, did not accord with the notions of propriety encouraged in that town, and an unfortunate fracas with the authorities ensued, in which he came off second best. Determined to be avenged on his enemy, the city prefect, Tiberio took the opportunity of a ceremony at the Cathedral, at which this dignitary was present, to creep up behind him and cut off the valuable silver buttons which adorned his coat of office.

The whole town was thrown into a ferment when the prefect discovered the indignity to which he had been subjected. The thief and the buttons were sought high and low. The scamp had not completed his vengeance, however; he had the buttons, but he meant to have the coat as well. During the height of the excitement be presented himself with typical impudence at the prefect's house. Announcing the news that the buttons had been found, and representing himself as a tailor sent to sew them on, he soon persuaded the housekeeper to deliver the coat itself into his keeping!

Concluding that a longer stay in Bologna would undermine his health, Tiberio took his departure for Florence that same evening. His stay in that city was profitable, but of short duration. Posing as a musician, he entertained the grand-duke with a selection of remarkable songs of his own composing, in which the braying of asses, the lowing of oxen, sundry caterwaulings, and other originalities made up for a total lack of any musical beauty. The grand-duke was so delighted, however, that he gave him a well-filled purse and many letters of introduction to other Italian potentates. Thus furnished, Fiorelli lost no time in setting off for Leghorn.

A curious adventure, which our rascal-errant did not fail to turn to his own advantage, occurred on his way to Leghorn. Two Jews, Aaron and Mordecai by name, were thither bound in the same party. To them Fiorelli introduced himself as a Portuguese, the son of a Lisbon merchant who posed as a Christian, though secretly practising the Jewish faith. The sole object of this earnest young man's journey to Leghorn was to be received into the Hebrew Church. Aaron and Mordecai were deeply moved at such singular devotion. Acting upon their advice, Tiberio adopted the name of Benjamin, and was thus introduced to the Jewish community of Leghorn, where he took up his abode, free of charge, in Aaron's house. At Leghorn he lived on the fat of the land until he perceived that his welcome had lost much of its cordiality. Moreover, whole days were passed in lengthy discussions on religious subjects which were of little interest to Tiberio. So it was with great pleasure that he learned one night that a boat was about to sail for Naples.

He had no difficulty in evolving a plan for robbing his benefactors before his departure. Presenting himself before the Chief Inquisitor, a man of great power who asked for nothing better than the handling of a case against the Jews, Fiorelli denounced Aaron and Mordecai as usurers and thieves who had threatened him with dire torture unless he abjured his baptismal faith and became a Jew. Such an opportunity was not to be lost. The couple were summoned before the Inquisitor, who would listen to nothing they might say in their own defence. After much bullying, they were finally ordered to restore to their Benjamin a quantity of baggage he professed to be his property, as well as to pay him a considerable sum of money which, he asserted, he had given Aaron when in his house. Thus set up in fortune, Tiberio triumphantly embarked, and was soon speeding before a fair wind to Naples.

The voyage gave him an opening for another piece of knavery. Seeing an elderly priest on board who was fingering a magnificent gold crucifix, the rascal adopted the rôle of a devout pilgrim who had hoped, by a visit to the shrine of St Anthony of Padua, to cure himself of fits of diabolical possession. He explained that only a gold crucifix hung about

his neck would avert the visits of the evil spirit, and easily persuaded the credulous old man to lend him the charm for the voyage. By slyly disembarking before any of the other passengers, Tiberio ensured himself against returns of the malignant spirit by retaining possession of so valuable a talisman.

IV.

At Naples, Tiberio made his appearance as a man of fashion with a fine carriage, rich dresses, and all that a golden crucifix can buy! He denied himself nothing so long as his money lasted, and when that was finished he found a troupe of comedians who received him with open arms. Engaged by the Duke of Satriano to perform before his guests, the knave turned the event to his own advantage, as usual, and, unobserved by the duke, secured a couple of handsome silver candlesticks. But this ducal party was his undoing. Whilst rehearsing one of his parts in a secluded portion of the duke's gardens, Tiberio perceived a face watching him intently from behind a shrub, and the next moment found himself in the clutches of the infuriated old priest from whom he had stolen the crucifix. Cries of 'Stop thief!' soon brought a crowd of the duke's retainers to the scene, and that same night saw Tiberio on board a vessel bound for Malta.

He was not, however, destined to pursue his adventures in that island. On the voyage he embroiled himself with the captain of the boat in a fierce quarrel for the favours of one of the lady passengers, and being a man of deeds, Captain Peresso got rid of his rival very simply by marooning him on the rocks of Sicily. After many tribulations the wanderer made his way to Palermo, where he was glad to enter the service of a famous actress, becoming her lackey, and occasionally being allowed to perform the insignificant part of Scaramouche in her troupe.

Tiberio was now twenty-five years of age. He could eat as much as four ordinary men, and drink them under the table. He was a wit, too, and was welcome at every *festa* and party his friends might give. This popularity of his led to a serious adventure with a happy ending.

A laundress of his acquaintance invited him to the wedding of her daughter. After the ceremony the party grew very merry, and none was so full of life or so boisterous as Tiberio. The warm Southern sun bathed the whole scene in joy—the lawn beneath the trees, the blue bay shimmering below, and the sparkling eyes of the Neapolitan girls as they danced and sang. One of them was an especial beauty. Every swain, including, it is whispered, the bridegroom, strove to win a flash of Marinetta's bright eyes or lead her in the tarantella. The sun, the music, the rhythm of the dance, and the touch of Marinetta's hand in his were too much for Tiberio, whose heart was aflame with wine and love. As they whirled about he suddenly stooped, clasped the girl in his arms, and kissed her passionately. The company were horrified and scandalised. The festivities stopped as at the fall of a thunderbolt. The decencies of the South were shocked. Old folks put their heads together; the matter was too serious to be passed over. Marinetta's good name had been compromised, and there was but one way out of the difficulty—she must become Tiberio's wife without delay. And so it was not long before another wedding took place, and Tiberio took away his lovely Marinetta, to whom, to do him justice, he proved a faithful and loving husband.

Upon his marriage Fiorelli left the actress's service, and having saved a little money, took his wife to Rome, where he opened a small show with wonderful success.

Cardinal Chigi stood sponsor for their first son, and it may well be imagined that Tiberio expected and extorted munificence worthy of so exalted a god-parent. But with his rising fortunes many of the old rascal tricks were abandoned, and this knave-errant now earned his living by means honest enough according to his own standards.

V.

From Rome to Milan, Parma, and Vienna Tiberio and his wife went wandering, courted by princes and flattered by the people wherever they stopped. But the splendour of the Court of Louis XIII. was lure enough for any actor with personality, and it was to Paris that the couple wended their way in 1640. The journey there was marked by a truly scaramouchian adventure. Whilst crossing the Mont Cenis, they found themselves benighted in the Inn of the Grande Croix, which in those days contained but a single guestroom, in which was one bed. This was already occupied by two bagmen. To Marinetta's disgust, she and her husband were allotted two heaps of straw. Unperturbed, Tiberio made ready to undress. 'But first pass me the soap,' said he in a loud voice. 'I want to soften the noose on this halter. I have got a man to hang to-morrow, and I cannot, in all conscience, add to his agony by using a hard rope.'

Marinetta thought he had gone mad, but not so the two bagmen. Awakened by his loud tones, and thinking they had to do with the hangman—maybe their consciences were none too clear—they quietly slipped from the bed and out of the house, leaving the faithful couple to pass a night of comfortable repose.

Our comedian made his début before Louis in character, with his dog, his guitar, and his parrot, and immediately won the royal heart. He soon became a favourite with the queen-mother, who used to call him in to amuse the little dauphin, hereafter to be Tiberio's true patron and friend—Louis XIV. No attention was too great to bestow upon him, and at no time in future

years was the royal condescension lacking. Tiberio's troubles were now over and wealth was his, ungained by knavery. His position was assured, and he became the idol of high and low. Henceforward the historian of his career is on surest ground.

Tiberio is described at this period as being tall and slim, short-sighted, and slightly hump-backed. He was a great eater, and yet possessed remarkable agility. But his greatest asset, and the cause of all his fame as Scaramouche, was a marvellous talent for posturing and making grimaces capable of expressing any human sentiment. Without uttering a syllable he would keep his audience in a state of suspense, sometimes exhibiting the living picture of a panic-stricken man, at other times portraying the feelings of an angry, jealous lover.

The rôle very frequently played with such success by Tiberio Fiorelli was that of the braggart, fire-eating captain who uttered most dreadful threats against absent foes, but shuddered at the sight of a drawn sword. Dressed from head to foot in black, a fearful man he was, brimming over with fierce oaths and blood-curdling speeches—until Harlequin would come along, and with a crack of his wooden sword send Scaramouche sneaking round the nearest corner. In one of his scenes Scaramouche is discovered tidying up a room, having done which, he sits down and plays a tune on his guitar. He is thus occupied when Pasquariello creeps up behind and gently beats time to the melody on Scaramouche's shoulder. This throws him into such paroxysms of terror that, without uttering a word, he keeps the audience spell-bound or throws them into shrieks of laughter.

Molière himself took lessons in the art of depicting by facial expression the passions animating the soul. His troupe and that of the Italian Comedy acted at the Court on alternate nights, and it is said that Molière never missed a single performance of Scaramouche.

Such was the favour now enjoyed by Tiberio that Anne of Austria, Queen Regent of France, and Cardinal Mazarin stood sponsors for one of his children in 1644, and each of his other sons had noble god-parents.

After some time Marinetta left her husband and returned to Italy, to which Scaramouche paid frequent visits. On his last visit he was absent seven years, not returning to France until after his wife's death.

VI.

A few years later Tiberio began to look for another wife, and his choice falling upon a young girl, daughter of a well-to-do baker, he began to press his suit. His attentions were not, however, acceptable; yet not until he had been the victim of a severe practical joke, in the course of which he was shut up in a flour-bin for two days, did Tiberio realise the hopelessness of his suit and leave the girl alone.

At the age of eighty-three he decided to quit the stage and pass his few remaining years in retirement. He was as active and agile as ever, one of his favourite tricks even at that advanced age being to box Pasquariello's ears with his heels! Nor did he consider himself too old to play the part of bridegroom, for, octogenarian though he was, he married a girl named Marie Duval. Little happiness attended this union, however, and before long, tormented by jealousy, and with a cruelty best left undescribed, he put his bride away in the Châtelet prison, where she presently died.

Of such a sound constitution was Tiberio that up to the age of eighty-six he had never had the slightest ailment. Death, however, could not be kept waiting longer, and Scaramouche met his new acquaintance with all his wonted originality. One day, as life was fast on the ebb, he demanded one of the favourite dishes of his long-past youth, a great plate of vermicelli and Parmesan cheese. The doctor warned him that he might yet live another week if he would deny himself the delicacy. 'Well, well!' said Scaramouche, 'a week more or less means little to a man of my age, and is certainly worth less than a dish of vermicelli. So prepare it at once, and send for a priest.'

Having made a good confession and recommended his soul to his Maker, he ate the vermicelli with the utmost gusto and drank deeply. At two o'clock in the morning, being unable to sleep, he called a couple of lads and challenged them to a game of cards. After a while he threw down the cards, bidding the boys continue their game, but not disturb him in his prayers. A few moments later, mumbling the closing words of the *Pater Noster*, he fell back dead.

For over fifty years Tiberio Fiorelli had been the life of the Italian Comedy in Paris. By his sole genius he had given the rôle of Scaramouche an entirely new character, raising it to a permanent place in the immortal family of Harlequin. Molière was well justified in writing as he did beneath Tiberio's portrait:

Cet illustre comédien
Atteignit de son art l'agréable manière;
Il fut le maître de Molière
Et la Nature fut le sien.

THE MONTH: SCIENCE AND ARTS.

FERRO-CONCRETE FLAG-STAFF.

ALMOST every one must be familiar with ferro-concrete posts for fences and gates, while where piles are used for piers and similar structures this material is now preferred to wood. At the same time, it is rather startling to hear of ferro-concrete being used for a flag-staff, yet this has been done successfully at the Ancon Hospital in the Panamá Canal Zone. Moreover, the size of the staff is no greater than that of a wooden one of equal height—eighty feet—the pole tapering from seventeen inches in diameter at the bottom to eight and a half inches at the top. This flag-staff was not made on the ground and raised into a vertical position, but was cast in place, the moulds being carried by a light wooden tower. Eight square steel bars, equally spaced just below the surface, form the reinforcement, these bars being tapered from one and a quarter inches at the bottom to half an inch at the top, and held together at intervals by steel rings. The staff is sunk ten feet into the ground, and was smoothed over with 'neat' cement after the moulds had been removed.

ARCHED HOUSES WITHOUT ROOFS.

All manner of suggestions are being put forward with a view to the production of cheap houses, one of the most interesting and promising having been made recently by Mr Albert C. Freeman, after studying a description of the catenarian arch to be seen supporting the lantern of the church of St Geneviève in Paris. The main feature of Mr Freeman's system is the elimination of the roof by curving the front and back walls towards each other until they meet at the top. Only at the bottom are these walls vertical as they begin curving inward just above the ground, the resulting contour being very similar to a section of the business end of a shell with the point well rounded off. The end-walls are, of course, vertical. This form of construction demands dormer windows and doors in the side-walls, but owing to the steepness of the curve the windows do not project nearly so much as from an ordinary roof. Special concrete blocks, reinforced with steel and made with a patented machine, are used for the walls, the blocks, which have a recess two and a half inches deep all round, being set in cement with expanded metal between them. The blunt apex of the structure is covered with curved blocks. Owing to the hollow end-walls and the air-chambers in the blocks for the curved walls, houses built on this system should be warm in winter and cool in summer; while, needless to say, they are sure to be dry. The cost of construction is said to be 30 per cent. less than that of brick houses with roofs.

A NEW PUSH-BIKE MOTOR.

Several attempts have been made during the last decade to produce a motor that can be successfully applied to the ordinary push-bike. One of the most recent and satisfactory is the Simplex Power Unit, which consists of a single-cylinder two-stroke horizontal engine, capable of developing one horse-power. This unit is mounted in the same position as a luggage-carrier, but, of course, the framing is very much stronger to carry the additional weight, which reaches twenty-three pounds. The motor drives the back-wheel by a chain which takes on to an extra chain wheel, mounted upon five special tubular spokes attached to the rim of the back-wheel at the side opposite to the pinion for the foot-power chain. Lubrication is effected by mixing a small proportion of lubricating oil with the petrol—a plan which is commonly followed for outboard marine motors. The petrol-tank holds half-a-gallon, which is said to be enough to propel bicycle and rider for ninety miles. With a rider weighing ten stone, a speed of twenty miles per hour is attainable on the level, with an average of fifteen miles per hour; while the cycle will ascend an incline of one in ten without assistance from the pedals. The only levers needed to control this motor are one connected to a decompressor and clutch, and the usual ignition and throttle controls. Ignition is provided by a magneto embodied in the engine.

HUGE ORE-LOADING PLANT.

What is claimed to be the largest ore-loading staith in the world was opened at Duluth, U.S.A., on 1st May. When its construction was begun the site was enclosed with steel sheet piling and pumped out dry, being afterwards partially filled with sand. Then a concrete slab was poured in, embedding the ends of the piles to a depth of nine inches. The storage accommodation consists of huge bunkers, each capable of holding 6540 cubic feet of ore, or the contents of eight standard fifty-ton ore-cars. According to the *Scientific American*, the total storage capacity is 153,600 tons, and 29,600 tons of steel were used in the construction of the bunkers and the loading-shoots. The staith measures 2438 feet in length, and two of the world's largest ships can berth at each side of it.

WATER-JETS SINK CONCRETE PILES.

Piles constructed of concrete, reinforced with steel bars, have (as indicated above) been used for many years, in preference to those of wood, for piers, quays, bridges, and other structures needing this form of support. Until recently such piles were driven by a steam pile-driver, which entailed steel points and special hoods

for the top ends to withstand the blows of the driver. A method of sinking concrete piles has now been devised whereby they are lowered down to their correct level without a blow being struck or any pressure being exerted by them other than that due to their weight. Passing through the middle of each pile from end to end is a four-inch steel pipe, projecting a few inches at the top, and terminating at the bottom in a coned casting with a two-inch outlet. A T-piece is fitted to the top of this pipe, and a two-inch pipe is passed through the T and down to the bottom, where a collar on the end of it jams in the coned casting. Water at pressures up to 200 pounds to the square inch can be passed into the small pipe, and, independently, into the larger one through the side of the T. At intervals along the lower part of the pile small cross-pipes lead from the larger pipe to the four sides, and where these emerge the ends are turned upwards. When a pile is to be sunk, it is simply lowered into the mud or to the ground by its own weight, and the water blows away the soil at the bottom end, allowing the pile to sink gently to the correct level. The process is facilitated by water from the cross-pipes, which helps to drive the soil upwards, while forming a lubricant for the sides. Once the water is turned off, the loose ground settles round the pipe and holds it as firmly as if it had been sunk with a pile-driver; in fact, piles sixteen inches square, sunk forty-eight feet into sand and clay on this system, have carried loads up to 100,000 pounds each. Where obstructions are likely to be encountered the points of the piles are protected by steel shoes, and the piles can be lifted and allowed to fall until buried objects are broken up or forced aside. Experiments show this method of sinking piles to be successful in all kinds of loose soils, either under water or on dry land.

A CLEAN, SILENT, AND EFFICIENT OIL-STOVE.

A great many houses in this country are still beyond the reach of public gas-mains, and although the larger country-houses have their own supplies of gas or electricity, the smaller householder has to content himself with oil-stoves to supplement coal for heating and cooking. Until the advent of the stove we are about to describe, no very satisfactory oil-burner for cooking and heating had been produced. Many types are feeble and dirty; and nine women out of ten cannot or will not use oil-stoves which have to be started by methylated spirit and pumped up to a high pressure of air. At the recent Shipping Exhibition, a number of oil-stoves known as the 'Valor Perfection' were shown. These stoves have circular wicks which give a very powerful blue flame, and they can be lit at once without any preparation or pumping. Although this type of stove is not new, it is not so well known as it might be, and some of the models and accessories exhibited are of recent origin. One of the stoves, for instance, has a single burner, and is similar in size and form to a Primus. A useful griller was to be seen, in which chops, steaks, or birds can be easily cooked over one burner. These stoves are made with ovens, and have one, two, three, or four burners. A device having three burners with a heater above them is used in conjunction with a circulating cistern for producing hot water for baths. One advantageous feature of the stove is the glass container, in which the level of the oil can always be seen.

NOVEL SHIP-SALVAGE DEVICES.

All the large ships sunk by German submarines during the war were built of steel, which, of course, corrodes quickly in sea-water. These vessels, however, have not deteriorated from this cause to the extent that might have been expected, and, owing to the high cost of building, most of them are well worth raising even at a heavy cost. Many methods of salvage for wrecks have been put forward by inventors, some of which have been described in these notes. One promising plan that has already proved successful consists in lashing collapsible pontoons to the sunken ship, and then pumping them full of air. Pontoons of this description have been made by Messrs Vickers Ltd., of Barrow-in-Furness, the material used for the covers being a special canvas. Although the weight of each pontoon is only one ton, when inflated it has a lifting-power of 100 tons. Two of these pontoons were recently attached to the stern of the s.s. *Main*, which was sunk by a U-boat in Luce Bay, off the Wigtownshire coast. They were pumped full of air by a compressor on a tug, and successfully raised the sunken steamer so that it could be beached, preparatory to being pumped out. Experience gained during this operation showed that the canvas pontoons were capable of withstanding a great deal of rough usage, and it is thought that similar bags can be made with lifting capacities up to 300, or even 500, tons. The latter size is large enough, if a number were used, to lift such vessels as the *Lusitania;* in fact, any sunken ship which divers can reach and secure to pontoons can be raised by such means. Another interesting scheme which was put in hand by the Admiralty before the end of the war depends for its lifting-power upon two enormous concrete pontoons having towers reaching to a height of 125 feet above sea-level. These salvage-vessels have been built on the beach at Southwick, near Brighton, where they gave rise to much conjecture until their purpose was made known after the Armistice had been signed. Likened by the *Scientific American* to huge wedding-cakes, they measure 180 feet in length, and consist of superimposed hexagonal stages. Hollow blocks of concrete

four feet square and two feet deep constitute the building units, and each pontoon is built in four storeys, the upper ones being stepped back, thus giving the appearance of a stepped pyramid. The concrete blocks are so arranged as to give a saw-tooth surface to the periphery of each storey. Surmounting the fourth storey is a hollow cylindrical tower, thirty feet in diameter and sixty-five feet in height. At the summit of this tower is a platform nineteen feet wide, supported by twelve columns. As already stated, these vessels were built on the beach, and holes were left in the sides of the bottom storey so that the tide could run in and out of them until they were completed and ready for floating, when the holes were stopped up and the vessels floated off to take up their duties. These salvage-craft are each fitted with numerous powerful winches, and when a sunken ship is to be raised they are floated over it, one on each side, and huge steel cables are either passed under the wreck or attached to it. At low-water the ends of the cables are wound in by the aforesaid winches; whilst, if necessary, the salvage-pontoons can be partly filled with water and sunk to a considerable depth, thus allowing the cables to be taken up still farther. As the tide rises the pontoons and the sunken ship all rise together, whilst a farther lift can be obtained by pumping the water out of the pontoons. At high water the three vessels are towed into shallower water, where the wreck is grounded and the process is repeated, until the hull is exposed at low tide and can be pumped out. Naturally, when the pull of the cables comes upon the salvage-pontoons, they will list over towards the wreck unless means are taken to counterbalance the weight of the vessel. This can be done by admitting water to certain chambers on the outer sides of the pontoons. In order to raise sunken ships in deeper water, it is proposed to haul loops of wire rope under the wreck by tugs, the ends of the ropes being subsequently wound up on the winches of the salvage-pontoons. This system should be practicable for sunken ships lying on sand or mud, although no doubt powerful tugs will be needed to haul the ropes into position. Means are provided for completely submerging the salvage-pontoons, if found desirable, so that they can be sunk down to any depth their hulls are strong enough to withstand. The powerful machinery needed for pumping the water out of them is carried in auxiliary craft.

BLOCKHOUSES FOR BANKS.

So common has the robbery of banks become in the suburbs of Chicago that in one establishment a steel blockhouse has been installed which commands every part of the banking-room, while loopholes facing on the street allow of firing at escaping thieves. The sides of the structure are of sufficient thickness to protect the occupants against bullets from small-arms or rifles, and narrow slits are provided through which observations can be made and the guns fired. A guard is maintained in the blockhouse both by night and by day.

FELLED TREES STOP RIVER EROSION.

Serious as are the losses of land by the erosion of the sea, it is doubtful whether they equal those resulting from the wearing away of their banks by the big rivers of the world. This action has been particularly pronounced with the Mississippi and the Missouri, and bank-protection works are a constant source of expense to the states and the landowners along their courses. A new method of protection has been recently put into operation which depends for its effectiveness upon the hollow piles described in a previous note. These were invented by Edward Bignell of Lincoln, U.S.A., who, as superintendent of a division of the Burlington Railroad, was 'up against' the problem of sinking piles to greater depths than they could be driven by blows on the head. Early last year the railroad-shops opposite Omaha were threatened by the Missouri, and, after other schemes had failed, Bignell piles were adopted in conjunction with felled trees (having all their branches left on), which were moored along the sides of the river. Steel collars, to which are attached chain cables, are fixed to the heads of the piles, which are sunk down level with the river-bed. The trees are attached to the cables and float in the current, which carries large quantities of sand in suspension, and runs, when unobstructed, at a rate of some eight miles an hour. If slowed down by the trees, however, the water deposits its sand where desired in the form of bars, which protect the banks and confine the river within safe limits. Ordinary cotton-wood trees are used, with trunks averaging a foot in diameter, and as many as 160 may be attached to one pile. This kind of protection has shown itself to be proof against floods and ice, which are often destructive to other types of protective works. In one case erosion was entirely stopped although twenty acres of bank had been cut away in thirty days previous to the sinking of the piles.

To Correspondents who wish fuller information regarding new inventions, publications, &c. mentioned here, addresses will be furnished, when possible, provided a stamped and addressed envelope or post-card be sent to the Editor, 339 High Street, Edinburgh.

*** TO CONTRIBUTORS.

1st. All communications should be addressed to 'The Editor, *Chambers's Journal*, 339 High Street, Edinburgh.'

2nd. For its return in case of ineligibility, postage-stamps should accompany every manuscript.

3rd. To secure their safe return if ineligible, ALL MANUSCRIPTS, whether accompanied by a letter of advice or otherwise, *should have the writer's Name and Address written upon them* IN FULL.

4th. Poetical contributions should invariably be accompanied by a stamped and directed envelope.

MERRIE GENTLEMEN.

By ARTHUR BEVERLEY BAXTER,

Author of *The Blower of Bubbles, The Airy Prince,* &c.

I.

IF you could find the village of Windbridge (which is very difficult, as it hides itself at the bottom of a hill, well off the main road that crosses the downs at a certain part of the English south-east coast), you would see the identical cottage where Dr Jellybud looked from his window at the beginning of this history.

For more years than most people could remember he had lived there, and every day he looked out of the window on rising, because he was a jovial, round-bellied old boy who was glad to see the morning; and if the sun has any sympathy in its nature at all, it must have had hard work to keep from coming out and smiling back at the jolly, red-faced doctor.

'Octavius,' cried his sister from below, 'breakfast is ready.'

'Coming, my dear; coming at once,' cried the doctor, immersing his face in a basin of cold water.

That was a harmless lie which, I am sure, never grew any blacker for repetition. He always *was* late for breakfast, and never did come 'at once;' but then, if he had, there would have been no necessity for his rubbing his hands, and making all sorts of genial excuses, and generally starting the day (as it should be started) as if life were a very pleasant thing altogether, and breakfast one of the pleasantest things in life.

The doctor had never married, which was strange too, for in that part of the country there wasn't a keener eye than his for a dimpled cheek or a pretty ankle. . . . But, then, possibly he liked so many dimples and admired such regiments of pretty ankles that he couldn't concentrate on any one set of them.

Yet it should be recorded that sometimes, when he used to sit by the fire and drink punch with Jacob Funnle, the county magistrate, who was given to amateur theatricals—it was a well-known fact that Funnle's Othello was far better than anything on the London stage—and who used to scare prisoners speechless by his manner when he tried them, Dr Jellybud would grow a little melancholy. On such occasions it was his habit to confess to an early and fruitless attachment to a 'splendid creature' with ten thousand a year in her own right, who had been cruel enough to hand over the care of her splendid self and the ten thousand a year to an ensign in the —th Bloodandthunderers, who owned the finest moustaches, the best legs, and the thickest head in London.

As this tale never failed to produce a state of abject sentimentality in both of them, old Funnle would propose, 'Women, lovely women—God bless 'em;' and, as any gentleman would, they always did full justice to the toast, bracing up surprisingly after it. In fact, more than once these evenings had ended with a chorus descriptive of the joys of bachelorhood, sung with a

heartiness that made it difficult to realise that one was a blighted lover and the other a lonely widower.

The doctor was the eighth child of a teacher in a poor little Cornish school, and by dint of much economy he had been sent to London, where, after several years in a hospital, he was duly proclaimed a competent member of the medical profession. The superbly moustached ensign having bludgeoned his matrimonial chances, Jellybud took over the practice of Dr Swiggins, who had looked after the health of all Windbridge for fifty years, and who, finally taking sick, had made the mistake of trying one of his own remedies, with the result that his place of residence changed to the cemetery, and his practice, as aforesaid, passed to Dr Jellybud.

As this was when Octavius was in his early thirties, his favourite sister, Regina, had come to keep house for him—just until he was married.

Thirty years passed by, and the pretty little sister with the cheeks like roses grew to be a sweet-countenanced woman with fading flowers in her face, but with a gentle kindliness that is a far more lasting and beautiful thing than roses, which must die with the passing of summer. The world is full of such women, offering their sympathy and understanding, and never asking any other reward than the knowledge that some load has been made a little lighter for their ministering.

So when this story opens his sister was still keeping house for the doctor, though it was a great joke between them that some day he would bring home a blushing young bride. And in return he would accuse Regina of designs on Jacob Funnle.

Altogether they were a very happy pair; and even if the old doctor never knew very much about medicine, and had forgotten most of the little he had learned, he did a tremendous amount of good by his cheeriness. In fact, as he used to drive through the village with his black bag in full view, Windbridge wouldn't have exchanged its family doctor for all the brains of Harley Street.

II.

'Well, my dear,' said Dr Jellybud, entering the dining-room with his face still glowing from recent ablutions, 'that's a very cosy fire. Sorry I am late. Damme! I'm always late—shouldn't wonder, you know, if I wasn't really intended for the seventh child, but consequence of being late they had to leave me till the eighth. I tell you that's good porridge, ain't it? Eat lots of oatmeal, sleep with your window open, keep cheerful, and half the doctors and undertakers would go bankrupt in a year.'

'It looks like rain, Octavius.'

'Should be snow this time of year.'

'I think there's a storm coming on. Do you have to go out to-day? You know, you're not so young as you were.'

'Yes I am, m'dear—younger. If a fellow lives properly, you know—open windows at night, not too much spirits and 'baccy, and absolutely never touches port wine—he simply lives in a circle. Starts young, grows to middle age, then gets younger and younger until he disappears again.'

'But, Octavius, whom do you have to see to-day?'

'The whole lot of 'em, Regina. There's Widow M'Gregor, getting more melancholy every day; and Joe Green, who is quarrelling with his wife all the time; then there's poor old Ned Clarke, who don't seem able to earn a penny; and, of course, I have to see Sam Heeling about the Christmas music—you know it falls on Sunday this year; and then I must go and see little Barbara Flint.'

'You shouldn't go away out to that lonely spot.'

'That's just it, m'dear. It *is* a lonely spot, and that pretty little creature's pining away like a bird in a cage, all on account of her sinful old dad, who won't see what's going on before his very eyes.'

'Yes; I noticed Barbara at church last Sunday, and she looked like a fading lily.'

'She does, Regina—just like a lily. It's my opinion, speaking as her medical adviser, that she's in love. She looks just like I did when —you know whom I mean—when she jilted me for that nincompoop in the Bloodandthunderers.'

After which melancholy thought the doctor devoted himself to his breakfast with more relish than ever.

'Barbara,' said Miss Jellybud, pouring out some coffee and uncovering a plate of steaming rolls, 'has never been the same since she visited her poor dead mother's brother in Surrey. It's my idea she fell in love with some one while there.'

'Like as not.'

'I wish I could go and see her, or even that she would come here of an afternoon and sit by the fire. I know I'm dull company for a young girl like her, but surely anything's better than remaining in that rickety old house on the downs with her mean old father.'

'The perverse old specimen!'

'Well, really, Octavius, I hate to be unkind; but when I think of how he screws the last penny out of everybody, and never spends anything except when he's forced to, and how he lives in that horrible house with little Barbara just the same as a prisoner, I must say that I think he's anything but a gentleman.'

'A gentleman, Regina!' The doctor's face grew quite apoplectic. 'He's not only Flint—he's a skinflint! A miser; a scoundrel! Damme! if only he would get sick, I'd poison him, and hang cheerfully for it. It's my opinion that this trouble between Joe Green and his wife, and Widow M'Gregor with her fretting, is all

in consequence of that bad-livered old scoundrel grinding the money out of them that haven't the means to pay. I tell you, Regina, Josephus Flint had better keep out of my way: he'd better not apply to Dr Jellybud for medicine unless he gets it analysed first.'

There was a scratching at the door and the low whine of a dog.

'There's Nero,' said the doctor. 'Let him in.'

His sister opened the door to admit the shaggiest and most melancholy dog that ever walked on four legs. Without so much as a wag of his tail, he took one look at his master and rolled over on the floor by the fire, as if life's burdens were really too heavy for him to bear much longer. His sadness was perhaps a business asset to the doctor, because, when a medical practitioner is as jovial as old Jellybud, it is just as well to have a dog that is always on the brink of tears.

Nero used to accompany his master on all his journeys, running behind the gig with his shaggy head just between the two wheels, which spattered him constantly with mud. And he being an object of particular animosity to other canines, who apparently regarded his melancholy as a personal affront, Nero's progress through the village was considerably harassed by mongrels all and sundry, who waged guerilla warfare on him, while the doctor would brandish his whip and threaten them with tortures unending.

'Well, Nero,' said the doctor, 'how's the weather?'

The dog uttered a dismal groan, as though that were the one subject which he could not bear to hear mentioned.

'Nero's in a good humour this morning,' said the happy little doctor. 'And now, m'dear, if you have the present for the Widow M'Gregor, and that leg of mutton we don't want for old Ned Clarke, I'll just tell the man to harness up, and then be off on my rounds.'

'I wish you wouldn't go, Octavius dear. There's going to be a storm.'

'Bless your sweet face!' said the doctor, producing his pipe, 'that's the very reason I must go. Those poor souls always get worse when the sky's clouding up and there's a nasty bite in the air.'

III.

If Dr Jellybud's dog was a creature of melancholy, his horse was a quadruped that would have earned a fortune for an undertaker. He was a large beast of fabulous age, and though he ate enough for three dray-horses, was all angles and corners. On the outward journeys, away from home, he made a tremendous show, tossing his head and heaving his flanks, though in reality going just a little quicker than a fast walk. But when the day's rounds were completed, and the doctor's gig was definitely set for home, the old horse would get right down to business, covering so much ground with his long, ungainly stride that the little red-wheeled gig used to bob from side to side, to the immediate peril of the doctor and any passing pedestrian who did not allow sufficient leeway. As for Nero, it must ever remain a mystery how he escaped decapitation. Perhaps a life of such daily jeopardy may have accounted for his dejected condition of mind.

The horse was named Socrates (out of respect for the learned lineage of the Jellybud family), and was unfortunate enough to be blind in his right eye. He was possessed, however, of an inordinate curiosity that only ripened with age, and such being the perverseness of human affairs that most incidents of interest happened on his left side, it resulted that Socrates was frequently facing the opposite way to that in which he was going.

In fact, as Dr Jellybud would drive down the street with Nero, the dog, in mournful faithfulness between the gig-wheels, and Socrates turning his head almost completely round, the impression one received was that the family practitioner was actually consulting with his horse concerning the treatment to be administered to the sick of Windbridge.

On the morning, then, that this narrative commences the doctor bade good-bye to his sister, who had been packing into the gig various little presents for people—'just things she didn't want'—as if she were affluent instead of being forced to economise on every shilling; and with much clattering of hoofs from Socrates, who seemed to be trying to devise a new step for the hornpipe, and a dismal groan from Nero, the equipage made its stately way through the village. Seated on the very high seat of the absurd little gig, and, as I have said, with the mysterious black bag in full view of the populace, the doctor acknowledged the hearty greetings of the few who were abroad on that bleak December morning with a cordiality tempered by consciousness of his exalted position.

Arriving without mishap at the Widow M'Gregor's (unless it could be counted a mishap when the chemist's dog made a rush at Nero and very nearly succeeded in embroiling him with the glaring red spokes), the doctor carefully tied Socrates to a post, and walking round the gig, entered the miserable little garden—the horse endeavouring to follow his master's circuitous progress with his good eye until a strangling sensation reminded him that he couldn't turn a complete circle with his neck.

'Good-morning to you, madam,' said the doctor, as a tired woman, whose face was threaded with wrinkles, opened the door. 'I hope I see you hearty.'

'Na, na, doctor. I'm no herty—far frae it.'

'Tut, tut, madam!' said the doctor, taking a seat in a bare, dingy room and rubbing his hands

jovially together; 'you 're looking the very picture of health.'

'Then it disna tak' muckle to mak' a picter,' was the miserable response. 'I 'm feelin' richt bad, for it 's a raw mornin', and I canna afford mair than a wee bit fire.'

'I am sorry to hear that,' began the doctor; 'very'——

'Ay—sympathy 's a' verra weel, but it disna bur-r-rn. It tak's a' my earnin's to pey auld Flint the rent. He raised it on me last week again, and me a puir weedow.'

The doctor grew so red in the face with anger, and so short of breath with its suppression, that he was forced to stand up to permit the proper circulation and respiration.

'Flint,' said he forcefully, 'is a scoundrel. A double-dyed, double-damned scoundrel!'

'Ay,' said Mrs M'Gregor drearily; 'but chuckin' stanes disna heat the hoose.'

'I tell you what, madam,' said the family physician; 'if that fellow isn't very careful, he 'll meet with a painful accident one of these days. I don't want to startle you, madam, but when I was younger I once took on "Bruiser" Jones, a professional pugilist. I won't say what I did to him—I was young and impetuous in those days—but "Bruiser" was never the same man again. No, sir—I mean, no, madam!'

'Ay,' agreed the widow, with a doleful sigh, 'we were a' young aince, though ye wouldna think it to look at me noo.'

'Mrs M'Gregor,' said the doctor, in the manner which had so nearly been the undoing of the ensign in the Bloodandthunderers, 'I remember, when you came to the village from Scotland nearly thirty years ago, "By gad!" I said; "there 's a woman!" Those were the very words—"There 's a woman!" And, by gad! you don't look a day older now.'

'Then your eyesicht is waur than it should be,' was the gracious response.

'By-the-by,' said Jellybud, remembering the professional nature of his visit, 'be sure and sleep with your window open, eat plenty of porridge, and—— Dear me! where did I leave that bag? Oh, there it is. I have a bottle of port wine here which I want to get rid of, in case I 'm tempted to drink it. Would you believe it, madam, an inch of that wine in the bottom of a glass, and Dr Jellybud would join his predecessor in the cemetery?' The doctor produced the bottle from the bag and handed it to her. 'Will you accept it, Mrs M'Gregor?' he said appealingly.

'Ay, wull I. Beggars canna be choosers; but it 's a puir drink compared wi' whuskey. Hae ye an opener?—and we 'll juist sample it, efter a mainner o' speakin.'

Dr Jellybud *had* an opener, and in a second he had extracted the cork, and the good lady poured two generous portions into two cracked glasses

'Mrs M'Gregor,' said the doctor, not at all like a man who was about to drink the hemlock and end his days on earth, 'I wish you a Merry Christmas.'

'Ay,' said the old woman, 'it 's a daft-like wish when a weedow 's as puir as me; but I thank ye for the speerit that prompts it.'

IV.

It was not necessary to drive to old Ned Clarke's tumble-down cottage, as it was only a few steps from where the Widow M'Gregor lived, so, hurrying to Ned's door, the energetic little doctor gave a brisk double-knock. It was opened by a very old man in shabby clothes, whose large face, once lit with a certain rugged good-humour, had grown dull with fading faculties and the ugly companionship of poverty. He was a man of nearly ninety years of age, but with a frame so strong that, though it was a little bent, it refused to yield to the siege of dimming memory and dulling mind.

'Good-morning, Ned,' said the doctor. 'I hope I find you well.'

'I cannot complain,' said the other in a deliberate, heavy voice that pronounced every syllable distinctly, as if he were conscious that the work of his mind might be slow, but he would make it thorough, 'though it be cold, and my old bones aching just a little with the damp morning.' Ned led the way into the cottage and indicated a chair for his visitor. 'But it will not be long now, doctor, for I be growing old and no use to no one. I 'm a weary, tired man, as will be very glad when his time has coom.'

'My dear sir,' said the doctor, 'you have years of life in you yet. Why, the village wouldn't be the same without you! Bless my heart! take Ned Clarke from Windbridge and what remains? There 's a riddle for you. How long have you lived here, Ned?'

'Sixty year and a little better; ever since I hurt my leg in the navy and was sent ashore. You wouldn't know Windbridge in them days, doctor. Where the chapel be now there were a scaff'ld, and one day I see'd a man hanged there. Ah, I see'd him. There he hanged for more 'n a week; but he had killed another, and 'tis writ in Holy Scripter that—that—my memory bean't what it were, but I recall his hanging, and the Good Book says something that makes it all right. But I remember thinking at the time that it were a rare awful thing to hang a man. Shoot him, or drown him; but hanging 's a choky business, and bean't a proper sight for women and children to see.'

'Your cottage is cold here, Ned.'

'Yes, doctor, it do be chilsome; but, then, I 'm a hardy fellow, spite of my ninety year coom this May, though I don't go for to say that a bit of fire wouldn't be a kindly thing.'

'Have you no coal or firewood?'

'Yes, a little. But I must save it for the days

when my old bones ache worse 'n to-day, for I be too bad in the back now for to cut the bush; though I do say that it 's a pleasant thing for an old man to sit with his pipe and listen to the logs a-blazing in the fire. But I cannot complain, doctor, even if it do coom hard to move from this cot in another week, and me not knowing where to go, unless into the work'us, which goes again' my feelings arter fighting all these years for to die independent like.'

Dr Jellybud took out a pair of spectacles and adjusted them on the very tip of his nose. 'Ned,' he said calmly, though his face was purple, 'why are you leaving here?'

The old man slowly tapped the arm of his chair with his hand. 'It be Master Flint, doctor,' he said. 'He has raised the rent five bob a month more, and no matter how I scrape I cannot go for to meet it.'

The doctor took the glasses off the end of his nose and put them back in the case. He then produced a very large handkerchief and wiped his brow, stopping in the act suddenly and brandishing a fist within an inch of Ned Clarke's nose.

'Ned,' he said tensely, 'do you see that?'

'Yezzir,' replied the old man. 'What be you going to do with it?'

'Never mind, sir; never mind,' said the doctor, plunging the fist beneath the tails of his coat, and tossing them violently up and down. 'All I can say to Mr Flint is that I don't envy him—that 's all. By the way, Ned'—the little man's fury had subsided as swiftly as it had come—'here 's a leg of mutton which my sister bought, forgetting that neither of us can abide mutton. She was wondering if you 'd mind taking it, so that it wouldn't be wasted.'

'Doctor,' said Clarke slowly, 'you and your sister be a very kindly pair. It 's my opinion as people like you, that just keeps doing things for poor folk, has as good a chance up yonder on the quarter-deck as them long-faced chapel people as keeps on praying for them, but don't go for to do nothing but pray.'

'But, my dear sir,' said Jellybud, 'that mutton would be wasted. It 's nothing but that. And now I must be off. Sleep with your window open?'

'I do, doctor. I be a man as likes the feel o' the open air upon his face.'

'That 's right. Well, Ned my boy, a Merry Christmas!'

'Thank you, doctor; and I 'll take it kindly of you to give that there same wish to your sister, from an old man whose time has almost coom. This be my last winter, doctor, for I can see the signal flying at the mast.'

'Tut, tut, Ned!—you 'll be the pride of the village for another ten years.'

'P'r'aps yes—p'r'aps no, doctor; though I do take it bad for to leave Windbridge now, as Master Flint be forcing me to do. It were sixty year and a little better when I came here first. You wouldn't have knowed the village in them days. Where the chapel be now, there were a scaff'ld, and one day I see'd a man hanged there.'

'Well, Ned, a Merry Christmas!'

'I wish you the same, doctor, and thank you kindly.'

V.

With a growing indignation that threatened to burst a blood-vessel in his head, Dr Octavius Jellybud completed his morning rounds, dispensing a very little medical advice, a great deal of cheeriness, and generally contributing towards the good of men with that sublime art of *philanthropia* which Lord Bacon attributes to the ancient Greeks. Nor did the threats which he breathed against the person of one, Josephus Flint, Esq., of 'The Oaks,' in any way impair his sympathy for the forlorn of Windbridge. On the contrary, he mixed gentleness and violence and boisterous good-humour in the same vial, and produced a remedy which would have made a fortune for him if he could have put it on the market.

He had just spent fifteen minutes with Mrs Green, whose trouble with her husband Joe was one of those offsprings of poverty, a state supposed by comfortable philosophers to be a very good one for people who are used to it; and he had hurried down the road to arrange with Sam Heeling about the Christmas music (the doctor's voice being of the kind that can sing bass, tenor, or alto, wherever there happens to be a shortage), when the lowering clouds warned him that the storm would not hold off much longer.

For a full minute he debated with himself whether to go home or carry out his original plan of visiting Barbara Flint. After the manner of a man who is undecided, he gazed at the clouds and shook his head; then he looked at Socrates and frowned; after that he looked up the road and then down it, as if the solution might appear unexpectedly from either quarter; finally he clambered into the gig with a look of implacable determination.

'One more run, Socrates,' he said. 'Out to "The Oaks," and then back home.'

After ten minutes of protest on the part of Socrates, which resulted in horse, gig, and doctor going round and round in a circle (while Nero followed patiently between the wheels, under the impression that he was covering a considerable amount of ground), they started off suddenly at a very good clip for the distant dwelling of Josephus Flint.

But to get to 'The Oaks' it was necessary to pass 'The Briars,' which was the dwelling-place of that worthy soul, Jacob Funnle, county magistrate and prince of Othellos. 'The Briars'

was one of the pleasantest places imaginable, with great fireplaces that made merry with logs, a beam-ceilinged den, a larder in which game was always hanging from the hooks. And there was no denying it—Funnle was the one man in the village who could give the doctor a contest at cribbage. It was their custom to wager half-a-crown on a game, and rivalry was so intense that the inhabitants of Windbridge could always tell next day by their faces who had lost and who had won.

Nevertheless, Dr Jellybud had a conscience, and, like most honest men, was afraid of it. It was his habit to declare that working-hours were working-hours, and that the time for play must on no account interfere with them. Therefore he determined, with a capital D, that even if it was a disagreeable, raw morning, and even if Funnle's chimneys were throwing sparks into the air, he would not listen to their siren melody. As it was impossible to follow the plan of Ulysses and strap himself to the gig, he emulated Orpheus, and, looking away from the temptation, sang lustily along the country road a chorus which, if it did not exactly offer praises to the gods, was not without its holy aspect, being all about a friar.

But he had forgotten that included in the seductions of 'The Briars' there was an exceedingly comfortable stable where two old friends of Socrates were ending their days in well-fed contentment. Therefore it happened that, when the roadway leading to Funnle's home was reached, Socrates stopped so suddenly that Nero, whose mind was on something else, kept right on up the avenue of wheels, between the legs of the horse, and was a good fifty yards along the road before he pulled himself up.

'Now, Socrates,' said the doctor, 'none of that.'

Being a philosopher, the horse remained calm, merely turning round, as usual, by the longest route to bring his good eye to bear on the speaker.

'Come on, Socrates,' said Dr Jellybud, brandishing the whip; 'there can't be two masters on a job like this.'

As an illustration that only certain types can be trusted with the truth, the horse no sooner heard this sagacious remark than he apparently determined to be the one master himself, and turning headlong into the avenue, actually galloped the whole distance to the stables.

'Now then, you scoundrel,' said the doctor, puffing hard from the unexpecting jolting, 'you 're a nice, grateful beast, ain't you? After all these years I've kept you in oats, you go and play a trick like that.'

The feelings of the horse were spared further by the simultaneous appearance of Funnle and the groom, the former taking charge of the doctor, and the latter unharnessing the horse.

'Well, Jellybud,' said the magistrate, 'what ill wind brings you here? Isn't the undertaker getting enough to do these days?'

'Funnle,' said the doctor, as they cordially shook hands, 'I believe you'd rather die than have the doctor earn an honest pound physicking you.'

'What's the use of giving him an honest pound? He'd only lose it at cribbage.'

'Lose, my dear Funnle! Did you say lose?' The doctor grew quite indignant at the thought. 'I would say that betting money against Jacob Funnle at cribbage should be listed as a safe investment for widows and orphans.'

For a moment the magistrate, who was tall and could look very fierce on occasion, stared haughtily at his guest, while his whiskers, which ended half-way down his face, seemed to bristle outwards with condensed fury. Satisfying himself, however, with a scornful laugh, he permitted hospitality to prevail, and led the doctor into the aforesaid den with the beam-ceiling.

'That's a fire!' said Jellybud, rubbing his hands together jovially, and chuckling at the merry noise of the flames roaring up the chimney.

'Then,' said the host, making a poor pretence at seeming casual, 'what do you say to a game by it?'

'No,' said the doctor.

'Just one?'

'No, Funnle, not even one. Business'——

'Fiddlesticks!'

'Anything but fiddlesticks, my dear sir. My rule of life is: work hard, loaf hard, sleep hard—but never two at the same time. By the way, I hope you sleep with your window open. That's the secret of health: very little spirits, very little 'baccy, and on no account any port wine. One inch of port'——

'That reminds me,' said Funnle, 'I want you to try a new weed. A fellow in Pall Mall sold it to me last month when I was to town, and attributed to it all the flavour of Ambrosia. Here are bowl and pipe all waiting for you.'

'Thank you, old fellow,' said the doctor. 'Now, I call that real thoughtful of you.'

'Not at all, Jellybud. Now, draw your chair up nearer the fire and—what do you say to one game at half-a-crown?'

'No, sir,' said the doctor heroically, 'it can't be done. As a matter of fact, I came in here to-day to ask your advice. You're a justice of the peace, ain't you?'

'I am,' said the other, with dignity.

'Well, Funnle, I'm going to break it.'

'Eh?' said the host, somewhat startled. 'Oh, I see: you are going to disturb Her Majesty's peace, are you?'

'As to that,' said the doctor uncomfortably, 'there's no more loyal subject alive than myself; but if the peace belongs to Her Majesty, then I'm a Dutchman if I don't break it, even if they smother me in the Tower for it.'

'You had better be careful, sir,' said Jacob

Funnle, Esq., J.P., of 'The Briars,' rising to his feet, buttoning his coat, adjusting his spectacles, and generally managing to look every inch a magistrate. 'What is the *casus belli?*'

'Flint,' said the doctor.

'Oh!' said the magistrate, taking off his spectacles. 'What's he up to now?'

'Raised the rent on Widow M'Gregor, Ned Clarke, Sam Heeling, and Joe Green,' said the doctor, so forcefully that he was almost lifted clean out of his chair.

'Now, I call that,' said Funnle, undoing two buttons of his coat, 'a rascally thing to do.'

'It's a downright, dastardly, dirty, evil, murdering trick,' cried Dr Jellybud; 'and when Flint and I meet—then watch for sparks.'

'Now, just a minute,' said the other, puffing thoughtfully and doing up one of the two liberated buttons. 'What are you thinking of doing?'

'Doing?' cried the doctor. 'I'm going to call and give him a piece of my mind. Then, if he won't reduce those rents, why, damme! I'll pulverise him; I'll make him an interesting anatomical study for medical students. Did you ever hear of "Bruiser" Jones?'

Jacob Funnle, who had taken a seat, rose once again, replaced the spectacles on his nose, and resecured the top magisterial button.

'Jellybud,' said he, frowning tremendously, 'there is about you *poco di matto*. You have the presumption to come to me with this threat of violence to one of Her Majesty's subjects, forgetting that, *virtute officii*, I should commit you at once for conspiracy. Remember, as the ancients had it, *verbum sapienti sat est*, which in vulgar parlance means that a wink is as good as a nod. As a magistrate, my duty is clear; as one who is not indifferent to the claims of long acquaintanceship, I advise *via media*—in other words, "take another coach." It is a *sine quâ non* that you have the law on your side, for, if it be against you, a traveller on the desert of Sahara were better able to escape the rays of the sun than you to elude the long grip of JUSTICE!'

After this imposing oration, Jacob Funnle, Esq., removed his glasses, unbuttoned his coat, lit his pipe, and sat down.

'When do the new rents start, Jellybud?' he said amiably.

'Next week—Boxing Day,' answered the doctor, who had not quite recovered from the awful feeling that the law was chasing him over the Rocky Mountains.

'Then, look you, old fire-eater, we'll think this over together.'

'And while we're thinking,' said the doctor, his indignation driving away his fear, 'Widow M'Gregor is freezing, and old Ned Clarke has no roof to cover his head.'

'H'm—m,' mused the magistrate. 'Jellybud, you old firebrand, there's my hand on it that I'll join you in any scheme—providing it does not break one of Her Majesty's statutes—that will bring Master Flint to his senses. But I demand one condition.'

The doctor frowned dubiously. 'What is it?' he asked.

'That you don't do anything to Flint until we discuss it further.'

'Very good, old fellow,' said the doctor, shaking hands with the utmost heartiness; 'though I was all keyed up to a bout with a villain. I'll never forget the third round against "Bruiser"'——

'Well, now that that's settled,' said the magistrate, 'what do you say to one game? And, seeing that it's the Christmas season, shall we make it three bob instead of half-a-crown?'

'As to that,' said the doctor, refilling his pipe, 'I suppose you are entitled to your revenge.'

'Revenge?' said the other with a sneer. 'Why, last month my housemaid, Jennie, threatened to leave my service, all of having to gather up half-crowns left here by a certain doctor. And as for my dog Prince, he went thin as a lath, ruining his digestion with eating 'em.'

The doctor produced his glasses and set them on the very tip of his nose—not that his eyes needed any assistance, but it served to check the eruption of temper.

'Funnle,' he said, more in sadness than in anger, 'I am sorry to say it of a friend, but you are not telling the truth.'

For a moment there was an intense silence, charged with explosive matter, but the host's fiery face gradually melted into a grin and his whiskers drooped on his face like sails that are becalmed.

'What will you have to drink, old spit-fire?' he said.

'Damme!' said the doctor, his face glowing with complete and contagious good-humour; 'give me a glass of port.'

VI.

As has been stated, Windbridge lies at the bottom of a hill. As thus it is sheltered from the wind, and as there is no place for a bridge anywhere, doubtless these two facts gave rise to the village's name—it being a good old English custom to call places after features that do not exist, quite as frequently as after things that do.

But the men who first led the village destiny downhill were not lacking in wisdom, for the winds that rise from the sea and sweep the downs that extend for fifteen miles inland are cold and biting in most months of the year, but especially so when the forces of winter advance to wrest earth from the lethargy of autumn.

At least, so thought a solitary traveller who was wending his way up the long up-and-down road that stretches from the coast to the county

town, ten miles beyond Windbridge. It was a miserable December morning, too sulky to snow, too lazy to rain, but determined, dog-in-the-manger-like, that the sun wouldn't be given a chance whatever happened. The sky was dark and sullen with heavy, gray clouds, and the sea, which has no mind of its own, but always borrows its mood from the heavens, was like swirling lead.

The traveller was a young man, dressed in a style indicative of decent country family rather than of a man about town; his boots were good—sturdy ones, like his brown hands, intended for use. With his cloak thrown over his shoulder, carrying a stick and a knapsack, he was covering a good four English miles an hour, while his breath on the raw morning air appeared like steam.

Every now and then, when he reached the top of a rise (and the road from the sea to the county town is a series of camel's humps), he would pause and gaze at the bleak vista of the downs. If the sister-elements of the air and the water were dull and cheerless, the sight of those desolate stretches, with miserable growth of stubble, could not have been much more enlivening.

As far as the eye could see, there was no sign of life except where a lonely cottage huddled against a slope, as though its owner were an ex-hangman eating out his days in remorse. And, to add to the general eeriness of the scene, the wind was howling and moaning in chromatic rise and fall like a ghostly orchestra of murdered clarionet-players.

The young man was within three miles of Windbridge when the truce of the elements was broken, and a drizzling rain began to fall—not the kind of rain which comes down in an honest, straightforward manner, but one that watches its chance, creeps under coat-collars, and trickles down the neck, or glides off a hat on to the nose; the kind of rain that loves to hide in the sleeves, or ooze into some crack between the sole and the uppers of a boot; a miserable, slinking rain that knew it had no business there at all in December, but was determined to cause as much discomfort as possible before the slumbering Spirit of Winter woke and did its duty.

Buttoning his cloak about him, and pulling his hat down to cover his face (which was a manly, weather-tanned one), the traveller stepped out more briskly than before, and without pausing at any hill, reached the last slope, which led him to the cross-roads.

And at its summit he paused.

The roads now eligible were like the twisted prongs of a fork. One prong went to the left, and led to the county town; another ambled straight on, and then, by a sort of practical joke, made a gradual detour to the right and took you back to the sea again; while a third stole furtively to the right for half a mile, where it abruptly dipped, and pulled up short at Windbridge, hidden from view below.

To aid distracted travellers, a sign-post, all bent with age, was stuck in the very centre of the cross-roads, with its left arm declaring that the county town was somewhere near the North Star, and its right that Windbridge lay buried in the bowels of the earth.

Perhaps it was the perplexity of those who journeyed that way which had prompted some philanthropic soul, many decades before, to erect an inn on the spot, where direction and refreshment could be obtained. At any rate, there it stood, all by itself, a fine, little, stony, door-and-hinges sort of inn, with a snug little bar just inside the door, and queer dark rooms hidden all over the place, and pretty little casement windows meant to be looked out of by pretty blue eyes—or brown ones either, for that matter.

Unfortunately, like most of the best little inns of England, 'The Fiddlers Three' boasted an evil past. It is a discouraging fact that wickedness in both families and public-houses seems a better foundation than good behaviour; for the gentlemen who write on social reform are always telling us that our oldest families were a bad lot in the time of Ethelred the Unready or Boadicea; and certainly the snuggest and pleasantest taverns in deserted spots of the country usually seem to have attracted and harboured all the wandering vagabonds of the district in the past.

There was no question of it, but 'The Fiddlers Three,' when it was owned by Patrick O'Flynn (who was hanged by mistake in 1827—but richly deserved it), was in league with both smugglers and highwaymen. It had been his custom to keep a look-out across the downs, and, if he saw travellers approaching, put a light in the western window to acquaint the gentlemen of the road of the fact. And when the Excise men would drop in for a glass of grog before going down to Perkin's Cove to try to catch the smugglers who were known to use it, Patrick showed a red light in an eastern window—and never a smuggler would be caught that night.

It was in later and more peaceful times, however, that our lonely traveller paused to survey 'The Fiddlers Three,' which was standing apparently deserted and strangely quiet in the drip-drip-drip of the rain. Not a movement could be seen about the inn; not the chortle of a single fowl could be heard; not the yelp of a restless dog.

From a chimney at the back of the house a thin stream of smoke was emerging into the soaking air, and walking towards it, the traveller came to a covered shed where a solitary figure was sitting on a barrel.

'Hello!' said the young wayfarer, halting his investigations.

The other made no reply, but taking up a

stick, proceeded to whittle it with a knife. He was dressed in a blue smock, with pantaloons that were far too large for him, and were tied at the ankles to prevent their getting underneath his boots. Although his face was young, there was a weak beard of several months' growth on his chin, and his large colourless eyes, gleaming from nebulous depths, lacked focus, so that his gaze seemed to expand like the rays of a lantern, and to surround, rather than concentrate on, what he looked at.

'Hello!' said the stranger again.

'Follow the sparks,' said the other, pausing in his whittling and speaking in a far-away, breathy voice. 'Watch 'em coming from the chimneys. Follow the sparks; they'll lead you to it. What's your name?'

He appeared to lose interest in the question as soon as it was asked, and carefully examining the stick in his hand, resumed his occupation.

The young man smiled, and putting down his knapsack, sat on an old box in the yard.

'What's your name?' repeated the strange figure without looking up. 'If you've got no name they can't bury you. Must have one to put on the tombstone or the coach will never find you.'

The stranger sucked at an unfilled pipe. 'Have *you* got a name?' he asked.

'Ah—that I have: Jack Fish—poor Jack Fish. Come here.' He beckoned to the other, and solemnly tapped his own head with the handle of the knife. 'Queer,' he whispered; 'something wrong inside. Don't tell no one.'

The traveller nodded sympathetically.

'They laugh at me,' said the poor fellow, measuring the stick against his arm and frowning profoundly. 'They say poor Jack Fish sees things. Ha, ha! They don't be far wrong there. Sees 'em, and *hears* 'em too. Do you know where they keep the ghosts of old stage-coaches?'

'No.'

'Do you know that on Christmas Eve the coachmen and guards—them that is dead, I mean—harness 'em up and ride over the country blowing horns and cracking whips. Did you ever hear that afore?'

The visitor shook his head, and the idiot laughed softly to himself, both his voice and his shining eyes full of the mysticism of his disordered fantasies.

'Jack Fish,' he moaned, suddenly breaking off from his laugh and clasping his head with his hands as though struck with pain. 'Poor—Jack—Fish. That's what they call me.' He looked up vacantly, then took up his knife and stick once more. 'They laugh at me, and say I sees things—ah, and *hears* 'em too; but when I meets 'em on a dark night and tells 'em that if you catch the sound of wheels on Christmas Eve a-grinding on the road, and horses clattering hard—*and if there ain't no wheels nor horses neither*—then I tells 'em that before another Christmas comes they will be dead. Listen.' He leaned over to the stranger, and his voice was low and had the effect of distance. 'Before another Christmas comes,' he repeated, 'you're dead. They bury you in a cemetery, with your name writ on a stone—but the sparks will find you. They'll follow the sparks—follow the sparks. And when I tells 'em that on a dark night, they say, "Poor Jack Fish!" but I see 'em hurrying away with their eyes all fearsome, and they never stops until they're inside and ha' locked the doors secure.'

With a quiet laugh he whittled for a few minutes; while the stranger, noticing that his pipe was unfilled, took a pouch from the knapsack and remedied the deficiency.

'On Christmas Eve,' went on the idiot after a few minutes' silence, 'the coachmen always comes out of their graves and harnesses up the old Brighton coach. Then they watches where the sparks goes as comes out of chimneys, and follows them to the graveyards. At midnight they blows their horns, and all the Merrie Gentlemen come out of their graves—them as used to smuggle by sea, and them as robbed on the roads by night, and them that was pirates a-cutting men's throats and hanging them up in the sun all day to rot. Merrie Gentlemen, I calls 'em. And at midnight every Christmas Eve they gather for some rum and 'baccy, and a merry time they has laughing over the days when they was alive. But where do you think they come?'

The stranger shook his head.

'Here,' said the idiot triumphantly; 'right here at "The Fiddlers Three." I let 'em in. They don't mind poor Jack Fish—I let 'em in.'

As if he had wasted too much time already, the half-wit resumed his work with such energy that the air was full of flying bits of the stick; while the traveller, apparently lost in his own thoughts, sat silently puffing his pipe, as the persistent rain covered the roof of the shed and dripped drearily through the cracks.

'Where's Windbridge, Jack?' asked the stranger after a considerable pause.

'Go along the road,' said Jack without looking up, 'roll down the hill, take two turns and a jump, and beware of the dog!'

The other nodded. 'Is that the road there?' he queried.

'Ah,' said the idiot, 'it might be, if it ain't moved. I heard some of the chimneys saying as how they was thinking of moving farther downhill.'

'Jack,' said the traveller abruptly, 'where does Josephus Flint live?'

The idiot put down the stick and laughed softly to himself. 'I see him yesterday on the road,' he said, checking his mirth, 'all doubled up and snarling like a dog. "Get away, Jack Fish," he sez, all frighted and shaking his fist

at me. "You bring bad luck." "I do," I sez, "for the Merrie Gentlemen will have you this very Christmas Eve, and take you back with 'em to their graves." And away he ran—down the road, with his stick knocking the pebbles all ways, and him yelling as how I lied and the devil was in me. And as long as I stood there laughing, he was going hickety-hump, hickety-hump, like as if the grave-diggers was after him.'

During this recital the stranger appeared more interested, and at its finish he rose and stretched his arms. 'Which is Flint's house?' he asked.

The idiot pointed vaguely towards the road that led to the county town. 'Follow the sparks,' he said.

'Is that it where the smoke's coming out—away over the fields there?'

The half-wit looked, and nodded his head. 'Perhaps it is,' he said grudgingly; 'but the Merrie Gentlemen will have him this Christmas Eve.'

The traveller adjusted his cloak once more, and shaking his hat to clear it of moisture, replaced it on his head. 'Good-bye, Jack,' he said.

But the figure in the smock was gazing at the stick, which by that time was little more than the size of a pencil, apparently trying to recall the use for which he had intended it. When he reached the road the stranger looked back, but the poor fellow was still sitting there, lost in some fantastic reverie of his tired, useless brain.

VII.

The dwelling of Josephus Flint lay back from the road, surrounded by great trees that kept the place in constant shade. It was a gloomy, lonely abode; and even at night, when other places were bright with light, the darkness of the house would be broken only by a single lamp moving about wherever the miserly owner went.

Josephus Flint was not a man to have guests at his home, and in his turn he never visited any one, so that 'The Oaks,' as his house was called, was more like a gloomy fortress under siege than a dwelling-place for human beings. Yet it was notorious that Flint had money. Rumour, in her extravagance, had it that he was fabulously rich; but be that as it may, his fortune was considerable, and grew little less for any spending he might do.

By dint of reaching here and clawing there, he had succeeded in acquiring the ownership of nearly all the poorer dwelling-places of Windbridge, by reason of which he was able, like a Spaniard torturing prisoners on the rack, to squeeze and turn the handle of his power until his name had become a thing of detestation. On the few occasions that he ventured through the streets of the village he was greeted with malignant scowls and muttered imprecations; but these only served to add fuel to the burning flames of his greed, and to convince him further of his rare shrewdness.

Perhaps, as had been predicted more than once, he would have been brought to task by some of the more adventurous spirits, such as Dr Jellybud, if it had not been that, in addition to his other wealth, the old miser possessed a daughter, who inspired an affection which was no less general than was the dislike of her father. There was absolutely no reason why a shrivelled, whining, yellow-faced fellow like Flint should have had a daughter like Barbara. Eugenically it was all wrong. But there she was, and there was no denying her, even if any one wanted to.

Though she was allowed from the house only of a Sunday morning, or on the very rarest of occasions—when, perhaps, the choir in which she sang might be holding some secular celebration (as even the most serious choirs do every now and then), Barbara always looked as fresh and dainty as if such things as a miserly father and a great, creaky, lonely house were completely unknown to her.

Barbara Flint was not a tall, imposing girl—I don't suppose any one would ever have spoken of her as 'queenly;' on the contrary, her brown curls were just about the height of a man's shoulder (which is the proper height for brown curls to be), and her eyes were a mischievous, twinkling pair that no sooner looked at a man than everything would go out of his head and he would be forced straightway to lower his own optics. Not that that was much refuge, for it only brought you to Barbara's mouth—a coaxing, tantalising affair altogether—and as it was quite impossible to look for any length of time at that without completely losing one's presence of mind, it was necessary to leave there too. But whether it was her snowy, rounded neck, her dainty fingers, or her quite bewildering waist, looking at Barbara Flint was very trying for masculine eyes. It wasn't even safe to lower one's eyes to the floor, for there were Barbara's ankles—and, as Dr Jellybud once said . . . But, then, he was a bit of a dog in his day.

In fact, the only safe way to talk to Barbara Flint was to stare straight at the ceiling; but who wanted to stare at a ceiling if he could look at Barbara instead?

But there had come a change.

In a moment of generosity, or whatever ingredient passed therefor in old Flint's system, he had allowed her to visit her uncle in Surrey. When the bird returned to its cage the eyes were no longer sparkling, but pensive; the tantalising mouth drooped, and the roses in her cheeks changed to lilies. Gossip speculated; conjecture waxed eloquent; but she confided in no one, and it is hardly to be expected that her father, blind through greed to all the pleasant things of life, would notice the disappearance of the roses from his daughter's face.

[*Christmas Number.*

Week by week she grew more quiet and thoughtful, but, if possible, more lovely than before. It is perfectly surprising what a charming effect can be given to a pretty face by its owner thinking; and even more surprising, the cynical will add, how seldom this beauty-ruse is adopted by the fair ones of the land.

But, though prettier than ever, Barbara grew more and more like an imprisoned bird pining for the open meadows, like a flower that summer's departing spirit has forgotten to call.

VIII.

Thus to the gloomy fortress of 'The Oaks,' with its drooping prisoner, came the stranger of the downs. Walking up the unused avenue, as still as the tomb, he knocked firmly at the door, the noise startling a whole community of birds into an indignant chatter and bringing an echo from a deserted stable.

When he had repeated the knock a third time, he heard a shuffling step, the undoing of a chain, the unlocking of a padlock, and the slow withdrawal of a bolt. After this disarmament, the door, which creaked horribly in protest, was slightly opened, and an old retainer, whose hair was so thin that his head seemed covered with cobwebs, peered through the crevice.

'Go 'way,' he said in a quavering, cracked voice. 'Ye have no business here. Go 'way.'

The young man quietly advanced his foot against the door.

'I want to see Miss Barbara,' he said.

'Go 'way,' repeated the servant, coughing querulously with the effort of speech. 'Mas'r Flint's orders—ye be begging, I know. No beggars; no beggars. He has nought to give. Go 'way.'

With this hearty welcome, the old man tried to close the door, but the stranger stopped it with his foot, and then, rather roughly, put his shoulder against it, with the result that it swung back abruptly, pinning the old servitor against the wall, with only his hands and feet showing in convulsive movements, like a drowning man struggling to swim.

'Here,' said the impetuous invader, 'come out and listen to me. See this half-crown? That's for you if you tell Miss Barbara that Jerry wants to speak with her. I'll wait in this room to the right, and if you don't get that message to her at once, I'll crack your old egg-shell of a head.'

The servant clutched the coin avariciously, and grinning knowingly, shuffled down the dark hallway, murmuring strange sounds, and wagging his yellow head at all angles to assure himself that it was still there and in good working order. The stranger moved into a great dreary room with dingy furniture covered with shabby upholstery, a grate that had known no coal for many winters, a long table in the centre, with its contents concealed beneath a shroud-like cloth, and windows where the light was repelled by heavy curtains, as though beneath the table-cover there was some one lying dead.

With an impatient frown the visitor took in the appointments of the room, and undoing his cloak, threw it back over his shoulders. The drops of rain still clinging to it fell and made a little pool on the worn-out carpet.

There was a light footstep on the stairway, a sudden glimpse of dimples, blushes, curls, and twinkling feet, and an equally sudden encircling of their owner by a pair of particularly strong arms.

'Oh, Jerry!' said the young lady, speaking into the breast-pocket of his coat.

'Barbara!' said the stranger, with his lips pressed against the brown curls.

As neither of them seemed to think that anything more need be said, they might have gone on indefinitely, with her apostrophising the breast-pocket, and him murmuring 'Barbara!' into the curls (and by no means a pastime to be sneered at either!), if she had not been suddenly overcome with a combination of timidity and curiosity.

'Oh, Jerry,' she whispered, 'why have you come?'

'Barbara,' said the stranger—and his voice went all wobbly with emotion—'I couldn't live another day without you.'

'Oh, Jerry!' said Barbara, sighing happily at this outrageous lie—although the young man was naturally honest and wouldn't have stated what he didn't believe, yet—well, confound it! *you* try holding in your arms the sweetest little bit of femininity for a hundred miles in any direction, and see if hyperbole doesn't creep in somewhere.

'Jerry,' said Barbara, looking up at him, and bringing her coaxing lips cruelly near his, 'you must go away.'

'Never,' said Jerry.

At this point conversation ceased. But words are poor things at best, and if a young man in his twenties and a young lady as fragrant and winsome as Barbara Flint couldn't find a better medium of expression than language, then the world was made for philosophers and not for lovers.

'But you *must*,' said Barbara, after a lengthy pause, speaking with that sublime irrelevancy of young people who are able to take up the threads of a conversation at any time with an aplomb that would drive a memory-expert into a paroxysm of envy.

'If I go away,' said the stranger, 'you must come too. Listen, Barbara. I tried to forget you, but ever since you visited your uncle I have been the most wretched man alive. I have endeavoured to get interested in my farm. I went to town to try to forget. I even thought of going to Canada.'

'Oh, Jerry!' said Barbara.

'Yes I did,' said the other stoutly. 'Bad

Indians or no Red Indians, I was going there. But the more I thought of it all, the harder it was to forget you. Oh, Barbara dear, if you don't want to see me go to the other end of the world and die a miserable bachelor, say that you love me and will be my wife.' (And Jacob Funnle in his most dramatic moments never equalled the intensity of the young man's voice as he uttered those words.)

'No, dear,' said Barbara, 'you must go away.' Here she pressed his hand very tightly—as if that made the going away any easier! 'Father would never consent, for, you know, I am only nineteen; and, besides, there is no one to look after him.'

'Then bring him along, Barbara,' said Jerry. 'From all I hear, he seems a surly brute—excuse my speaking of your father in that way, my love—but when I see this horrible house and think how you are a prisoner in it, I would rather have him come and live with us than let you stay here one day longer than necessary.'

'Oh, you would, would you?'

The young people separated swiftly, as Josephus Flint uttered these words in a thin, quivering voice, as though the bones in his throat were already loosened by death's palsy and rattling in ghoulish anticipation of his approaching disintegration. Having been warned by his faithful servitor, who was curiously devoted to the miser, Josephus had crept towards the lovers, feeling every step with his stick before he ventured on it, with the result that he had arrived unperceived, and just in time to hear the candid reference to his own charming disposition. He was a wrinkled, biscuit-coloured man, whose very blood had grown miserly, and, refusing to flow freely through his veins, had left him open to periodical attacks of rheumatism, caused by the damp, unaired rooms and the constant shadow in which mind and body lived. Although Josephus was considerably bent from all this, and yellow of skin, a pair of piercing eyes and a strong, hooked nose kept his appearance from senility — lending an effect of smouldering vitality, as a burning coal will often continue to glow when its fellows have become lifeless ashes.

'So you would take me with you?' said Mr Flint, with a horrible rattle, shaking his stick at the uninvited guest, while the old retainer, who had acted as informer and had followed him into the room, rubbed his shrivelled hands and wagged his old egg of a head in great enjoyment of the scene. 'You would be kindly to an old man just for nothing, eh? Not for his gold—oh no, not for his gold—nor for his houses bringing in good rents neither!' Here Mr Flint grinned disagreeably, displaying a cracked tooth to the very best advantage. 'Bringing in good rents,' he went on, sucking a breath in between the cracked tooth and its neighbour with an unearthly whistle; 'and they 'll bring more, too, mark ye. The villagers can't afford to buy, and there 's no other houses to be had, so they 'll pay Josephus Flint more and more—and more'——

His words ended in a cough, and with difficulty he regained his breath. There was a cackle of laughter from the aged servant, who tremblingly ran his fingers over his colourless lips, as though the jest were so good that he begrudged the escaping of any of it in merriment.

'Mr Flint,' said the young man, glancing for encouragement at Barbara's beaming eyes, 'I love your daughter. I have loved her now for many months, and I cannot live without her.'

'Ah — he loves her,' sneered the miser, apparently speaking to no one in particular. 'He didn't know anything about her being an only child, nothing about her father's money —oh, no—nothing at all about the money. Hark 'ee, Smithers—hark to him raving about my daughter, and never a word about the money I 've scraped and worked and starved and fought for. Hark 'ee, Smithers.'

Thus appealed to, the old servant opened his mouth wide, and from its toothless interior came a faint, subterranean sound, no louder than the mew of a kitten.

'Sir,' said the young man, 'you wrong me cruelly. I don't need a penny of your money—Barbara is all I want.' At which statement the young lady mentioned cast such an affectionate glance upon him that further speech became quite impossible.

'The girl,' said the miser, 'has no mind of her own. She 's only a chit of a thing, and thinks as how every monkey-face that looks sweet at her wants her for a wife. I know your game, young fellow. You 've got a smooth tongue that can fool her, but you can't come over Josephus Flint. He wasn't born yesterday—no, nor the day before neither. Eh, Smithers?'

'Mr Flint,' said the young suitor, 'I have asked Barbara to become my wife.'

'And I tell you,' cried the miser, his thin voice rising almost to a scream, 'that she 'll not have you—and all your sneaking around here won't get you no further.'

'But,' said the young man, biting his lip with suppressed anger, 'she can speak for herself. She 's old enough to know her own mind.'

'Nothing of the sort,' cried Flint. 'She 's a child—a silly, brainless thing, as every skulking hound that wants her father's money tries to be sweet with.'

'Oh, Jerry,' said Barbara, wiping a tear from one of the twin jewels, 'I think you had better go.'

'Never!' said Jerry, with a repetition of the before-mentioned hyperbole.

'Her advice is good,' sneered Josephus Flint; 'the door works both ways, and will let you out same as it let you in. So out you go, my strutting peacock, and don't let me see your fine

Christmas Number.

feathers about here no more unless you want them clipped.'

'Sir,' said the young man, taking a very slight step forward, which so startled Mr Flint that he staggered back into the arms of old Smithers, 'if it weren't for your daughter I'd take you two old devils by the scruff of the neck and drown you like cats in a tub. You're a scoundrel, sir; and when you insult me, and your daughter too—which is far worse—you do so because you know your age protects you.'

'Begone,' cried the miser, an ugly pallor mixing with the disagreeable yellow of his face. 'Begone, afore I put the dogs on you.'

'Go 'way,' bleated Smithers, shaking a long, shining finger over Flint's shoulder. 'Go 'way.'

'Yes, Jerry dear,' pleaded Barbara, 'please go. Father will be all right directly.'

'Barbara,' said Jerry, 'come with me. There's no law, written or unwritten, that can keep us apart if you really love me. Get a few things together at once, and I'll warrant that you'll leave the house unmolested.'

'Smithers,' shrieked the miser, brandishing his stick, 'hark to him. You be witness to his trying to abduct my daughter. There's a law for that, Smithers, and I'll have it on him if it takes every penny I've scraped together.'

'Mr Flint'—— said Jerry quietly.

'Ah—"Mister Flint! Mister Flint!"' shrieked the old fellow in a tempest of rage—'that's your song, you parrot; but it will be "Mr Turnkey, Mr Turnkey," for you, my fine fellow. Breaking into a man's house, assaulting his servant, trying to steal his daughter—there's a law for that. And, for all I know, that may be only your excuse for robbing the house.—He was alone here, Smithers! He's been robbing us! He's been robbing'—— His voice rose to a scream, and ended in a fit of coughing, which discoloured his face a horrible black; while Smithers slapped him on the back, and crooned toothless mouthings of encouragement and sympathy.

'Sir,' said Jerry, 'I will go—but you have not heard the last of me. If Barbara will be my wife, I shall come and take her, even if you bar every window and door six feet deep with the gold you've stolen from the poor.'

'Libel!' yelled Mr Flint. 'Blackmail! Threats! I'll have the law, Smithers—I'll'——

'Call the law as loudly as you like,' said the young man disdainfully, buttoning his cloak about him and reaching for his hat; 'but some of these nights you'll have visitors here that the law can't touch. Watch out, Mr Flint, that the man who has wronged the living so long may not be punished *by the dead*.'

There was a choking sound from the miser; his face was livid, and the rattling sound in his throat seemed startlingly loud. Weak with anger and terror, he pulled the collar from his throat to ease his breathing, and turning helplessly to old Smithers, leaned on his shoulder for support.

'Conspiracy,' he said faintly, 'everywhere. . . . All against me. . . . It's Jack Fish's doing. I'll have the law on him . . . dangerous . . . lock him up. They're all against me—Smithers—my own daughter . . . everybody . . . against me.'

'No, they ain't,' squeaked the old servitor, patting the miser's shoulder with his bony hand. 'I ain't again' ye, Mas'r Flint. You be a good mas'r to old Smithers these forty year. I ain't again' ye.'

'Conspiracy,' moaned the miser, his whole body trembling. 'They don't come out in the open. . . . They won't fight fair. . . . They try to frighten me, Smithers.'

'I know, mas'r,' croaked the servitor. 'Go 'way'—he shook his finger at the young man—'ye have no business here. Ye be a beggar—that's what ye are. Go 'way.'

'Barbara,' said the young man, 'is it your wish that I go?'

'Yes, yes, dear,' said the girl bravely; 'I must stay with father. Perhaps in a couple of years I could see you again.'

'But you do love me, Barbara?'

'Oh, Jerry!' said Barbara, and burst into tears, which the young man checked by vehemently catching her in his arms, imprinting a kiss on her lips, stamping past the two old men, conferring a snap of the fingers on them as he did so, and leaving the house—performing the whole series of actions in a little less time than it takes to record.

As he reached the avenue, the rain, which apparently had been waiting for him, came down in an absolute deluge. Pulling his hat tight down on his ears, the young man of the downs walked sternly away, the rain splashing off his hat in such torrents that he looked like a figure in a fountain that had suddenly decided to go for a walk.

IX.

It will have been noted by this time that Dr Octavius Jellybud possessed a deep fixity of purpose. Duty to him was as the magnetic north to the needle of a compass, and just as compelling. When he declared he was going to see Barbara Flint that day, the entire king's army of horse and foot who were said to be unequal to replacing Humpty-Dumpty on the wall would have been just as helpless in preventing Dr Jellybud from attaining his objective.

Yet, even as mariners steering by a perfect chart have been known to run on shoals, the doctor suffered peculiarly from the diverting cross-currents which beset the human destiny. There never was a family physician who planned his day more ruthlessly; there probably was never one so unsuccessful in adhering to his plans.

In spite of his indomitable will, he was forced to realise that where Might (in the form of Jacob

Funnle's house) could not prevail, Treachery (in the person of Socrates), by deserting the straight road of duty for the avenue of ease and oats, could puncture the strongest armour of inflexibility.

But though temporarily drawn from his course, the doctor was not the kind of man to give up without a struggle. At the conclusion of his game of cribbage with Funnle he pocketed three shillings, and resolutely refusing to stay for luncheon, went out to the stables and superintended the harnessing of the indignant Socrates.

Waving his host farewell, he climbed into the gig.

'Good-bye, Funnle,' he said, indicating to his horse by a 'Chck!' that he was to proceed. The response very nearly threw the worthy physician by a back-somersault into the road. Socrates bolted forward a full length, and then did a shuffling, music-hall step that gave him a particularly misanthropic look, failing to advance the gig a single yard.

'Now then,' said the doctor, readjusting his hat and shifting himself several inches forward, 'none of that.—Good-bye, Funnle.'

After six repetitions of this spasmodic mode of transit (during which Nero was four times within an inch of having his brains kicked out), Socrates squared well away, and without further mishap they reached the main road, and went bowling along once more towards 'The Oaks.'

But the troubles of this man of iron will were not yet over. Rain has a habit of falling upon 'the place beneath,' as one of our first women barristers sagely remarked during the trial of a much-hounded Jew—a trial in which the young lady modestly assumed the rôles of prosecuting counsel, judge, and jury; and therefore, just as the doctor was within half a mile of 'The Fiddlers Three,' which he had to pass before gaining the road to Flint's house, the storm, which had so drenched the young man of the downs, came swift as wrath upon the doctor.

'Hello!' said the doctor, buttoning everything up and covering his head with a rubber cape; 'this is very remarkable for the time of year. I am very much afraid we'll have to put in at "The Fiddlers Three" until it passes.'

It was a wise resolution, for the rain was coming down with such force that it was rebounding a good foot from the road and turning the country-side into a network of muddy, running streams; and the rain being joined by a bolshevistic wind that did its best to blow the doctor and his gig clean back to Windbridge, progress was extremely difficult. At length, however, the friendly shelter of the stable was reached, and the grinning half-wit helped the practitioner from his pedestal.

With a kindly pat on the shoulder, which the poor fellow seemed to appreciate tremendously (for, if his brain was half-witted, that is not to say that he was half-hearted as well), the doctor shook hands with the landlord, no less a person than Abraham Fish, who had hurried out to take the doctor's dripping coat.

Opening the door for his guest, Abraham bustled about, putting new logs on the fire in the coffee-room, and ordering the buxom cook to prepare some chops right away; while an exceedingly pretty bar-and-house-maid was told to mix 'something warm' for the doctor, but first to bring some slippers to take the place of his wet boots. In fact, 'The Fiddlers Three,' instead of being a desolate, deserted tavern, as it had looked in the morning to Jerry, was turned into a hive of bustling hospitality; and as the doctor sat before the fire with a jar of tobacco handed from a shelf by the landlord, noting with approval that the pretty little bar-and-house-maid was squeezing a bit of lemon into the glass of 'something warm,' Dr Jellybud felt that, except for the three violinists (and, after all, that's an awful load of artistic temperament to have hanging around), his lot could compare very favourably with that of Old King Cole himself.

'Horrible weather, Abraham,' said the doctor.

'Very aggravatin',' said the landlord.

'Well, my dear,' said the doctor, accepting the steaming libation from the daughter of Bacchus, 'here's looking at you.'

'Go on with you,' said the young woman, blushing most agreeably, and coyly looking at the ground.

The phrase 'something warm' is a peculiar one. It may mean a great deal, and then, again, it may mean very little. In these days 'something warm' has a geographical quality, signifying quite a different thing in America from what it would, say, in Scotland; but whatever Abraham Fish meant when he used that phrase back in the times of which this story tells, the bar-and-house-maid must have given it a very satisfactory translation. Of course, the potion may have possessed only medicinal qualities, and the squeezing of the lemon may have been merely a 'gilding of the philosophic pill,' but no sooner were the contents out of the glass and inside the doctor than a gradual glow of comfort began to spread from his chilled feet to the bald spot, about the size of a half-crown, on the very pinnacle of his head. He listened to the logs roaring in the fireplace; he noticed the noiseless and endless activities of the pretty bar-and-house-maid; he smelt the fragrance of broiling chops, percolating gratefully from the kitchen; and a smile of such cherubic sweetness expanded over his plump countenance that if it could only have been put into a stained-glass cathedral window he might have passed for a medieval saint.

X.

The doctor was just relapsing into a reverie, the burden of which was the thought of how

pleasant a thing life was, when the front-door was violently opened, and a gust of wind, a swirl of rain, and a bad-tempered young man all came in together.

'Damme!' said the doctor. 'Close the door. Come in. Draw your chair up by the fire.—Abraham, here's a drowned man for you.'

'Can I get something to eat here?' said the stranger sharply as the landlord helped to divest him of cloak and hat.

'Directly, sir,' said Mr Fish. 'I'll hang your things up in the kitchen for to dry. Your feet be soaked, sir. Take off them boots and we'll have 'em dry in an hour.—Now then, Nancy—a glass of something warm for the gen'l'man.'

With rather a sulky air the young man received these hospitable ministrations, and with a curt 'Good-day' took his seat beside the doctor, draining his glass of restorative without so much as a glance at the officiating Nancy, who had assumed her most demure and captivating manner for the occasion.

'Disagreeable weather,' said the doctor.

'Infernal,' said the other, staring dreamily into the fire.

'You are a stranger to Windbridge?'

'Yes.'

As the new-comer did not deign any further information, a silence ensued, while 'The Fiddlers Three' rocked and creaked in the gale and the windows were hard pressed to resist the attacking torrents of rain.

'Visiting about these parts?' suggested the doctor interrogatively.

'No.'

'Just'——

'Yes.'

'I see,' said the doctor, who was just as wise as before, but, owing to his medical experience, had acquired the habit of appearing to understand exactly what every one meant. To be able to describe one's symptoms to a physician who says, 'I see,' is to experience complete mental relief on the spot.

'Disagreeable weather,' said the doctor again.

'Detestable.'

'For this time of year.'

'For any time of year,' said the stranger.

'But particularly for *this* time of year,' persisted the doctor.

'Well, it's very disagreeable, anyway.'

'Exactly,' said the doctor, quite convinced that he had proved a knotty point.

'Nice cosy little inn, this,' he went on after another lengthy pause, as the celestial odour of chops was wafted into the room. 'Ever been here before?'

'No,' said the young man; 'and there'll be two moons in the sky when I come again.'

'Now I gather,' said Octavius Jellybud thoughtfully, 'that something unpleasant has happened to you. I knew it wasn't just a bad liver at your age.'

The young man rose to his feet, and, crossing to the side of the fire, leaned against the stone frame, looking musingly into the flames.

'Sir,' he said, 'excuse my curtness to you. You will pardon me if you reflect that I crossed these grizzly downs in a drizzling rain, borne up by hope of seeing and claiming for my wife a young woman whom I had every reason to believe looked kindly on me, only to be ordered out of the house by her father, and—what is worse—being accused of trying to rob the place. Curse it, sir! if I were older, or he younger, I'd make him eat those words and shake him by the throat until they were well down his gullet.'

Dr Jellybud's face was a study of sympathetic understanding. Possessing a blighted romance of his own, he found his greatest joy in the romance of others; and the straightforward story of the young stranger had roused the keenest interest in him.

'But, my dear sir,' he said encouragingly, 'it will all come right.'

'Yes'—the young man shrugged his shoulders—'even Barbara said we might see each other again in a couple of years!'

'BARBARA?' The doctor sat bolt-upright and gripped the arms of his chair. 'Are you the lover of Barbara Flint?'

'I was,' said the other, 'though I did not mean to mention her name.'

'I might have known it,' cried the doctor, jumping to his feet and striding up and down the room, tossing his coat-tails violently as he did so. 'You're the chap—bless my soul!—you're the lucky scoundrel that captured our little beauty's heart, are you? I see—I've got it—clear as day. Here's my hand—Jellybud's my name—Dr Octavius Jellybud. What's yours?'

'Jerry'—— began the other, heartily gripping the doctor's hand.

'Jerry? That's enough,' said the practitioner energetically. 'Jerry will do for me—and there's something wrong if you and I, Jerry, don't do for old FLINT!' At which word, delivered with terrific energy, the doctor took a pass in the air with his right fist, then assumed an 'on guard' position that would have won applause in any sporting club in the country.

'Then you know Barbara?' said the young man soulfully, finding a melancholy pleasure in the mere mention of her name.

'Know her, my dear Jerry!' The doctor's frown vanished before the sunshine of his good-humour. 'Bless your heart! I officiated when she arrived; and as I said to her mother at the time—charming woman—never should have married that obnoxious specimen—I said, "There'll be tears in heaven at parting from this lovely little thing"—which were about the the last words the poor soul heard, for she fell sick of pneumonia from living in that damp house, and died a few hours later.'

Here the doctor blew his nose with such violence that it sounded like a trumpet.

'I am the most miserable man alive,' said Jerry, turning towards the fire with a countenance which lent considerable force to his assertion.

'Tell me all that happened,' said the doctor, resuming his seat, and, as was his professional custom, adjusting the glasses on the end of his nose. 'The only difference between whispering a secret down a well and telling it to a doctor is that a doctor can't be pumped; so out with it, Jerry.'

With lips that trembled angrily, the young man told the story of his visit: how he had proved that Barbara did love him; how their Eden was invaded by the serpent; how words had flown about like brick-bats; . . . and, in short, he told his tale with a manliness and a frankness that would have melted the most rugged nature.

'. . . Is it fair, doctor,' concluded the youth, 'that Barbara and I, who love each other so dearly, should be parted by this curmudgeon, who can see nothing for the greed blinding his eyes—is it fair?'

'No, sir!' cried the doctor, jumping up and sitting down violently. 'No, SIR!'

'I wish you had seen him,' said the young man, with a mirthless laugh, 'when I told him that the dead would get him yet. I guessed from Jack Fish that the old miser was superstitious, but I could hardly believe my eyes when I saw him with his jaw quivering and his whole body trembling like a jelly, as if he saw the ghosts in the very room.'

'Poor Jack!' said Abraham Fish, the landlord, who had joined the two guests, and had heard the last remarks. 'The silly lad's barmy in the nob. He always holds as how every Christmas Eve the old dead pirates and highwaymen—them as used "The Fiddlers Three" in the good old days—comes back here for an hour. It's a creepy thing, gents, when the wind's a-howling over them there downs, and the poor boy telling it like as if he hears the dead uns hammering at the door. It do be a creepy thing—and Master Flint is that scared that when he sees Jack he runs away as fast as his crooked old legs will take him.'

The doctor puffed at his pipe, but a trained physiognomist would have noticed that his eyebrows were lowered and his lips pursed up in an expression of deep mental concentration.

'For twenty year now,' went on the landlord, 'Master Flint do always come here on Christmas Eve. There he sits in that corner all by hisself—and when he thinks as how almost every one is gone, he sez, "Fish, a glass of beer for all these gen'l'men, at my expense." I don't know why he goes for to do it, and most of us would rather drink a glass of physic—beggin' your pardon, Dr Jellybud—than take anything from that there aggravatin' curmudgeon. But wishes don't get nowhere—and he'll be here this Christmas Eve same as before.'

Beckoning them to be silent, the doctor requested the young man and the landlord to gather close about him. He was almost purple in the face with condensed excitement, and his merry old eyes were shining like lamps.

'Listen,' he whispered. 'Listen to this.'

XI.

Whatever it was the doctor said, it must have been very amusing, for at its conclusion all three burst into such a prolonged and hearty laugh that poor Jack Fish came in at the noise, terror-stricken.

'What is it?' cried the half-wit, dancing about the room with his fingers extended in the air like the blades of an open fan. 'Burn the house! Scuttle the ship! Cut his throat! What is it? Ghosts and graveyards! What is it?'

'Jack,' cried the jovial doctor, 'here's a half-crown for you. You've earned it, my boy.'

With a gleeful laugh the idiot thrust the coin into his smock, and, with eyes rolling about in their sockets, left the room muttering and chuckling to himself.

At this point Nancy arrived to announce that the meal was ready, and proceeded to spread a table right where they were (it being the wish of the doctor and Jerry that they should eat together). After which they set to with such heartiness that Barbara Flint would have been more unhappy still if she could have seen the jolly look on the face of the lover so recently torn from her arms. As for the bar-and-housemaid, she waited on them so dexterously and daintily, and joined in their mysteriously boisterous good-humour so cheerfully, that on three occasions the doctor insisted upon placing his arm around her—a recognition of her charms which brought such outbursts of guffaws each time from the whole group that the buxom cook in the kitchen (who hadn't the faintest idea of what was going on) laughed herself into hysterics, and had to be restored with a drop of something from the bar. In fact, it was such a merry and noisy party that even Nero appeared at the door with the nearest thing approaching a grin ever seen on his super-melancholy visage.

'Then it's decided,' said the doctor, at the end of the meal, apropos of what they had discussed. 'You come and stay with me—my sister will be delighted—and on the way home we'll drop in and see Funnle.—Abraham, have Socrates harnessed.'

Half-an-hour later, with the stranger seated beside the doctor, the gig started off for 'The Briars' once more, and as the wind and the rain were behind him, Socrates established a record for speed that is still spoken of in awe by the villagers of Windbridge.

[*Christmas Number.*

XII.

Christmas Eve.

Windbridge, after lying disconsolate for two days in the grip of unseasonable rain, had been transformed into a shimmering, crystal fairyland. Early in the morning snow began to fall, covering the downs in a great blanket of white; clothing the naked trees in soft, clinging garments; embedding cottages in thick hoods; changing green hedges to furry palisades. Hour after hour the descending, fluttering hosts of snowflakes fell twinkling through the air. Tracks of passing vehicles were made, and obliterated as soon as made. On church tower, on pinnacles of trees, on creeping vines, the soft encroaching canopy of Nature fell, hanging its jewelry on them all.

And when, towards night, the storehouse of the skies held no more treasure, the moon appeared, with its alchemy of silvery blue, and touched the world with its star-tipped wand. Cottage roofs changed to glittering minarets; out on the downs the light of a solitary shepherd's hut became a sapphire glowing in a sea of satin white; the village itself was a twinkling street of little snow-bound palaces for gnomes.

It was Christmas Eve—that strangely gripping season of the heart; a time that means so much to children, a time when children mean so much to us; a passing hour when selfishness and greed and carking care fly up the chimneys like poor Jack Fish's sparks; when hearts beat faster, hands clasp tighter; when tears and laughter are nearer the brink, and old scenes and old friends are best. One moment in life's little day when kindly hearts can make a palace of a hut, or lack of them turn affluence to poverty.

Far out at the cross-roads, 'The Fiddlers Three,' deep-banked in snow, was all ablaze with merriment. A goodly company of villagers, as was their custom, had gathered for a jovial tankard and the easy badinage of hard-working, well-fed, honest souls. It is true, I grant, the conversation was not over-deep, nor dealt with things of metaphysical import. They did not immerse themselves in the Dead Sea of advanced socialistic thought, nor did they feel the subliminal uprush of those who by some hired medium strive to hitch this world to the next; but they *did* laugh, and they *did* sing; and when they wished each other the greetings of the season, they did not mumble or stumble over them. When they sang a foolish chorus, each man did his best to sing louder than his neighbour; and when they passed the hat for a crippled villager, they gave as they sang and laughed—cheerily, heartily, generously,

Milords and gentlemen, senators and scientists, presidents and potentates, is there nothing to learn in these troublesome times from the goodly gathering at 'The Fiddlers Three'?

It was nearly eleven o'clock when those of the villagers who had spouses to consider left, and the inn resumed its normal aspect. The logs were burning low, Nancy had washed and 'shined' every glass in the place, then retired upstairs, when the door was cautiously opened and the head of Josephus Flint appeared in the aperture.

'A Merry Christmas to ye all!' he croaked, addressing the three invariables who were attending the last moments of the dying fire.

With good grace they returned the wish; and the miser, stamping his feet to shake off the clinging snow, entered and took his customary seat back in the shadows, sitting without a word as his fingers played a querulous tattoo on his chin.

In a few minutes one of the perennials left, amidst a chorus of good wishes from his partners; and hammering the table with his stick, Flint summoned the landlord.

'Fish,' he said, with the disagreeable rattle of his throat, 'a glass of beer all round for these gentlemen.'

'All of 'em?' said the landlord, glancing at the two survivors of the party. As it was obviously a question which did not necessitate an answer, he retired behind the bar and filled three glasses, giving two to the guests and the third to the generous donor himself.

With a perfunctory 'Here's to you, sir,' the pair of villagers quaffed the foaming, twopenny draught, and then departed, having achieved the thirsty purpose for which they had remained.

Twenty minutes passed.

The smouldering logs glowed faintly in the fireplace; a solitary candle spluttered, almost went out, revived, drooped, and sent strange shadows playing grotesquely about the room. The inn that had been so noisy was as silent as a tomb set in the great white desert of the downs.

And still the miser sat with wrinkled, yellow brow supported by his lean, clawing fingers, his hungry eyes gazing into the smouldering fire. There was the soft sound of some loosened snow gliding from the roof to the ground. A blue ray of moonlight crept stealthily in through a window. Over the downs came the howl of a lonely dog.

XIII.

Midnight.

The miser still sat alone, wrapped in some dream of gold that left him lost to his surroundings.

Suddenly his thin blood froze in horror. There was a loud hammering at the outer kitchen door, the sound of a neighing horse, noisy voices uttering strange oaths. He heard the shriek of Jack Fish and the stamp of jingling spurs.

Staggering to his feet, the miser reached for his hat and strove to leave the room, but his feet were lead, and his trembling limbs powerless to move them. The voices were coming nearer;

the door was opening. He looked wildly over his shoulder, and with a moan sank to his knees and hid behind the chair he had been sitting in.

There at the door, in the almost total darkness, he saw two hideous faces. They were glowing like flames, as if two satyrs stood grinning into the fires of hell. Across the brow of the taller one, and enveloping his left eye, was a blood-stained bandage. The other's countenance was a murderous, red-bearded one, with an open sword-cut running diagonally across it.

'What ho!' bellowed the taller one, and the horror-stricken miser saw that he was dressed in the vile trappings of a pirate, knife, cutlass, and all. 'Some rum, landlord; and, look ye, blackguard, make it boiling hot, for sink me by the head if that grave of mine doesn't grow more rheumaticky every year.'

With clumsy, stumbling steps and terrified countenance, Abraham Fish appeared, and taking two bottles from the bar, hurried towards the kitchen. Through the door Flint could just make out the jibbering figure of the half-wit muttering wildly to himself as he sat, cross-legged, on the floor.

'One moment, by Jupiter!' said the shorter spectre, drawing a pair of enormous pistols from their holsters and halting the landlord as he was just leaving the room. 'Are we alone?'

'Y-yes, s-s-sir,' stammered the landlord.

'Cut his throat,' said the pirate in a blood-curdling voice; 'throw him down the well.'

'W-would you care for a light?' asked the proprietor. Josephus Flint's heart distinctly stopped, then resumed its beat at a greater speed than ever.

'Goggles and gutter-snipes!' swore the shorter ghost, juggling a pistol and narrowly missing a tumble as his enormous spurs interlocked. 'Begone and fetch the rum, or hang me to the nearest gibbet if I don't puncture your windpipe.'

Not waiting for a second intimation, the landlord bowed low and precipitately disappeared as the pirate drew his enormous cutlass and took a heavy step in his direction.

'Well, Turpin, my lad,' said the pirate, putting down his cutlass on the floor and drawing up a chair to the table in the centre of the room, 'are you ready with the dice?'

'Squirks and skittles!' ejaculated the other, whose costume bore out the fact that he had once been a highwayman, and whose bearded, maltreated face looked blotched and hideous in the meagre glimmer of the persistent candle. ''Sdeath! but my fingers itch to feel the scoundrel's throat.'

'Now then,' said the other, reaching for his cutlass and laying it on the table, 'let us understand each other *verbatim et literatim*. Three throws of the dice, and the winner of two takes Master Flint along with him.'

'*What's that?*' cried the highwayman, jumping to his feet and pointing his pistols recklessly around the room.

'WHAT'S WHAT?' roared the pirate, lunging into the dark with his cutlass.

'Slugs and squashes! Methought I heard the rattle of some villain's throat.'

'Hop aboard me!' cried the pirate, making the air sing with his cutlass; 'where is the yellow-livered scroundrel? I'll carve him. I'll change his architecture!'

In spite of this opportunity for improving his figure, the listener remained hidden, one hand clutching the chair, the other holding his jaw lest the noise of his chattering teeth be heard. After the two diabolical figures had uttered a few more oaths and threats, they sat down again, the cutlass was once more put on the table, and the pistols were replaced in their holsters.

'Now then,' said the rather stout highwayman, 'your deal'——

'Lash me to the mast!' roared the bandaged robber of the sea, taking a pair of dice from his pocket and shaking them about in his closed hand. 'Roll for me, my beauties—roll high for your favourite uncle.—What is it, Dick?'

'Gumph and snuckles!' cried the highwayman. 'Three.'

The pirate grasped his cutlass, but changing his mind, folded his arms and looked hideously over his bandage as his opponent threw five.

'By my skull!' muttered the seaman, reaching angrily for the dice; 'am I to be thwarted of Master Flint's company just as I've at last worked it out so we sha'n't be crowded in my grave? Roll for me, you little angels—roll for your handsome uncle. Come, eleven!—What do you say to that, Jel—Turpin? Eleven it is.'

'As to that,' sneered the highwayman, 'accidents will happen.'

For a moment the two ghosts glared ferociously into each other's faces.

'Rake me fore and aft!' roared the pirate, '*vivit post funera virtus*—which means that, though the undertaker have you, virtue will emerge triumphant. Give me the dice—this is the time we throw the grappling-irons upon each other.'

'Curse me!' ejaculated the other, 'but I'm dry as a skeleton.'

'Well said. What ho! Landlord! What of the rum?'

'C-coming, gents,' cried the voice of Abraham Fish, and a moment later he appeared with two steaming glasses of what looked extraordinarily like the beverage known as 'something warm.'

'Boots and bottles!' said the highwayman, taking a sip. 'Tell me, rogue—and if thou liest may the saints protect thee!—dost know a fellow by the name of Flint?'

'I d-d-do, sir.'

'Not so much "d-d-d-o" and more talk,' muttered the pirate, fingering his cutlass.

[*Christmas Number.*

'Where doth he abide, rogue?' asked the portly shade of the lamented Turpin.

'Down the road, a good three-quarters of a mile from here.'

''Tis well. And tell me, donkey-face, what say they of Master Flint in these parts?'

'Nothing good, your honour. He be very close with his money.'

'Ha, ha!' roared the pirate. 'Scuttle the frigate! but he'll be closer still when he lies beside me in the grave.'

'He was here, gents, only an hour since.'

'Gumph and snuckles!' cried the red-bearded Turpin, drawing both pistols again. 'Have we missed the scoundrel, then?'

'Enough of talk,' said the pirate. 'Let's to the dice. Then, when 'tis finished, we'll on to Master Flint's house, drag him out by the heels, and make him answer to a tribunal of ghosts the charge that he has robbed and hounded the poor, tortured the helpless, and soured the lives of his fellow-men.'

'Hear, hear!' said the highwayman; 'for, though in our day we've murdered many and robbed a goodly number more, we never yet took money from the poor. And so, my lad, it is your roll; then to the Merrie Gentlemen with good Master Flint between us.'

'A last throw,' muttered the pirate, shaking the dice. 'By the Jolly Roger! I never failed at love or gambling yet. If you love me, my beauties, roll 'em high; if you love me, give me my little Flint to fondle and strangle in my mouldy'——

There was a cry and a horrible rattle of a man's throat. With his face so pallid that its gleaming surface challenged the fiery horror of the ghostly visitors, Josephus Flint staggered forward and fell upon his knees.

'Squirks!' roared the highwayman, covering him with both pistols and upsetting a chair by catching it with his spurs.

'Sink me, by Jupiter!' bellowed the pirate, dropping the dice and picking up the cutlass.

'Throw him in the fire! Stir it up, landlord.'

'No, no—drown him. Cut his throat and drown him.'

'Mercy!' shrieked the miser, imploring it with clasped, trembling hands. 'Awful spirits of the past, have mercy.'

'Who is the blackguard?' cried the pirate.

'Wax and waistcoats!' roared the highwayman, 'what's his name?'

'Flint,' said the landlord, peering into the miser's lowered face.

'WHAT!' shouted the pirate. 'Rake me'——

'Prime my cocking-piece!' cried the highwayman, endeavouring to pull back the firing-pins of his pistols, and, considering his life's calling, displaying an extraordinary ignorance of their mechanism.

'Mercy!' moaned the miser. 'Ghosts of the bygone past, mercy!'

'What mercy have you shown to others?' said the pirate, noisily sharpening his cutlass against the heel of his boot. 'Stand up till I cut your throat.'

'I'll make it right,' cried the miserable Flint, shaking and quivering like a leaf in a gale. 'I'll pay the money back. Don't bury me alive—*alive!*' Josephus Flint fell forward, clutching at his throat and coughing horribly.

'Poison him,' suggested the highwayman unfeelingly, still deeply engrossed in the obstinate nature of his firearms.

'Spirits sent from the grave to haunt me,' whimpered the miser, 'mark my repentance. I have been cruel. I have extorted money from the poor. Mercy! Mercy!'

'Boil him in oil,' said the highwayman, handing a pistol to the landlord to see if he could unravel its complexity.

'Hold!' said the pirate, dramatically pinning the cutlass into the floor and missing his right big toe by the fraction of an inch. 'We must deal with this malefactor *recte et suaviter*. The villain has confessed — he offers restitution. Let us hear him out, for it is *lex terræ* to allow a prisoner to speak for himself before you hang him.—Look you, Flint, wouldst save thy hang-dog life?'

'Mercy!' moaned the cringing miser.

'Very well,' said the pirate, adjusting a pair of glasses over the blood-stained bandage. 'Turpin, I see some ink and a quill upon the shelf. Pray give it to the hound. Good!—And now, Master Flint, rise up.' He prodded the miser with the point of his cutlass, causing him to squeal like a stuck pig. 'Sit down there.'

'There,' repeated the highwayman, grasping the sorry figure by the shoulders and shoving him so violently into the chair by the table that every bone in his body was jarred, his teeth meeting with the click one hears when a boxer catches a gaping opponent an 'upper-cut' on the jaw.

'You swear,' said the pirate, 'that you will tell the truth, the whole truth, and nothing but the truth, so'——

'Here's the remains of a candle,' said the highwayman, carrying the tenacious bit of tallow to the table and thrusting the barrel of an uncocked pistol into the miser's ear.

'Write,' said the pirate.

'Take it down,' echoed the highwayman.

'"I hereby swear,"' dictated the follower of the black flag slowly, '"that I have grossly overcharged the following of my tenants"—— Landlord, recite the names; and if you value your donkey's ears, leave not *out* one.'

'Leave out *not* one,' corrected the highwayman.

'So far as I remember, gents,' said the landlord, who had apparently grown quite used to his uncanny visitors, 'the names are'——

'Take 'em down, by Venus!' thundered the pirate.

'Ned Clarke,' went on the innkeeper, 'Widow M'Gregor, Sam Heeling, Joe Green, Silas Walker, Brown the chemist, and Martin Sutherland.'

'Got that, yellow face?' said the pirate as the stuttering pen finished its scratchy journey over the surface of a large sheet of note-paper. 'Now then, write on—"and therefore I agree to refund one-half of all rents charged for the last five years, and further to reduce all rents to one-half their present amount."'

The trembling hand of the miser was poised protestingly over the paper.

'Gutter-snipes!' bellowed the fiery-faced and fiery-natured highwayman, bringing the handle of a pistol smartly on the knuckles of the writer; 'you would, eh?'

With a howl of pain the poor wretch thrust his bruised knuckles into his mouth, but at the brandished cutlass he hurriedly resumed his writing.

With whimpering tears the miser wrote on for half-an-hour as the pirate (who was extraordinarily well informed on Mr Flint's private affairs) dictated his act of repentance and restitution for the usury he had practised, the securities for petty loans he had annexed—in short, thoroughly covering the whole avenue of inhumanity which had made one man's wealth by the misery of others.

'Now sign,' said the pirate sternly.

'In blood,' said the red-headed highwayman.

'Ink,' corrected the chief inquisitor, motioning his fellow to be quiet. 'Landlord, sign as witness. Good!'

'And now,' moaned the miser, wringing his hands, 'let me go home. I'm worn and old. My blood's all chilled and my bones be shaking with the ague.'

'One moment,' said the highwayman. 'You have a daughter.'

The miser said nothing, but his shrivelled lips mouthed impotent nothings, his eyes turning weakly away from the horrible bearded face with its glowing sword-cut.

'She has a lover,' went on the gentleman of the road.

'I deny it,' cried Flint; 'a villainous jackanapes as wants nought but my money.'

'You lie!' bellowed the pirate.

'Guggles and mugglesquirks!' roared the late Turpin; 'cut his throat.'

'Write,' said the pirate sternly.

'Take it down,' added his portly friend.

'"I hereby agree,"' dictated the outlaw of the seas, '"to the immediate marriage of my daughter Barbara to Jerry"—— What's his other name, Turpin?'

'Now, damme!' said the highwayman, 'I never asked him that.'

'It is of no consequence.—Proceed: "to Jerry; and to show my joy in such a happy union I herewith endow my daughter with the sum of one thousand pounds."'

'Mercy!' whined the miser.

'Write,' said the highwayman, 'or we'll slaughter you, and let the buzzards have your carcass for their Christmas meal.'

'Very good,' said the pirate, examining the completed document, and replacing his spectacles in their case. 'I shall leave this with the local magistrate, and—— Listen, Turpin; I hear the horn. Our time above-ground is finished, and the coach is calling us.—Flint, in place of your sordid soul let me advise *mens sibi conscia recti;* and do not forget how brief is the span of life to expiate your many crimes. Take warning, Master Flint, and all of those who live like you, that he who prospers by the misery of others lives after death in constant torture of remorse. Let the spirit of your repentance exceed the act. For I warn you, should you fail to fulfil this long-overdue reparation, that a traveller on the mighty Sahara could more easily escape the rays of the sun than you could avoid the clutch of our ghostly, ghastly, grisly revenge.—Turpin—away!'

'Lead on, old fellow,' said the highwayman, pocketing his pistols and following the high-minded pirate from the room.

Heedless of the jingling spurs and the excited jabbering of poor Jack Fish, who had been waiting outside in a wild fantasia of delight; heedless of the voices of the departing ghosts mingling with the landlord's—and one that sounded strangely like Jerry's—Flint sat trembling at the table, gazing with unseeing eyes into the eerie blackness of the room.

The obstinate candle uttered a final gasp and went out. A breath of wind down the chimney stirred the charred ashes of the fire.

From the downs came the howl of the lonely hound.

XIV.

Christmas: Sunday morning.

Clanging on the frosty air, the old church bell rang out its call to service, and soon the tranquil street, smothered in snow, was dotted with villagers emerging from their cottages. Quietly, as befitted the day, but with hearts brimful of human kindness, these humble sharers of a simple destiny uttered the old, old Yuletide greeting; and as they made their way through the deep drifts of snow, sparkling like diamonds in the sunlight, the pleasant odour of cooking goose and roasting turkey from busy kitchens reminded them that temporal pleasure would follow hard upon the heels of spiritual exercise.

Even the old church, decked with holly and evergreens, took on a festive look as a golden ray of sunlight stole in through St Peter's Window, and irreverently rested on the bald pate of the rector, who was in such rare form, when

he chanted the service, that every one said it was as good as an archbishop and twice as natural. Though, not to be outdone by the Cloth, Jacob Funnle read the lessons so impressively, and rolled the old Hebrew names about with such magisterial dignity, that the eyeballs of the children nearly came clean out of their settings.

But the choir was the thing!

It sang so lustily that the sainted windows rattled as if in a gale (Dr Jellybud singing two notes higher and several tones louder than any one else), while red-cheeked girls who sat in the two front rows indulged in the usual pretence of maidenly bashfulness (but made a pretty joyful noise for all that), and tried to keep their eyes off that handsome tenor, George Smith, the chemist's assistant.

The anthem was announced. It was a 'Te Deum' that started with a long note on the organ, followed by a dynamic, triple *fortissimo* Wagnerian outburst on the word 'We.' But just as the nineteen members of the choir had come in on a terrific 'We' in nineteen variations of the pitch, something happened, and the whole thing came to a sudden stop.

The rector rubbed his eyes; Jacob Funnle put on his spectacles, took them off and wiped them, and put them on again; Sam Heeling turned completely round, forgetting all about his organ; while the boy who blew it walked right into the centre of the chancel, where he could get a good view. Only Joe Green, who had got away to a wonderful start in the 'Te Deum,' went all the way through to 'the goodly fellowship of the Prophets' before he realised that he was the only one singing.

Coming up the centre aisle, with Barbara (whose absence from the choir had been greatly lamented) on his arm, and Jerry walking on the other side, was Josephus Flint. Behind them, carrying a Bible and looking furtively to each side, was Smithers, the aged servitor.

If 'The Fiddlers Three' had picked itself up and gone for a stroll, or if the church steeple had started turning somersaults, the inhabitants of Windbridge could not have been more surprised. In absolute silence they watched the miser, who had never been in the church before, enter an empty pew; while Barbara found the place for him in the book, and Jerry stood up beside her so straight and handsome that the spell of the chemist's assistant over the sopranos was broken for ever.

There is no saying how long this tableau might have gone on if Dr Jellybud had not risen magnificently to the occasion. Seizing the anthem-book and emitting a stentorian 'WE,' he started the 'Te Deum' off in so high a key that, though the whole pack followed gamely after him, probably never before or since has a choir made such faces or such extraordinary sounds (for the rest of the day most of them could speak only in a whisper); and as for Sam Heeling, as soon as the boy had resumed blowing, he tried to head the doctor off in every key known to Christian and Pagan musical composition, failing utterly, but establishing an undying reputation for virtuosity and sportsmanship.

Under this extra inspiration the rector's plea for the collection on behalf of the poor was so eloquent and moving that the women produced a veritable snow-flurry of handkerchiefs, and men jingled sixpences together in their pockets, hardly able to restrain their eagerness to be up and at the collection-bags. When it came the turn of Josephus Flint, he put in four half-crowns. It's true, he was so overcome with giddiness directly afterwards that he was forced to sit down, while old Smithers patted his back and did his best to revive him—but he gave the four half-crowns, for so it is written in the annals of Windbridge.

XV.

When the service was over, what a pent-up flood of good feeling broke loose! They all shook old Flint's hand, as if he were the villagers' life-long benefactor, and crowded around his daughter; while the sexton, quite overcome by the scene, rang the church bell for a full half-hour without stopping once.

Just as the miser was breaking away from the crowd, Dr Octavius Jellybud bore down on him, and refusing to accept any excuses, took the old man off to dinner. The ubiquitous Funnle followed close behind with Barbara on his arm, Jerry and Miss Jellybud coming along behind them, and old Smithers bringing up the rear, wagging his head and expressing mumbled doubts about the whole business.

What a dinner!

Of course, there may have been other Christmas dinners just as sumptuous as that of the Jellybuds; but to this day, whenever the rector refers to the Babylonian feasts of Belshazzar, the minds of the congregation invariably visualise that famous repast at the doctor's. It is a fact, not a figure of speech, that the table groaned with good things, and the more it groaned the louder every one laughed.

For, even if the viands have been equalled (which I strongly doubt), you would have to search a long time to find a merrier party. At the place of honour was Ned Clarke, his sturdy frame bearing his dignity of years like the fine old oak he was. Opposite him was the Widow M'Gregor, whose sagacious Scottish comments on the day still live among the before-mentioned annals of the village. Then there was Jacob Funnle at one end of the table, so full of anecdote and good-humour that it was extraordinary where he found room to put the army of good things which he ate. But he had a rival. Sam Heeling was there with his wife;

and throwing aside the cares of choir leadership, Sam got off so many side-splitting jokes (most of which had survived the test of time) that it was an absolute miracle any one got a mouthful down without choking to death. Nor was the rector far behind Funnle and Heeling, 'getting off' one himself (with considerable prompting by his wife) that made Abraham Fish, who was sitting opposite him, declare he would have made a fortune as an innkeeper.

Out in the kitchen the buxom cook of 'The Fiddlers Three' was in full charge, laughing louder than any one else; and—since who wants to dine at an inn on Christmas Day?—there was Nancy, the bar-and-house-maid, helping to wait at table, looking as pretty and appetising as a northern snow-apple. And as the doctor was never a man to do things by halves, a separate table was set, where poor Jack Fish sat chuckling softly to himself, with old Smithers as a dinner partner, the latter keeping his head cocked to one side, listening for the voice of his master, and mumbling delightedly every time he heard it.

There was a toast to the lovers, Barbara blushing so prettily that every man grew envious of Jerry on the spot; while Jerry's reply caused the Widow M'Gregor to whisper audibly that he 'wasna unlike Sandy M'Gregor hissel', but no sae gleg-lookin'.'

There was a second toast to the doctor's sister. And was there ever a soul deserved it more than that busy little woman of a hundred household cares, waiting and smiling on every one—finding such pleasure in the giving of pleasure—losing herself in sublime sympathy for others!

There was a third toast to Josephus Flint; and though he did not reply, his twitching features showed he was learning that gold is not the only treasure of this life.

'Ladies and gentlemen,' said the toast-master—no less a personage than Jacob Funnle—'I give you our host.'

Is it anything against the little doctor that, as he looked around the group of happy, glowing faces, his twinkling eyes were suddenly dimmed? Was he less a man because his lips trembled slightly when he said how happy it all made him? There he stood at the head of the table, one hand playing with an enormous watch-chain, and the other stroking the head of the melancholy Nero, who was resting his forepaws on the table, and looking as mournful as if the whole cost were coming out of his personal pocket. There the doctor stood, and there we shall leave him.

Would, in this first Christmas of Peace, that more hearts swelled up with goodwill to men as did that of the sturdy little family doctor that Sunday, many years ago!

L'ENVOI.

So this little story of the village by the downs comes to its close.

Flint did everything he promised, and more—but I don't think he ever enjoyed giving. On Christmas Eve, attended by Smithers, he always went to 'The Fiddlers Three' and 'stood' a glass of beer all round, but he made sure to be home before midnight. Sometimes he would go to visit Barbara and Jerry in Surrey, and would always have a gift for little Octavius and littler Jacob, but he seemed happier in his own dreary home in company with the toothless Smithers, who looked upon him as the kindest master in the country.

As to the 'Merrie Gentlemen,' carping sceptics have tried to maintain that the ghostly visitors weren't ghosts at all. It has even been said that in the books, for that date, of Willy Clarkson, the ageless theatrical costumier of Wardour Street, London, the following items occur: 'One large-sized pirate, complete with cutlass; one stout highwayman, complete with pistols; phosphorus, grease paints, &c.'

But the villagers of Windbridge will have none of it.

If you have any doubts yourself, why not watch the sparks emerging from the chimneys on a Christmas Eve? Note the direction of the wind, and follow them into the dark. Perhaps you will find the place where they keep the ghosts of departed stage-coaches.

If you do, don't fail to look for a yellow gig with glaring red wheels, for it once belonged to the last of the old family doctors.

THE GARDEN OF MY HEART.

THE little garden of my heart
Is very dear to me;
'Tis cradled 'mong the quiet hills,
And shelter'd from the sea.
'Tis gay with sweet old-fashion'd flowers,
The flow'rs I love so well;
It draws me, when I'm far away,
And holds me like a spell.

The little garden of my heart
Is sweet beyond compare;
The dove of peace her shining wings
Methinks has folded there.
'Tis there my childhood's days were spent—
'Tis *there* I'm fain to be
When at the setting of Life's sun
Comes one clear call for me.

M. HEDDERWICK BROWNE.

'IMPHM!' SAID MRS KNOX.

By MARY STUART BOYD,
Author of *Kavanagh's Lucky Bean*, *The Fortunate Isles*, &c.

CHAPTER I.—HER HUSBAND'S SECRET.

MRS KNOX sat by the kitchen fire in her top flat in Apsley Place, Glasgow, one December night a dozen years ago. The brown teapot, which long use had stained black in parts, sat on the hob; but though its owner was an ardent tea-drinker, the contents held no lure for her that night. Her never buoyant spirits were at their lowest; and, as always when she became down-hearted, one question recurred to torment her—What had Knox done with the money?

It was the sole mystery of an otherwise apparently transparent life. Had Mrs Knox voiced her opinion of her spouse before a paralytic seizure robbed her of his companionship, she would confidently have asserted that he kept nothing secret from her. Her firmest belief was that she knew his innermost thoughts. Not that she had esteemed those thoughts highly, or even listened very attentively when he sought to put them into words. But, after his sudden death, when she looked into his savings-bank book and discovered that, only a few days before he was stricken down, he had withdrawn £47, 10s.—a sum that constituted nearly half of his total deposit—she felt as though she had never really known her husband.

Since their early married days, when the signing of his name to oblige a friend had involved him in a grievous payment of fifteen pounds, John Knox had scrupulously kept the promise exacted by his wife never again to become surety for anybody. She knew he would not break his word, and he had no expensive tastes, so where the money had gone was a puzzle.

Knox's employers had not assessed the value of his services at an extravagant rate; but what he earned, combined with the sums paid by their two lodgers, had enabled the couple to live without privation, and even to save a little fund against possible rainy days.

At this moment the missing money would have been specially welcome, for, after Dennis Kavanagh had taken his hurried departure, the room he rented had stood empty, except during a disastrous fortnight when it was occupied by a good-looking and plausible young Englishman, who left without paying a penny, and in the going took with him a new Burberry rain-coat, a leather portmanteau, and a presentation silk umbrella, all belonging to Mr Cruikshank, the schoolmaster, who for several years had tenanted the two best rooms.

The weekly sum paid by Mr Cruikshank, Mrs Knox knew, was not sufficient to meet the rent and the taxes and to defray the cost of her food. Already she had been obliged to dip into the secret hoard that she kept hidden in a cracked jug behind the zinc pail and the scrubbing-brushes, in the little cupboard under the sink, where no burglar, however cunning at discovering concealed treasure, would be likely to look for it. The money still remaining in the savings-bank Mrs Knox regarded as the sole barrier between herself and want; dire necessity alone would have induced her to draw upon it. And now that Mr Cruikshank had brought matters to a climax by telling her that, from the beginning of the Christmas holidays, his apartments would be vacant, Mrs Knox felt convinced that her feet were set on the broad road that leads direct to the gates of the poorhouse.

A smart knock at the outer door, followed by three cheery little taps, proclaimed the arrival of a familiar visitor. 'That 's Mirren,' Mrs Knox told herself, hastening to admit her guest. Marion Weir, who was a niece of the late Mr Knox, filled the post of parlour-maid in a West End family. She had been fond of her uncle, and for his sake retained a kindly interest in his widow.

'Well, aunt, and how are you keeping?' Marion asked anxiously, impressed by her hostess's lugubrious demeanour as they sat by the fire. 'You look as if you were in a real bad way.'

Mrs Knox sighed dismally. 'My looks dinna belie me, then. I 'm on the straight road to the poorhouse.'

'To the poorhouse?'

Mrs Knox nodded with something of satisfaction in the gloomy prognostication. 'Aye; to the Govan Poorhouse. Imphm!'

'Why, whatever 's the matter now?' Mirren demanded.

'Mr Cruikshank has given me warnin', and when he leaves the whole house 'll be standin' empty, an' no a brass farthing comin' in, and the rent and taxes goin' on.'

'But Mr Cruikshank has been here a long time. What 's the reason he 's leavin' you?'

'He says it 's because he 's goin' out to Hillhead so as to be nearer his classes. But fine I ken that he 'll no stay in a house where he 's had a thief for a fellow-lodger. He 's never said it, mind you, but I ken he blames me for his property being stolen.'

'How can he blame you? You couldn't help it if that Smith turned out dishonest.'

'I see now I shouldna have taken in a stranger without askin' for what they ca' references.'

'Oh, havers! Whenever did you hear tell of anybody in Apsley Place askin' lodgers for references?'

'No ever,' Mrs Knox admitted somewhat grudgingly. 'But that disna alter the case. As I was sayin', lodgers are no so easy gotten now. An' in twa-three months I'll be roupit to the door.'

'Tuts, aunt! it's surely no as bad as a' that? You'll get plenty more lodgers if you have a wee thing patience,' Mirren made hopeful prophecy; though, as she thought of the dingy rooms, and of the savourless cooking, she mentally inclined to agree with her aunt's estimate of the possibilities. 'Your rooms have never stood long empty yet. And, anyway, if you're needin' money, I have some by me, and you're welcome to the loan'——

'It's no that,' Mrs Knox interrupted. 'I have something of my ain yet. But auld age is comin' on. I'll no aye be sae able to toil and fight. If I just had that siller that Knox made away with. Forty-seven pounds ten shillings, and it was gone—clean gone, as ye might say, in the twinklin' o' an eye!' she added impressively.

Mirren had heard the tale of the vanished money many times, and she hastened to change the subject. 'I havena told you my news yet. Peter's master is opening a new branch for house-painting in the South Side, and Peter's to be the manager of it. And Peter and me is thinkin' of getting married at the May term. If things was bad you'd be welcome to stop with us. And if you were wantin' to give the house a good clean when Mr Cruikshank's rooms are empty, I could come over and help. Peter might give us a hand with the whitewashing in his odd time. I'm to have a holiday, for Mrs Montgomery is going away.'

If Mrs Knox was interested in anybody beyond herself, it was in her niece's mistress, whom she had never seen. At the mention of the name of Montgomery her attention was instantly diverted from her own affairs.

'Keep me! She's no goin' away to anither of thae hydropathics, is she?'

Mirren nodded affirmation. 'Yes; she says she's needin' a change. It's to a big one in England this time. She's got a grand new evening-dress, and her fur coat relined with brocaded satin, and a transformation, as they ca' it, for her hair. It makes her look real young. Aunt, I wish you would get one. Mrs Montgomery's hair is as gray as yours, and she hasn't near as much of it as you have. A transformation would suit you fine.'

'Me! No, thank ye. A nice-lookin' object I'd be with ither folks' hair on my head!' Mrs Knox's tone might be scornful, but she was secretly flattered by the suggestion.

'Peter'll be waitin' for me at the close-mouth. I'll need to be goin'. You're looking real tired, aunt. Let me make you a bit of buttered toast for your supper afore I go.'

'No supper for me,' Mrs Knox said firmly. 'I'm feelin' that bilious that I'll take naething but a pill and a cup of tea the night.'

When Mirren had joined her sweetheart, and Mrs Knox was left alone, her thoughts kept turning enviously to Mrs Montgomery. 'I doubt if she has ever done a hand's turn in her life. No a thing but dress herself up, and jaunt about. An' here's me, that has worked hard all my days, has naething to show for it but a yellow face and a bilious disposition with bein' kept too much in the house.' Rummaging in the dresser-drawer, she found the pill-box. 'I wish I had a thousand pounds, an' then I'd dress myself up in grand clothes and transformations, and be a fine lady an' live at hydropathics like Mirren's mistress,' Mrs Knox promised herself, as she stood holding the big pill-box in her hand. 'But it seems, when I need a change o' air, my portion is jist to bide at home and take a pill!'

It appeared, however, as if fortune would deny the good lady even that cheap solace, for, when Mrs Knox opened the pill-box, it proved to contain only a curious crescent-shaped lucky bean—the 'wish-bean' she had raked out of the ashes of the fire when Dennis Kavanagh flung it there on the eve of his departure, confidently believing he had made an end of its occult powers for ever.

CHAPTER II.—WHAT THE OLD DESK HELD.

IT was so seldom that any communication reached her by post that the following morning, when the postman delivered the missive that was fated to change her whole outlook upon life, Mrs Knox did not trouble even to glance at the address, but, from sheer force of habit, took it in to Mr Cruikshank, who, as usual at that hour, was engaged in bolting his breakfast before hastening off to his pupils.

'This isn't for me, Mrs Knox,' he exclaimed, as she was leaving the room. 'It's addressed to your husband.'

Carrying away the letter without comment, Mrs Knox went close up to the kitchen window to read it. 'John Knox, Esq.,' was legibly typed on the face of the envelope. The back bore the stamp of the Universal Insurance Company.

The formal aspect of the document awoke vague forebodings in the breast of the widow, and stirred afresh her ingrained distrust of her husband's business capacity. 'What has Knox been doin' now?' she asked herself testily, forgetting that for nearly a year Mr Knox's behaviour had ceased to have power to fret her.

Opening the envelope, Mrs Knox was amazed to find a printed notice in which the Universal Insurance Company informed John Knox, Esq., that the premium on his life insurance policy, No. G74183, would fall due on the 20th December, and must be paid within one calendar month thereafter.

Putting on her spectacles to see more clearly, Mrs Knox re-read the bewildering document, then read it again slowly aloud, still without gaining any understanding of its purport. She had just resolved to ask Mr Cruikshank's opinion when his quick step in the lobby, and the sound of the door shutting behind him, showed that she was too late, and that, did she wish to consult him, she must await his return.

As she went about her housework Mrs Knox became more and more anxious to learn the meaning of the mysterious intimation. All she could gather from it was that a sum of money owed by her deceased husband was due, and must shortly be paid. Her sorely perturbed mind lost no time in deciding that some rash action of her husband's had involved her in an outlay she could ill afford.

'It was just like Knox to die sudden, and leave me with a thing like that on my hands; an' them full enough as it is,' she thought bitterly. 'I'm sure, if I told him once, I told him a hundred times that he had nae head for business speculations, an' should leave them alone.'

As the day wore on Mrs Knox's apprehensions increased. She became too impatient to wait for Mr Cruikshank's return, and decided to consult Mr Forbes, the house-factor. On his office door she had noticed the brass plate of a fire insurance company. From that the astute dame deduced an understanding of life insurance that might be qualified to reveal the inner meaning of the disturbing epistle. And as Mr Forbes was not actually a certified lawyer, she thought he would be unlikely to charge a fee for his advice.

Since the occasion ranked as an important one, Mrs Knox dressed herself, putting on the handsome widow's weeds that she had bought before she discovered the appalling deficit in the family savings. Mrs Knox was tall; she carried herself well; and in the black raiment she looked an eminently respectable—even a dignified—figure of woe.

On entering Mr Forbes's office she was annoyed to find him already engaged interviewing a neighbour, Mrs M'Whisten, with whom, owing to a difference of opinion regarding the rightful custody of the washing-house key, she had, for a considerable period, been on strained terms.

As she waited in the outer room in company with the office-boy, Mrs Knox could hear Mrs M'Whisten expatiating at length on her wrongs, which in this instance appeared to culminate in the dastardly behaviour of certain boys who had played 'tig' among her clean linen when it was hanging out to dry, and who, when reasoned with, had climbed on the roof of the washing-house and shouted opprobrious epithets at her.

'You leave these laddies to me, Mrs M'Whisten. Don't you worry any more about them. I'll make them sorry they were born before I'm done with them,' was Mr Forbes's comforting assurance, as he showed the irate lady out.—1919.]

'Well, Mrs Knox, I'm glad to see you. What can I do for you to-day?'

When Mrs Knox had explained the nature of her errand, Mr Forbes examined the paper critically. 'That's a good company, anyway,' he said. 'Your husband was well advised to insure with them.'

'But Knox wasna insured at all. At least, I never heard tell of it, if he was,' she insisted.

'Mr Knox died suddenly—didn't he?'

Mrs Knox heaved a deep sigh. 'John took a stroke of palsy at a quarter-past nine o'clock on a Friday night, and passed away early on the following Monday morning, without ever speakin' an understandable word.' Her tone revealed a gruesome satisfaction in the tragedy of his passing.

'Well, all I can make out is that Mr Knox may have insured his life for your benefit, and meant to tell you as a pleasant surprise, say on New Year's Day,' Mr Forbes suggested, with his customary kindly way of anticipating the brightest side of possibilities. 'If that is the case, the insurance policy must be somewhere. You have the papers he left?'

'Knox had no papers that I ken of forby his savings-bank book. If he had any more, they'll be in the old desk. I never opened it.'

'You might take a look and tell me. Or, if you like, I'll come round with you now. Such matters had better be inquired into as soon as possible.'

The old desk was in the place it had occupied throughout Mrs Knox's wedded life—on the chiffonier in the parlour flanking the family Bible. Early in life John Knox had married, and within seven years had lost both his young wife and his little son. Left alone, he sold off his furniture and went into lodgings, and many years had elapsed before he took another wife. When he married his spinster landlady, the desk was the sole article that he contributed to the household plenishing. His widow guessed that some cherished relics of his past life were locked up in the old desk. Possibly an innate delicacy of feeling had induced her to hold its contents sacred; or, more probably, an unacknowledged jealousy of those he had loved before he knew her had made her refrain from opening it.

The desk, which was a solid article of mahogany bound with brass, had belonged to Knox's father. That, perhaps, was the reason he had retained it when, in a spasm of grief, he had broken up his home. Unlocking it, Mrs Knox spread the contents on the table, Mr Forbes looking on the while in silent sympathy with the dead man, the relics of whose hidden life lay before them.

There was a tarnished silver medal that had been awarded to John Knox at school for excellence in writing, and a bundle or two of letters, whose British stamps had been so long out of use that they had almost a foreign aspect. A piece of unfinished crochet-trimming had the needle still sticking in the ball of cotton. But the thing that touched Mr Forbes most acutely was

a little rubbed and worn otter sporran, a memento of the wee son whom, though he died of measles when he was only five years old, his father had never forgotten.

Engrossed in the thoughts raised by these tokens of the dead, the factor had almost forgotten the object of the search, when Mrs Knox, who had been turning over some loose papers, held out a long envelope bearing the stamp of the Universal Insurance Company.

'This is maybe what we're wantin'. You look at it. I canna see without my glasses.'

The envelope was found to enclose a life insurance policy issued to John Knox for the sum of £1000.

'That's the very thing! I must congratulate you, Mrs Knox. Your husband appears to have insured his life just about this time last year. That was shortly before his death, wasn't it? He had paid only one premium.'

Mrs Knox bent forward, her sallow cheeks flushed with restrained emotion. 'Does that paper tell how much Knox paid—to insure his life, I mean?' she asked breathlessly.

'Yes. It's stated here. The amount he paid was forty-seven pounds ten shillings.'

To Mr Forbes's astonishment, the usually reticent widow burst into a sound that was half-laugh, half-sob. 'That was it, then! That was where the siller went!' she cried exultantly. 'Here I've been misjudgin' my man, thinkin' he had done me an injustice. An' all the time he was tryin' to make provision for my old age. I'm a thankless woman. I am that. Imphm!'

'Well, unless the insurance people refuse to pay your claim on the ground that they were not informed of the death within a specified period after it occurred, you are a luckier woman to-day than you were last night, Mrs Knox.'

'An' it no farther back than last night that I was wishin' for a thousand pounds. An' me with no a ghost of a notion where the money could possibly come from! But do you think they'll refuse to pay?' she asked with a sudden spasm of anxiety.

'I don't think it's the least likely they will. Still, it would be better not to lose any more time before forwarding your claim. The office is in St Vincent Street. It is nearly three o'clock. Can you go over and see them at once?'

'Keep me! Is it that time? Then I canna go. Mr Cruikshank'll be in for his dinner at four o'clock. He disna like to be kept waitin', an' the meat's no in the pot yet,' Mrs Knox made disconsolate confession. 'No, I canna gang.'

'If it's of any service to you, I'll call on the insurance company and lay your case before them,' Mr Forbes offered kindly. 'I'll just leave word at my office, and then go over to St Vincent Street at once.'

Left alone, Mrs Knox set about the preparation of the meal in an absent-minded fashion that boded ill for the edibility of the viands that would ultimately be set before her lodger. On reaching a plate from the dresser she caught sight of the open pill-box, which still contained Kavanagh's lucky bean. On the previous night, when she had opened the box in quest of a pill, the bean had looked bright and attractive, with its encircling scarlet band showing vividly against the black. Now it seemed dull and worthless. Lifting the box, Mrs Knox threw it and its contents into the refuse-bucket.

'If I get that siller I ken what I'll dae with it,' she told herself emphatically, as she cleaned the knives with a vigour that betrayed her inward excitement. 'Never in all my life have I had a penny to spend that I hadna seventeen different roads for it to gang. If that thousand pounds comes my way, fine I ken what I'll dae with it. I'll *squander* it—that will I. Aye. Imphm!'

CHAPTER III.—MRS KNOX TAKES HER FLING.

THE thing that couldn't had occurred! Mrs Knox was the possessor of the wished-for thousand pounds. Her hitherto narrow world had suddenly expanded into a boundless realm gay with enticing possibilities.

The Universal Insurance Company, had they chosen to contest her claim, might doubtless have made a stand on one of those by-laws, printed in very small type, which nobody bothers to read. But they made no difficulties. Very shortly after they had received a certificate of the registration of death, the widow received the insurance money. Before the actual bank-notes were in her hands Mrs Knox spent the entire amount in imagination half-a-dozen times a day. But when the money was really in her possession her ideas changed. They shrank. The rigorous economy she had been obliged to practise all her life had become a habit that could not lightly be broken.

Acting on Mr Forbes's advice, Mrs Knox invested the bulk of what she called her 'fortune' in an annuity. A sensation of remorse at having ever doubted his integrity induced her to expend a considerable sum in erecting a handsome tombstone to the memory of her husband. The remainder of the money was lodged in the bank, where it could be drawn upon as desired.

These arrangements accomplished, Mrs Knox was free to embark on the course of squandering that she had promised herself. Unfortunately, though she still adhered to her treasured plan of taking a holiday at a hydropathic, Mrs Knox was exceedingly loath to spend money on the indispensable preparatory arrangements for such a trip. Mirren Weir, going shopping with her, found the frugal lady reluctant to part with even a shilling, until, by a happy chance, she remembered the improvement the transformation had wrought in Mrs Montgomery's appearance, and managed, by dint of skilful cajolery, to inveigle

her aunt into a hairdresser's. After Mrs Knox had seen herself with her gray hair artistically waved, and raised *à la Pompadour* over the transformation, her scruples vanished; and the early days of the January sales found her an eager and interested buyer.

Her employer being out of town, Mirren's time was at her aunt's disposal. It was she who wrote for the prospectus of Invercairn Hydropathic Establishment, and arranged the dates of Mrs Knox's visit; she who coaxed her aunt into the purchase of a set of furs (greatly reduced) that she declared made the owner look like a dowager duchess, and of a dress (at lowest sale price) that was suitable for evening wear. It was Mirren who supplemented her relative's somewhat circumscribed wardrobe by lending her a selection of her own most treasured belongings, notably articles of the toilet, and a dressing-gown of quilted lavender Japanese silk that had originally been the property of Mrs Montgomery.

When the great day came, Mirren escorted her aunt to the station and saw her off. Any uneasiness Mrs Knox might have experienced at abandoning her house had been removed by Mirren volunteering to spend her holiday in taking care of it.

'But I didna mean to travel in the first class,' Mrs Knox protested when she saw her niece, who had taken her ticket, directing a porter where to put her suit-case.

'Whisht!' cautioned Mirren. 'It wouldna have done to go third. There's sure to be other folk going to the hydropathic travelling in the train, an' they'd have seen you. Remember you're a grand lady now.'

The entrance of two passengers into her compartment put an end to Mrs Knox's protests. Just as the train was on the point of starting, Mirren beckoned her aunt to the window.

'Aunt, am I to get doing what I like with the house when you're away?' she asked hastily. 'I'd like to tosh it up a wee bit.'

The fire of adventure was hot in Mrs Knox's veins. For the first time in her confined life she had abandoned stereotyped ways, and she felt gloriously reckless. For the moment, indeed, she hardly cared if she never saw the flat in Apsley Place again. Leaning out of the carriage window, as the whistle blew, she said, 'Do whatever you like. You can make a kirk or a mill o' the house for all I care!'

And the train moved off, leaving Mirren with an expression of blank astonishment on her face, and the unbelievable words ringing in her ears.

The train was an express, and, fortunately for Mrs Knox, the journey occupied rather less than an hour. All the way she sat bolt-upright in her seat, clutching her umbrella and the handbag that held her ticket and purse, quite unconscious of the strained tensity of her attitude.

Her travelling companions were a portly gentleman and a pleasant-looking lady in a rich fur coat. They were evidently worried about a matter that they discussed in low tones. Mrs Knox's hearing was keen, and she gathered that their trouble concerned somebody called 'Rita,' and what a certain Mrs Steele had reported of her doings.

'Yes, and the worst of it is that, now that Rita is of age, she can snap her fingers at us, and marry any fortune-hunter she chooses,' she overheard the lady say helplessly.

'Rita always was self-willed. Robert spoiled her. If she insists on making a fool of herself, we can't do anything to stop her,' the stout gentleman said bluntly.

'I know that, dear. But it's our duty, for her dead parents' sake, to try to prevent the poor deluded girl deliberately ruining her life.'

'I warn you we'll get no thanks for interfering.' The gentleman resumed the study of his evening paper. His wife sighed, and the discussion ended.

When the train stopped at Invercairn Station, Mrs Knox entrusted her luggage to the care of a porter, and followed him to where the hydropathic bus was waiting. Two business men, who lived at the hydro and travelled daily to and from Glasgow, were already seated in it, and, after her fellow-travellers had also taken their places, the bus jogged off.

The latent craving for adventure that had been suppressed throughout her cramped existence now dominated Mrs Knox. She felt young, alert, acutely observant. Every trifling inconsequent detail became vividly imprinted on her memory. Yet she sat silent, apparently unmoved, presenting a stolid front to the world.

The bus stopped before the entrance to an imposing building. Following the others up the steps, Mrs Knox found herself in a large hall which seemed full of people. The arrival of the afternoon bus from the station was the exciting moment of the day to the hydro visitors, who assembled in the lounge-hall to see if it had brought any new guests who were likely to prove entertaining.

Mrs Knox saw her train companions recognised by a young lady who did not appear overjoyed to receive her visitors. After a word or two had been exchanged in low tones, the young lady led them towards the wide staircase, saying impatiently, 'Come up to my room, then, if you have anything to say.'

The manageress, now coming forward, greeted Mrs Knox cordially, and passed her on to the care of the assistant manageress, who showed the new arrival where to write her name in the visitors' book, and then escorted her upstairs to a bedroom, where she left her, after expressing a hope that madam would find it comfortable, and mentioning that afternoon tea would be served in the drawing-room in a few minutes.

Before taking off her wraps, Mrs Knox sat down in one of the cane-seated chairs and sur-

veyed her surroundings a little disconsolately. Seen first in the dusk of a January day, the plainly furnished, lofty-ceilinged room struck her as being austere and chilly. The narrow white bed looked cold and uninviting. The fireplace was so highly polished as to hint that flame had never sullied its brightness. 'Well, if this is what folk leave their comfortable firesides for'—— Mrs Knox was thinking, when the sound of conversation in an adjoining apartment attracted her attention.

The two rooms were evidently part of a suite, for there was a communicating door—now locked—between them. Though she distinctly heard voices, even Mrs Knox's sharp ears could not distinguish more than that some sort of argument was in progress.

Drawn by the irresistible lure of tea, Mrs Knox removed her outdoor garments, experiencing as she did so a thrill of pride in the new fur stole and muff, which she still regarded as a wicked extravagance. Then, opening the bedroom door, she was on the point of stepping out, when the sound of people leaving the next room made her shrink back.

The three persons who appeared proved to be her companions in the train and the young lady they had hoped to influence. Apparently their efforts had been in vain; for, as they paused for a last word, just outside the half-open door within whose shadow Mrs Knox was standing, she heard the kindly woman say earnestly, 'Believe me, dear, your uncle and I came from the best of motives. It was only a desire for your good that brought us—wasn't it, William?'

'I haven't the slightest doubt that your motives are unimpeachable,' the young lady said haughtily. 'But please remember in future that I am my own mistress, and quite able to manage my affairs without any interference from my relatives. And I shall be obliged if you will tell your informant, Mrs Steele, to mind her own business in future.'

'Come away, Alice,' the portly gentleman said irritably. 'I told you it would be wasting words to try to reason with Rita. If we make haste we 'll just catch that train.'

As they moved towards the staircase Mrs Knox heard the nice woman say tearfully, 'Rita dear, remember, whatever happens, you will always find a home and a sincere welcome at "Earlston."' Then they passed out of earshot.

Mrs Knox's luncheon had been an early and perfunctory one. Excitement and the keen air had sharpened her appetite, and she looked eagerly forward to the promised tea. To her disappointment, on entering the drawing-room she found that, instead of the comfortable sit-round-the-table sort of meal she had anticipated and desired, the function meant a small cup of tea served from a side-table.

The guests who had been longest in residence had taken possession of the most luxurious chairs, and had appropriated the warmest corners by the fire. They were all busy with fancy-work and gossiping, and were evidently on friendly terms with each other. Many covert glances were cast at the new-comer, and one or two kindly disposed souls would have liked to make advances to the stranger; but, though Mrs Knox did not guess it, her ultra-dignified bearing and stern expression served to repel even the best-intentioned.

'Where 's Rita Ballengray?' one matron asked. 'She hasn't come in for tea.'

'I saw her in the hall a little while ago. She had been seeing some callers away,' a girl volunteered. 'She was ordering tea to be sent up to her room. She said she had a headache.'

'I expect Miss Rita is feeling lonely to-day. She 'll be all right when a certain gentleman returns.'

As a ripple of sympathetic laughter followed this arch insinuation, Mrs Knox was conscious of a feeling of superiority in that she knew, or thought she knew, the true reason of Miss Rita Ballengray's temporary disinclination for society.

Mrs Knox was gasping for a second cup of tea, but everybody else appeared to be satisfied. She might have helped herself had not the tea-table been on the farther side of the large drawing-room. And, before so many critical eyes, she did not feel equal to facing the ordeal of leaving her chair and going to fetch it. So she continued to sit stiffly upright, outwardly uninterested and apathetic, but inwardly keenly conscious of every movement or varied inflection of voice among her fellow-guests. Yet above all was she obsessed by the knowledge that she had badly needed her tea, and that she had failed to secure it.

Feeling desperately lonely, and looking quite unapproachable, she sat turning over the leaves of an illustrated paper that lay on a table beside her, till a gong sounded and the company dispersed, saying that it was time to dress for dinner. 'This 'll be the time for me to put on my new gown,' Mrs Knox decided, and followed closely in their wake.

As she passed through the hall her casual glance rested upon an umbrella-stand, and she stopped short, for, prominent among the collection of sticks and umbrellas, she thought she saw the familiar handle of Mr Cruikshank's stolen umbrella. Mrs Knox was naturally composed in manner, but, at the recognition, it must be confessed she gasped. On the ground that few umbrellas are unique creations, that most of them have many counterparts, a more experienced traveller might have argued herself out of the belief that the umbrella was the identical one that had been taken from her house. But in Mrs Knox's estimation Mr Cruikshank's presentation umbrella was a wholly distinctive article. For one thing, it had a striking gold, or silver-gilt, handle; for another, the owner's initials, C. C., were legibly graven on the top.

[*Christmas Number.*

'Whose umbrella is that?' she asked the page-boy, who was hanging a bag of golf-clubs on the stand.

'That's Mr Coulter's umbrella, ma'am,' the boy answered respectfully. 'He's been away to-day, but he's coming back to-night.'

'If that's Mr Coulter's umbrella, I'd like to take a look at Mr Coulter,' Mrs Knox told herself as she ascended the stair. 'Aye. It might pay me to have a look at Mr Coulter. Imphm!'

CHAPTER IV.—TWO DARK HORSES.

THE bedroom seemed even chillier than before when Mrs Knox entered it to change her dress for the late dinner which she anticipated with mingled feelings of pleasure and nervousness. The room was dark, too, and when she would have lit the gas she could find neither matches nor bracket. No bell-pull was visible either, and matters seemed at a standstill, when a maid, entering with hot water, switched on the electric light, and, in answer to Mrs Knox's request, showed her where to find the electric bell-push.

The new gown with its elaborately trimmed chiffon bodice might look smart, but it felt cold. Its wearer would have given much for the gray Shetland shawl she had accustomed herself to wear; but Mirren had wisely forbidden its inclusion in the packing. Praying that pride might keep her warm, Mrs Knox went downstairs when the gong sounded, and following the company into the large, brilliantly lit dining-room, found herself placed at a little table beside a sprightly English widow whom she had noticed at tea.

Mrs Norton lost no time in entering into friendly conversation. When by dint of skilful questioning she succeeded in getting her laconic companion to admit to her present visit being the first she had paid to any hydropathic, Mrs Norton revealed an intimate knowledge of the merits and demerits of many similar establishments. She frankly confessed that, since her widowhood, she had lived almost entirely at hydropathics.

'I find I get so much better value for my money than if I tried to keep house; and then, when I tire of one place, it is so easy to move on to another. I have only two hundred a year, and what can one do on an income like that?' Mrs Knox may have thought that *she* could do a good deal, but, like the wise monkey, she said nothing. 'Why, in London I couldn't even *live!* And a tiny house and one inexperienced maid in the country would be too awful for words. Now, here I get congenial society, and good cooking, and large rooms. I hate poky rooms—don't you?'

Mrs Knox, who was wondering if it was the pink sauce served with it that made the boiled haddock taste so much nicer than usual, uttered a half-articulate reply that convinced Mrs Norton her table companion was accustomed to such a spacious dwelling that she considered her present quarters inferior. Mrs Knox was what is known in racing parlance as a 'dark horse.' Even with her extensive acquaintance with the residents in similar hostelries, Mrs Norton felt quite unable to place her. She had hoped that her loquacity would have the customary effect of eliciting similar confidences. But, quite apart from her natural taciturnity, Mrs Knox, who almost for the first time in her life was enjoying the pleasures of the table, was more concerned with her dinner than with Mrs Norton's affairs, and she remained irresponsive.

Rather than sit silent, the garrulous widow would have prattled even to a deaf mute, so she continued to chatter.

'We have had quite a romance at the hydro lately. That young lady sitting alone at the little table by the window has got engaged to a man she met here for the first time about three weeks ago. A real case of love at first sight it was. She is an heiress—the only child of a wealthy shipbuilder. The man is English, and perfectly *charming*. I tell her we are *all* in love with him! I don't suppose he is rich, but he comes of good family—a younger son, I believe. And Rita is rich enough for both. Her chaperon, Mrs Steele, quarrelled with her about him, and went off in a great hurry yesterday. But all our sympathies are with the young lovers. I do delight in romance—don't you? He has been away to-day, and the dear girl has been quite disconsolate—wouldn't even come down to tea. Said she had a headache, but—— Oh! there he is. *Now* she'll be all right.'

Glancing up from the roast-fowl that she was carefully consuming, Mrs Knox became suddenly electrified.

'Who is that?' she demanded sharply, indicating a well-dressed, good-looking young man, who, smiling recognition of the welcome that greeted his tardy arrival, was making his way to the table where Miss Rita Ballengray was seated.

'Oh, that is Claude Coulter, the hero of the little romance I was speaking about. Isn't it *refreshing* to see how devoted they are? Do you know him?' asked Mrs Norton, noticing the attention with which Mrs Knox was regarding the late-comer.

'I never knew anybody of the name of Coulter,' Mrs Knox said guardedly. The tempting food had ceased to interest her, for in the successful wooer of the heiress she had recognised the insinuating young Englishman who, passing under the name of Edward Smith, had defrauded her of a fortnight's board and lodging, and who when leaving covertly had annexed some of Mr Cruikshank's property as his own.

She was hard at work trying to piece together a mental jig-saw puzzle, of which the fragmentary pieces were the scraps of conversation overheard.

in the train and on the landing, Mrs Norton's gossip, the presence of Mr Cruikshank's umbrella, and the reappearance of Mr Smith in the character of the well-born Mr Claude Coulter.

Mrs Knox wondered if her former lodger would recognise her, and trusted he would not until she had had time to think matters over quietly, and decide how to act. But she need not have concerned herself. Dress and surroundings work marvels in effecting a disguise. And when Mr Coulter's casual glance chanced to rest upon her, he saw only another of those elderly dames of independent means who form the prop-in-chief of hydropathics.

Mrs Knox next feared that he might see her name in the visitors' book, and fly before she had an opportunity of exposing him. She did not guess that to the young Englishman she had been known as Mrs 'Noakes.' Never having seen his hostess's name in writing, Mr Smith (or Coulter) had accepted it as she pronounced it, though it would have aroused the good lady's indignant denial had any one told her that she miscalled herself 'Noakes.'

In the presence of her lover Miss Ballengray had completely recovered her lost spirits. She was flushed and animated. After dinner, when the other guests amused themselves with card-games, they two sat in a secluded corner of the drawing-room whispering together. Seated bolt-upright in her chair, Mrs Knox, who had declined to join in the games, watched them silently—though her dominant sensation was a longing for tea. The thimbleful of coffee served after dinner had seemed to her a mockery. In the midst of the gay throng she positively pined for the company of her brown teapot, and thought with envy how, at that very moment, Mirren might be sitting beside a cosy fire in the kitchen, her feet on the fender, a cup of strong, well-sweetened tea in her hand, and the kettle singing on the hob.

In spite of the novelty, the evening seemed interminable. It was a relief at length to get away to bed. In the corridor she came upon the lovers bidding each other a protracted 'Good-night,' and remembered that Miss Ballengray's room was the large one next to her own—the room in which the independent girl had defied the authority of her relatives.

Accustomed to the amenities of her kitchen fire, Mrs Knox shuddered a little as she undressed and crept in between the rigidly clean linen sheets. There was no hot jar to take the chill off the bed, and at first she felt numb with cold. As she gradually became warmer, her brain began to work feverishly. Ideas tumbled over each other pell-mell. She would publicly expose the villain who was masquerading as a gentleman. She would confront him with the stolen umbrella. She would warn the deluded girl. She would summon the local police, and deliver him over to justice. She would make herself known to him, and see how he would act. She would . . . She would . . .

Out of this medley of confused resolves one alone remained. She would secure the evidence of the purloined umbrella. There was a weapon ready to her hand.

Stealing out of bed when the house was still, she drew on her stockings, and, having thrown on the quilted silk dressing-gown, cautiously opened her bedroom door and peeped out. All was quiet. The dimly lit corridors and hall were empty. Slipping from her room, she moved noiselessly, on stockinged feet, towards the staircase. Once she narrowly avoided tripping over boots put out to clean.

By the aid of the one light in the hall she secured the umbrella. Concealing it in the folds of her dressing-gown, she crept upstairs. When she had reached the haven of her own room without misadventure, Mrs Knox breathed freely. As she locked the recovered article in her wardrobe and tucked the key under her pillow, she nodded her head.

'Aye, my gentleman 's clever! But he 's no the only clever one in the world,' she thought triumphantly. 'Other folk can be clever as well as Mr Claude Coulter. Aye, that they can. Imphm!'

CHAPTER V.—STOLEN GOODS.

WHEN they met at breakfast next morning, Mrs Norton, undeterred by Mrs Knox's reserve, began at once to initiate her into the latest hydropathic scandal.

'I have been scolding myself all night because I didn't warn you. I really ought to have put you on your guard. It was a duty, for you were a stranger amongst us. But I suppose I was too busy talking about our little romance—and, by the way, I hear Rita Ballengray's uncle and aunt came here yesterday, and made a *frightful* row about her getting engaged to Mr Coulter. Positively *raved* and *stormed* at the poor girl, and threatened to shut her up in a madhouse if she didn't throw him over at once! Luckily the brave child held her own, but it must have been terrible for her.'

'You were speakin' about something you should have warned me against,' Mrs Knox interrupted. She felt she had nothing to learn from Mrs Norton regarding Miss Ballengray's affairs.

'Oh yes. What I wanted to say was'—she dropped her voice to a confidential whisper—'that I hope you haven't many valuables with you. If you have, I do trust you 'll take the *greatest* care of them. There have been quite a lot of mysterious losses at the hydro lately. Several people have missed money. Rita Ballengray had ten pounds taken from her purse, and Mr Coulter had his cheque-book stolen. The worst thing was that Lady Moffat lost a priceless diamond cross. She wore it one night there was a dance

here, and next morning it was gone! So, as I said, I do hope you haven't many valuables with you.'

'No that many,' Mrs Knox made non-committal reply, serene in the knowledge that, at the moment, she was wearing the only jewellery she possessed—two rings and a large old-fashioned cameo brooch—and that her money and return-ticket were securely safety-pinned into a substantial gray linen pouch that fastened round her waist, and hung suspended beneath her skirt. 'I havena more with me than what I can take care of. Thankin' ye for warnin' me, all the same. An' Mr Coulter had his cheque-book stolen, ye said?'

'Yes. His account is with the Bank of England. He telegraphed to London at once to stop payment of his cheques; but just fancy what harm the thief might have done before the loss was discovered! Why, he might easily have drawn out all Mr Coulter's deposits!'

'So he might; aye, he might do that easy. Imphm!' agreed Mrs Knox, inwardly reckoning that the proceeding might prove a simpler matter than her informant guessed.

These revelations decided Mrs Knox that she must take action, and quickly. Her difficulty was how to set about it. Mrs Knox was acutely conscious that, while she was a complete stranger to the company, Mr Claude Coulter was on a familiar footing, and evidently a great favourite with everybody. Were she to accuse him of having stolen goods in his possession, public sympathy would, she felt assured, be with him; and while it would be simple enough to denounce him, it might be extremely difficult, by her own unsupported word, to convince people that she was right.

As they passed through the lounge after breakfast Mrs Norton stopped Mr Coulter, and Mrs Knox heard her ask if he had any news of his cheque-book.

'No, and never shall, I'm afraid,' Mr Coulter replied with a rueful shrug of his shoulders. 'It was partly my own fault, of course. I should have kept it securely locked away; but I had just begun to fill in some cheques when the gong sounded, and I went in to lunch, leaving it lying on the table in the writing-room. When I returned it had vanished, as I might have known it would. I wired to the Bank of England to send me on a new cheque-book, and I hope they won't lose time about it, for I had no idea how being without money would hamper one. I declare I'll feel like a pauper till the new book comes.'

Mrs Knox caught Mrs Norton's offer of a loan —'Only five pounds or so'—and heard Mr Coulter's grateful acceptance—'Just till to-morrow, you know.' As she passed on with Mr Coulter's effusive thanks in her ears, Mrs Knox told herself that the alleged theft of the cheque-book was proving a little mine of wealth to the plausible young man.

It was a fine morning. The sun shone. The air was crisp and invigorating. The day was decidedly not one to be wasted indoors. The guests quickly dispersed in various directions. Sitting in the lounge with a copy of the *Glasgow Herald* in her hands, Mrs Knox watched their departure, noting specially that Miss Ballengray and Mr Coulter, carrying golf-clubs, had gone off towards the private golf-course of the hydropathic.

For a little longer Mrs Knox sat deep in thought; then, having resolved upon a course of action, she proceeded to put it into force. Opening the visitors' book, she turned over the pages until she found the entries she wanted. These were two: 'Miss Rita Ballengray, Earlston, Great Western Road, Glasgow, No. 33;' and 'Claude Coulter, Mayfair, London, No. 48.'

Making a mental note of Miss Ballengray's home address, and of the number of her suitor's room, Mrs Knox went upstairs. Passing the door of her own chamber, she walked deliberately along the corridors until she reached No. 48. Opening the door, she entered. The first object she saw was Mr Cruikshank's portmanteau, which rested upon a luggage-stool. A glance showed her that it was empty. Trying the wardrobe door, she found that it was locked. Leaving the room, she got the key of her own wardrobe, and returned with it to Mr Coulter's room. The appointments of both apartments were exactly alike, and she had rightly concluded that the key that fitted one wardrobe would open the other.

Hanging up inside, with divers other garments, the origin of which Mrs Knox felt curious to learn, she saw Mr Cruikshank's rain-coat. Taking it over her arm, Mrs Knox closed and locked the wardrobe; then, picking up the portmanteau, she opened the door and peeped along the passage. Seeing that it was still empty, she slipped out, to find herself face to face with a young chamber-maid, who emerged from a housemaid's pantry, laden with a pail and a mop. If the girl, who looked stupid, noticed anything odd in the appearance of an elderly lady, whose own apartment was some distance off, leaving a gentleman's room carrying a waterproof and a portmanteau, her blank expression did not change. And Mrs Knox regained the seclusion of her own chamber, with the comforting consciousness that she had achieved something.

Having locked the purloined goods in her wardrobe, Mrs Knox donned her outdoor raiment and walked down to the post-office in the little town, where she wrote out and despatched a telegram.

She was well on her way back to the hydro, when, arrested by a sudden idea, she turned and retraced her steps to the post-office, where, after a good deal of consideration as to the form it should take, she wrote out and sent off a second message. Not in the course of her whole life had Mrs Knox spent so much on telegrams as

she did that morning, but she felt that the end she had in view justified the expenditure. Then she returned to the hydropathic, and, in a state of suppressed excitement, waited for things to happen.

CHAPTER VI.—MR COULTER IS INSULTED.

TO have left her life of retirement with the intention of taking a quiet holiday, and to find herself, within twenty-four hours of leaving home, playing one of the chief parts in a thrilling drama, was enough to render any one less unemotional than Mrs Knox distracted and hysterical. At this juncture Mrs Knox's lifelong habit of self-restraint stood her in good stead. She was able to present an imperturbable front to the world, while keeping a sharp eye on those of its denizens who specially interested her.

In the afternoon she took up her position in a retired corner of the lounge, where, herself unobserved, she could watch all outgoers and incomers. By a side-stroke of fortune, Mr Coulter and his fiancée, searching for a nook to 'spoon' in, chose a couch on the other side of the screen that stood near her. Moving her chair as close as she could to the side of the screen, Mrs Knox became an unblushing eavesdropper. She was rewarded by learning that Mr Coulter's journey on the previous day had been for the purpose of securing a special license, and that now he was using his whole powers of persuasion to induce Miss Ballengray to go off with him, the following morning, to Edinburgh, where they would be privately married.

The girl spoke in so low a tone that Mrs Knox had the greatest difficulty in catching her words. All she gathered was that, though at first Miss Ballengray was inclined to demur at the haste Mr Coulter deemed a necessity, she appeared later to yield to his entreaties. The note of relief in his voice, and the warmth of his reiterated assurances that she would never regret taking the step—that his whole life would be spent in worshipping her—warned Mrs Knox afresh that there was not a moment to be lost if his schemes were to be frustrated. 'I'm sure I needna wonder at the fair-spoken rascal takin' her in, when he took *me* in,' she thought, with sympathy for the new victim.

As Mrs Knox sat impatiently waiting for the next move in the game, it was played, but in a manner she had not anticipated.

Mr Coulter had gone upstairs to fetch something—probably the marriage license—to show his bride-elect. A minute later the sound of a bell ringing frantically broke the somnolence of the winter afternoon. There was the tread of quick steps above, the echo of heated voices; then Mr Coulter appeared on the staircase, followed by two agitated maid-servants.

'The thief is still in the house!' he exclaimed. 'More things have been stolen from my room!'

Except for Mrs Knox and the lovers, the hall had previously been nearly empty. Yet the first promise of sensation found it suddenly full of people. From drawing-room, library, recreation-hall, and waiting-room guests flocked, eager to enjoy the new excitement. Mr Coulter speedily became the centre of an interested group. He was telling Miss Anderson, the manageress, how, having gone up to his room to look for a paper, he had found that his Burberry rain-coat and his portmanteau had both been taken away.

'When did you last see these things?' asked the manageress.

'This morning. I swear they were both there when I went out golfing. The coat was locked in the wardrobe, and I had the key in my possession. The thief must own a key that fits.'

'No one has left the hydro, so the thief may be still amongst us.' The manageress cast a suspicious glance around. 'The maids were working upstairs all morning, turning out rooms. They must have seen if any unauthorised person entered Mr Coulter's room, or was about that corridor.'

'Oh! Oh!'

The ejaculation of the moon-faced young chamber-maid called attention to where she stood gazing open-mouthed at Mrs Knox.

Miss Anderson pounced upon her. 'Well, Wilson, what is it? You were working up there. Did you see anybody go into Mr Coulter's room?'

'No, please, ma'am.'

'Then what are you making a noise about?' demanded the sorely tried manageress impatiently. She was jealous for the good name of the house, and the inexplicable robberies were getting on her nerves.

'Please, ma'am, I never seen anybody go into his room, but I seen somebody comin' out of it.'

'You *did*? Then why didn't you stop him?'

'Please, ma'am, it weren't a him. It were a lady. An' I never knew then but what it were her own room she were a-comin' out of.'

'And who was the lady? Now, be careful what you say.'

'That's her standin' over there. An' may I drop down dead this minute if I'm telling a lie,' said Wilson, bursting into uncontrollable tears. But no one had any attention to spare for Wilson's emotions. All the interest was centred on Mrs Knox, who, when the accusing finger was pointed in her direction, had risen from her seat, and now stood erect, a target for all inquisitive eyes.

'*Mrs Noakes!*' Coulter murmured uneasily. Until this moment he had not recognised his erstwhile landlady. As a prudent measure he made a scarcely perceptible movement to the rear, and so became a less prominent member of the party.

'Mrs Knox—of course, we all know it's an utterly ridiculous question to ask'—Miss Ander-

son spoke apologetically—'but *do* you know anything of the articles that Mr Coulter has missed from his room?'

'If you're referrin' to any goods belongin' to the man that calls himself Claude Coulter, I ken naething about them. But if you're speakin' of a gold-handled umbrella, and a waterproof coat, and a real leather portmanteau that were stolen from my house in Glasgow when he was lodging with me under the name of Edward Smith, and went away without payin' a penny, they are locked in my wardrobe, ready for their rightful owner, an' that's Mr Cruikshank, when he comes to claim them.'

'Oh, this is sheer nonsense! It's a dangerous libel!' Mr Coulter spoke with an admirable affectation of incredulity. Everybody knows who I am, and that the things are my property. This lady has just come—can anybody here vouch for her respectability?'

'Well, well!' the manageress interposed briskly, 'the things are evidently not lost, at any rate. If they are in Mrs Knox's wardrobe they can easily be recovered. I am sure Mr Coulter will be willing to overlook the matter, and nothing more need be said about it.' In her fervent desire to maintain the high reputation of the establishment under her direction, Miss Anderson felt almost willing to regard the occurrence as a little eccentricity on the part of Mrs Knox, to whose story she did not attach the slightest credence. 'But perhaps we should see the things first.—Mrs Knox, may I trouble you for the key of your wardrobe?'

Raising the skirt of her dress, Mrs Knox dived into her linen pouch and produced the key. Taking it, the assistant manageress hastened upstairs, closely attended by one or two of the more actively inquisitive guests, among whom was Mrs Norton. The others clustered round Mr Coulter, who was vigorously asserting that he had never seen Mrs Knox before, and insisting that, as she was undoubtedly mad, her friends ought to be wired for to remove her. Speaking to no one, Mrs Knox quietly bided her time.

During all the commotion Miss Ballengray stood aloof, smiling contemptuously. In her opinion Mrs Knox was a lunatic who ought to be under restraint. Her proud spirit was amazed that her lover should condescend to seek to vindicate himself from so preposterous a calumny.

Then the party that had gone upstairs came into view on the staircase, bearing the articles in dispute.

'You see the bag and the umbrella have my initials, C. C., on them, and in the coat-pockets you'll find communications addressed to me,' Mr Coulter made voluble explanation. 'This so-called Mrs Noakes must be one of the clever gang of thieves who have robbed so many of us guests. Once she is in custody, we'll have a chance of finding out who her accomplices are, and of recovering our belongings. I'll be precious glad to see my cheque-book again!'

Nothing succeeds like cheek. The sympathy of the company was entirely with Mr Coulter. From every side antagonistic glances were levelled at Mrs Knox. Whispers of 'Don't let her escape,' 'Telephone for the police,' were heard; but, secure in the justice of her cause, the good lady never flinched.

'Give me a grip of that coat and of that umbrella,' she demanded, spots of scarlet flaming in her cheeks. 'See! If you examine that umbrella you'll see where a wee plate has been taken off. When the umbrella was stolen there was an inscription on the plate sayin' the umbrella was the gift of Mr Cruikshank's grateful pupils.'

'Stuff and nonsense! Silly rot!' Mr Coulter ejaculated; but his manner was less assured, and he evinced no desire to disprove Mrs Knox's words.

'An' if you'll take a look at the lining of the coat you'll see where it's been mended. For Mr Cruikshank tore it the only time he had it on, and I darned it.' She was turning over the coat in quest of the place, when, quite accidentally, she made the discovery Coulter would have given his ears to avert. 'There's something hard sewed in the lining.—Here—you, miss! You see what it is,' she said, thrusting the garment into the hands of the manageress.

'Miss Anderson, I must trouble you for my property,' Mr Coulter cried excitedly, darting forward and trying to snatch the coat out of her hands. 'We have endured the insolence of this maniac long enough.'

Mrs Knox warded him off with a firm hand, and the manageress, with a whispered word to her assistant, proceeded quietly to snip the stitches with her pocket-scissors. A moment later she gave a cry of surprise, and a gasp of consternation ran through the company as she held up a slender gold chain, at the end of which hung a magnificent cross of diamonds.

'The diamond cross!' 'Lady Moffat's diamond cross!'

The visitors might be engrossed looking at the dazzling trinket, but Mrs Knox's attention never left Mr Coulter. She was just in time to prevent his stealthy attempt to escape. Through the happening of more exciting matters, the customary event of the day—the arrival of the afternoon bus from the station—had passed unnoticed, and its passengers had entered the lounge unobserved, except by Mrs Knox, who had reasons of her own for anxiously awaiting its coming.

'Here, Mr Cruikshank, that's him! That's the thief! Keep him, or he'll be off,' she cried. completely roused out of her usual calm, and Coulter found himself firmly gripped by two pairs of muscular hands—those of Mr Cruikshank, who had come in answer to Mrs Knox's telegram, and of an old pupil, with whom he had renewed acquaintance coming up in the bus. 'Mr Cruikshank, keep a tight hold of that man, an' tell these folks who he is.'

Blinking a little through his eye-glasses, Mr Cruikshank surveyed his prisoner deliberately before making pronouncement. 'He appears to me to bear a striking resemblance to a young man called Smith, who decamped from your house, Mrs Knox, with some of my property.'

'Let me go! This is all a put-up job,' Coulter blustered, struggling fiercely. 'He 's another of the gang. I can explain everything.'

'And Lady Moffat's diamond cross—can you explain it away too?' Miss Anderson inquired quietly.

'That old woman must have hid it in the coat.'

'Did she conceal these pawn-tickets there also?' the manageress asked, holding up some tell-tale slips of paper. 'Gentlemen, I must ask you to have the kindness to retain this man till the police come. I had them 'phoned for when I guessed where the guilt lay. Though, Mrs Knox, I must confess that at one moment I fancied they might be wanted for you.'

Rita Ballengray had shrunk back, and was gazing with ashen face at the fortune-hunter who had so narrowly been prevented from wrecking her life. She was trembling violently, dreading the moment when the attention of the curious might be diverted to herself, yet powerless to move from the spot, when an arm passed gently round her waist drew her back into the shadow, out of sight of the others.

'Rita, my poor, poor child,' her aunt's voice murmured.

'Oh, Aunt Alice! You here!'

'Yes, dear. I've come to take you home,' Mrs Ballengray said as she led her humbled niece upstairs. 'The car is waiting. I'll help you to pack, and we 'll leave at once.'

'How did you guess I needed you?' Rita sobbed when they had gained the shelter of her room. 'And after I had been so hateful to you and uncle yesterday! What made you come?'

'I had a telegram saying, "Your niece requires you. Come at once." I thought it must have come from you, dear.'

'No; I know nothing about it. Some angel must have sent it,' Rita said with conviction.

Meantime Mr Coulter—or Smith—stripped of his pretensions, had passed out into the night in the safe custody of the law. And Mr Cruikshank had accompanied him to the police-station to prefer the charge before returning to spend the night at the hydropathic.

Then excitement waxed higher than ever. For once in her life Mrs Knox found herself the centre of attraction. Admiring listeners hung breathlessly on her words. The most luxurious arm-chair was hers. Hers, too, the much-coveted corner by the drawing-room fire.

'Dear Mrs Knox, words cannot express what the hydro owes to your bravery in exposing that dreadful man. What further villainies you have saved us from no one will ever know,' Miss Anderson said gratefully. 'But you must be exhausted after all that strain—simply worn out. What refreshment can I offer you? Do ask for anything you fancy. The whole resources of the house are at your disposal.'

'I think,' Mrs Knox said slowly, giving utterance to the craving that had been hers ever since she left home—'I *know* I would like a good big teapot of tea all to myself!'

CHAPTER VII.—HAME 'S BEST.

MRS KNOX, still scarcely knowing whether she was standing on her head or on her heels, had at length broken away from the crowd of eager questioners and gone up to her room in search of a little quiet and seclusion, before it was time to prepare for dinner.

She was considering the advisability of lying down for a little, when a gentle knock summoned her to the door, where she found Rita's aunt waiting to speak to her.

'May I come in for a moment?' Mrs Ballengray asked in a confidential whisper. 'I want to thank you from the bottom of my heart for what you have done for my niece. I know you must have sent the telegram that brought me here in time to help her in her terrible trial.' She had taken Mrs Knox's hands, and was pressing them warmly between her own. 'Rita has been well brought up. I can't understand how she could ever have been so deluded as to believe that wretch was a *gentleman!*'

'Well, he took *me* in.' Mrs Knox's tone suggested that any one who had proved astute enough to deceive *her* might quite reasonably be excused for deceiving the rest of the world.

'Heaven itself must have prompted you to send the message!' Tears of gratitude stood in Mrs Ballengray's eyes. 'Rita has a proud spirit. No one knows what rash step the poor child might have taken if she had been alone in her bitter humiliation among all those gaping people.'

'Aye. I've noticed they 're gey inquisitive mysel',' Mrs Knox agreed.

'I was out at luncheon when your wire came, but the moment I got it I motored over, and arrived here just in time to see that creature exposed. I'll take Rita home with me now: and in a few days we 'll go off to Cairo, or some bright place where everything will be new to her. Rita is young. She 'll soon get over the shock of her disillusionment.'

'I've heard there 's naething like a change for healin' a broken heart.' Mrs Knox spoke sagely. 'Though I can't say I 've ever suffered from that complaint mysel',' she added truthfully.

'We may never meet again, dear Mrs Knox, but her uncle and I will never forget what a dreadful fate you saved the poor girl from. Will you be here long?'

Mrs Knox understood the significance of the inquiry when, three days later, a handsome dressing-bag arrived for her, with the Ballen-

grays' 'grateful thanks.' As hitherto Mrs Knox's toilet appointments had been limited to a hair-brush and comb, and a tooth-brush, the uses of many of the silver fittings were unknown to her. Nevertheless, throughout the rest of her life the bag remained her proudest possession.

During the remainder of her stay at Invercairn Hydropathic Mrs Knox took precedence as a personage. Each newly arrived guest heard the tale of how the intrepid dame, single-handed, had been the means of bringing just retribution on the subtle thief who, until she came on the scene, had cleverly despoiled the visitors, and who, but for her daring intervention, would have succeeded in beguiling an heiress into a secret marriage.

When Mrs Knox, to oblige interested inquirers, was induced to relate the story of her early acquaintance with Edward Smith—*alias* Claude Coulter—she invariably prefixed her recital by saying, 'That was before I unexpectedly came into a fortune'—a casual statement which, naturally enough, gave rise to rumours of great wealth, and certainly did nothing to detract from the prevailing opinion of Mrs Knox's importance.

When the fortnight's holiday was ended, Mrs Knox resolutely turned her face homewards. She had taken her promised 'fling.' It was over, and once again the uncompromising facts of domestic life had to be encountered.

Fresh air, outdoor exercise, variety of well-cooked food, and probably lessened indulgence in tea-drinking had worked a surprising improvement in the good lady's physical appearance.

When Mirren opened the door of the flat to her aunt she instantly remarked on the difference. 'My word, aunt, but you are looking fine! Anybody would think you were ten years younger. That shows the good a change does.'

But Mrs Knox was too staggered by the altered aspect of her house even to hear what Mirren said. As if by the touch of some magic wand, cheerfulness had dispelled the accustomed gloom. In the lobby the dismal marbled wall-paper had given place to one of a soft primrose tone, which gave the effect of sunshine. The paint was fresh, and a gaily coloured rug lay on the stained boards.

In the kitchen grate a bright fire burned, lighting up the newly tinted walls and white-washed ceiling, and displaying the hues of the carpet, and of the turkey-red curtains that draped the windows and the wall-bed.

'Sirs me! but this is changed days!' ejaculated the amazed householder. 'I think I ken that carpet. What's it doin' on the kitchen floor?'

'Yes; that's the carpet out of Mr Cruikshank's parlour.—I'll no deny it; but dinna you say one word till you've seen the rest of the house,' implored Mirren. 'I took you at your word, an' I've spent some of your money. An' if you're no pleased with anything I've bought for you, Peter an' me 'll buy it back for our own house. You being away, an' no lodgers to attend to, I thought it was a grand opportunity of gettin' the house done up.'

'I 'm thinkin' it wasna oot o' the need of it,' was Mrs Knox's laconic comment. But, knowing her aunt, Mirren knew that she was pleased, and felt encouraged to go on with her record.

'When I spoke to Mr Forbes, he was quite willing to paper and paint the best rooms; and Peter and his apprentice did the rest of the house on Saturday afternoons, and o' nights.'

In the sitting-room that until lately had been occupied by Mr Cruikshank the greatest surprise awaited Mrs Knox. The appearance of the apartment was completely altered. It looked spacious and cheerily attractive. The walls were pearl-gray, the woodwork was cream enamelled, as were the new low book-shelves on either side of the fireplace. Creamy casement curtains had ousted the flabby lace ones from their time-honoured prominence. A fire was burning, and a vase of scarlet tulips decorated a table that was neatly laid for dinner.

'It's a real pity ye hadna made they reforms before Mr Cruikshank left. He 'd maybe have stopped on,' Mrs Knox remarked with grim sarcasm. 'Wha 's the dinner for?'

'It's just for Mr Cruikshank himself! That 's another surprise for you!' cried Mirren joyously. 'He came on Tuesday, and said, if his old rooms wasn't occupied, he 'd like to come back. He couldn't stand the woman at Hillhead. He said her tongue never lay. And, forby—though he never said it—I jalouse she wasn't any too honest. And when Mr Cruikshank saw how nice the rooms were since they had been done up, he said himself that he 'd pay half-a-crown a week more. And there 's an engineering student taken the back-room from next week. It looks real nice since it was toshed up a bit. And he 's willing to pay eighteenpence more than Dennis Kavanagh did. With him, and Mr Cruikshank, and your annuity, and the money lying in the bank, you 'll be real comfortable off.'

''Deed will I, an' that 's the truth,' acquiesced Mrs Knox. 'An' I 'm that obliged to you for what you 've done, an' to Peter too. An' I 'm sure'——

'Tuts! It was nothing but a pleasure,' Mirren interrupted. 'Come away ben the house. You must be wearying for a cup of tea after your journey. And I 've got real good kippers.'

'Mirren,' Mrs Knox said solemnly a little later, as she replenished her cup for the third time, 'since I left home I have travelled. I have seen the world. I don't deny but what I have learned things, an' the very first time I 'm out I 'll buy a cookery-book. But one thing I will maintain until my dying day, and that is, that "East or West, hame 's best." Aye, that 's the gospel truth, an' so it is. Aye. Imphm!'

THE KHAMSIN.

A MEMORY OF SINAI.

By J. A. NIMMO.

WE had sweltered near the Canal, and watched great steamers sail, as it seemed, over solid earth—robbing the camel of his ancient cognomen 'ship of the desert.' We had been baked in open trucks that bore us eastward, while our sun-tired eyes blinked at the endless white road shimmering beside the track—a road like a chalk line drawn across brown paper. We had trekked from railhead over wind-blown ridges and dunes of soft, yielding sand till the sun went down, and we camped dead-weary beneath the naked stars. Next morning we saw the sea.

Here at last was desert without the sense of desolation. The eye followed the flowing contours of scrub-sprinkled dunes with comfort, and, seaward, dwelt with delight on the sweep and roll of the blue Mediterranean. Dividing land and sea, like a gigantic golden scimitar, curved the yellow beach, where ten thousand children could have built sand-castles. Higher up, amid rough grasses and cacti, lurked a few tiny sea-bleached flowers.

Camp had been pitched for three days when the khamsin came. Not like the simoom, with its attendant sand-devils, which bursts howling from the desert, tearing and battering and stifling for brief minutes; but noiselessly, stealthily, the khamsin came, blowing tirelessly, ceaselessly from the south. Over leagues and leagues of red-hot sand it had blown, and its fiery breath dried the marrow in the bones and bred toxins in the blood. For hours and hours the khamsin blew. . . . .

That night a full moon showed blood-red above the desert's edge, then, lifting through noisome vapours, rose clean and white and high, flooding the world with misty light. The men lay outside their tents in strange postures, listless, breathless. A few spoke in whispers, and an officer moved from group to group, talking cheerily.

A man lay beside his corporal, staring at a black kit-bag. He nudged the other nervously.

'What 's wrong wi' that bag?' he grumbled.

'Nothing,' said the corporal. 'Don't worry, man.'

'But it 's growing bigger. It 's swelling! It 's—— Oh Lord! what 's wrong with it?'

'Don't be a fool!' said the corporal. 'Here, have a drink.' He produced his water-bottle, which contained a mere teaspoonful of tepid water. The man sucked down the last drop greedily. He had finished his own allowance hours before. The corporal rose and sat upon the bag.

'You see,' he said wearily, 'it 's only an ordinary kit-bag.'

And still the khamsin blew.

At noon next day the men lay in their tents, half-nude, waiting, waiting for the wind to change. In the corporal's tent a voice babbled.

'Rotten business soldiering. If you 're not freezing or soaking or stuck in mud, you 're roasting. Now, this hell-hot wind—it 's worse than a black sou'-easter in Algoa Bay. It 's flopped out two of the quarter guard already, and '——

'Did you hear about that chap in C Company?' broke in another voice. 'Drank sea-water last night, and went stark staring mad.'

'More fool he,' said the first voice. 'But that 's different. Now, this stinking wind—they say it lasts fifty days!—is just the thing to bring on heat-apoplexy, especially if you 're fat '——

'Aw, chuck it!' A large blotched face was raised in angry expostulation. The naked, full-fleshed torso attached poured perspiration at the movement. The man's eyes dropped, and he brushed something off his knee. Seizing a boot, he beat frenziedly at a sinuous, myriad-legged horror that squirmed in the soft sand.

The corporal, who lay near the tent door, turned. 'You 'll never kill it that way,' he said.

The fat man seized a second boot, and gleefully crushed the writhing centipede between the two iron-shod heels. The others, roused from stupor, sank back, and the corporal turned again to the tent door. His eyes were fixed eagerly on a tiny yellow flag marking the camp boundary. For hours it had flown steadily seaward. Now it drooped.

Something in his tense attitude communicated itself to the men; something, too, in the air moved them—a hint of imminent change. The corporal's eyes never left the flag. Weakly it stirred and sank. Again it stirred, fluttered impotently, and sank. A long, long pause; and then it rose and flew straight inland. On his face the corporal felt the cool, salt breeze that blows from the sea.

'Boys,' he shouted joyfully, 'the wind 's changed!'

The khamsin had passed.

[*Christmas Number.*

THE FALL TRIUMPHANT.

By C. L. M. BROWN.

I.

NONE of us is perfect; even the best and most strictly disciplined amongst us have, somewhere hidden away, the secret failing, the little ewe-lamb of guilt which, in spite of our strong resolutions, we know we cherish and admire above all our fleecy flock of virtues. Such is our poor human nature; and so it was with the Rev. Peter Pomeroy Prendergast.

Peter Pomeroy was assistant curate at the parish church of Gessingham, and he was exceedingly and deservedly popular. Gessingham is a small town in a secluded district of the south of England, and its society is the most eternly respectable and resolutely select to be found on this side eternity, I am tempted to think. As is usually the case, man being by nature a timorous biped, by far the greater proportion of people who mattered—certainly the dominating element of Gessingham society—were ladies. Moreover, they were ladies who prided themselves on their *tone;* none of the corrupting ideas of modern fashion were permitted to find a home in the untainted drawing-rooms of Gessingham. London and kindred cities, with their short skirts and their cigarette-smoking viragoes, might sink to the level of Nineveh and Babylon of old; but here, thank Heaven! they knew what became a lady and what did not. True it is that Mrs Fenton, whose husband was an architect, and whose second cousin had tried to write a play, once began a novel by Ouida, but she had not finished it. No, she had burned it at the third chapter. Without exaggeration it may be said that the primrose paths of folly did not lead to the carriage-drives of Gessingham.

'Nonsense!' you may say. 'All that is done with long ago; it vanished with the last decade and the coming of rag-time and the tango, those final demolishers of the Victorian tradition. There are no places left now like the one you describe.' To which I merely reply, 'Are there *not?*'

II.

Hither, aged twenty-five, came the Rev. Peter Pomeroy Prendergast, and Gessingham took him to its bosom and fed him on China tea and toasted scones. He became the pet of Mrs Burrage-Gracey, the rector's wife and uncrowned queen of Gessingham; the two Misses Gardiner, antique, almost grotesque, but *so* lady-like, doted upon him; homely maidens approaching the still waters of forty regarded their fair selves in the flattering mirrors of hope, and dreamed wild dreams. Peter Pomeroy was the acknowledged darling of the drawing-room, the idol of the at-home.

For one thing, men were scarce in Gessingham—young ones, that is. Of course, there were a certain number of husbands about, but a real untamed man, unbranded by the matrimonial iron, was something of an event. The rising male generation of Gessingham had a lamentable habit of quitting the calm security of its confines as they came to manhood, and going forth after the fleshpots of the world. One supposes it was the call of the wild. But Peter Pomeroy was a charming young man; he had a handsome boyish face, with frank laughing eyes and a smile that would have captivated a cab-driver, and his manner was irresistible. Gessingham never put up a fight at all.

By the time that he had worn the cloth a year, Peter had become so imbued with the ideas and the Puritan spirit of Gessingham that he almost forgot that he had ever known any others. His was an impressionable nature, quick to absorb the particular atmosphere in which he found himself, and it was very easy to fall in with and gradually assume the opinions of the community. There was a time—and that not long past—when he would have considered the prejudices of Gessingham as more than absurd; but, after all, he was ordained now, and it made a difference. Perhaps the austere views held by the ladies of the town were the views he really ought to hold. Perhaps that mode of life which he had formerly deemed harmless and attractive was unfit for decent people. At least, he persuaded himself, this was the view that as a clergyman he ought to adopt. It was certainly the view that he allowed Gessingham to credit him with.

III.

'But,' exclaims the shrewd and experienced reader, 'what about that little ewe-lamb of guilt or whatever you called it? What about that, pray?'

I was just coming to that.

To look too penetratingly into the past of any human being, even a young clergyman, is a performance as indecent as it is hazardous. Why should the mists of the morning be suffered to mar the cloudless serenity of the noon? And again, why?

Thus you must pardon me if, to gratify the improper curiosity of the above-mentioned reader, and also to make more clear what follows hereafter, I disclose one little flaw, if such it can be called, in the otherwise faultless demeanour

of the Rev. Peter Pomeroy. Briefly, it was a fatal susceptibility to the charms of feminine beauty. There was something in the eye of a pretty girl that could shatter in an instant the solid shield of his self-content and set his heart a-dancing to the delicious music of romance. In his younger days it had enticed him into many a fond flirtation, and though for the past year the restless little demon had slumbered within him, lulled by the somnolent atmosphere of Gessingham, he knew that it was not dead; more than once he had felt it stir in its sleep. The chance sight of a soft curving cheek glimpsed beneath a passing hat-brim, the swift vision of two warm red lips parted in an eager smile, were enough even now to set his pulses tingling and recall, deep within him, the echo of that old seductive music. If he had been born in the Middle Ages, Peter would not have sought the cloister; he would have been a troubadour. That is the truth of the matter.

Of course, he knew that all this was wrong now, and that he ought to trample it ruthlessly underfoot, grind it without remorse into the dull gray powder of the past; but somehow he couldn't. While realising that what had been harmless, if at times embarrassing, in an undergraduate was a distinct falling from grace in a cleric, he had not the heart to exterminate utterly this lawless (but withal so fragrant) little wild-flower of romance. At the bottom of his heart he loved it, and he knew it.

IV.

But it was with a mind untroubled by thoughts of this kind that Peter entered the rose-burdened porch of Gessingham Rectory and knocked robustly at the door. The rector's wife was giving a tea-party, with croquet on the lawn for the more athletic of the guests, and every one who counted at all in the Gessingham hierarchy was to be present. The Misses Gardiner, in large, stiff lace collars which gave them a startling resemblance to Tenniel's illustration of the Unicorn in *Through the Looking-Glass;* Mrs Stanton, the bank-manager's wife; the Misses Tree, whom the coming of Peter had roused from the lethargy of maiden despair; and many another worshipper at the shrine of good manners whom it is unnecessary to name, were already being entertained in the drawing-room when Peter entered.

'Ah, here is Mr Prendergast!' cried Mrs Burrage-Gracey, swishing forward to greet him. 'And how do you do? What a glorious afternoon! And did you get the strawberries safely? I do hope they were not squashed—the maids are so careless nowadays, one cannot trust them an instant out of one's sight.'

Peter gave the required assurances, and plunged with zest into the pleasures of the afternoon. He was immediately captured by the Misses Tree.

'And how are the guinea-pigs, Miss Theodora?' he inquired of the younger of the twain.

'Oh, the little dears,' exclaimed the damsel, 'they are so charming! They squeak and run around in the prettiest manner.—Do they not, Ursula?'

'Yes; and jump up and down, too,' added the elder Miss Tree. 'Why, the little one with the pink spot on its nose took a piece of groundsel out of my hand this morning!'

Above the chatter of the two maidens Peter heard the voice of Mrs Burrage-Gracey declaiming to Mrs Fenton. 'Such *terrible* people, my dear . . . at "The Walnuts" . . . perfectly *impossible*. . . . My husband called . . . said they did not usually attend church . . . probably agnostics . . . or artists. . . . I shall not think of calling.' . . . .

'We have named the brown-and-white one Francis, after St Francis of Assisi. Ursula thought it was irreverent, perhaps; but he is such a sweet little thing, I am sure St Francis wouldn't mind. And he squeaks *so* prettily,' said Miss Theodora; and Peter lost the remainder of Mrs Burrage-Gracey's harangue.

V.

Later in the afternoon, while recuperating after an energetic bout of croquet, Peter Pomeroy had an opportunity of speaking to the rector's wife. 'Did I hear you say that some new people are come to "The Walnuts"?' he inquired.

'Oh yes; have you not heard?' replied Mrs Burrage-Gracey eagerly. 'Some really terrible people from London named Gordon, I believe. A mother and son and two daughters; and I hear that all three of the women *smoke*, though I cannot believe it possible. But it is perfectly true that one of the daughters rode up the High Street on horseback sitting astride, like a jockey. Simply outrageous!'

'Dear me,' observed Peter, 'how very distressing! Have you called yet?'

'No, decidedly not,' snorted Mrs Burrage-Gracey; 'nor do I intend to do so. The rector has been, of course, but they practically told him that they never went inside a church. I trust Gessingham will entirely ignore them. Fancy dear Miss Gardiner going to such a house—they would probably offer her a cigar! There will be no need for you to call, Mr Prendergast; they are obviously people who have no respect for the clergy. I should not be surprised if they turn out to be actors, or something like that.'

'Most unfortunate,' said the Rev. Peter. 'Perhaps they will not stay long when they discover how little we approve of them.'

'I sincerely hope not,' declared Mrs Burrage-Gracey. 'I shall feel most uneasy whilst such a corrupting influence is in our midst. The rector and I have always endeavoured to main-

tain the moral tone of Gessingham at a high level, and I am sure a family of this type can do nothing but harm in the parish.'

'To be sure,' agreed Peter, rising to renew the conflict.

'Quite an amusing situation,' he said to himself as he walked home after the company had dispersed. But exactly how amusing he had yet to learn.

The subject was again brought to Peter's notice the following morning, when Mrs Blessing, his landlady, waxed indignant over the behaviour of Gessingham's new residents. According to reliable reports, the 'goings-on' at 'The Walnuts' were of a truly shocking description.

'If poor old Mr Green, as "The Walnuts" used to belong to, could but hear the dancin' and shoutin' and pianner-playin' that goes on of a night-time, he 'd get up out of his grave and give 'em notice.' Mrs Blessing departed, brandishing the marmalade-pot.

VI.

On his way back from the daily service Peter walked through the High Street, and here it was that the bolt descended from the blue. He was standing a moment to examine some second-hand books in a shop window, when a robust and strangely familiar voice smote his ears.

'By all that 's unholy,' it roared, 'if it isn't old P. P. P.!' and the next moment something in the nature of a sledge-hammer struck him upon the shoulder, propelling him forward almost to his knees. 'How are you, you old buccaneer?' added the voice enthusiastically.

Recovering himself, the Rev. Peter Pomeroy Prendergast turned and faced his assailant. Regarding him delightedly through a pair of large spectacles was a huge young man of about his own age. He was bareheaded, and wore an old brown-velvet jacket of the type frequently affected by artists with a Bohemian tendency; on his feet were a pair of ancient red carpet slippers, the heels of which flapped dismally at every step.

'Good heavens, Dick Gordon!' gasped Peter, and the world was chaos.

The young man beamed madly. 'Well,' he cried, 'fancy meeting you here of all places! Thank Heaven, then, we are still in the twentieth century! I began to think we 'd slipped back into the Middle Ages, or the Old Testament, or somewhere equally morbid. By Jove, and a parson, too! I say, you don't half look a sight —ha-ha-ha!'

Peter coloured. 'Don't be an ass, Gordon,' he said; 'you always knew I was going to be ordained.'

'Sorry, old man,' replied the other heartily— 'only my joke; but I can't imagine you like this yet. Come on—which way are you going? Let 's have a talk about old Cambridge days. Remember when we kept together in Fitzbilly Street? What? I say, it 's fine meeting you again, you old toreador.' He seized the Rev. Peter by the arm and marched him energetically down the High Street, talking volubly the while in his rich resonant voice.

VII.

Too dazed to resist, Peter kept pace with his loquacious friend, striving meanwhile to grasp fully the situation and its probable consequences. Here was Dick Gordon, his old 'varsity companion, reappearing into his new Gessingham life. That in itself was nothing terrible, had it not been for Dick's reputation. Already, as one might say, he and his were proscribed in the town as notorious evil-livers. 'I trust,' Mrs Burrage-Gracey had said, 'Gessingham will entirely ignore them.' How could he possibly ignore old Dick Gordon? Could he possibly intimate to Dick that he was no longer a desirable person to associate with? Must he be frigidly polite and let it go at that? *Did he want to let it go at that?* Who was Mrs Burrage-Gracey, after all, to declare people impossible? It was a beastly predicament, though.

'Whatever made you come to a place like this?' he inquired as they progressed down the High Street, where the unaccustomed garb of his friend was attracting no small amount of attention. Several small boys were following them at a respectful distance.

'Had to,' replied the other disjointedly. 'My mother . . . doctor's orders . . . London killing her . . . quiet neighbourhood . . . relaxing air . . . usual rigmarole, you know. Of course, *I* won't live here—just down for a month or so to see things all square for the girls. By the way, were you going anywhere just now?'

'No, no. I've finished for the day,' replied Peter a little breathlessly.

'Good! You must come along'——

He was interrupted by Peter suddenly clutching his arm in a frenzied grasp. Just ahead, and approaching them, Peter had descried the majestic figure of the rector's lady. What was he to do? How dare he introduce Dick in his remarkable get-up as his friend Gordon of 'The Walnuts'? Panic seized him, and with an excited cry he dragged his companion into the nearest shop, which was a greengrocer's.

'Hello! something stung you,' exclaimed Gordon in surprise; 'or are you after the Brussels-sprouts?'

'Mrs Burrage-Gracey,' gasped Peter wildly, 'the rector's wife!'

'Well, what about her?' replied the other, mystified by this strange behaviour. 'Has she

got her muzzle off, or do you owe her some money?'

'No, no, nothing like that; but I particularly want her not to see me—it's a whim of mine, that's all.'

'You'd better lie down in that corner and cover yourself up with cabbages,' suggested his friend. 'She'll never think of looking for a curate under a cabbage-heap.'

'Thank goodness, she's gone by!' said Peter with a gasp of relief. 'Lucky thing she's near-sighted. My word, it was a close shave!'

At that moment the shopkeeper entered from the rear of his premises. 'Ah, good-morning, Mr Prendergast,' he exclaimed pleasantly, with a glance at the curate's strange companion. 'What a beautiful morning! What may I have the pleasure of getting you?'

'Oh, nothing, nothing; we just popped in to shelter—er—that is, my friend—er—have you any Brazilian nuts, Mr Higgs?'

'I'm afraid not, sir,' replied the greengrocer; 'they're out of season just now, Brazils is.'

'Dear, dear! I wanted some for a sick child,' exclaimed the now thoroughly perturbed Peter. 'I must try elsewhere. Good-morning, Mr Higgs;' and he hurried his companion out of the shop.

'Look here, P. P. P.,' said Gordon when they were once more outside, 'if you were not an ecclesiastic, I should ask you very sternly where you've been spending the morning.'

'Don't be absurd, Dick,' said Peter, wiping his streaming forehead. 'I had a particular reason for not wanting to see Mrs Burrage-Gracey this morning. You don't understand.'

'I certainly don't,' replied Dick. 'Anyway, I'm deuced glad to see you again, you old brigand'—he beamed affectionately through his glasses. 'Come on, you must see the mater and the girls. They'll be no end braced to meet a real live individual again after a week among the natives.'

'I really can't now,' said Peter hastily. 'I'm in a terrible hurry.'

'But I thought you said'——

'I know—I've just remembered an important engagement—vestry meeting, you know—forgot all about it.' He consulted his watch with a feverish air.

'Come this afternoon, then. You know where our wigwam is. Don't forget; we'll be expecting you—fatted calf and all that sort of thing.'

'I'll be delighted,' said Peter. 'Good-bye; good-bye.'

'Cheerio, old sportsman. Come as early as you can; we don't worry about polite hours or any rot like that.'

Peter hurried away, and fled for the blessed seclusion of his lodgings. He wanted to think.

VIII.

Peter did not eat a hearty lunch; he was feeling upset. He wanted to get firmly astride the dilemma that had suddenly presented itself before him, to settle definitely his course of future action. On the one hand there was Dick Gordon—Dick, the dancer of irresponsible jigs upon the tin-roof of life, the most generous of friends and best of good fellows, but hopelessly incapable of realising what was and what was not a fit line of conduct for a clergyman to follow; on the other there was Mrs Burrage-Gracey and all she stood for—the esteem of the parishioners, the austere outlook on life which for the past twelve months he had made his own, even the dignity of his calling. Conscience bade him pay merely a formal visit to the Gordons and privately intimate to Dick that he couldn't expect him to be quite the same as in the good old past; that there were the prejudices of the town to consider; that he himself, indeed, had come to look on things in a somewhat more sober light than Cambridge had been wont to shed. Would Dick be hurt, he wondered, or would he merely roar with laughter and throw a cushion at him? He would certainly not understand. And, again, was he sure of his own attitude? Did he truly in his inmost self disapprove of Dick, or was he being blinded by the absurdly conventional atmosphere through which he had lately been viewing the world? There was no harm in Dick Gordon; he was as good as Mrs Burrage-Gracey any day. But, in the present situation, for him, a clergyman, openly to identify himself with the discredited 'Walnuts' meant not only social ruin, but probably public disgrace as well. If the rector himself did not take drastic action, people would write to the bishop. It was horrible.

Peter at length set out to pay his promised visit to 'The Walnuts' with a strong determination to maintain that dignified attitude which Gessingham required of its spiritual pastors, and for the rest to trust to fate. Unhappily, fate was to prove unworthy of his trust.

As he entered the gate of 'The Walnuts' he beheld Dick Gordon in his shirt-sleeves on the lawn, apparently engaged in a desperate struggle with a girl of about sixteen, whose pigtail had come unfurled and flew disorderly in the breeze. On seeing him approach they disentangled themselves, and Dick hurried to meet him, beaming joyously.

'Here you are at last,' he boomed. 'We've been expecting you this last hour. This is my kid sister, Madge. Just teaching her ju-jitsu—frightfully handy thing to know. Ought to take it up yourself—jolly useful if you had an obstreperous baby to christen! What?'

Peter shook hands with Madge, a pleasant, though at present rather dishevelled, schoolgirl

with a smile that was a diminutive feminine edition of her brother's colossal grin.

'And what do you think of Gessingham?' he asked in his best parochial manner.

'Well, nothing spesh,' answered the girl, endeavouring to capture an elusive coil of hair; 'rather a dull hole, don't you think?'

'You certainly can't compare it with the West End of London for gaiety,' admitted Peter with a smile.

'Come on,' broke in Dick, 'let's go and find the mater and Di;' and he led the way towards the house, flinging inconsequent remarks over his shoulder as he went.

IX.

As they approached the front-door a girl came out to meet them. She was perhaps twenty years of age and of medium height, with a small oval face and a largess of gold-brown curls clustering about her forehead. At the first glance Peter saw she was exceedingly pretty.

'Here we are, Di,' called out Dick Gordon. 'Here's P. P. P. at last.—My sister Diana,' he added over his shoulder for Peter's benefit.

The moment their eyes met, Peter knew he was lost—utterly, irrevocably. Blue eyes they were, blue as the waters of a northern sea, and in their lurking depths he read his fate more clearly than ever did clairvoyant in limpid crystal. That detestable weed of romance blossomed forthright in his heart, and its intoxicating sweetness filled him with sudden joy.

'How do you do?' he said.

'Good-afternoon, Mr Prendergast,' replied his destroyer. 'Dick told us he had met you in the town this morning. We are so glad—we know scarcely any one here. To tell the truth, I think the people are afraid of us; and you cannot wonder at it, the way my brother goes about.—Dick, why *can't* you put your boots on?'

'Too tired,' murmured Dick.

'Yes, I am afraid you will find Gessingham rather quiet after London,' said Peter; 'but the people are really very likeable when one gets to know them. They are a little old-world, that is all.'

'Old-world be darned!' ejaculated Dick; 'absolute barbarians, you mean. Why'——

'Dick!' exclaimed his sister with a swift glance at Peter.

'What's wrong, Di?' said he in surprise. 'Oh—ha, ha, don't be absurd! P. P. isn't one of that sort. Why, I've heard him pass remarks that you could toast muffins on, before now.'

'Yes; but you forget Mr Prendergast is a clergyman now, and probably doesn't approve of your disgraceful ways. You will have to be on your best behaviour unless you want to drive him away from "The Walnuts" altogether. We all shall.'

Was it Peter's overstrained imagination, or did he actually detect a subtle note of provocation in the girl's tone?

'I'm afraid I gave your brother up for lost long ago, Miss Gordon,' he remarked. 'But perhaps I may have one more try to reclaim him, if you'll promise to help me.'

'I don't think I should be of very much help,' said Diana. 'I'm so deep in the toils of sin myself.'

X.

They entered the house, and Peter was introduced to Mrs Gordon, a genial but somewhat worn-looking old lady, who was seated in an arm-chair smoking a cigarette.

'Excuse me for not rising, Mr Prendergast,' she said, 'but I'm in the hands of the doctor—my terrible children are steadily driving me to an early grave. I hope you won't be too shocked at my smoking; it is the one solace a poor lone widow woman has left.'

A fleeting vision of Mrs Burrage-Gracey flashed through Peter's mind as he replied with suitable gallantry. Could she but see him now—his feet of clay all bare. . . .

'May I have one of your cigarettes, mother?' remarked Diana, helping herself. 'Mine are all upstairs.—Mr Prendergast, will it drive you right away from "The Walnuts" if I smoke too? Will you dash out at the first puff, and never come near us again? I'll throw it into the fireplace if you only say the word.'

For reply Peter struck a match.

'Come into the studio,' said Dick. 'I want to show you a drawing of mine—rather great, I think, but nobody else does.'

They adjourned to the studio, a room where confusion reigned in triumphant disorder, and viewed the work of the artist.

'The apotheosis of beauty in form,' cried he, holding up a pencil drawing of a female figure standing on tiptoe; '"Eve Plucking the Apple." And that little beast Madge had the audacity to say it looked like a Congo native hanging to a tram strap! It's always that way with genius.' He skimmed the apotheosis of beauty in form gracefully into a distant corner of the studio. 'Phew!' he went on, 'it's abominably hot. Did they send that case of soda-water I ordered, Di? I could mop up a brewery.—What is it, P. P.—Scotch or Irish?'

For twelve long months no intoxicating liquor had passed Peter's lips; he was secretary of the Gessingham Temperance Society and Band of Hope.

'I don't know—I—er—in fact'——

'Perhaps Mr Prendergast doesn't like whisky,' said Diana quickly.

'Oh, doesn't he just?' bellowed Dick. 'I know Peter better than that.'

'But you don't realise Mr Prendergast is a clergyman now'——

'Scotch, please,' interposed Peter decisively.

XI.

Dick departed, and Peter and Diana were left together.

'So you don't care for Gessingham, Miss Gordon?' said he.

'Not for the town itself,' she answered. 'I'm afraid it is too respectable for such a disgraceful family as ours. But the country around is delightful. There is a little wood just off the main road, perfectly wild and wonderful. I go there nearly every morning to paint—I'm doing a water-colour of the church and town as you see them through the trees. I love the country, although it disapproves of me.'

'Do you mean the Maddeston road?' inquired Peter.

'I believe it is—the one with the oak-trees on each side.'

'Yes, that's it,' said Peter. 'But are you not nervous about going out into the country alone—with all the bulls and things about?'

Diana laughed. 'Gracious, no!' she said. 'Why, I don't believe the wildest of Gessingham bulls would risk its respectability by venturing into the same field as any one from "The Walnuts." You have no idea what the neighbourhood thinks of us. I quite expect you will shun us like the plague when you hear what fearful people we are.'

'On the contrary,' smiled Peter, 'my duty will compel me to take you all under my especial care.'

Dick returned, bearing a whisky-bottle and a siphon of soda. 'Well, P. P.,' he roared jovially, 'and how do you like parsonical life? Bit odd at first, wasn't it?'

'I get on very well, thanks,' replied Peter. 'The people here are very kind to me, all of them.'

'You poor old devil!' groaned Dick. 'Don't they drive you into a positive delirium tremens of boredom? Do you never have a mad impulse to rush out into the night and sow a wild oat?'

'Don't be an idiot, Dick,' said Peter. 'You don't realise the position.'

'Never mind,' cried the burly artist; 'things are going to be changed in Gessingham. We'll wake 'em up somewhat, you and I. We'll cause a regular ethical earthquake. By Jove'——

'Dick,' declared Peter solemnly as he drained his glass, 'if you don't shut up I'll punch your great idiotic head.'

It was several hours later that Peter at length left 'The Walnuts;' and as he came out of the gate with Dick, still in his slippers, gripping him affectionately by the arm, the elder Miss Gardiner was passing by on the other side.

Peter fell back to earth with a hard, uncomfortable bump.

XII.

Gessingham was pained—pained and grieved. At first it had been merely surprised, and perhaps just a trifle shocked, that the Rev. Peter Prendergast should be seen arm-in-arm with that awful young man from 'The Walnuts,' who appeared in the town in carpet slippers, and an alarming brown-velvet jacket that seemed somehow of itself to diffuse a vague halo of immorality. When it learned that they had been acquainted at college, Gessingham breathed freely again. Naturally he had been obliged to call, and no doubt he had not wished to walk arm-in-arm down the road with that impossible youth in carpet slippers. But the relief was short-lived. It was observed with astonishment and horror that the Rev. Peter frequented 'The Walnuts,' and the young man of the indecent attire was seen entering his rooms at all hours of the day and night. Worst of all, Peter had declined an afternoon croquet-party at Mrs Fenton's, and was afterwards reported to have been seen rushing wildly round the lawn at 'The Walnuts' in pursuit of one of its cigarette-smoking women, who was wearing his clerical hat and emitting loud shrieks of disgraceful laughter. This, in the elegant phrase of our stylists, put the tin hat on it.

'It is a very shocking thing,' said Mrs Burrage-Gracey when she called on the Misses Gardiner the day following this outrage. 'Of course, one cannot exonerate Mr Prendergast, but I really think he is more to be pitied than blamed. Those fearful people have dragged the poor lad down.'

'Indeed, how wicked!' exclaimed Miss Gardiner. 'I feel truly sorry for poor Mr Prendergast; he was such a dear, nice boy.'

'I wonder if ever he thinks of that beautiful sermon he once preached about Satan, invisible as the winds, whispering his temptations into our ears?' added her sister. 'Alas that such ungodly folk should come to disturb our happy parish!'

'Have you spoken to him about it?' inquired Miss Gardiner.

'Yes; both the rector and myself have spoken as strongly as possible on the subject, but his attitude is most strange. When I pointed out the improper character of these people, he seemed unable or unwilling to accept my meaning. He almost went so far as to suggest that I had been at fault in condemning them from the very first as I did, and refusing to call upon Mrs Gordon. Of course, it is those girls that have turned his head. Only think of it—a curate of Gessingham running round a lawn in pursuit of a shrieking young woman! However is it going to end?'

Miss Julia Gardiner leaned forward. 'Did—did he *catch* her?' she asked in a tremulous whisper.

'*She* would see to that,' snapped Mrs Burrage-Gracey—'shameless minx! And a mere child,

too, I am told. Imagine dear Miss Theodora Tree allowing herself to be pursued over lawns by a man! Oh, my dear, it is a most painful situation.'

'What depravity!' sighed Miss Gardiner.

XIII.

The change in the attitude of his Gessingham friends was quickly felt by Peter, and it touched him acutely. It was as if a biting frost had of a sudden chilled the warm glow of a July afternoon, and he was cold to the bone. He knew they were disappointed in him; that they had been fond of him, and were grieved at what they believed to be his danger. This hurt him more than their disapproval. Once again he began to have doubts as to whether they were not right, after all: was he indeed blindly treading the path to destruction? *Facilis descensus Averni* —easy indeed, and, oh! most sweet. For Peter was in the toils. Had it been only Dick, and a choice between Dick's ideas of existence and Mrs Burrage-Gracey's, he would have closed the door on his folly and returned repentant to the fold of grace and the smiles of the Misses Tree. But there was Diana—Diana's eyes of blue, Diana's gold-brown hair, Diana's soft-toned, madly provocative voice. At times he fancied that, while the rest of the Gordon family were blissfully ignorant of his predicament, she was watching him all the time; luring him on, away from safety, away from the calm haven of Mrs Burrage-Gracey's drawing-room, out into the sparkling open seas of unknown hazard. Yet he followed her—against his better judgment, perhaps, but with a song in his heart for all that.

XIV.

A more attractive morning for a country walk could not have been desired than that on which Peter left his lodgings and sought the oak-embowered pleasance of the Maddeston road; and it was a very charming direction to choose for a morning stroll. But it was neither bright sun nor leafy shade that tempted Peter forth—you know the real reason as well as I do. It was Diana, painting in the quiet seclusion of her 'wild and wonderful' wood—Diana, as fair as her chaste namesake of the skies, whom Gessingham regarded as a veritable agent of the devil.

Climbing the gate that led off from the road, Peter entered the little coppice. He soon saw her, seated on a camp-stool before her easel, intent on her work. Her hat was thrown off, and the sun, piercing the chequered shade of a silver birch, danced over her hair and smooth curving cheek. Truly the Devil employs comely agents for his unholy enterprises.

'Good-morning,' said Peter, pushing aside the branches that had shielded his approach, and stepping out into the little clearing where she sat.

Diana looked round with a little start. 'Good gracious, Peter!' she exclaimed; 'however did you get here?'

They had quickly fallen into the more familiar mode of address—formalities of any kind did not survive long in the Gordon family circle.

'You'd never guess,' he replied, smiling. 'I walked. As a matter of fact, I was just taking a stroll along the road there, and I remembered your saying you sometimes came here to work; so I just hopped across to see if you were here this morning. I hope I'm not interrupting you?'

'No, rather not,' replied Diana, laying aside her brush and palette. 'As a matter of fact, I was just wishing I had some one to talk to—can't get going at all to-day. And how is the parish progressing?'

'Much as usual,' quoth Peter. 'Hang the parish, anyway!' He threw himself down on the long grass and took out his cigarette-case. 'Smoke?' he inquired, extending it.

'Thanks,' said Diana, accepting. 'You know, Peter, it is very, very wrong of you to encourage me in vice like this. How can we frail creatures hope to conform to the standards of Gessingham propriety if the very people who ought to guide us aright tempt us to evil-doing?' She glanced at him in mock reproof.

'You know perfectly well that there is not the slightest harm in you or anybody else smoking,' replied Peter with almost unnecessary warmth. 'You are always teasing me about that kind of thing, as though I were a Mrs Grundy, and you know quite well I'm nothing of the sort.'

'I don't, Peter,' she answered, regarding him intently through the wreaths of smoke; 'and you are not certain of it yourself—now confess.'

'Rubbish!' spluttered Peter uncomfortably. 'Of course, I have to remember I'm a clergyman. I can't be quite as careless of propriety as—as Dick, for example; but I'm not a fool with it—at least, I hope not.'

'Listen,' said Diana. 'You are in an awkward position—no, don't interrupt, and don't get angry—you ought not to have anything to do with us, and you know it. We're social and moral outlaws here, and you are one of the pillars of respectable society. It is only your loyalty to Dick, because you were old friends at Cambridge, and your shrinking from hurting his feelings, that prevents you from cutting us altogether, as you should. And then—perhaps the bit hasn't quite ceased to chafe yet.'

'So you think it is only my friendship for—Dick, do you?' said Peter slowly.

Diana avoided his gaze with some hesitation. 'You admit I'm right, don't you?' she replied.

'No,' said Peter—'at least, not entirely. I admit I am in rather a difficult position because the people here are so extremely narrow and prejudiced in their old-fashioned ideas; but I don't like what you said about the bit chafing.

If you mean that I'm sorry I became a parson, you're wrong altogether.' He spoke with some heat.

'I didn't mean that,' she answered; 'I only meant—oh, I don't know what I meant. Anyhow, I think it is very nice of you to come and see us, Peter, and not leave us all alone. I would like you to know I think that.'

'Very self-sacrificing on my part, isn't it?' exclaimed Peter. 'I come because—because I want to. I—I hoped you might have guessed that, Di.'

'Oh!' said Diana uneasily.

XV.

For some reason Diana Gordon hastened to change the subject. 'I say, we had a terrible affair on Sunday; nearly a riot. Madge and Dick were practising that screw service on the lawn in the afternoon and kicking up a bit of a row, and the old fellow who lives opposite came across and asked to see mother. Mother turned him over to Dick, who promptly asked him to make a four. That did it, of course. He called Dick an unprincipled young blackguard; and Dick told him that no gentleman would stand on a tennis-court with hard-heeled boots the size of his. It was awful; we thought he was going to have a fit!'

Peter's heart sank. 'It will cause a terrible scandal in Gessingham,' he said gravely. 'It would be Mr Wilton; he's vicar's warden, and frightfully strict about Sabbath observance. Why couldn't Dick have apologised and tried to smooth him down? He's quite a harmless old chap, really; I get on very well with him.'

'Yes; but you know what Dick is,' said Diana, rising and gathering her belongings. 'I must be going home now. I'm going across the fields—— No, you can't carry anything, thank you. You must go and finish your walk. I'm not in the least nervous of bulls. Why, I killed a spider last night with quite a short stick! I'm a bit of an Amazon, you know. Good-bye.' She plunged through the trees, turning to wave her hand as she climbed the stile leading to the footpath through the fields. Peter raised his clerical hat.

He returned home slowly by the road, thinking. He had to confess to himself that he was horribly in love with Diana—'over both ears and then some,' as Dick would have put it. But she would never, never marry him—a parson. He allowed himself no illusion on that point. It was not the sort of life for a girl like her. She liked him, perhaps—probably he amused her. . . . 'I won't make an ass of myself, anyway,' he muttered grimly. He felt very desolate.

In his rooms he found a note awaiting him from Mrs Burrage-Gracey. 'Dear Mr Prendergast,' it said, 'will you please come and see me immediately? I have a matter of great importance to talk over with you. — Your sincere well-wisher,

'Millicent Burrage-Gracey.'

'"Your sincere well-wisher"!' repeated Peter, dropping into an arm-chair. 'Now for it!'

XVI.

'Yes,' said Mrs Burrage-Gracey, 'the rector has been called away suddenly, and he has left the matter in my hands—he felt that delay was impossible. I think you will see that yourself, Mr Prendergast. I do not wish to censure your conduct; I will not lay stress on the amount of anxiety and, in my own case at least, of grief you have caused to us who have thought of you so highly. Nor will I discuss the tenants of "The Walnuts," since you have chosen to make them your friends. I think the position is clear. It is enough to say that they have openly and publicly defied every sense of decency and proper conduct by playing tennis on Sunday—I will not inquire whether you were aware of this before—I sincerely trust not—and the rector has decided that it is impossible for a curate of the parish church to associate with them further. The matter was brought to his notice by the churchwardens, who expressed very strong views on the subject. It remains, then, for you, Mr Prendergast, to decide whether you shall relinquish your position here amongst us, or refrain in future from any relations with the Gordons at "The Walnuts." I think you yourself will agree that no middle course is possible.' Mrs Burrage-Gracey ceased, and toyed nervously with a knitting-needle.

Peter sat silent, his gaze fixed steadily on the carpet.

'I suppose you are right,' he said at length. 'I suppose I have been a fool.'

'I am very pleased to hear you say that,' observed Mrs Burrage-Gracey. 'I think you will make the right, the only possible, decision.'

Peter clasped and unclasped his hands. 'I should like a few moments to consider the matter,' he said.

'I have no desire to hurry you, Mr Prendergast,' she replied, 'but I cannot see that much consideration is necessary. The issue is quite clear—the old, old issue of right and wrong, of good and evil. I will return in a short while.' She rose and left Peter alone.

He saw that he must give in: there was no alternative. It was not as though there was any hope of his winning Diana; with that hope he would have laughed to scorn all the rectors in Great Britain and all their wives. But he had to lose Diana either way. Yes, he would give in—crush for ever under the hobnail of duty that cherished little flower of romance which had even now opened to glorious bloom in the heart of him. This should be the last rose of summer in all verity; henceforth the strait and narrow way.

[*Christmas Number.*

'When does the rector return?' he asked as Mrs Burrage-Gracey re-entered the room.

'To-morrow evening,' she replied.

'I will write to him,' said Peter, 'and I think I can promise that in future Gessingham shall have no occasion to find my conduct at fault. To-morrow morning I will call at "The Walnuts" and acquaint the Gordons of my resolve. I should go this afternoon, but I am due at Mrs Tomlin's for tennis.'

'I shall be there myself,' said Mrs Burrage-Gracey, smiling joyfully. 'I am so glad you have at last seen the folly of your recent actions, Mr Prendergast — I have been very anxious on your account. However, that is all of the past; we will mention it no more.'

As Peter left the Rectory and retraced his steps homeward, it seemed as though the lamp of all joy had been extinguished within him. Ahead all was dull, colourless, uninspiring; and behind him stood Diana, in whose eyes he had glimpsed for a moment the meaning of life. 'I was bound to lose her, anyway,' he murmured to himself; 'it is just as well to happen now.'

Poor Peter!

XVII.

The Tomlins' tennis-party was in full swing. It was a gathering of well-contented folk, and there was a touch almost of gaiety in the air. Mrs Burrage-Gracey had lost no time in whispering abroad the news of Peter's redemption, and it came as a great relief to all. Miss Ursula Tree was twice heard to laugh with almost girlish abandon, and the Misses Gardiner smiled gently from their wicker chairs in the shade. Every one greeted Peter most effusively; it was impossible for them to hide their delight at welcoming him back to the fold. 'Quite like the prodigal son of old, is it not?' whispered the elder Miss Gardiner to her neighbour. 'I am *so* glad!'

Peter did not share this general circumfluence of high spirits. He smiled and chatted mechanically, but his heart was heavy. His returns lacked their accustomed sting, and it was only by an effort that he kept his mind sufficiently with the game to be able to tell his partner from which court she ought to serve. At the conclusion of the set he found himself between the Misses Tree, who began eagerly to discourse of the amiable nature and intriguing deportment of Francis and Catharine, their guinea-pigs.

The tennis-court at 'Yew House' was situated at the end of the garden and surrounded by a thick yew hedge. Beyond this on two sides lay a meadow, for the Tomlins lived some little distance out of the town. It was just as Miss Theodora was in the middle of an ecstatic account of how Francis had stood on his hind-feet and pawed the air that Fate, Chance, Destiny, or what you will, of a sudden seized the racket of Mr Fenton and in the course of a hot rally smote the resilient white sphere far over the encircling wire-netting and the yew hedge into the distance and the meadow beyond.

'I'll get it,' cried Peter, glad of an excuse to escape from the babbling damsels. 'Play on; play on.'

He passed through the little iron gate that led into the field, and was hidden from view. The players continued their game.

Peter had not reappeared when a few moments later the set came to an end.

'It must have rolled into the long grass,' said Miss Tree nervously. 'Had not some one better go and help him?'

'Oh, Prendergast will find it all right,' said Mr Fenton hastily. He was tired and hot after his exertions, and did not relish the prospect of trampling about among nettles and thorns in search of a lost tennis-ball. 'I'll go presently if he doesn't turn up.'

He didn't turn up.

'Wherever can Mr Prendergast have got to?' exclaimed Mrs Tomlin when yet another set had terminated. 'Mr Prendergast,' she shouted loudly. But only a derisive echo mocked her from afar.

'What *can* have happened?' said Miss Gardiner.

'Oh dear! I hope he has not fallen down any old well or pit,' exclaimed Miss Theodora Tree, turning pale at her own tragic thought.

'Were there any cows in the field?' inquired her sister anxiously.

Mrs Tomlin went to the gate in the yew hedge and looked out. 'I don't see him anywhere in the meadow,' she said.

'Dear me! ought we to communicate with the police?' wailed Miss Theodora.

'We must go and look for him,' declared Mrs Burrage-Gracey, and, followed in breathless silence by the rest, she led the way in search of the missing Peter.

XVIII.

The field narrowed to a thin corner where it joined the Tomlins' garden, and beyond the hedge that bordered it ran a country lane leading off the main Maddeston road. Inside the field in the corner a haystack had been newly erected. Peter could see nothing of the lost ball on the freshly cut grass, and he concluded that it must have rolled into the nettles by the hedge. Without enthusiasm he was kicking them down and peering into the hedge-bottom, when a voice from the lane fell on his dulled senses, rousing him with the sudden force of an electric shock.

'Goodness, Peter,' it said, 'what *are* you doing?'

He sprang upright in astonishment. In the lane, watching him with an amused smile, stood Diana. She was wearing a loose blue jacket and short skirt, and carried a walking-stick.

Peter thought he had never seen her look so beautiful, so eminently desirable above all else in earth or heaven.

'I—I'm looking for a ball,' he answered. His heart was pounding against his ribs with sledge-hammer strokes; in the sudden emotion he could with difficulty control his voice.

'Been having a little game?' inquired Diana teasingly. But Peter did not heed the jest in her tones.

'Tennis,' he exclaimed, 'over there'—indicating the direction of the Tomlins' vaguely with his thumb. 'That fat fool Fenton hit a ball over here somewhere, and I was looking for it.'

Diana approached on the other side of the hedge and clambered a little way up the bank. 'I say, will they see me if I come over and help you?' she inquired adventurously.

'I don't know—I don't care,' replied Peter recklessly. This was too cruel, this meeting, he felt. Was he to be tortured beyond human endurance?

'Give me a hand,' said Diana. She was already half over a rather difficult stile. Peter helped her down. The touch of her warm fingers almost overcame him.

'Oh, Diana!' he gulped.

'What's the matter, Peter?' she said quickly. 'You look awfully cut up.'

'I've something I must say, Di,' cried Peter with a rush of words. 'I can't talk to you here, in sight of the lawn.' He glanced round. 'Come behind the corner of this haystack, will you? I must tell you all about it. I've had an awful interview with Mrs Burrage-Gracey,' he went on when they were hidden from sight—'simply awful—just after I left you this morning.'

'About me—us?' asked Diana.

'Yes; they've heard about Dick and Madge playing tennis last Sunday—it was the last straw. They gave me the alternative of resigning my curacy here or breaking off all intercourse with "The Walnuts." I—I gave way; it was no good.'

'Oh, Peter,' cried Diana, catching her breath, 'what beasts we've been, getting you into trouble like this! Of course you must not resign—you must simply stop coming to see us; it will be just as it was before we came.'

'It won't—it won't ever—Di,' Peter's voice trembled. 'Oh, Diana, I'm awfully in love with you—awfully; but I won't make a fool of myself by asking you to marry me. I know you could never be happy as a parson's wife—I've seen that always.'

Diana's lip quivered, and she kept her eyes from him. 'I've been an awful beast, Peter,' she said—'a rotten *cad*. It's been all my fault. I'm going now—home—altogether. Good-bye, Peter.' She held out her hand, and her eyes met his.

Peter lost his head. 'Di!' he cried incoherently, and with a quick movement he caught her in his arms and kissed her on the lips.

And it was at that untimely moment that the search-party, headed by Mrs Burrage-Gracey, with Mrs Tomlin, Mr Fenton, Mr Tomlin, and the Misses Tree in strong support, appeared round the corner of the haystack and stopped dead—stricken to silence.

XIX.

Several æons of time slipped by before any one moved or spoke. Then Peter stepped back and passed his hand over his brow. 'I—I'm very sorry, Mrs Tomlin,' he said dazedly, 'I couldn't find the tennis-ball anywhere; I can't think where it can have got to.'

Mrs Burrage-Gracey found her voice. '*Mr Prendergast*,' she said in an awful tone, 'how *could* you?'

Peter seemed to recover his wits. 'I beg your pardon, Mrs Burrage-Gracey,' he said quietly, 'and yours also, Mrs Tomlin. I have been guilty of great rudeness in leaving you so long. But I was—er—detained. I have nothing more to say now. I do not think I will play any more tennis, Mrs Tomlin. Thank you for an enjoyable afternoon, and pardon my informal manner of leaving.' He paused. 'Er—I don't think this situation need be prolonged further.'

'No,' said Mrs Burrage-Gracey, 'it certainly need *not*. To you, Mr Prendergast, I have nothing to say—now. I am disappointed in you.—But as to you,' she added fiercely to Diana, who had stood in silence, 'you shameless young woman, I hope I may see you hounded out of the parish, back to the dissolute city where you belong. Perhaps you will leave us now—since you have succeeded in dragging this young man to ruin and disgrace—wretched creature that you are!'

Diana, scarlet to the temples, opened her lips to speak, but Peter stepped quickly before her.

'You will pardon me, Mrs Burrage-Gracey,' he said with a forced calm, 'but your words are not prompted by that courtesy and good-breeding which I have always associated with you. I beg you to be more moderate in your choice of epithets when addressing the lady who has consented to be my wife. I bid you good-afternoon.'

Something in the nature of a wail of despair rose from the ranks of the successful searchers at this announcement.

'Then you are more hopelessly lost than ever,' cried Mrs Burrage-Gracey, and turning like a stately galleon, she sailed majestically away in the direction of the tennis-lawn, the others following her in dumbfounded silence. Last to turn away were the Misses Tree; they were as white as ghosts.

XX.

At last Peter and Diana were alone once more.

'Will you ever forgive me, Di?' asked Peter.

[*Christmas Number.*

'I simply had to silence that awful woman. It was you, not myself, I wanted to shield.'

'Oh, Peter,' she replied, 'I'm so, *so* sorry. I've ruined everything for you—she was quite right. It was my fault—my fault. Oh, why did I make you kiss me?'

'Make me!' exclaimed Peter.

'Of course. You don't think it was *your* doing, do you?' she answered, almost jealously. 'But I'll go away—back to London; they won't send you away if I'm gone.'

'I will not stay at Gessingham,' said Peter; 'I shall go—I don't know where. Oh, if only I had you with me, Di, nothing would matter—nothing. But I must tread that down. I've kissed you once—now it's past—over, done with, ancient history. Here endeth the diverting history of Peter Prendergast's folly. I must start a new history now, I suppose.' He laughed bitterly.

'Oh, Peter!' whispered Diana.

'I will go now,' said he. 'My dear, I shall always remember you; if only—— But I know you could never marry a parson—it would kill you.'

'No, Peter,' replied Diana very softly, 'I don't think I'd like to marry a *parson;* but—I believe—I'd rather like to marry *you,* Peter, if you don't think I'm *too* impossible.' She glanced up at him from beneath her dark lashes.

'Di!' cried Peter with a gasp. He stepped towards her, and as the song of life swelled to a mad crescendo of triumph in his heart, history repeated itself.

A BALLAD OF THE GRASSMARKET, EDINBURGH.

HER coming, like the dawn, dispels
  The gloom that fills the sombre street;
The flagstones chime like fairy bells
  Beneath the magic of her feet.

The grim old Castle, roused from dreams
  Of siege and sally long ago,
Bends down the morning's rosiest beams
  To kiss her tripping by below.

Though oft upon my shoulder sits
  Black Care, he flies when she's at hand;
And where her witching footstep flits
  I see a sunlit silver strand,

With shimmering braid of pearly surf,
  And ocean of a wondrous blue,
And hills behind of emerald turf—
  Such green as Northland never knew!

And scented southern breezes blow
  That gleaming argosies careen;
And orange-groves in blossom glow—
  And I am king, and she is queen.

And in her hair, that midnight vies,
  Are starry jewels blazing bright;
But from the heaven of her eyes
  There softly shines a fairer light.

She passes by—and soon become
  My dreams of Tyrian splendours dim.
I hear again the traffic's hum,
  And see the Castle, towering grim.

Yet long about my casement clings
  A light not borrowed from the sun,
And faintly floats on filmy wings
  The perfumed breath of Lebanon.

P. TAYLOR.

THE CEILING CHILD.

When my clothes are neatly folded, and my prayers correctly said,
And Mother's put the candle out and tucked me up in bed,
She goes away and leaves me, but I needn't really mind,
For she always first remembers to pull up the window-blind.

And just outside my window, on the other side the way,
A street-lamp shines so brightly that it's 'most as light as day;
It shines right in my room, and—just above my little bed—
It paints *another window* on the ceiling overhead.

There are curtains at the window, and the blind-cord bobs about.
It looks so like a real one that you'd think you could look out!
But it's *better* than a real one, is this window overhead;
It's a magic one—an entrance into Fairyland—instead!

I lie and look, and long to be upon the other side,
And, as I gaze, quite suddenly the window opens wide.
A little boy looks out at me and beckons with his hand—
The Ceiling Child is calling me to come to Fairyland!

He drops a moonbeam ladder from the ceiling down to me,
And then I find I'm climbing—climbing up it eagerly.
He reaches out to help me, so I haven't any fear,
And, 'Welcome into Fairyland!' he whispers in my ear.

I wish that I could tell you all I hear and see and do,
For I know you'd like to go with me to Ceiling Country too.
I have wonderful adventures, as I travel wide and far—
But I can't remember afterwards exactly what they are!

I *think* I am a princess, dressed in shining cloth of gold.
(I *know* I never need be good or do as I am told!)
I *think* the Ceiling Child's a prince; and, everywhere I go,
He goes along, and plays with me—for company, you know!

But always in the morning I am back again in bed,
And by daylight I can never see that window overhead.
So I simply have to wait until my bed-time comes again,
And the Ceiling Child comes tapping on the Ceiling window-pane.

B. Noël Saxelby.

Volume IX. of the Seventh Series of Chambers's Journal *is now completed, price* 15*s. net.*
An Index, with Title-page, price Twopence, has been prepared, and may be ordered through any bookseller.
A cloth case for binding the whole of the numbers for 1919 *is also ready, price* 2*s.* 6*d. net.*
Annual subscription, including postage to any address, either at home or abroad, 15*s.*

The January Part of CHAMBERS'S JOURNAL will contain—in addition to the customary features of entertaining and fascinating Short Tales and Original Articles of a popular and informative character—the Opening Chapters of a brilliant Serial Story, entitled

THE PARTS MEN PLAY,

By ARTHUR BEVERLEY BAXTER,

Author of 'The Blower of Bubbles,' 'Merrie Gentlemen,' &c.

In this, his first full-length novel, the young Canadian writer applies to a better understanding of each other (and of themselves) by Britain and the United States, those qualities of keen (but not unkind) satire, genial yet shrewd philosophy, exuberant humour, wholesome pathos, vivid characterisation, charming fancy and delightful style, which readers of his short stories have learned to expect of him.

END OF THE NINTH VOLUME.
